REPORT OF THE CHAIRMAN, WORKING GROUP 4B
REGARDING ADDITIONS TO BE MADE TO THE PROPOSED
"OMNIBUS" RECOMMENDATION TO BE ADDRESSED TO THE C.C.I.R.
TO REPLACE RECOMMENDATION No. Spa 3

1. During its 11th meeting, on 5 July 1971, the Working Group 4B considered the proposal USA/168/290 on a draft recommendation to the C.C.I.R., relating to the Broadcasting-Satellite Service and a proposal from the U.K. Delegation relating to specifying some numerical values of power flux-densities from space stations in the Broadcasting-Satellite Service which would permit differentiation between individual reception and community reception in the Broadcasting-Satellite Service.

2. As regards the proposal USA/168/290, the Working Group was of the opinion that while the U.S.A. proposal was covered in the draft recommendation in Document No. 278, that draft recommendation was limited to the band / 614-790 kHz / whereas the proposal USA/168/290 was more general in nature and applied to all frequency bands which may be allocated to the Broadcasting-Satellite Service. It was therefore decided to request Committee 4 to include the ideas in the U.S.A. proposal in the "omnibus" recommendation to the C.C.I.R. which is at present under consideration by Committee 4.

3. As regards the proposal of the U.K. Delegation, the Working Group 4B noted that, although some results are available in Table 3.3 VI on page 34 of the S.J.M. Report, it would be useful to study this question further and in view of the fact that limited time is available to the Conference and that it would not be possible to specify any values at present, the Working Group decided to request Committee 4 to include this proposal also in the "omnibus" recommendation referred to above.

G.C. BROOKS
Chairman
Working Group 4B
1. Considerations of sharing in the satellite-to-ship direction

1.1 The proposals contained in United Kingdom Documents Nos. 108 and 133 were examined, taking firstly the band 468-470 Mc/s which is proposed for use in the satellite-to-ship direction.

The sharing considerations here are:

a) maritime-satellite systems interfering with terrestrial mobile systems;

b) maritime-satellite systems interfering with terrestrial fixed systems;

c) maritime-satellite systems interfering with meteorological-satellite systems.

1.2 In the consideration of 1.1 a), it was concluded that in order to protect the land mobile service, the maximum power flux-density at the surface of the earth should not exceed $-145 \text{ dBW/m}^2$, in a 25 kc/s band, at angles between 0° and 20° to the horizontal, rising linearly to $-141 \text{ dBW/m}^2$ at 60°, and not exceeding that value between 60° and 90°*).

1.3 In the consideration of 1.1 b), as a basis of calculation a 24-telephone channel terrestrial link was assumed, operating under the worst possible interference conditions, with the main beam pointing directly at the maritime-satellite.

*) It was considered that these values should only be adopted provisionally, and subject to further study by the C.C.I.R.
Under this condition, the above power flux-densities would cause some degradation in the performance of one or more telephone channels in the terrestrial system. Although this is the worst condition of interference, the probability of its occurring (even where there would be only 3 satellites to provide world-wide coverage) is not insignificant. While the limits of p.f.d. set out in Section 2 might be adopted on a provisional basis, and subject to further study by the C.C.I.R. it was recognized that additional measures might need to be taken to safeguard terrestrial fixed links. Examples of interference calculations are shown in the attached Annex.

1.4 In the consideration of 1.1 c), it was concluded that the proposed secondary maritime-satellite service could not share the same frequencies with the existing secondary meteorological-satellite service in the band 468-470 Mc/s which operates at a power flux-density of -154 dBW/m² in any 4 kc/s band.

2. Considerations of sharing in the ship-to-satellite direction:

2.1 The proposals contained in Documents Nos. 108 and 155 relating to the frequency band between 606 and 614 Mc/s are that 611-615 Mc/s should be used for ship-to-satellite transmissions on the high seas, and 607-607.25 Mc/s for use in coastal waters.

The sharing considerations here are:

a) maritime-satellite ship transmissions interfering with radio astronomy;

b) television broadcasting transmitters interfering with a maritime-satellite space station;

c) maritime-satellite ship transmitters interfering with television broadcast receivers.

2.2 In the consideration of 2.1 a), calculations were made of the geographical separations that would be necessary if the ship radiated within a frequency band used for radio astronomy.

Taking as the basis of calculation the need to keep interfering signals below -255 dB/m²/c/s (S.J.M. Report, Annex 7.1, Table 7.1.1), in order to provide protection for 99% of the time in temperate zones it was calculated that for a radio astronomy station located on the coast, without site shielding, the geographical separation from the ship, (assumed to be radiating horizontally an e.i.r.p. of +14 dBW), would need to be much greater than 1000 km. The propagation characteristics appropriate to paths of greater length than 1000 km are not available, but come within the scope of Study Programme 5-1D-1/5 of the C.C.I.R. If the astronomy station were sited such that the path was mainly
over land, again without site shielding, the separation distance would be some 800 to 900 km. With site shielding of 20 db, the separation distances would be greater than 1,000 km over sea, and 650 km over land. Because of these separation distances it is concluded that sharing between the Radio-Astronomy Service and the Maritime-Satellite Service is not feasible on an equal basis.

2.3 As regards 2.1 b), it should be noted that if the frequency band 607-607.25 Mc/s were allocated to the Maritime-Satellite Service, television transmissions in Region 2 in the band 602-608 Mc/s will have a sound carrier at 607.75 Mc/s which would be a source of interference to the satellite. The aggregate of e.i.r.p. radiated in the satellite band towards the satellite from all television transmitters should not exceed a value of about +10 dBW/16 kc/s, based on the assumption that the ship's e.i.r.p. is +25 dBW. These considerations also apply to Region 3.

Similar problems of interference apply to the band 611-613 Mc/s if the television channel occupying the band 608-614 Mc/s is used in Region 3. Similarly in Region 1 there is a sharing problem in the use of the band 606-614 Mc/s for television broadcasting and the Maritime-Satellite Service.

Because of the need to limit the e.i.r.p. as above, it is concluded that sharing between the Terrestrial Broadcasting Service and the Maritime-Satellite Service is not feasible on an equal basis.

2.4 As regards 2.1 c), in order to avoid interference to television receivers from ships' transmissions operating on a frequency of 607-607.25 Mc/s, the Broadcasting Service area and the areas of shipping operations would need to be separated from one another.

In order to avoid interference to the television channel above the proposed frequency band of 611-613 Mc/s, a frequency separation of about 1 Mc/s is necessary to avoid interference to television receivers near the coast, even when the ship is some distance outside coastal waters.

G.C. BROOKS
Chairman
Working Group 4B

</table>

### Assumptions

1. **Baseband range of wanted system = 12-108 kc/s**
2. **R.m.s. deviation 35 kc/s. Receiver noise factor 3 db**
3. **Case 1 15 db antenna gain pointing directly at satellite**
4. **Case 2 12 db antenna gain pointing directly at satellite**
5. **Case 3 12 db antenna gain - average off-beam gain, 2 db**
(vi) 3 db polarization discrimination satellite-terrestrial link

(vii) Power flux-density, 0 to 20° = -145 dBm²/25 kc/s (This applies to Cases 1 and 2)

(viii) Power flux-density 60° to 90° = -141 dBm²/25 kc/s (This applies to Case 3)

Remarks

In practice, the total system noise will be greater than the values shown in Column 3 of the table due to intermodulation noise.

Factors which will contribute to the reduction of interference may be the dispersal effect of modulation on the interfering carrier, and/or voice switching of the satellite transmission, together with jitter of the wanted and unwanted carriers, which will result in a subjective reduction in noise.

On the other hand, no account has been taken of the consequence of interference being reflected into the terrestrial link antennae from the ground.

In a multi-hop system, owing to the frequency shift between adjacent hops, the average interference per hop will be 3 db below the values shown.
REPORT OF THE CHAIRMAN, WORKING GROUP 4B
REGARDING DOCUMENT No. 260 FROM
CHAIRMAN OF WORKING GROUP 4E

1. During its twelfth meeting on 6 July 1971, Working Group 4B considered Document No. 260 and especially paragraphs 3.1 and 3.2 thereof. After careful examination of:

1.1 : Paragraph 3.2 of Document No. 61
1.2 : Recommendation No. 432-1 of the C.C.I.R., and
1.3 : Article 2 and Appendix 5 of the existing Radio Regulations,

with reference to the activities of Working Group 4B, the Working Group came to the following conclusions:

2. As regards paragraph 3.2.1 of Document No. 260, Working Group 4B was of the view that the items of basic characteristics to be notified to the I.F.R.B. should be limited to the minimum necessary ones which would enable the I.F.R.B. to examine the notices with reference to their conformity with the provisions of the Radio Regulations. With this principle in view, Working Group 4E should decide in consultation with Committee 6, the basic characteristics which should be included in Appendices 1, 1A & 1B. Working Group 4B had no specific items to suggest to Working Group 4E.

3. As regards paragraph 3.2.2 of Document No. 260, Working Group 4B agreed in principle that it is desirable to update Article 2 and Appendix 5 of the present Radio Regulations, to incorporate therein the provisions of Recommendation 432-1 of the C.C.I.R. However, Working Group 4B had no occasion to use Article 2 and Appendix 5 during the course of its work and therefore had no specific proposals on this subject. Working Group 4B was of the opinion that the Chairman of Working Group 4E may like to decide upon the need or otherwise to revise the provisions of Article 2 and Appendix 5 in consultation with Committee 6.

SECOND REPORT OF COMMITTEE 5 (ALLOCATIONS)

Article 1 Section IIA ADD 84QA ADD 84QB ADD 84ATC

Article 6 MOD 415 MOD 417 ADD 419A

Article 27 MOD 951 MOD 952

Draft Resolution relating to the use of the band 156-174 Mc/s by the Maritime Mobile-Satellite Service

Draft Recommendation relating to a revised presentation of the Sections of Article 1 of the Radio Regulations

Draft Recommendation relating to the future exploitation of bands allocated to the Inter-Satellite Service

Draft Recommendation relating to the future use of the certain frequency bands between 40 and 275 Gc/s by the Radiocommunication Services

Draft Recommendation relating to the future use of the 41-43 Gc/s band by the Fixed and Mobile Services

Draft Recommendation relating to requirements for future frequency allocations for Maritime Mobile Service using space techniques
Draft Recommendation relating to the protection of radio astronomy observations on the shielded area of the moon

Draft Recommendation relating to the future provision of a band near 10 Mc/s for the Radio Astronomy Service

Committee 5 adopted the above texts which are reproduced in the Annex to the present Report and submitted for first reading by the Plenary.

H.A. KIEFFER
Chairman

Annex : 1
ANNEX

ARTICLE 1, SECTION IIA

ADD 84AQA Aeronautical Radionavigation-Satellite Service.
A radionavigation-satellite service in which mobile earth stations are located on board aircraft.

ADD 84AQB Maritime Radionavigation-Satellite Service.
A radionavigation-satellite service in which mobile earth stations are located on board ships.

ADD 84ATC Time Signal-Satellite Service.
A radiocommunication service using space stations on earth satellites for the same purposes as those of time signal service.
ARTICLE 6 MOD 415, MOD 417

MOD 415 § 2. (1) When special circumstances make it indispensable to do so, an administration may, as an exception to the normal methods of working authorized by these Regulations, have recourse to the special methods of working enumerated below, on the sole condition that the characteristics of the stations still conform to those inserted in the Master International Frequency Register:

a) a fixed station in the Terrestrial Service or Fixed Satellite Service may, on a secondary basis transmit to mobile stations on its normal frequencies;

b) a land station may communicate, on a secondary basis, with fixed stations in Terrestrial Service or Fixed Satellite Service or other land stations of the same category.

MOD 417 § 3. Any administration may assign a frequency in a band allocated to the Fixed Service or allocated to the Fixed Satellite Service to a station authorized to transmit, unilaterally, from one specified fixed point to one or more specified fixed points provided that such transmissions are not intended to be received directly by the general public.

ARTICLE 6 ADD 419A

ADD 419A Aircraft earth stations are authorized to use frequencies in the bands allocated to the Maritime Mobile Satellite Service for the purpose of communicating, via the stations of that service, with the public telegraph and telephone networks.
ARTICLE 27 MOD 951, MOD 952

MOD 951 § 3. (1) Aircraft stations may communicate with stations of the Maritime Mobile or Maritime Mobile-Satellite Services. They shall then conform to those provisions of these Regulations which relate to those services.

MOD 952 § (2) For this purpose, aircraft stations should use the frequencies allocated to the Maritime Mobile or Maritime Mobile-Satellite Services. However, having regard to interference which may be caused by aircraft stations at high altitudes, maritime mobile frequencies in the bands above 30 Mc/s shall not be used by aircraft stations in any specific area in which interference is likely to be caused. In particular, aircraft stations operating in Region 1 should not use frequencies in the bands above 30 Mc/s allocated to the Maritime Mobile Service by virtue of any agreement between administrations in that Region.
DRAFT RÉSOLUTION

relating to the use of the band 156-174 Mc/s by the Maritime Mobile Satellite Service

considering

a) that there is a need to develop the use of Space Radiocommunication techniques to meet the future requirements of the Maritime Mobile Service;

b) that of the bands used at present by the Maritime Mobile Service, there may be advantages in using for the Maritime Mobile Satellite Service narrow channels between 156-174 Mc/s for safety and distress;

recognizing

1) that the maritime mobile bands between 156-174 Mc/s are also used for other services;

2) that the power flux-densities laid down by maritime satellites in this band may cause harmful interference to terrestrial receivers and that the satellite receiver may suffer harmful interference from terrestrial radiocommunication transmissions;

3) that the Terrestrial Maritime Mobile Service makes extensive use of the channels given in Appendix 18 of the Radio Regulations;

is of the opinion

that it is important for the Maritime Mobile Satellite Service to be able to use some narrow channels, on an exclusive basis, for safety and distress as soon as practicable;

having provided for

the possible use of narrow channels for safety and distress by the Maritime Mobile Satellite Service in bands 157.3125-157.4125 Mc/s and 161.9125-162.0125 Mc/s not earlier than 1 January 1976 (see Radio Regulation No. 287A);
resolves

that the World Administrative Maritime Radio Conference to be held in 1974 be invited to consider this matter further and to decide if and to what extent the Maritime Mobile Satellite Service should be introduced in the above bands on an exclusive basis and to make any consequential changes in the Radio Regulations and in the use of the channels in Appendix 18;

requests the Secretary-General

to communicate this Resolution to Members and Associate Members and to the Administrative Council for inclusion in the draft agenda for the 1974 Maritime Conference.
DRAFT RECOMMENDATION

relating to a revised presentation of the sections of Article 1 of the Radio Regulations

The World Administrative Radio Conference for Space Telecommunications

considering

a) that the amendments made to the Article 1 of the Radio Regulations have resulted in a lack of system in the placing of individual terms and the somewhat illogical sequence in which they come;

b) that it would therefore be desirable to rearrange Article 1 of the Radio Regulations in a more appropriate form;

recognizing

that this Conference was not able to perform this task

recommends

that the next World Administrative Conference which is competent to revise Article 1 of the Radio Regulations should consider the possibility of rearranging Article 1 in a more logical manner, for instance, on the lines of the Annex to this Recommendation, and to consider further consequential amendments to this Article, as necessary.

Annex : 1.
Article 1

Section I.  General terms
Section II.  Radio systems
Section III.  Radio Services and stations
  Sub-Section IIIA.  Terrestrial Radiocommunication
  Sub-Section IIIB.  Space Radiocommunication
  Sub-Section IIIC.  Radio astronomy
Section IV.  Technical characteristics
DRAFT RECOMMENDATION

relating to the future exploitation of bands allocated to the Inter-Satellite Service

considering

a) that the bands 54.25-58.2 GHz, 59-64 GHz, 105-130 GHz, 170-182 GHz and 185-190 GHz have been allocated to the Inter-Satellite Service;

b) that all the foregoing bands are located in parts of the radio-frequency spectrum close to peaks of atmospheric absorption;

and recognizing

that the Inter-Satellite and Terrestrial Radiocommunication Services are mutually protected by the attenuation due to atmospheric absorption;

recommends

that a future World Administrative Radio Conference should consider allocating these bands also to Terrestrial Radiocommunication (except Aeronautical Mobile) Services.
DRAFT RECOMMENDATION

relating to the future use of certain frequency bands between 40 and 275 Gc/s by the radiocommunication services

considering

that the 45-48 Gc/s, 66-71 Gc/s, 95-101 Gc/s, 142-150 Gc/s, 190-200 Gc/s and 250-265 Gc/s bands have been allocated to the following services:

- Aeronautical Mobile-Satellite
- Maritime Mobile-Satellite
- Aeronautical Radionavigation-Satellite
- Maritime Radionavigation-Satellite;

recognizing

that it is not desirable for compatibility considerations that at a later date these bands should be shared with Terrestrial Radiocommunication Services other than those of interest to the Aeronautical and Maritime Mobile Services and/or the aeronautical and Maritime Radionavigation Services;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 43-48 Gc/s, 66-71 Gc/s, 95-101 Gc/s, 142-150 Gc/s, 190-200 Gc/s and 250-265 Gc/s bands to the following services:

AERONAUTICAL RADIONAVIGATION
AERONAUTICAL MOBILE
MARITIME MOBILE
MARITIME RADIONAVIGATION

in an appropriate manner.
DRAFT RECOMMENDATION

relating to the future use of the 41-43 GHz band by the Fixed and Mobile Services

considering

that the 41-43 GHz band has been allocated to the Broadcasting-Satellite Service;

recognizing

that it is possible, by appropriate co-ordination, for a frequency band to be shared by the Broadcasting-Satellite Service, on the one hand, and the Fixed and Mobile Services, on the other;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 41-43 GHz band to the Fixed and Mobile Services.
DRAFT RECOMMENDATION

relating to requirements for future frequency allocations for Maritime Mobile Service using space techniques

The World Administrative Radio Conference, Geneva, 1971,

having noted that the Inter-Governmental Maritime Consultative Organization (I.M.C.O.) has stated a requirement for frequencies on the order of 400 MHz, believing that small vessels in particular may be excluded from satellite communications if such frequencies are not made available;

further noting that the C.C.I.R. Special Joint Meeting, Geneva, 1971, concluded that the present Conference should be invited to examine the possibility of providing exclusive channels for the Maritime Mobile Service at about 400 MHz and that provision of such channels is desirable:

considering

a) that ship stations and survival craft stations are completely dependent upon the use of radio for communication;

b) that the use of space techniques will provide the Maritime Mobile Service with a reliable method of communication, considerably improved over existing methods;

c) that reliable Maritime Mobile Service communications will greatly assist in the saving of lives and property;
d) that although the Conference has made certain provisions for the use of space techniques by the Maritime Mobile Service, there is some uncertainty with respect to the adequacy and usefulness of these provisions, particularly insofar as small ships and survival craft are concerned.

e) that general participation of small ships in a service using space techniques would not only benefit the efficient and safe operation of these ships, but it would also improve the safety service for larger ships and survival craft.

f) that future conferences might find it necessary to make additional allocation provisions for such uses in more nearly optimum portions of the spectrum;

g) that some communications functions, such as certain broadcasting and fixed applications, may not be dependent upon the transmission of radio waves, but could in fact use other means, thereby making available portions of the spectrum for services which are so dependent.

recommends

1. that administrations and appropriate international organizations should continue to review the requirements for the application of space techniques for the Maritime Mobile Service and the suitability of current frequency allocation provisions in meeting those requirements;

2. that the C.C.I.R. should continue its studies to determine the optimum portions of the frequency spectrum and related sharing conditions to accommodate Maritime Mobile Service requirements, taking into consideration technological advances in space techniques for Mobile Services;

3. that a future appropriate Administrative Radio Conference should review the requirements of the Maritime Mobile and Safety Services, and if necessary, provide the frequency allocation to satisfy these requirements.
DRAFT RECOMMENDATION

relating to the Protection of Radio Astronomy Observations
on the Shielded Area of the Moon

The World Administrative Radio Conference, Geneva, 1971,

considering

a) that radio astronomy observations at frequencies below the
ionospheric critical frequencies and above 100 Gc/s are hampered or
prevented by absorption in the earth's atmosphere;

b) that successful radio astronomy observations require complete
freedom from harmful interference;

c) that observations from the shielded area of the moon offer unique opportunities for observations which are not affected by such absorption;

d) that the shielded area of the moon appears to be the most
potentially useful area accessible to man which is completely free from
interference from terrestrial transmissions;

e) that the shielded area of the moon refers to the area of the
moon which is more than 23.2° beyond the mean limb of the moon as seen
from the centre of the earth;

f) that the transmissions of data from observation stations to
collection points by radio-communication will be in the bands allocated
for this purpose;

noting

the desirability of maintaining the shielded side of the moon as
an area of maximum value for observations by the Radio Astronomy and
passive Space Research Services and consequently to be as free as possible
from transmissions;
recommends

1) that the C.C.I.R. study the problem of the frequency bands most suitable for radio astronomy observations on the shielded side of the moon and work out recommendations concerning these bands as well as criteria for their application and protection;

2) that in the meantime administrations, in accordance with the intent of this recommendation, take all practicable steps to ensure that there will be no interference to radio astronomy observations on the shielded side of the moon; and

3) that administrations should apply such recommendations as will be provided on this matter by the C.C.I.R. pending the convening of the next World Administrative Radio Conference.
DRAFT RECOMMENDATION

relating to the future provision of a band near 10 Mc/s for the Radio Astronomy Service

The World Administrative Radio Conference 1971

considering

a) the requirements of the Radio Astronomy Service, as expressed by the Inter-Union Commission on Frequency Allocations for Radio Astronomy and Space Science (IUCAF), for a frequency allocation near 10 Mc/s;

b) that the use of the standard frequency guard bands has not satisfied the needs of the Radio Astronomy Service at a frequency near 10 Mc/s;

c) that propagation conditions at a frequency near 10 Mc/s are such that interference to the Radio Astronomy Service might result from a transmitter operating anywhere on the earth and as a consequence an exclusive world-wide allocation is necessary for long term observations;

d) that successful radio astronomical measurements have, at times, been made at frequencies near 10 Mc/s;

e) that IUCAF is co-ordinating the needs of radio astronomers for frequency allocations;
recommends

1) that administrations keep under review the possibility of releasing a band of frequencies 50 kc/s wide for the use of the Radio Astronomy Service between 10 Mc/s and 15 Mc/s;

2) that administrations give close attention to any future recommendation of the IUCAF concerning the specific frequency band between 10 Mc/s and 15 Mc/s required by the Radio Astronomy Service;

3) that a future World Administrative Radio Conference consider granting to the Radio Astronomy Service an exclusive allocation in this region of the spectrum.
SUMMARY RECORD
OF THE
FIFTH MEETING OF COMMITTEE 5
(ALLOCATIONS)
Wednesday, 7 July 1971, at 1500 hrs

Chairman: Mr. H.A. KIEFFER (Switzerland)

Subjects discussed:

1. Proposal by IRAQ (40-275 GHz) 230 and Add. 1
2. First report from Working Group 5D 203 and Corr. 1
   Second report from Working Group 5D 239
   Third report from Working Group 5D 240
   Fourth report from Working Group 5D 241
3. First report from Working Group 5E 248
1. Proposal by Iraq (40-275 GHz) (Document No. 230 and Add. 1)

The Chairman explained that a further vote would be taken on the proposal in application of No. 273 of the Convention.

The Delegate of Iraq said that during discussion the previous day no views had been expressed by those delegations voting against the proposal; as the majority had abstained he had felt the proposal might lack clarity and he had therefore combined the two parts into a single paragraph:

"The bands to be allocated above 40 GHz should be limited to the space services needing them now or which will be needing them within the next ten years."

The Delegates of India, Pakistan and Argentina supported that modification.

The Chairman put the modified proposal to the vote and it was accepted by 29 votes to 5, with 25 abstentions.

The Chairman said that the content of the bands in question would be considered during the discussions on allocations above 40 MHz.

The Delegate of the United States of America said he had abstained from voting on the understanding that the modified proposal was a replacement for paragraphs 1 and 2 on page 2 of Document No. 230.

The Delegates of Italy and the United Kingdom explained that they had abstained for the same reason.

2. First report from Working Group ED (Document No. 203 + Corrigendum 1)

The Chairman of Working Group ED indicated that in Appendix E, ADD 274B, "and Mexico" should be inserted after "Cuba". The report had been adopted unanimously by the Working Group, except for the part concerning Radio Astronomy in the HF bands but that had already been dealt with in an earlier meeting of the Committee.

The Chairman took the report paragraph by paragraph.
1.1 and Appendix A : Adopted
1.2 and Appendix B : Adopted
1.3 and Appendix C : Adopted
1.4 and Appendix D : Adopted
1.5 and Appendix E :

The Chairman of Working Group 5D said that the final sentence of 1.5 was no longer necessary and should be deleted.

The Observer from I.C.A.O., referring to MOD 274, said that the presence of those stations, particularly in the European region, complicated the already difficult task of aeronautical mobile route frequency management and I.C.A.O. hoped that the Administrations concerned would give favourable consideration to the transfer of the stations to another band at the earliest practicable date.

The Delegate of Roumania asked for Roumania to be added to the list of countries mentioned in MOD 274. It was so adopted.

In the Spanish text, first line of ADD 274B, the figure should be corrected to read 132-137 Mc/s.

Adopted, as amended

1.7 and Appendix F :

The Delegate of Italy said that the Table in Appendix F differed from that in the Working Group 5B report and suggested it be left in abeyance until the 5B report had been considered. It was so agreed.

1.8 and Appendix G :

The Delegate of Morocco said that Morocco should be deleted from MOD 281C. The Chairman expressed appreciation to the Delegation of Morocco and asked if any other Administration could follow this good example.

The Delegates of Ceylon and India said their countries should be added to those listed in MOD 281E. It was so adopted.

1.9 and Appendix H : Adopted
1.10 and Appendix I : Adopted

2. Noted.
Second report from Working Group 5D (Document No. 239)

The Chairman of Working Group 5D said that following consideration of Document No. 282, the text of MOD 322 should be altered to read:

"In Denmark, Norway and Sweden, the bands 430-432 Mc/s and 438-440 Mc/s are allocated to the fixed and mobile services."

1.1 and Appendix A: Adopted

1.2 and Appendix B: Adopted

1.3 and Appendix C:

The Delegates of Bulgaria and the Syrian Arab Republic asked for their countries to be included in MOD 311A. Those additions were adopted.

1.4 and Appendix D: Adopted

1.5 and Appendix E: Adopted, with the amendments indicated by the Working Group Chairman.

Third report from Working Group 5D (Document No. 240)

The Chairman of Working Group 5D said that the Drafting Group would adjust the denominations in the Table to bring them into line with terms and definitions adopted by Committee 5, presented by Working Group 5 ad hoc in Documents Nos. 218 and Corr. and No. 251. He drew attention to the final sentence on page 6 and to a typing mistake in the English text on page 2, which should read "(see Appendix B)".

Appendix A

The Chairman said that ADD 402A should read "In France and Greece, ..." The Delegate of the United Kingdom, pointing out that the provision was not concerned with Space Services and therefore did not fall within the competence of the Conference, proposed that it be deleted entirely. It was so agreed.

The Delegate of France said he had noted the point but could not agree with the deletion.
Appendix B

The Chairman drew attention to the final sentence "it ... systems" which would be held in abeyance and said that the note would be removed as its content could be shown in the Table.

There was a lengthy discussion following the suggestion of the Delegate of Syria that allocations could be limited to 150 GHz and the request by the Delegate of Iraq for comments from those delegations which did, in fact, need such allocations in the near future.

The Delegate of the United States of America said that the techniques used in the services concerned (all closely related to the Mobile Service) were developing rapidly and would in many cases become part of operational systems. Provided guidance were given at the present time to designers and equipment manufacturers, a later conference could go into details of how bands could best be divided among the various services. The Delegate of Japan said that there was a possibility of the band being used but the main interest was in setting a target for the development of new systems.

The Observer from I.C.A.O. said that the I.C.A.O. co-ordinated proposals went up to 265 GHz for development purposes. The Delegate of New Zealand said that his Administration had also submitted proposals going up to 265 GHz. Since that part of the spectrum was unused, it should be allocated up to a limit considered reasonable by those delegations which could foresee using it.

The Delegate of the U.S.S.R. thought that U.S.S.R. requirements could be catered for in the band up to 150 GHz.

The Director of the C.C.I.R., speaking at the request of the Chairman, said that the C.C.I.R. had already been studying propagation characteristics and techniques in the higher GHz ranges and in his view it was essential for the I.T.U. to maintain its guiding role.

The Observer from I.A.T.A. said that in the bands below 40 GHz many allocations were exclusive and I.A.T.A. could see no reason for a change in philosophy in higher bands: he felt that exclusive bands should be made available in the interests of free development.
The Delegates of Denmark and Sweden were not in favour of allocating the band to as many as four services; although they accepted the decision of the Sub-Working Group, they wished to place on record that they did not consider such action to be good frequency management.

The Delegate of Ethiopia referred to the Iraq proposal adopted at the start of the meeting which called for allocations to be limited to more or less immediate requirements. He thought it would be useful to have all the allocations to the various services in those bands shown in the form of a chart. The Delegate of Syria withdrew his own proposal and supported that suggestion.

The Delegate of the United Kingdom, supported by the Delegate of Italy, said that the Working Group report dealt with Mobile Services and he could not see how an overall picture including other services would help. He had been surprised to hear of attempts to discourage Space Services from developing in the higher reaches of the spectrum as that order of frequencies was of no use to Terrestrial Services. He was very much in favour of the Space Services using as high a range of frequencies as possible.

The Delegate of Syria then suggested that the bandwidths might be reduced. Having been reminded by the Chairman that the bands in question were allocated to four services, he withdrew that suggestion, the Chairman giving the assurance that the genuine concern expressed about the manner in which the spectrum would be used in future would be borne in mind.

Appendix B was therefore adopted.

With regard to ADD 412I, the Chairman said that if the Committee agreed a draft recommendation could be produced for discussion at a subsequent meeting, it being understood that the rest of the note would be removed, as he had explained earlier.

The Delegate of New Zealand agreed with that suggestion, noting that the draft recommendation attached to Document No. 254 from Working Group 5A should be taken into consideration.

The Observer from I.C.A.O. said that one of the points made in the I.C.A.O. Council was the importance of the principle of exclusive allocations. That was obviously not possible in the development stage but it might be desirable, in the drafting, to ask future radio conferences to consider that possibility.
Fourth report from Working Group 5D (Document No. 241)

The Chairman of Working Group 5D pointed out a small correction to the French text only: on page 4, 6th line, the final figure should read "157, 4 125 MHz".

The Delegate of Austria said he had not yet been able to make sure whether the arrangement given in Document No. 241 would be compatible with the arrangements for traffic on the lower Danube.

Appendices A and B to Document No. 241 were adopted.

The Chairman of Working Group 5D thanked Working Group 5D-2 and its Chairman, Mr. V.K.Y. Winkleman (Netherlands) for their successful drafting of the texts of these Appendices.

In reply to a point raised by the Delegate of France, the Chairman said that Proposal F/28/280, which had not been examined by Working Group 5D as planned, would be considered at a later meeting of Committee 5.

3. First report from Working Group 5E (Document No. 248)

The report was adopted.

The meeting rose at 1800 hrs.

The Chairman:

H.A. KIEFFER
SECOND REPORT OF SUB-WORKING GROUP 5E-1
TO WORKING GROUP 5E

Broadcasting-Satellite Service (620-960 Mc/s)

1. Frequency band 620-790 Mc/s

The Sub-Working Group agreed in principle that the band 620-790 Mc/s may also be used by stations in the Broadcasting-Satellite Service subject to agreement on the power flux-density limitation values to be inserted in the text of ADD 332A. The Group provisionally agreed on the remainder of the text of foot-note ADD 332A, as shown in the Annex to the present Report.

2. Frequency band 790-960 Mc/s

2.1 Sub-Working Group 5E-1 agreed by a large majority not to recommend a world-wide allocation to the Broadcasting-Satellite Service in the band 790-960 Mc/s.

2.2 The question of Regional allocations was raised; however, time did not permit of its examination.

Per ÅKERLIND
Chairman

Annex : 1
ANNEX

620-790 Mc/s

ADD 332A Within the frequency band 620-790 Mc/s, assignments may be made to stations in the Broadcasting-Satellite Service, subject to agreement among the Administrations concerned and affected (see Articles 9 & 9A or Resolution ). Such stations shall not produce a power flux-density in excess of the value within the territories of other Administrations without the consent of those Administrations.
SUMMARY RECORD
OF THE
SECOND MEETING OF COMMITTEE 6
Friday, 25 June 1971, at 0940 hrs

Acting Chairman: Dr. M.K. BASU (India)

Subjects discussed:

1. Approval of the Summary Record of the First Meeting

2. Progress of work report by Working Group Chairman

3. Consideration of document by Working Group 6B

4. Distribution of new documents among the Working Groups
1. Approval of the Summary Record of the First Meeting
   (Document No. 142 + Add. No. 1)

   Approved

2. Progress of work report by Working Group Chairman
   (Document No. 195)

3. Consideration of document by Working Group 6B
   (Document No. 195)

   Working Group 6A

   The Chairman of Working Group 6A said that the Working Group was
   making satisfactory progress. It had agreed on six principles to serve as
   a basis for its revision of Article 9A and its drafting group had almost
   completed the relevant draft which would be submitted to the next meeting
   of Committee 6. Another sub-group had agreed on principles and was now
   drafting proposed texts for Appendices 1 and 1A. Working Group 6A had also
   reached agreement in principle on the Broadcasting-Satellite Service and
   had set up a small group to be convened by Mr. JOB (France) to draft the
   necessary resolutions.

   The Chairman stated that the Committee would consider drafts of
   Articles 9 and 9A at its next meetings.

   Working Group 6B

   The Chairman of Working Group 6B said that the Working Group had
   almost completed its work and introduced Document No. 195.

   Paragraph 1, Article 8

   The proposed modification was approved for the French and English
   texts.

   The Delegate of Mexico said that the Spanish text of RR477
   should be maintained as worded in the present Radio Regulations, except
   for the statement "particularly the portion concerning high frequencies",
   which was to be deleted. It was very important to say that the Board had
   to carry out a "continuous and methodic study of the radio spectrum
   utilization" because, as he understood, that was the intention of the
   Conference held in 1959 and it was actually what the Board was doing.
The Chairman of the I.F.R.B. said that the present Spanish text would be maintained with the correction mentioned by the Delegate of Mexico.

The Spanish text in Document No. 195 so modified was also approved.

Paragraph 2, Article 14

The proposed modification was approved.

Paragraph 3, Article 15

The proposed modification was approved.

Paragraph 4, Article 1 (Section III)

The Chairman of Working Group 6B explained that the conclusions of paragraph 4 had not yet been finally approved by the Working Group, but in view of the need to refer them back to Committees 4 and 5 as soon as possible, it was agreed that Committee 6 should consider them immediately.

Sub-paragraph 4.1

Approved.

Sub-paragraph 4.2

The Delegates of Belgium, New Zealand, the Netherlands and Argentina supported the inclusion of the words "the effect of" which they thought rendered the definition more logical. The Chairman of the I.F.R.B., pointing out that the inclusion of these words might influence the formulation of Articles 9 and 9A, suggested that the question be referred back to Working Group 6A for further study.

The Chairman said that a final decision on the question would be taken at the Committee's next meeting.

Sub-paragraph 4.3

The Chairman of Working Group 6B said he had found that point outside the Group's terms of reference, and it was agreed to delete sub-paragraph 4.3 from Document No. 195.
Sub-paragraph 4.4

The Chairman said that the Working Group's views on sub-paragraph 4.4.1 would be considered at the Committee's next meeting, before being transmitted to Committee 4.

There was some discussion of sub-paragraph 4.4.2 during which the Delegate of Argentina, strongly supported by the Delegate of France, pointed out the illogicality of having a definition (No. 89), which was dependent on another definition (No. 85), and suggested that a better formulation of No. 89 should be sought. The Representative of the I.F.R.B. and the Delegates of New Zealand, India, United States of America and the Netherlands said that No. 89 had satisfactorily stood the test of time, and while conceding the validity of the Argentinian Delegate's view, preferred to retain the connection between No. 85 and No. 89 by maintaining No. 89 unchanged.

A decision was postponed, pending the submission by the Delegate of France of a proposed new text for No. 89 to the next meeting of Working Group 6A.

Sub-paragraph 4.5

Decision postponed pending consideration by Working Group 6A.

4. Distribution of new documents among the Working Groups

Distribution as in Annex to Document No. C6-2 approved.

The meeting rose at 11:05 hours.

The Secretary: W. GARCIA-RIOS

The Acting-Chairman: M.K. DASU
NOTE FROM THE CHAIRMAN OF COMMITTEE 4.

TO THE CHAIRMAN OF COMMITTEE 6

1. Your attention is drawn to the following documents of Committee 4, which were approved by Committee 4 at its 7th Meeting on 7 July 1971:

   a) Addendum No. 1(Rev.) to Document No. 198 (ref. paragraph 2 on page 1).

   b) Document No. 275 (ref. paragraph 3 on page 1).

2. You are requested kindly to ensure that in Articles 9 and 9A suitable provisions are incorporated to provide for the co-ordination envisaged in Nos. 470MB and 470NGA in the Annex to Addendum No. 1(Rev.) to Document No. 198 and in No. 470NK in the Annex to Document No. 275.

E. SANDBACH
Chairman
Committee 4
NOTE FROM THE CHAIRMAN OF COMMITTEE 4
TO THE CHAIRMAN OF COMMITTEE 5

1. Your attention is drawn to Documents Nos. 274 and 275 of Committee 4, which were approved by Committee 4 at its 7th Meeting on 7 July 1971, which deal with sharing considerations for the Broadcasting-Satellite Service with terrestrial services in the frequency bands around 2.5 Gc/s and the proposed provisions of Article 7 to incorporate the concerned sharing criteria in the Radio Regulations respectively.

2. You are requested kindly to note the contents of these documents.

3. Sharing considerations for Broadcasting-Satellite Service with terrestrial services in the band 614-790 Mc/s are contained in Document No. 278 which has not yet been considered by Committee 4.

E. SANDBACH
Chairman
Committee 4
REPORT OF WORKING GROUP 6A ON ARTICLE 9A

The Working Group 6A has held several meetings during which the proposals submitted to the Conference by Administrations with respect to Article 9A were examined. The Group has based its work on the six following principles, adopted by it at its 4th meeting.

1) The data related to the "Advance Publication Procedure" must be published world-wide by means of the I.F.R.B. weekly circular whether or not geostationary satellites are involved;

2) All administrations have the right to make comments;

3) The publication of data must contain a specified minimum of data to permit the calculation of A T;

4) When the co-ordination procedure is commenced, it will be directed to the administrations whose interests may be affected and to those which would have made comments;

5) The administration initiating co-ordination will inform the I.F.R.B. who will publish this information in its weekly circular;
6) An administration believing that its notified or co-ordinated system was not taken into account shall have the right to require that it will be brought into the co-ordination procedures provided that this administration will provide the necessary information.

The Working Group was able to reconcile the views expressed in the various proposals and to submit to Committee 6 only one text for Article 9A. Some parts of this text are put within square brackets which, except in a small number of cases, refer to definitions which have to be adopted by other Committees. This result could be obtained only thanks to the spirit of co-operation shown by all delegates.

P.E. WILLEMS
Chairman,
Working Group 6A

Annex: 1
ANNEX

ARTICLE 9A

Co-ordination, Notification and Recording in the Master International Frequency Register of Frequency Assignments to Stations in the Space and Radio Astronomy Services, except the broadcasting satellite service.

Section I Procedure for the Advance Publication of information on planned Satellite Systems.

639AA §1. (1) An administration (or one acting on behalf of a group of named administrations) which intends to establish a satellite system shall, prior to the co-ordination procedure in accordance with No. 639AK where applicable, send to the Board not earlier than five years before the date of bringing the planned system into service the information listed in Appendix I.

(2) Any amendments to the information sent concerning a planned satellite system in accordance with No. 639AA shall, as soon as they become available, also be sent to the Board.

(3) The Board shall publish the information sent under Nos. 639AA and 639AB in a special section of its weekly circular and shall also, when the weekly circular contains such information, so advise all administrations by circular telegram.

1) The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).
ADD 639AD  

(4) If, after studying the information published under No. 639AC, any administration is of the opinion that interference, which may be unacceptable, may be caused to its existing or planned space services, it shall within ninety days after the date of the weekly circular publishing the information listed in Appendix /1B/, send its comments to the administration concerned. A copy of these comments shall also be sent to the Board. If no such comments are received from an administration within the period mentioned above, it may be assumed that that administration has no basic objections to the planned satellite system.

ADD 639AE  

(5) An administration receiving comments sent in accordance with No. 639AD shall endeavour to resolve any difficulties that may arise.

ADD 639AF  

(6) In case of difficulties arising when the planned satellite system is intended to use the geostationary orbit:
a) The administration responsible for the planned system shall first explore all possible means of meeting its requirements, taking into account the characteristics of other geostationary satellite systems, and without considering the possibility of adjustments to systems of other administrations. If no such means can be found, the administration concerned is then free to apply to other administrations concerned to solve these difficulties.

b) An administration receiving a request under (a) above shall, in consultation with the requesting administration, explore all possible means of meeting the requirements of the requesting administration, for example, by relocating one or more of its own geostationary space stations involved, or by changing the emissions, frequency usage (including changes in frequency bands) or other technical or operational characteristics;

c) If after following the procedure outlined in (a) and (b) above there are unresolved difficulties, the administrations concerned shall together make every possible effort to resolve these difficulties by means of mutually acceptable adjustments, for example, to geostationary

1) See Resolution No. Spa C
space station locations and to other characteristics of the systems involved in order to provide for the normal operation of both the planned and existing systems.

ADD 639AG

(7) In their attempts to resolve the difficulties mentioned above administrations may seek the assistance of the Board.

ADD 639AH

(8) In complying with the provisions of Nos. 639AE to 639AG, an administration responsible for a planned satellite system shall if necessary defer its commencement of the co-ordination procedure, or where this is not applicable, the sending of its notices to the Board, until one hundred and fifty days after the date of the weekly circular containing the information listed in Appendix [Th]. However, in respect of those administrations with whom difficulties have been resolved or who have responded favourably, the co-ordination procedure, where applicable, may be commenced prior to the expiration of the one hundred and fifty days mentioned above.
(9) An administration whose plans for a satellite system have been published in accordance with Nos. 639AA to 639AC shall periodically inform the Board as to whether or not comments have been received and as to the progress made, with other administrations, in resolving any difficulties. The Board shall publish this information in a special section of its weekly circular and shall also, when the weekly circular contains such information, so inform all administrations by circular telegram.
ADD Section II Co-ordination Procedures to be Applied in Appropriate Cases

ADD 639A.1 § 2. (1) Before an administration notifies to the Board or brings into use any frequency assignment to a space station on a geostationary satellite or to an earth station that is to communicate with a space station on a geostationary satellite, it shall effect co-ordination with any other administration whose assignment in the same band for a space station on a geostationary satellite or an earth station that communicates with a space station on a geostationary satellite is recorded in the Master Register, or had been co-ordinated or is being co-ordinated under the provisions of this paragraph. For this purpose, the administration requesting co-ordination shall send to any other such administration the information listed in Appendix 1A/.

ADD 639A.K (2) No co-ordination under No. 639A.1 is required:

a) where the increase in the equivalent noise temperature of an earth station receiver of another administration caused by a new assignment in another system (a space station and associated earth stations) is below the permissible increase in noise temperature as determined by the application of the procedure specified in Appendix 2A/1."

1) For a broadcasting satellite space station, the technical data used to effect co-ordination should be based upon the latest Recommendations of the C.C.I.R., as accepted by the administrations concerned under Resolution No. Spa. In the absence of relevant C.C.I.R. Recommendations, the technical data to be used to effect co-ordination shall be agreed between the administrations concerned."
b) when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase the equivalent noise temperature of an earth station receiver of another administration above the permissible increase in noise temperature as determined by the application of the procedure specified in Appendix J.

ADD 639AJ

(3) An administration initiating the co-ordination procedure referred to in No. 639AJ shall at the same time send to the Board a copy of the request for co-ordination, with the information listed in Appendix IA and the name(s) of the administration(s) with which co-ordination is sought. The Board shall publish this information in a special section of its weekly circular, together with a reference to the weekly circular in which details of the system were published in accordance with Section I of this Article. When the weekly circular contains such information, the Board shall so inform all administrations by circular telegram.

ADD 639AM

(4) An administration believing that it should have been included in the co-ordination procedure under No. 639AJ shall have the right to request that it be brought into the co-ordination procedure.
3. (1) Before an administration notifies to the Board or brings into use any frequency assignment to an earth station, whether for transmitting or receiving, in a particular band allocated with equal rights to the space service and the fixed or the mobile service in the frequency spectrum above one Ge/s, it shall effect co-ordination of the assignment with any other administration whose territory lies wholly or partly within the co-ordination area, but only in respect of the fixed or the mobile service. For this purpose it shall send to any other such administration a copy of a diagram drawn to an appropriate scale indicating the location of the earth station and showing the co-ordination distance from the earth station for the cases of transmission and reception by the earth station, as a function of azimuth and the data on which it is based, including all pertinent details of the proposed frequency assignment, as listed in Appendix IA, and an indication of the approximate date on which it is planned to begin operations.

1) Calculated in accordance with the procedures described in Appendix 287.
ADD 639AO (2) An administration with which co-ordination is sought under No. 639AJ shall immediately by telegram acknowledge receipt of the co-ordination data. If no acknowledgement is received within thirty days after the date of the weekly circular publishing the information under No. 639AL, the sender shall despatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of thirty days. Upon receipt of the co-ordination data, an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested, promptly examine the matter with regard to interference 1) which would be caused to the service rendered by its stations in respect of which co-ordination is sought under No. 639AJ; and shall, within an overall period of ninety days from the date of the relevant weekly circular, notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree, it shall, within the same period, send to the administration seeking co-ordination the technical details upon which its disagreement is based, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem. A copy of these comments shall also be sent to the Board.

ADD 639AO.1 1) Criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
MOD 639AP

(3) An administration with which co-ordination is sought under No. 639AN shall acknowledge receipt immediately by telegram of the co-ordination data. If no acknowledgement is received within fifteen days of despatch of the co-ordination data the sender shall despatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of fifteen days. Upon receipt of the co-ordination data an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested, promptly examine the matter both with regard:

a) interference \(^1\) which would be caused to the service rendered by its stations in the fixed or mobile service operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer, and

b) interference \(^1\) which would be caused to reception at the earth station by the service rendered by its stations in the fixed or mobile service operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer.

\(^1\) Criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
and shall, within an overall period of sixty days from despatch of the co-ordination data notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree it shall, within the same period, send to the administration seeking co-ordination a copy of a diagram drawn to an appropriate scale showing the location of its stations in the fixed or the mobile service which are or will be within the co-ordination area of the earth transmitting or receiving station, as appropriate, together with all other relevant basic characteristics, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

(4) When the administration with which co-ordination is sought sends the information mentioned in No. 6396 to the administration seeking co-ordination a copy thereof shall also be sent to the Board. The Board shall consider as notifications in accordance with Section I of Article 9 only that information relating to existing stations in the fixed or the mobile service or to those to be brought into use within the next three years.
(5) No co-ordination under No. 639AN is required when an administration proposes:

a) to bring into use an earth station, the co-ordination area of which does not include any of the territory of any other country;

b) to change the characteristics of an existing assignment in such a way as not to exceed the permissible level of interference to or from the stations in the fixed or the mobile service of other administrations;

c) to bring into use an earth station in the band 4,000–4,700 Mc/s or the band 8,100–8,400 Mc/s or

d) to operate a mobile earth station. However, if the co-ordination area associated with the operation of such a mobile earth station, in a frequency band referred to in No. 639AN, includes any of the territory of another country, it shall be subject to prior agreement between the administrations concerned in order to avoid harmful interference to existing stations with fixed and mobile services of that country. This agreement shall cover the characteristics of the mobile earth station(s) or the characteristics of a typical mobile earth station, and shall apply to a specified service area; unless otherwise stipulated in the agreement, it shall apply to any mobile earth stations in the specified service area provided that the probability of harmful interference caused by them shall not be greater than that caused by the typical earth station.
An administration seeking co-ordination may request the Board to endeavour to effect co-ordination in those cases where:

a) an administration with which co-ordination is sought under No. 639AJ fails to acknowledge receipt, under No. 639AO, within sixty days after the date of the weekly circular publishing the information relating to the request for co-ordination;

b) an administration with which co-ordination is sought under No. 639AU fails to acknowledge receipt, under No. 639AF within thirty days of despatch of the co-ordination data;

c) an administration has acknowledged receipt under No. 639AO, but fails to give a decision within a period of ninety days from the date of the relevant weekly circular;

d) an administration has acknowledged receipt under No. 639AP but fails to give a decision within a period of sixty days from despatch of the co-ordination data;

e) there is disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference;

f) co-ordination between administrations is not possible for any other reason.

In so doing it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.
(3) Where the Board receives a request under 639AS a) or b), it shall forthwith send a telegram to the administration concerned requesting immediate acknowledgement.

(4) Where the Board receives an acknowledgement following its action under No. 639AV, or where the Board receives a request under No. 639AS c) or d), it shall forthwith send a telegram to the administration concerned requesting an early decision in the matter.

(5) Where the Board receives a request under No. 639AS f), it shall endeavour to effect co-ordination in accordance with the provisions of Nos. 639AJ and 639AN, as appropriate. The Board shall also, where appropriate, act in accordance with No. 639AL. Where the Board receives no acknowledgement to its request for co-ordination within the period specified in No. 639AO or 639AP, as appropriate, it shall act in accordance with No. 639AU.

(6) Where an administration fails to reply within thirty days of the Board's telegram requesting an acknowledgement sent under No. 639AU, or fails to give a decision in the matter within thirty days of the Board's telegram of request sent under No. 639AV, it shall be deemed that the administration with which co-ordination was sought has undertaken:

a) that no complaint will be made in respect of any harmful interference which may be caused to the services rendered by its stations in the space, fixed or mobile service, by the use of the assignment for which co-ordination was requested;

b) that its stations in the space, fixed or mobile service, will not cause harmful interference to the use of the assignment for which co-ordination was requested.
(7) Where necessary, as part of the procedure under No. 639AS, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

§5 In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after one hundred and fifty days from the date of the request for co-ordination, taking into consideration the provisions of No. 639BF send its notice concerning the proposed assignment to the Board.

§6 (1) Any frequency assignment to an earth or space station shall be notified to the International Frequency Registration Board:
   a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration; or
b) if the frequency is to be used for international radiocommunications; or

c) if it is desired to obtain international recognition of the use of the frequency.

(2) Similar notice shall be given for any frequency to be used for the reception of transmissions from earth or space stations by a particular space or earth station in each case where one or more of the conditions specified in No. 639BA are applicable.

(3) Similar notice may be given for any frequency or frequency band to be used for reception by a particular radio astronomy station, if it is desired that such data should be included in the Master Register.

(4) A notice submitted in accordance with No. 639BA or 639BB and relating to a frequency assignment to mobile earth stations in a satellite system shall include the technical characteristics either of each mobile earth station or of a typical mobile earth station and the indication of the service area within which these stations are to be operated.

§7 For any notification under No. 639BA, 639BB, 639BC; or 639BD, an individual notice for each frequency assignment shall be drawn up as prescribed in Appendix A, which specifies in Sections 5, C, D, E or F the basic characteristics to be furnished, according to the case. It is recommended that the notifying administration should also supply the additional data called for in Section A of that Appendix, together with such further data as it may consider appropriate.
§ 8. (1) For a frequency assignment to an earth or space station, each notice must reach the Board not earlier than three years before the date on which the assignment is to be brought into use. The notice must reach the Board in any case not later than ninety days before this date, except in the case of assignments in the space research service in bands allocated exclusively to this service or in shared bands in which this service is the sole primary service. In the case of such an assignment in the space research service the notice should, whenever practicable, reach the Board before the date on which the assignment is brought into use, but it must in any case reach the Board not later than thirty days after the date it is actually brought into use.

1) The notifying administration shall take this limit into account when deciding, where appropriate, to initiate the co-ordination procedure(s).
Section IV Procedure for the examination of notices and the
recording of frequency assignments in the Master Register

639BH §9. Any notice which does not contain at least those
characteristics specified in Appendix [1A] (Sections [A], [B],
[C], [D], [E], or [F], as appropriate) shall be returned by the Board
immediately, by airmail, to the notifying administration
with the reasons therefor.

639BI §10. Upon receipt of a complete notice, the Board shall
include the particulars thereof, with the date of receipt,
in the weekly circular referred to in No. 497, which shall
contain the particulars of all such notices received since
the publication of the previous circular.

639BJ §11. The circular shall constitute the acknowledgement
to the notifying administration of the receipt of a complete
notice.

639BK §12. Complete notices shall be considered by the Board in
the order of their receipt. The Board shall not postpone
the formulation of a finding unless it lacks sufficient data
to render a decision in connection therewith; moreover, the
Board shall not act upon any notice which has a technical
bearing on an earlier notice still under consideration by
the Board, until it has reached a finding with respect to
such earlier notice.
The Board shall examine each notice:

a) with respect to its conformity with the Convention, the Table of Frequency Allocations and the other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and the probability of harmful interference);

b) where appropriate, with respect to its conformity with the provisions of No. 639AJ, relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis space systems;

c) where appropriate, with respect to its conformity with the provisions of No. 639AN relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis stations in the terrestrial services.
ADD 639BP  
d) where appropriate, with respect to the probability of harmful interference to the service rendered by a station in the [space service] for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639BM if this frequency assignment has not in fact caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

MOD 639BQ  
e) where appropriate, with respect to the probability of harmful interference to the service rendered by a station in the [fixed or the mobile service] for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 501 or [570AB], as appropriate, if this frequency assignment has not, in fact, caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

ADD 639BR  
f) where appropriate, with respect to the probability of harmful interference caused to the receiving earth station by a station in the [fixed or the mobile service] for which a frequency assignment already recorded in the Master Register is in conformity with No. 501 or [570AB], as appropriate.
When, following an examination of a notice with respect to No. 639BP, the Board reaches an unfavourable finding based upon the probability of harmful interference to a recorded assignment for a space station which the Board has reason to believe may not be in regular use, the Board shall forthwith consult the administration responsible for the registered assignment. If it is established, after such consultation and on the basis of the information available, that the recorded assignment has not been in use for two years, it shall not be taken into account for the purposes of the examination in progress and any other further examination under No. 639BP conducted before the date on which the assignment is brought back into use. This date shall be entered in the Master Register. Before the assignment is brought back into use, it shall be subject to further co-ordination in accordance with the provisions of No. 639AJ or further examination by the Board with respect to No. 639BP as appropriate.
MOD 639BT §14 Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 639BM, 639BN, 639BO, 639BP, 639BQ, 639BR, as appropriate, further action shall be as follows:

MOD 639BU §15 (1) Finding favourable with respect to No. 639BM in cases where the provisions of Nos. 639BN and 639BO are not applicable.

(MOD) 639BV (2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

(MOD) 639BM §16 (1) Finding favourable with respect to No. 639BM

MOD 639BX (2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, and the finding is favourable with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
ADD 639BY

(3) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115 and the finding is unfavourable with respect to No. 639BJ, 639BK, 639BP, 639BQ or 639BR, as appropriate, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.

ADD 639BZ

(4) The period of one hundred and twenty days mentioned in Nos. 639BY and 639CP shall count from:

- the date when the assignment to the station in the space service which received an unfavourable finding is brought into use, if the assignment to the station which was the basis for the unfavourable finding is then in use;
otherwise, from the date when the assignment to the station which was the basis for the unfavourable finding is brought into use.

But if the assignment to the station which was the basis for the unfavourable finding has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance shall, if necessary, be made for the additional period mentioned in No. 639CY.

(5) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.
MOD 639B  (6) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 639CA. If it is resubmitted with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of No. 639EX or 639BY, as appropriate. If it is resubmitted with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 639BM, it shall be treated as a new notice.

MOD 639CC §17 (1) Finding favourable with respect to No. 639BM in cases where the provisions of No. 639BN or 639BO are applicable.

MOD 639CD  (2) Where the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BO have been successfully completed with all administrations whose fixed or mobile or space services may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
MOD 639CE

(3) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take the appropriate action necessary and shall inform the administrations concerned of the results obtained. If the Board's efforts are successful, the notice shall be treated in accordance with No. 639CD. If the Board's efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of Nos. 639BP, 639BQ and 639BR, as appropriate.

MOD 639CF

(4) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.
(5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BC have been successfully completed with all administrations whose fixed or mobile or space services may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

(6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination under No. 639AJ or 639AN, it shall be treated in accordance with the provisions of No. 639CE. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.
MOD 639CI
(7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, the Board shall inform the administrations concerned thereof. The notice shall be examined by the Board with respect to the provisions of Nos. 639BP and 639BQ, as appropriate. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

MOD 639CJ
§ 18. (1) Finding favourable with respect to Nos. 639BM, 639BP, 639BQ and 639BR, as appropriate.

(MOD) 639CK
(2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

ADD 639CL
(3) However, should the examination show that the level of the interference noise and the percentage of time during which it occurs have values slightly greater than those used for assessing the probability of harmful interference (extreme propagation conditions, abnormal atmospheric humidity, etc.), a remark shall be included in the Master Register to show that there may be a slight risk of harmful interference and hence additional precautions must be taken in the use of the assignment to avoid harmful interference to assignments already recorded in the Master Register.
§ 19. (1) Finding favourable with respect to No. 639BM but unfavourable with respect to Nos. 639BR, 639BQ or 639BR, as appropriate.

(2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

(3) Should the notifying administration resubmit the notice with modifications which result, after re-examination, in a favourable finding by the Board with respect to Nos. 639BP, 639BQ and 639BR, as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be indicated in the Remarks Column.
MOD 639CP

(4) Should the notifying administration resubmit the notice, either unchanged, or with modifications which decrease the probability of harmful interference, but not sufficiently to permit the provisions of No. 63900 to be applied, and should that administration insist upon reconsideration of the notice, but should the Board's finding remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column. The period of one hundred and twenty days shall count from the date indicated in No. 639BZ.
(MOD) 639CQ  s20  (1) Notices relating to radio astronomy stations.

MOD 639CR  

(2) A notice relating to a radio astronomy station shall not be examined by the Board with respect to Nos. 639BN, 639BO, 639BP, 639BQ, and 639BR. Whatever the finding, the assignment shall be recorded in the Master Register with a date in Column 2c. The date of receipt by the Board of the notice shall be recorded in the Remarks Column.

(MOD) 639CS  s21  (1) Change in the basic characteristics of assignments already recorded in the Master Register.

MOD 639CT  

(2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix [IA] (except the name of the station or the name of the locality in which it is situated) shall be examined by the Board according to No. 639BM, and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ, and 639BR, and the provisions of Nos. 639BU to 639CR inclusive applied. Where the change should be recorded, the assignment shall be amended according to the notice.
(3) However, in the case of a change in the characteristics of an assignment which is in conformity with No. 639BM, should the Board reach a favourable finding with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, where appropriate, or find that the change does not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. The date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.

§22 In applying the provisions of the whole of this Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

§23 (1) Recording of Frequency Assignments notified before being brought into use.

(2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to No. 639BM and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.
(3) If, within the period of thirty days after the projected date of bringing into use, the Board receives confirmation from the notifying administration of the date of putting into use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

(4) In the circumstances described in Nos. 639BY and 639CF, and as long as an assignment which received an unfavourable finding cannot be resubmitted as a consequence of the provisions of No. 639BZ, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 639BY or 639CF, as appropriate, the information relating to the absence of complaint of harmful interference.
MOD 639DA

(5) If the Board does not receive this confirmation within the period referred to in No. 639CY or at the end of the period referred to in No. 639BY or 639CP as appropriate, the entry concerned shall be cancelled. The Board shall advise the administration concerned before taking such action.

(MOD)

Section V. Recording of findings in the Master Register

MOD 639DB

§24 In any case where a frequency assignment is recorded in the Master Register, the finding reached by the Board shall be indicated by a symbol in Column 13a. In addition, a remark indicating the reasons for any unfavourable finding shall be inserted in the Remarks Column.

(MOD)

Section VI. Categories of frequency assignments

(MOD) 639DC

§25 (1) The date in Column 2c shall be the date of putting into use notified by the administration concerned. It is given for information only.

ADD 639DD

(2) If harmful interference is actually caused to the reception of any station in the space service whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to Nos. 639BM, 639BN, 639BG, 639BF, 639BQ and 639BR, as appropriate, by the use of a frequency assignment in the space service which has been recorded in the Master Register in accordance with the provisions of No. 639CP, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.
(MOD) 639DE (3) If harmful interference to the reception of any station whose assignment is in accordance with No. 501, 570AB or 639BM, as appropriate, is actually caused by the use of a frequency assignment which is not in conformity with No. 639BM, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

(MOD) Section VII. Review of findings

(MOD) 639DF §26 (1) The review of a finding by the Board may be undertaken:

- at the request of the notifying administration,
- at the request of any other administration interested in the question, but only on the grounds of actual harmful interference,
- on the initiative of the Board itself when it considers this is justified.
MOD 639DG

(2) The Board, in the light of all the data at its disposal shall review the matter, taking into account Nos. 639BM, 639BN, 639BO, 639BP, 639BQ and 639BR, where appropriate, and shall render an appropriate finding, informing the notifying administration prior either to the promulgation of its finding or to any recording action.

MOD 639DH

§ 27. (1) After actual use for a reasonable period of an assignment which has been entered in the Master Register on the insistence of the notifying administration, following an unfavourable finding with respect to Nos. 639BP, 639BQ or 639BR, this administration may request the Board to review the finding. Thereupon the Board shall review the matter, having first consulted the administrations concerned.

(MOD) 639DI

(2) If the finding of the Board is then favourable it shall enter in the Master Register the changes that are required so that the entry shall appear in the future as if the original finding had been favourable.
(MOD) 639DJ

(3) If the finding with regard to the probability of harmful interference remains unfavourable, no change shall be made in the original entry.

ADD 639DK

§24A. (1) Where the use of a recorded assignment to a space station is suspended for a period of eighteen months, the notifying administration shall, within that eighteen month period, inform the Board of the date on which such use was suspended and of the date on which the assignment is to be brought back into regular use.

ADD 639DL

(2) Whenever it appears to the Board, whether or not as a result of action under No. 639DK, that a recorded assignment to a space station has not been in regular use for more than eighteen months, the Board shall enquire of the notifying administration as to when the assignment is to be brought back into regular use.

ADD 639DM

(3) If no reply is received within six months of action by the Board under No. 639DL, or if the reply does not confirm that the assignment to a space station is to be brought back into regular use within this six month limit, a mark shall be applied against the entry in the Master Register. Thereafter, the assignment shall be treated in accordance with No. 639BS as one which has been established as having been out of regular use for two years.
Section VIII. Modification, cancellation and review of entries in the Master Register

§ 28. In case of permanent discontinuance of the use of any recorded frequency assignment, the notifying administration shall inform the Board within ninety days of such discontinuance, whereupon the entry shall be removed from the Master Register.

§ 29. Whenever it appears to the Board from the information available that a recorded assignment has not been brought into regular operation in accordance with the notified basic characteristics, or is not being used in accordance with those basic characteristics, the Board shall consult the notifying administration and, subject to its agreement, shall either cancel or suitably modify the entry.
If, in connection with an enquiry by the Board under No. 639DL, the notifying administration has failed to supply the Board within forty-five days with the necessary or pertinent information, the Board shall make suitable entries in the Remarks Column of the Master Register to indicate the situation.

Section IX. Studies and Recommendations

§ 31.(1) If it is requested by any administration, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall conduct a study of cases of alleged contravention or non-observance of these Regulations, or of harmful interference.

(2) The Board shall thereupon prepare and forward to the administration concerned a report containing its finding and recommendations for the solution of the problem.
§ 32. In a case where, as a result of a study, the Board submits to one or more administrations suggestions or recommendations for the solution of a problem, and where no answer has been received from one or more of these administrations within a period of ninety days, the Board shall consider that the suggestions or recommendations concerned are unacceptable to the administrations which did not answer. If it was the requesting administration which failed to answer within this period, the Board shall close the study.

Section X. Miscellaneous Provisions

§ 33. (1) If it is requested by any administration, particularly by an administration of a country in need of special assistance, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall render the following assistance:

a) computation of the increase in the equivalent noise temperature of an earth station receiver as in 639AK;

b) preparation of the diagram showing co-ordination area as in 639AN;

c) any other assistance of a technical nature for completion of the procedures in this Article;

(2) In making a request to the Board under 639DT, the administration shall furnish the Board with the necessary information.
§ 34. The technical standards of the Board shall be based upon the relevant provisions of these Regulations and the Appendices thereto, the decisions of Administrative Conferences of the Union as appropriate, the Recommendations of the C.C.I.R., the state of the radio art, and the development of new transmission techniques.

§ 35. The Board shall promulgate to administrations its findings and reasons therefor, together with all changes made to the Master-Register, through the weekly circular referred to in No. 497.

§ 36. In case a Member or Associate Member of the Union avails itself of the provisions of Article 28 of the Convention, the Board shall, upon request, make its records available for such proceedings as are prescribed in the Convention for the settlement of international disputes.
SEVENTH REPORT OF WORKING GROUP 4E

TO COMMITTEE 4

Working Group 4E examined the technical content of Document No. DT/77 proposed by Sub-Working Group 6A-4.

After having considered this document from a technical point of view, Working Group 4E agreed on some comments which are given in the Annex to this Document to be sent to Working Group 6A for its deliberation on the Appendix 1B to Article 9A of the Radio Regulations.

Although none of these comments changes the substance of Document No. DT/77, Working Group 4E thought that it may be desirable to incorporate them in the final draft of that Appendix.

N. OHYAMA
Chairman
Working Group 4E

Annex : 1
ANNEX

PROPOSED AMENDMENT ON DOCUMENT No. DT/77

1. Page 3

1.1 The first line of the first paragraph of sub-paragraph a) should read:

"... service area, in all cases indicate the ..."

1.2 The second line of the second paragraph of sub-paragraph a) should read:

"... indicate, if available, the maximum ..."

Reason: While the first paragraph is mandatory, the second paragraph is optional which is necessary for calculation of interference caused by existing satellite system and may not be available at the early stage of planning.

1.3 The second line of sub-paragraph a) should read:

"indicate the estimated gain of ..."

1.4 The second line of sub-paragraph b) should read:

"indicate the estimated isotropic gain ..."

Reason: At the planning stage, those data may not be available other than those estimated ones.

2. Page 4

2.1 The first line of the paragraph under Item 6 should read:

"indicate, when no other than single frequency ..."

Reason: The proposed change may clear the meaning.
2.2 The first line of the first sub-paragraph under Item 4 should read:

"indicate, in all cases indicate ..."

2.3 The second line of the second sub-paragraph under Item 4 should read:

"indicate, if available, the maximum ..."

Reason: Same as stated in 1.1 and 1.2 above.

2.4 The third line of the second paragraph under Item 4 should read:

"... category of carrier [supplied under Item 4, Section C] received by ...

Reason: Additional note may make clear the information referred.

3. Page 5

3.1 The second line of sub-paragraph a) should read:

"indicate the estimated gain of ..."

3.2 The second line of sub-paragraph b) should read:

"indicate the estimated isotropic ...

Reason: Same as stated in 1.3 and 1.4 above.

3.3 The first line of the first paragraph of sub-paragraph a) under Item 6 should read:

"... indicate, when no other than simple ...

Reason: Same as stated in 2.1 above.
3.4 The third line of second paragraph of sub-paragraph a) should read:

"... of carrier [supplied under Item 4, Section C] received by ..."

3.5 The fourth line of sub-paragraph b) should read:

"... of carrier [supplied under Item 4, Section C]"

Reason: Same as stated in 2.4 above.

4. Page 6

4.1 Sub-paragraph c) of Section E should read:

"c) type class of emission"

Reason: This is the term used in the present Radio Regulations.
THIRD REPORT OF WORKING GROUP 5 ad hoc
TO COMMITTEE 5

1. The Working Group considered the proposals by France (Document No. 83) and Mexico (Document No. 77) for the rearrangement of the sections of Article 1.

2. The Group considered that, at this stage of the Conference, it was not desirable to make too many amendments to Article 1 and, with reference to Document No. 218, it was agreed:

   a) that definitions MOD 84AE, space station, MOD 84AD, earth station, MOD 84AC, space radiocommunication, MOD 84AA, terrestrial radiocommunication, MOD 84AB, terrestrial station, and the notes ADD 84AA-1 and ADD 84AB-1, should be placed at the beginning of Section II after the number 21 (station);

   b) that the other definitions contained in Document No. 218 and to be included in Section IIA should remain in the order in which they appear in the Annex to the said document, the definitions of individual reception and community reception in the broadcast-satellite service being inserted immediately after the definition of that service;

   c) that definitions NOC 84AJ, active satellite, and NOC 84AK, passive satellite, should be moved to Section IIB, after the definition of satellite;

   d) that definition MOD 69, safety service, should stay in Section II.

3. Recognizing the merits of the Mexican proposals (Document No. 77) and expressing the hope that a future conference would divide up the subjects of Article 1 in a more logical way, the Group decided to prepare a draft recommendation on the subject. This draft recommendation, which is Annex 1 to the present report, was approved by the Group and submitted for approval to Committee 5.
4. In view of certain proposals being studied by Committee 5 Working Groups, the Group decided to supplement the lists of definitions annexed to Documents Nos. 218 and 251 by those given in Annex 2 to this report. These definitions concern the following services:

- aeronautical radionavigation-satellite service;
- maritime radionavigation-satellite service;
- time signal-satellite service.

5. The Group considered the terminology to be used in the frequency table for indicating the up and down paths of satellite links.

For the sake of uniformity, the Group decided that in all such cases the expressions "Space-to-Earth" and "Earth-to-Space" should be used, and that the expressions "Satellite-to-Earth" and "Earth-to-Satellite" should no longer be used.

6. Following a request by the Chairman of Committee 4 to the Chairman of Committee 5, the Group examined the terms and definitions given in point 4 and in the Annex of Document No. 146.

The Group considers:

a) that the terms and definitions given in point 4 were unrelated to the work of Committee 5; and

b) that the terms and definitions given in the Annex were not useful for the work of Committee 5, unless one or more of the Working Groups of the Committee took a contrary view.

7. With this Report the Working Group finishes the work assigned to it by Committee 5.

A. PETTI
Chairman

Annexes : 2
ANNEX 1

RECOMMENDATION RELATING TO A REVISED PRESENTATION OF
THE SECTIONS OF ARTICLE 1 OF THE RADIO REGULATIONS

The World Administrative Radio Conference for Space
Telecommunications

considering

a) that the amendments made to the Article 1 of the Radio Regulations
have resulted in a lack of system in the placing of individual terms and the
somewhat illogical sequence in which they come;

b) that it would therefore be desirable to rearrange Article 1 of
the Radio Regulations in a more appropriate form;

recognizing

that this Conference was not able to perform this task

recommends

that the next World Administrative Conference which is competent
to revise Article 1 of the Radio Regulations should consider the possibility
of rearranging Article 1 in a more logical manner, for instance, on the
lines of the Annex to this Recommendation.

Annex: 1
Annex to Recommendation No. ...  

Article 1

Section I. General terms
Section II. Radio systems
Section III. Radio services and stations
  Sub-Section IIIA. Terrestrial Radiocommunication
  Sub-Section IIIIB. Space Radiocommunication
  Sub-Section IIIIC. Radio astronomy
Section IV. Technical characteristics
ADD AQA  Aeronautical Radionavigation-Satellite Service.
A radionavigation-satellite service in which mobile earth stations are located on board aircraft.

ADD AQB  Maritime Radionavigation-Satellite Service.
A radionavigation-satellite service in which mobile earth stations are located on board ships.

ADD ATC  Time Signal-Satellite Service.
A radiocommunication service using space stations on earth satellites for the same purposes as those of time signal service.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

[ARTICLE 1]

[Sections II and II.A.]

MOD 84AE  \textit{Space Station}

A station located on an object which is beyond, is intended to go beyond, or has been beyond, the major portion of the earth's atmosphere.

MOD 84AD  \textit{Earth Station}

A station located either on the earth's surface or within the major portion of the earth's atmosphere intended for communication:

- with one or more space stations; or
- with one or more stations of the same kind by means of one or more passive satellites or other objects in space.

MOD 84AC  \textit{Space Radiocommunication}

Any radiocommunication involving the use of one or more space stations or the use of one or more passive satellites or other objects in space.

MOD 84AA  \textit{Terrestrial Radiocommunication}\footnote{In these Regulations, unless otherwise stated, any radiocommunication service relates to terrestrial radiocommunication.}

Any radiocommunication other than space radiocommunication or radio astronomy.

MOD 84AB  \textit{Terrestrial Station}\footnote{In these Regulations, unless otherwise stated, any station is a terrestrial station.}

A station effecting terrestrial radiocommunication.
MOD 84AF  
*Space System*

Any group of co-operating earth and/or space stations employing space radiocommunication for specific purposes.

MOD 84AL  
*Satellite System*

A space system using one or more artificial earth satellites.

MOD 84AG  
*Fixed-Satellite Service*

A radiocommunication service:

— between earth stations at specified fixed points when one or more satellites are used; in some cases this service includes satellite to satellite links, which may also be effected in the inter-satellite service;

— for connection between one or more earth stations at specified fixed points and satellites used for a service other than the fixed-satellite service, (for example, the mobile-satellite service, broadcasting-satellite service, etc.).

ADD 84AGA  
*Mobile-Satellite Service*

A radiocommunication service:

— between mobile earth stations and one or more space stations; or between space stations used by this service;

— or between mobile earth stations by means of one or more space stations;

— and if the system so requires, for connection between these space stations and one or more specified fixed points on the earth.

B3–02
ADD 84AGB  *Aeronautical Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on board aircraft. Survival craft stations and emergency position indicating radiobeacon stations may also participate in this service.

ADD 84AGC  *Maritime Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on board ships. Survival craft stations and emergency position indicating radiobeacon stations may also participate in this service.

ADD 84AGD  *Land Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on land.

MOD 84AP  *Broadcasting-Satellite Service*

A radiocommunication service in which signals transmitted or retransmitted by space stations are intended for direct reception by the general public.

ADD 84APA  *Individual reception* (in the Broadcasting-Satellite Service)

The reception of emissions from a broadcasting-satellite space station by simple domestic installations and in particular those possessing small antennae.

ADD 84APB  *Community reception* (in the Broadcasting-Satellite Service)

The reception of emissions from a broadcasting-satellite space station by receiving equipment, which in some cases may be

ADD 84AP.1  *In the broadcasting-satellite service, the term “direct reception” shall encompass both individual reception and community reception.*
complex and have antennae larger than those used for individual reception, and intended for use:

— by a group of the general public at one location, or
— through a distribution system covering a limited area.

ADD 84APC  
**Radiodetermination-Satellite Service**

A radiocommunication service involving the use of radiodetermination and the use of one or more space stations.

MOD 84AQ  
**Radionavigation-Satellite Service**

A radiodetermination-satellite service applied to navigation; in certain cases this service includes transmission or retransmission of supplementary information necessary for the operation of the Radionavigation Systems.

ADD 84ASA  
**Earth Exploration-Satellite Service**

A radiocommunication service between earth stations and one or more space stations in which:

— information relating to the characteristics of the Earth and its natural phenomena is obtained from instruments on earth satellites;

— similar information is collected from air-borne or earth-based platforms;

— such information may be distributed to earth stations within the system concerned;

— platform interrogation may be included.

MOD 84AT  
**Meteorological-Satellite Service**

An earth exploration-satellite service for meteorological purposes.
ADD 84ATA  Amateur-Satellite Service
A radiocommunication service using space stations on earth satellites for the same purposes as those of the amateur service.

ADD 84ATB  Standard Frequency-Satellite Service
A radiocommunication service using space stations on earth satellites for the same purposes as those of the standard frequency service.

MOD 84AM  Space Research Service
A radiocommunication service in which spacecraft or other objects in space are used for scientific or technological research purposes.

ADD 84AMA  Space Operation Service
A radiocommunication service concerned exclusively with the operation of spacecraft, in particular tracking, telemetry and telecommand.

These functions will normally be provided within the service in which the space station is operating.

ADD 84AMB  Inter-Satellite Service
A radiocommunication service providing links between artificial earth satellites.

MOD 69  Safety Service
A radiocommunication service used permanently or temporarily for the safeguarding of human life and property on the earth’s surface, in the air or in space.
NOC 84AJ  Active Satellite
NOC 84AK  Passive Satellite
NOC 84AW  Space Telemetering
NOC 84AX  Maintenance Space Telemetering
NOC 84AY  Space Telecommand
NOC 84AZ  Space Tracking

SUP 84AH  Communication-Satellite Earth Station
SUP 84AI  Communication-Satellite Space Station
SUP 84AN  Space Research Earth Station
SUP 84AO  Space Research Space Station
SUP 84AR  Radionavigation-Satellite Earth Station
SUP 84AS  Radionavigation-Satellite Space Station
SUP 84AU  Meteorological-Satellite Earth Station
SUP 84AV  Meteorological-Satellite Space Station
FOURTH REPORT FROM COMMITTEE 4

After consideration of Document No. MEX/78, Committee 4 has approved the proposed modification to Radio Regulation 112. The changes proposed will mean that the English and Spanish versions of the Radio Regulations will then be aligned with the French version. In addition it was recognized by Committee 4 that the term "hertz" has been recommended by the C.C.I.R. and adopted by the International Scientific Unions and other technical bodies as a unit of frequency, and that the I.T.U. should follow suit as soon as practicable.

The texts in question have been forwarded to the Drafting Committee.

E. SANDBACH
Chairman
Committee 4

Annex : 1 Amended Radio Regulation 112, Nomenclature of the Frequency and Wavelength Bands Used in Radiocommunication.
MOD Section III. Nomenclature of the Frequency and Wavelength Bands Used in Radiocommunication

MOD 112. § 7. The radio spectrum shall be subdivided into nine frequency bands, which shall be designated by progressive whole numbers in accordance with the following Table. Frequencies shall be expressed:

- in kilohertz (kHz) up to and including 3,000 kHz
- in megahertz (MHz) thereafter up to and including 3,000 MHz
- in gigahertz (GHz) thereafter up to and including 3,000 GHz.

However, where adherence to these provisions would introduce serious difficulties, for example in connection with the notification and registration of frequencies, the lists of frequencies and related matters, reasonable departures may be made.

Note 1: "Band Number N" extends from $0.3 \times 10^N$ to $3 \times 10^N$ Hz.

Note 2: Abbreviations:

Hz = hertz
k = kilo ($10^3$), M = mega ($10^6$), G = giga ($10^9$), T = tera ($10^{12}$)

Note 3: Abbreviations for adjectival band designations:

Band 4 = VLF  Band 8 = VHF
Band 5 = LF   Band 9 = UHF
Band 6 = MF  Band 10 = SHF
Band 7 = HF  Band 11 = EHF
The Proposals coming before the Plenary Meeting make provisions for the Amateur Satellite Service in a number of bands allocated exclusively to that Service but do not provide for any use of space techniques in the region of the spectrum lying between 146 MHz and 24 GHz. The United Kingdom considers that the Amateur Satellite Service needs to have access to this part of the spectrum and that this is practicable in the bands the amateurs share with radiolocation, on a secondary basis. This was reflected in the proposals brought to this Conference, in which safeguards were included as a precaution against any interference by the Amateur Satellite Service.

From the very first days of wireless experimentation at the turn of the century, amateurs have contributed to the advancement of the art of radio communication. Initially relegated to the "worthless" bands below 200 metres, in the early 1920s amateurs were responsible for the discovery of the real value of those high frequencies for long-distance communication. Nor is their interest in space phenomena new; in 1956 an amateur built the first radio telescope and received radio noise of extra-terrestrial origin. Inspired by the historic 1957 launch of the first earth satellite, and facilitated by advance technical data published in the Soviet amateur magazine "Radio", amateurs around the world in the very first hours monitored the 20- and 40-MHz transmissions and provided many eager scientists with some of the first orbital data. Five "OSCAR" amateur satellites, the first in 1961, have been placed in orbit as additional packages to basic launch missions, for the purposes of experimentation and self-training in space communications techniques. Amateurs in more than 25 countries have participated in monitoring, tracking and reporting data. The use of voluntary services by thousands of individuals on a world-wide basis provides a service to humanity in the advancement of scientific knowledge that cannot be matched by any single country.
Of particular importance to the Amateur Satellite Service is the band 420-450 MHz. At the Fourth Meeting of Committee 5 on 6 July, when dealing with the First Report of Working Group 5C, a majority voted against approving the use by amateurs of space techniques in the band 420-450 MHz. However, as United Kingdom pointed out at the time, it appeared that no special or separate attention was given to the proposal under the same heading in the Working Group Report for a compromise arrangement whereby amateur space techniques could be permitted in a small section of the band, namely 435-438 MHz. This compromise, first proposed by Switzerland, received considerable support at Working Group level (Third Meeting Working Group 5C of 17 June). The United Kingdom considers this provides the possibility of unanimous agreement and accordingly proposes that amateur space techniques be approved in a narrow portion of the existing band, by means of a foot-note, 320A, reading:

"In the band 435-438 MHz, the Amateur Satellite Service may be authorized, on condition that harmful interference shall not be caused to other services operating in accordance with the Table of Frequency Allocations. Administrations authorizing such use shall ensure that any harmful interference caused by emissions from amateur satellites is immediately eliminated."

The attention of Administrations is also drawn to Document No. 259, the Fourth Report of Working Group 4E to Committee 4, covering an Addition to Article 41 of the Radio Regulations:

"ADD 1567 bis 5bis. Space stations in the Amateur Service shall be fitted with appropriate devices for controlling emissions in the event that harmful interference is reported in accordance with the procedure laid down in Article 15. Administrations authorizing such space stations shall inform the I.F.R.B., and shall insure that sufficient ground command stations are established before launch to guarantee that any harmful interference that might be reported can be terminated by the authorizing Administration. (See No. 470V)."
FOURTH AND LAST REPORT OF WORKING GROUP 5E
TO COMMITTEE 5 (ALLOCATIONS)

BROADCASTING-SATELLITE SERVICE

- Frequency bands between 670 Mc/s and 960 Mc/s
- Frequency bands between 2500 Mc/s and 2690 Mc/s

1. Frequency band 620–790 Mc/s

The Working Group provisionally agreed that the band 620–790 Mc/s may also be used by stations in the Broadcasting-Satellite Service subject to agreement on the power flux-density limitation values to be inserted in the text of ADD 332A. The Group provisionally agreed also on the remainder of the text of foot-note ADD 332A, subject to agreed technical criteria being received from Committee 4.

Ibis On a proposition by the Delegate of the U.S.S.R., the Group agreed to forward the text of ADD 332A, which appears in Annex A to the present Report, for the consideration of Committee 5 in the light of the related conclusions of Committees 4 and 6, it being noted that any statements made in Committee 5 could be included, upon request, in the official records of the Conference.

2. Frequency band 790–960 Mc/s

The Group decided to transmit the following conclusion to Committee 5:

2.1 "Sub-Working Group 5E–1 agreed by a large majority not to recommend a world-wide allocation to the Broadcasting-Satellite Service in the band 790–960 Mc/s.

2.2 The question of Regional allocations was raised; however, time did not permit of its examination."
The Delegation of Portugal reserved its right to revert to this subject later should it still so desire. The Delegation of the United Arab Republic was opposed to any allocation to the Broadcasting-Satellite Service in the bands between 620 Mc/s and 960 Mc/s and reserved its right to take up the matter in Committee 5 should it still so desire.

Frequency band 2 500–2 690 Mc/s

4.1 The Working Group had the Third Report by Sub-Group 5E-1 (Document No. 321) as a basis for its examination of this band. The delegations concerned confirmed their reservations of the right to revert to certain subjects should they still so desire as reproduced hereafter.

4.2 The Group had before it Proposals CAN-USA/164/4 in part, CAN-USA/164/5, 6, 7 and 10, IND/39/31 and 32, B/71/81 and 82. These Proposals were thoroughly examined and the Sub-Working Group provisionally agreed the revised provisions appearing in the Annex to the present Report.

4.3 The Delegation of India agreed to adjust the lower limit of their Proposal from 2 400 Mc/s to 2 690 Mc/s in the interests of obtaining unanimity.

4.4 Proposals AUS/190/1 and 2 were not supported and the Delegation of Australia reserved the right to revert to them in Working Group 5E or in Committee 5, if it still so desired.

4.5 The Delegation of Cuba was against the addition of regional with or without a capital "R" in the ADD 361B (No. 125.1 of the Radio Regulations refers), and reserved the right to revert to this question later, if it still so desired.

4.6 The Delegations of Bulgaria, Poland, Portugal, Federal Republic of Germany, Czechoslovakia and the U.S.S.R. explained the heavy use of the band by the services to which it is at present allocated and the serious difficulties involved by the proposed additional allocation to the
Broadcasting-Satellite Service for community-type reception. While preferring the status quo for Region 1, they insisted upon receiving sound guarantees from Committee 4 on technical criteria and adequate provisions for co-ordination procedures from Committee 6 before a final agreement could be considered.

4.7 The Delegation of Japan also explained the heavy use of this band by Terrestrial Services and the serious difficulties the proposed allocations would cause. The Delegation reserved the right to revert to this question later, if it still so desired.

4.8 The Delegations of the U.A.R. and Uganda recalled the unanimously adopted United Nations resolution reproduced by the Secretary-General in Document No. 58.

4.9 The Delegation of Denmark explained that it was quite conceivable that Scandinavian countries might wish to develop a system in the future at this order of frequency and consequently urged the adoption of world-wide provisions.

4.10 The Delegation of the United Kingdom recalled the unanimous agreement reached in Working Group 5B concerning the band 2 670-2 690 Mc/s ADD 363A (G/54/55) by which administrations should bear in mind the needs of the Radio Astronomy Service in their future planning of this band. In connection with the retention of Radiolocation on a secondary basis in the band 2 500-2 600 Mc/s, the Delegation's request for a foot-note allocation was unanimously agreed as a modification to No. 362 of the Radio Regulations as shown in Annex B to the present Report.

4.11 The Group received Document No. 272 containing an alternative Proposal by Canada and New Zealand consequential to the discussion of Document No. 164 from Canada and the United States of America.

4.12 In the resumed study of the provisional agreement, the following Delegations declared no support for an allocation to the Broadcasting-Satellite Service at this order of frequency and no support for the foot-note 364C by which new tropospheric scatter systems are prohibited in the band 2 500-2 690 Mc/s as of the entry into force of the Final Acts of the present Conference: Poland, the Ukraine, Romania, Czechoslovakia, the U.S.S.R., Bulgaria and Bielorussia. However, a show of hands resulted in 19 in favour and 39 against the deletion of foot-note ADD 3. The Delegations of Italy, Portugal, the U.S.S.R., Pakistan, Austria, Brazil and Poland reserved the right to revert to this question in Committee 5 should they still so desire.
4.13 There was a motion for the exclusion of an allocation of the Broadcasting-Satellite Service in the European Broadcasting Area, which was rejected by 11 for and 34 against the motion.

4.14 The provisionally agreed revisions of the Table for these bands were confirmed by the Sub-Group and Working Group 5E as shown in Annex B to the present Report.

4.15 In view of these decisions, various suggestions were made in an attempt to give wider satisfaction. Among these was the suggestion of a foot-note based on the provisions of No. 145 of the Radio Regulations to be worded:

"In the U.S.S.R., Iran, Portugal and Switzerland, the band 2 500-2 690 Mc/s is allocated to the Fixed and Mobile Services only."

This foot-note was approved without objection. It was pointed out that the restrictions contained in Article 7 for bands shared between Space Services and the Fixed and Mobile Services would apply to the Fixed and Mobile Services appearing in the foot-note.

4.16 The Delegation of the U.S.S.R. proposed a revised text for foot-note ADD 340C which, after thorough examination and slight amendment by the Delegations of the Syrian Arab Republic and Brazil, was agreed by a large majority for world-wide application. The agreed text appears in Annex B to the present Report.

4.17 In connection with the show of cards by which the support for the text was evaluated, several delegations including Italy, United Kingdom and Canada reserved the right to revert to this action which they considered to be outside the competence of the Group. According to these delegations, it should have been specified that the motion related to the application of the foot-note insofar as the Broadcasting-Satellite Service only was concerned and not with respect to the Fixed-Satellite Service also.

4.18 A motion by the Delegation of Chili, to re-instate the MOBILE Service in the Table for Region 2 for the band 2 655-2 690 Mc/s, gave rise to some difficulties. However, in the final analysis, the Group agreed to the motion.
4.19 A motion by the Delegation of Denmark to limit the allocations to the MOBILE Service in the bands between 2 500 Mc/s and 2 690 Mc/s to the Land and Maritime Mobile Services. This also was agreed by the Group.

4.20 The Delegation of U.S.S.R. reserved the right to revert to the question of excluding the European Broadcasting Area from the allocation to the Broadcasting-Satellite Service and declared that, in any event, this allocation would not be used in the U.S.S.R.

4.21 Finally, the Delegation of Cuba objected strongly against various aspects of foot-note No. 3618 and reserved the right to revert to this question later should it still so desire.

R. GALIČ
Chairman
Working Group 5E

Annexes : 2
ANNEX A

620-790 Mc/s

ADD 332A

Within the frequency band 620-790 Mc/s, assignments may be made to stations in the Broadcasting-Satellite Service, subject to agreement among the administrations concerned and affected (see Articles 9 and 9A or Resolution ). Such stations shall not produce a power flux-density in excess of the value within the territories of other administrations without the consent of those administrations.

</table>
In France and the United Kingdom, the band 2 450-2 500 Mc/s is allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services.

In France the band 2 500-2 550 Mc/s is also allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services. In Canada, the band 2 500-2 550 Mc/s is also allocated on primary basis to the Radiolocation Service.

The use of the band 2 500-2 590 Mc/s by the Broadcasting-Satellite Service is limited to domestic and regional systems for community reception and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected (see Articles 9 and 9A or Resolution No. xxx). The power flux-density at the surface of the earth shall not exceed those given in Article 7 Nos. 470NH-470NK.

In the United Kingdom, the band 2 500-2 600 Mc/s is also allocated, on a secondary basis, to the Radiolocation Service.

When planning new tropospheric scatter radio-relay links in the band 2 500-2 690 Mc/s, all possible measures shall be taken to avoid directing the antennae of these links towards the geostationary orbit.

The use of bands 2 500-2 535 Mc/s and 2 655-2 690 Mc/s by the Fixed-Satellite Service is limited to domestic and regional systems and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected. In the direction Earth-to-Space, the power flux-density at the surface of the earth shall not exceed ........................ see Article 7./

In the U.S.S.R., Iran, Portugal and Switzerland, the band 2 500-2 690 Mc/s is allocated to the Fixed and Mobile Services only.

/Note to Committee 7:
Text of foot-note A is to be adjusted according to the results of the work of the present Conference pertinent to this subject.

SECOND REPORT OF WORKING GROUP 5E
TO COMMITTEE 5
(ALLOCATIONS)

BROADCASTING-SATELLITE SERVICE
- Frequency bands between 670 Mc/s and 960 Mc/s
- Frequency bands between 2,500 Mc/s and 2,690 Mc/s

1. Frequency band 620-790 Mc/s

The Working Group provisionally agreed that the band 620-790 Mc/s may also be used by stations in the Broadcasting-Satellite Service subject to agreement on the power flux-density limitation values to be inserted in the text of ADD 3:2A. The Group provisionally agreed also on the remainder of the text of foot-note ADD 3:2A, subject to agreed technical criteria being received from Committee 4.

2. Frequency band 790-960 Mc/s

The Group decided to transmit the following conclusion to Committee 5:

2.1 "Sub-Working Group 5E-1 agreed by a large majority not to recommend a world-wide allocation to the Broadcasting-Satellite Service in the band 790-960 Mc/s.

2.2 The question of Regional allocations was raised; however, time did not permit of its examination."
The Delegation of Portugal reserved its right to revert to this subject later should it still so desire. The Delegation of the United Arab Republic was opposed to any allocation to the Broadcasting-Satellite Service in the bands between 620 Mc/s and 560 Mc/s and reserved its right to take up the matter in Committee 5 should it still so desire.

On a proposition by the Delegate of the U.S.S.R., the Group agreed to forward the text of ADD 332A, which appears in Annex A to the present Report, for the consideration of Committee 5 in the light of the related conclusions of Committees 4 and 6, it being noted that any statements made in Committee 5 could be included, upon request, in the official records of the Conference.

Frequency band 2 500-2 690 Mc/s

5.1 The Working Group had the Third Report by Sub-Group 5E-1 (Document No. 321) as a basis for its examination of this band. The delegations concerned confirmed their reservations of the right to revert to certain subjects should they still so desire as reproduced hereafter.

5.2 The Group had before it Proposals CAN-USA/164/4 in part, CAN-USA/164/5, 6, 7 and 10, IND/39/31 and 32, B/71/81 and 82. These Proposals were thoroughly examined and the Sub-Working Group provisionally agreed the revised provisions appearing in the Annex to the present Report.

5.3 The Delegation of India agreed to adjust the lower limit of their Proposal from 2 400 Mc/s to 2 560 Mc/s in the interests of obtaining unanimity.

5.4 Proposals AUS/190/1 and 2 were not supported and the Delegation of Australia reserved the right to revert to them in Working Group 5E or in Committee 5, if it still so desired.

5.5 The Delegation of Cuba was against the addition of regional with or without a capital "R" in the ADD 361B (No. 125.1 of the Radio Regulations refers), and reserved the right to revert to this question later, if it still so desired.

5.6 The Delegations of Bulgaria, Poland, Portugal, Federal Republic of Germany, Czechoslovakia and the U.S.S.R. explained the heavy use of the band by the services to which it is at present allocated and the serious difficulties involved by the proposed additional allocation to the
Broadcasting-Satellite Service for community-type reception. While preferring the status quo for Region 1, they insisted upon receiving sound guarantees from Committee 4 on technical criteria and adequate provisions for co-ordination procedures from Committee 6 before a final agreement could be considered.

5.7 The Delegation of Japan also explained the heavy use of this band by Terrestrial Services and the serious difficulties the proposed allocations would cause. The Delegation reserved the right to revert to this question later, if it still so desired.

5.8 The Delegations of the U.A.R. and Uganda recalled the unanimously adopted United Nations resolution reproduced by the Secretary-General in Document No. 58.

5.9 The Delegation of Denmark explained that it was quite conceivable that Scandinavian countries might wish to develop a system in the future at this order of frequency and consequently urged the adoption of world-wide provisions.

5.10 The Delegation of the United Kingdom recalled the unanimous agreement reached in Working Group 5B concerning the band 2 670-2 690 Mc/s ADD 363A (G/54/93) by which administrations should bear in mind the needs of the Radio Astronomy Service in their future planning of this band. In connection with the retention of Radiolocation on a secondary basis in the band 2 500-2 690 Mc/s, the Delegation’s request for a foot-note allocation was unanimously agreed as a modification to No. 362 of the Radio Regulations as shown in Annex B to the present Report.

5.11 The Group received Document No. 272 containing an alternative Proposal by Canada and New Zealand consequential to the discussion of Document No. 164 from Canada and the United States of America.

5.12 In the resumed study of the provisional agreement, the following Delegations declared no support for an allocation to the Broadcasting-Satellite Service at this order of frequency and no support for the foot-note 364C by which new tropospheric scatter systems are prohibited in the band 2 500-2 690 Mc/s as of the entry into force of the Final Acts of the present Conference: Poland, the Ukraine, Romania, Czechoslovakia, the U.S.S.R., Bulgaria and Bielorussia. However, a show of hands resulted in 19 in favour and 39 against the deletion of foot-note ADD 364C. The Delegations of Italy, Portugal, the U.S.S.R., Pakistan, Australia, Brazil and Poland reserved the right to revert to this question in Committee 5 should they still so desire.
5.13 There was a motion for the exclusion of an allocation of the Broadcasting-Satellite Service in the European Broadcasting Area, which was rejected by 11 for and 3 against the motion.

5.14 The provisionally agreed revisions of the Table for these bands were confirmed by the Sub-Group and Working Group 5E as shown in Annex B to the present Report.

5.15 In view of these decisions, various suggestions were made in an attempt to give wider satisfaction. Among these was the suggestion of a foot-note based on the provisions of No. 145 of the Radio Regulations to be worded:

"In the U.S.S.R., Iran, Portugal and Switzerland, the band 2 500-2 690 Mc/s is allocated to the Fixed and Mobile Services only."

This foot-note was approved without objection. It was pointed out that the restrictions contained in Article 7 for bands shared between Space Services and the Fixed and Mobile Services would apply to the Fixed and Mobile Services appearing in the foot-note.

5.16 The Delegation of the U.S.S.R. proposed a revised text for foot-note ADD 364C which, after thorough examination and slight amendment by the Delegations of the Syrian Arab Republic and Brazil, was agreed by a large majority for world-wide application. The agreed text appears in Annex B to the present Report.

5.17 In connection with the show of cards by which the support for the text was evaluated, several delegations including Italy, United Kingdom and Canada reserved the right to revert to this action which they considered to be outside the competence of the Group. According to these delegations, it should have been specified that the motion related to the application of the foot-note insofar as the Broadcasting-Satellite Service only was concerned and not with respect to the Fixed-Satellite Service also.

5.18 A motion by the Delegation of Chile, to re-instate the MOBILE Service in the Table for Region 2 for the band 2 655-2 690 Mc/s, gave rise to some difficulties. However, in the final analysis, the Group agreed to the motion.
5.19 A motion by the Delegation of Denmark to limit the allocations to the MOBILE Service in the bands between 2 500 Mc/s and 2 690 Mc/s to the Land and Maritime Mobile Services. This also was agreed by the Group.

5.20 The Delegation of U.S.S.R. reserved the right to revert to the question of excluding the European Broadcasting Area from the allocation to the Broadcasting-Satellite Service and declared that, in any event, this allocation would not be used in the U.S.S.R.

5.21 Finally, the Delegation of Cuba objected strongly against various aspects of foot-note No. 3618 and reserved the right to revert to this question later should it still so desire.

R. GALIĆ  
Chairman  
Working Group 5E

ANNEX A

620-790 Mc/s

ADD 332A

Within the frequency band 620-790 Mc/s, assignments may be made to stations in the Broadcasting-Satellite Service, subject to agreement among the administrations concerned and affected (see Articles 9 and 9A or Resolution ). Such stations shall not produce a power flux-density in excess of the value within the territories of other administrations without the consent of those administrations.

In France and the United Kingdom, the band 2450-2500Mc/s is allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services.

In France, the band 2500-2550Mc/s is also allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services. In Canada, the band 2500-2550Mc/s is also allocated on primary basis to the Radiolocation Service.

The use of the band 2500-2690Mc/s by the Broadcasting-Satellite Service is limited to domestic and regional systems for community reception and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected (see Articles 9 and 9A or Resolution No. xxx). The power flux-density at the surface of the earth shall not exceed those given in Article 7 Nos. 470NH-470NK.

In the United Kingdom, the band 2500-2600Mc/s is also allocated, on a secondary basis, to the Radiolocation Service.

When planning new tropospheric scatter radio-relay links in the band 2500-2650Mc/s, all possible measures shall be taken to avoid directing the antennae of these links towards the geostationary orbit.

The use of bands 2500-2535Mc/s and 2655-2690Mc/s by the Fixed-Satellite Service is limited to domestic and regional systems and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected. In the direction Space-to-Earth, the power flux-density at the surface of the earth shall not exceed "See Article 7."

Note to Committee 7:
Text of foot-note A is to be adjusted according to the results of the work of the present Conference pertinent to this subject.

1. **117.975-136 Mc/s band**

   The Working Group decided not to amend the text of No. 273A as it now stands in the Radio Regulations.

   In order to facilitate the adoption of the First Report (Document No. 203), a corrigendum was drafted to rectify its presentation by adding the symbol NOC. (Document No. 203, as amended was adopted by Committee 5 on 7 July 1971).

2. **890-960 Mc/s band**

   The Working Group decided to amend the text of No. 340 in order to reduce the limits of the band around the ISM frequency 915 Mc/s (see Appendix A).

3. **1525-1535 Mc/s band**

   The Working Group decided to delete Number 350E and to amend Number 350A in order to protect the 1535-1540 Mc/s part now allocated to the Maritime Mobile-Satellite Service (see Appendix A).
4. 1 535-1 660 Mc/s band

4.1 As a result of the admirable work carried out by Sub-Working Group 5D-1 under the chairmanship of Mr. Foxcroft (Australia), the Working Group reached agreement on the allocations between 1 535-1 660 Mc/s and the corresponding foot-notes (see Appendix B); however, this agreement was only made possible by numerous concessions on the part of the delegations represented.

4.2 A minority of delegations nevertheless stated that they would have preferred the allocations to be made in a narrower band - namely, 110 Mc/s instead of 125 Mc/s (1 550-1 660 Mc/s). The Delegation of U.S.S.R. reserved the right to re-open this question in Committee 5 if they still so desire.

4.3 With regard to notes 352F and 352I concerning the joint use by the Aeronautical Mobile (R) and Maritime Mobile Services of a shared band (1 542.5-1 543.5 Mc/s and 1 644-1 645 Mc/s), the Working Group was divided on the conditions of use to be specified. It finally adopted the text which appears in Appendix B.

4.4 Furthermore, the observers for I.C.A.O. and I.A.T.A. felt that they must make individual statements in order to inform Committee 5 of the views of their organizations on the utilization of the 1 535-1 660 Mc/s band.

These statements are annexed to the present report (see Annexes 1 and 2).

4.5 Finally, Group 5D agreed on the inclusion in Document No. 279 (Radio astronomy between 1 611.5-1 612.5 Mc/s) of Note 352K, drafted and adopted by Group 5B, under the number 352E.

5. 2 400-2 550 Mc/s band

The Group considered that proposals relating to this band were outside its terms of reference (see Document No. DT/59(Rev.)).

6. 4 200-4 400 Mc/s band

After examining the proposals on aeronautical radionavigation, the Group decided to keep note 352A in the Table concerning this frequency band.
7. 5000-5 250 Mc/s band

The majority was unfavourable to the division of the Table with regard to this frequency band, but agreed to the insertion of a foot-note 383B to permit bilateral links for the Aeronautical Mobile (R) and/or the Radiodetermination Service (see Appendix C).

8. 7 250-7 300 Mc/s and 7 975-8 025 Mc/s bands

The Group decided to delete Number 392C, not to amend Number 392H and to add Israel to the list of countries referred to in 392C (see Appendix D).

Maurice CHEF
Chairman

Annexes : 2
1. I.C.A.O. is the United Nations Specialized Agency universally recognized as empowered to establish and present international civil aviation requirements in respect of applications of space technology. Over the past two years your own Governments, under the aegis of I.C.A.O., have made a careful and co-ordinated assessment of the future needs of civil aviation for space services. Aided by its ASTRA Panel, I.C.A.O. finally developed a well-founded and conservative statement of the bandwidths needed between 1,535 and 1,660 MHz to assure, in the future, the safety, regularity and efficiency of air transport, which are its primary aims under the terms of its Convention. Whilst manifestly civil aviation does not carry the bulk of world freight, it does carry the great majority of human beings who travel across the broad deserts and oceans of the world, and the safety of human life is its constant concern.

2. This Conference has, I believe, made a real effort to satisfy these aeronautical requirements in the face of conflicting and competing demands from another service. In my personal opinion these competing requirements are not of a nature which justifies the comparatively large allocations which have been made to them at the expense of aviation. However, the decision reached shows that, collectively, you do not yet share this opinion.

3. The effect of these decisions on the future operational and technical development of international civil aviation will have to be carefully studied in the coming months. It is quite likely that, at a future I.T.U. Conference, civil aviation may be forced to seek an upward revision of the allocations made here, and I trust that, at that time, you will be able to accord a more appropriate priority to the requirements of what is, after all, essentially a safety service.
ANNEX 2

I.A.T.A. STATEMENT

ON 1 535-1 660 MHz ALLOCATIONS

(1 July 1971)

1. I.A.T.A. wishes to express its grave concern with the decisions which have been taken in connection with the allocation to the Aeronautical Mobile Service in the band 1 535-1 660 MHz. Attention has already been drawn to the views expressed by I.C.A.O. Member States justifying the retention of 80 MHz for aeronautical radio navigation and 40 MHz for the Aeronautical Mobile (R) Services to meet the existing and forecast requirement for aviation world-wide.

2. Although there appear to be very considerable doubts as to the usefulness of this part of the spectrum for maritime mobile use in the foreseeable future, the conference has seen fit to make incursions into the spectrum allocated by the 1963 Space Conference for the Aeronautical Services.

3. It is I.A.T.A.'s view that allocation to meet the demands of a service carrying traffic predominantly of a public correspondence nature, at the expense of Aeronautical Services ignores the realities of the situation. The needs of the Aeronautical Services are directed principally to the safety of human life. The spectrum requirements for systems necessary for the safe and expeditious operation and control of large and fast aircraft each carrying hundreds of passengers at just subsonic (and in the near future at greater than Mach 2) speeds in three dimensions, should not be sacrificed in favour of claims of other services operating in a far less critical manner. I.A.T.A. also notes that the possibility of reducing the allocations of other services in this part of the spectrum was not examined by the conference.

4. Further, the allocation of 2 MHz spectrum to shared aeronautical and maritime use at the expense of aeronautical radio navigation has effectively sterilized this spectrum and is unjustified in I.A.T.A.'s view as the International Aviation Authorities have been unable, after much study, to identify any such use apart from the remote possibility of a few channels for some as yet undefined common Search and Rescue facility excluding Distress/Alerting.
5. In the view of I.A.T.A. the W.A.R.C. has artificially constrained system development and design in the allocation of spectrum by means of unnecessary Definitions and Foot-notes. I.A.T.A. observes that insufficient regard has been paid to the need for the appropriate specialized agencies of the United Nations to have full freedom to develop and apply the technology best suited to their individual and unique needs. I.A.T.A. is convinced that the best course for the W.A.R.C. would have been to allow the specialized United Nations Agencies, and in particular I.C.A.O., in accordance with its defined responsibilities, to specify systems best suited to the requirements of aircraft operation and control.
Appendix A

MOD 340

In Region 2, the frequency 915 Mc/s is designated for industrial, scientific and medical purposes. Emissions must be confined within the limits of ±13 Mc/s of that frequency. Radiocommunication services operating within these limits must accept any harmful interference that may be experienced from the operation of industrial, scientific and medical equipment.

MOD 350A

Space stations employing frequencies in the band 1,525-1,535 Mc/s for telemetering purposes may also transmit tracking signals in the band.

**MOD** 352A

The bands 1 558.5-1 636.5 Mc/s, 5 000-5 250 Mc/s and 15.4-15.7 Gc/s are reserved on a world-wide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based or satellite-borne facilities.

**MOD** 352B

The bands 1 558.5-1 636.5 Mc/s, 5 000-5 250 Mc/s and 15.4-15.7 Gc/s are also allocated to the aeronautical mobile (R) service for the use and development of systems using space communications techniques. Such use and development is subject to agreement and co-ordination among administrations concerned and those having services operating in accordance with the Table, which may be affected.

**SUP** 352C

**[MOD]** 352D

In Austria, Indonesia and the F.R. of Germany, the band 1 540-1 660 Mc/s is also allocated to the fixed service.

**ADD** 352E

Limited to transmissions from satellite-borne stations to stations in the maritime mobile-satellite service for communication and/or radio-determination purposes. Transmissions from coast stations directly to ship stations, or between ship stations, are also authorized when such transmissions are used to extend or supplement the satellite-to-ship links.
Limited to transmissions from satellite-borne stations to stations in the aeronautical mobile (R) and maritime mobile satellite services for communication and/or radiodetermination purposes. Transmissions from land stations to mobile stations, or between mobile stations, of these services, are also authorized. The utilization of this band is subject to prior operational co-ordination between the two services.

Limited to transmissions from satellite-borne stations to stations in the aeronautical mobile (R) satellite service for communication and/or radiodetermination purposes. Transmissions from terrestrial aeronautical stations directly to aircraft stations, or between aircraft stations, in the aeronautical mobile (R) service are also authorized when such transmissions are used to extend or supplement the satellite-to-aircraft links.

Limited transmissions from stations in the maritime mobile satellite service to satellite-borne stations for communication and/or radiodetermination purposes. Transmissions from ship stations directly to coast stations, or between ship stations, are also authorized when such transmissions are used to extend and supplement the ship-to-satellite links.

Limited to transmissions from stations in the aeronautical mobile (R) and maritime mobile-satellite services to satellite-borne stations for communication and/or radiodetermination purposes. Transmissions from mobile stations to land stations, or between mobile stations, of these services, are also authorized. The utilization of this band is subject to prior operational co-ordination between the two services.
ADD 352J

Limited to transmissions from stations in the aeronautical mobile (R)-satellite service to satellite-borne stations for communication and/or radiodetermination purposes. Transmissions from aircraft stations in the aeronautical mobile (R) service directly to terrestrial aeronautical stations, or between aircraft stations, are also authorized when such transmissions are used to extend or supplement aircraft-to-satellite links.

*) ADD 352K

Radio astronomy observations on important spectral lines due to the hydroxyl radicle OH at frequencies 1 612.231 Mc/s and 1 720.55 Mc/s are carried out in a number of countries under national arrangements; the bands observed being 1 611.5-1 612.5 Mc/s and 1 720-1 721 Mc/s respectively. Administrations should bear in mind the needs of radio astronomy service in their future planning of these bands.

*) Text shown in proposed ADD 352E in Annex A to Document No. 279 (Third Report of Working Group 5B to Committee 5).

MOD 392G

In Algeria, Austria, Bulgaria, Cyprus, Cuba, Ethiopia, Finland, Hungary, Israel, Japan, Kuwait, Lebanon, Liberia, Malaysia, Morocco, the Philippines, Poland, the United Arab Republic, Yugoslavia, Roumania, Sweden, Switzerland, Czechoslovakia and the U.S.S.R., the band 7 '250-7 '300 MHz is also allocated to the fixed and mobile services.

NCC 392H
"A revised version of this proposal which tends to restrict the limitations for the Broadcasting Service was also rejected (application of No. 719 of the I.T.U. Convention). The Delegations of the United Kingdom and of Sweden reserved their right to raise the matter again if they still so desire.

2.3 The Working Group finally adopted the attached draft Recommendation which appears at Appendix B. The Delegation of Greece then withdrew its draft Resolution which appears in Document No. 277."

"Tampoco ha podido ser aceptada una versión emmendada de esta proposición que reducía las limitaciones del servicio de radiodifusión (aplicación del número 719 del Convenio). Las Delegaciones del Reino Unido y de Suecia se reservaron el derecho de insistir sobre esta cuestión si lo consideran conveniente.

2.3 El Subgrupo de trabajo adoptó el adjunto proyecto de Recomendación (Apéndice B), sometido al Subgrupo por la Delegación de Estados Unidos de América. La Delegación de Grecia retiró entonces su proyecto que figuraba en el Documento N.º 277."
SIXTH REPORT OF WORKING GROUP 5D

TO COMMITTEE 5

Bands : 235 -328.6 Mc/s
       335.4-339.9 Mc/s
       432 -615 Mc/s

---

1. Bands 235-328.6 Mc/s and 335.4-399.9 Mc/s

   1.1 The Working Group agreed to add the new foot-note 308A in Table with respect to the above-mentioned frequency bands (see Appendix A).

   1.2 The Delegation of Poland stated that they accepted this new foot-note as a compromise though their original proposal concerned only the bands 230-300 Mc/s and 344-390 Mc/s.

   1.3 Proposals B/71/59, J/98/54 and J/98/58 were rejected.

   1.4 The Delegation of India insisted upon the necessity to protect the Radio Astronomy Service in their country and the Working Group accepted to propose the foot-note 810A (see Appendix A) taking into account the decision taken by Committee 5 at its 4th meeting when considering Document No. 177(Rev.) (1st Report of Working Group 5B).

2. Bands 432-615 Mc/s

   2.1 After considerable discussion, Proposals G/108/321, 322 and 323 and the Proposal of Sweden contained in Document No. 244 were rejected.

   2.2 The Working Group then examined a new proposal presented by the Delegations of the United Kingdom and of Sweden (Document No. 293) which was not accepted by a majority of the Working Group.
A revised version of this proposal which tended to restrict the limitations for the Broadcasting Service was also rejected (application of No. 719 of the I.T.U. Convention). The Delegations of the United Kingdom and of Sweden reserved their right to raise the matter again if they still so desire. This statement was supported by the Delegation of Norway.

2.3 The Working Group finally adopted the attached draft Recommendation which appears at Appendix B.

Maurice CHEF
Chairman

Appendices : 2
In India, the band 322-328.6 Mc/s is also allocated to the Radio Astronomy Service.

**ADD 308A**  
In the bands 240-328.6 Mc/s and 335.4-399.9 Mc/s, the mobile service may be authorized the use and development, for that service, of systems using space techniques. Such use shall be subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.
APPENDIX B

DRAFT RECOMMENDATION

relating to requirements for future frequency allocations for Maritime Mobile Service using space techniques

The World Administrative Radio Conference, Geneva, 1971,

having noted

that the Inter-Governmental Maritime Consultative Organization (I.M.C.O.) has stated a requirement for frequencies on the order of 400 MHz, believing that small vessels in particular may be excluded from satellite communications if such frequencies are not made available;

further noting

that the C.C.I.R. Special Joint Meeting, Geneva, 1971, concluded that the present Conference should be invited to examine the possibility of providing exclusive channels for the Maritime Mobile Service at about 400 MHz and that provision of such channels is desirable:

considering

a) that ship stations and survival craft stations are completely dependent upon the use of radio for communication;

b) that the use of space techniques will provide the Maritime Mobile Service with a reliable method of communication, considerably improved over existing methods;

C) that reliable Maritime Mobile Service communications will greatly assist in the saving of lives and property;
d) that although the Conference has made certain provisions for the use of space techniques by the Maritime Mobile Service, there is some uncertainty with respect to the adequacy and usefulness of these provisions, particularly insofar as small ships and survival craft are concerned.

e) that general participation of small ships in a service using space techniques would not only benefit the efficient and safe operation of these ships, but it would also improve the safety service for larger ships and survival craft.

f) that future conferences might find it necessary to make additional allocation provisions for such uses in more nearly optimum portions of the spectrum;

g) that some communications functions, such as certain broadcasting and fixed applications, may not be dependent upon the transmission of radio waves, but could in fact use other means, thereby making available portions of the spectrum for services which are so dependent.

recommends

1. that administrations and appropriate international organizations should continue to review the requirements for the application of space techniques for the Maritime Mobile Service and the suitability of current frequency allocation provisions in meeting those requirements;

2. that the C.C.I.R. should continue its studies to determine the optimum portions of the frequency spectrum and related sharing conditions to accommodate Maritime Mobile Service requirements, taking into consideration technological advances in space techniques for Mobile Services;

3. that a future appropriate Administrative Radio Conference should review the requirements of the Maritime Mobile and Safety Services, and if necessary, provide the frequency allocation to satisfy these requirements.
ADDITIONAL PROPOSALS

Reason: To confirm the possibility of using satellite transmissions close to 150 and 400 Mc/s for space research (particularly for geodesy) and to provide for this purpose a distinctly higher frequency harmonically related to the two frequencies mentioned above, the French Delegation proposes the insertion of two foot-notes.

These proposals are in agreement with the recommendations made by COSPAR on the subject.

ADD 285C Emissions of the radionavigation-satellite service in the bands 149.9-150.05 Mc/s and 399.9-400.05 Mc/s may also be used by earth receiving stations of the space research service.
The band 1 699.6-1 700.2 Mc/s may be used, on a secondary basis, for the transmission on board satellites of frequencies harmonically related to those emitted in the bands 149.9-150.05 Mc/s and 399.5-400.05 Mc/s for the requirements of precision radionavigation and geodesy.
FOURTH REPORT OF WORKING GROUP 5A

TO COMMITTEE 5 (ALLOCATIONS)

FIXED-SATELLITE SERVICE

Frequency bands:
- 1 429-1 525 Mc/s
- 2 150-2 200 Mc/s
- 5 650-5 925 Mc/s
- 6 425-7 750 Mc/s
- 8 025-8 400 Mc/s
- 14,4-15,25 Gc/s
- 38-40 Gc/s

1. **Frequency band**: 1 429-1 525 Mc/s
   
   The Delegation of Canada stated that it would withdraw its Proposal CAN/14/50 for this band as soon as their alternative Proposal contained in Documents Nos. 164 and 272 was approved in Committee 5.

2. **Frequency band**: 2 150-2 200 Mc/s
   
   The Delegation of the U.S.A. stated that, taking into consideration the agreement on allocations to the Fixed-Satellite Service which resulted from the Proposals in Documents Nos. 164 and 272, the Administration of U.S.A. would withdraw its Proposal USA/28/78 in this band.

3. **Frequency band**: 5 650-5 925 Mc/s
   
   The Working Group agreed that it could make no contribution to Committee 5 with respect to the proposals in this band (AUS/60/70, G/54/98, URS/59/22, 23, USA/28/88 and B/71/87) which had already been examined by other Working Groups.
4. **Frequency band**: 6425-7750 Mc/s

4.1 The Working Group, after examination of Proposals B/71/90,91, agreed to suggest to Committee 5 the modification of foot-note 392G, as shown in the Annex to the present Report.

4.2 The Working Group, having examined the Second Report of Sub-Working Group 5A-2, which concerned a proposal by the U.S.A. (Document No. 217) for the band 6625-7125 Mc/s, could not agree to suggest the proposed allocation to Committee 5. The Delegation of the U.S.A. reserved its right to revert to this subject in Committee 5, where it would present a new proposal in the form of a foot-note concerning only Region 2.

4.3 The remaining Proposals in frequency range 6425-7750 Mc/s (F/41/115-117), G/54/101-103, HOL/49/70,71 and USA/28/93,94) had already been considered in other Working Groups, and the meeting agreed that no new contribution could be made to Committee 5 with respect to these Proposals.

5. **Frequency band**: 8025-8400 Mc/s

Examination of Proposals in this band (CAN/14/79,80, F/41/118,119, G/56/104,105, HOL/49/72,73, USA/28/95) revealed that they had already been discussed in other Working Groups. The group agreed that it could not make any further contribution.

6. **Frequency band**: 14.4-15.25 Gc/s

The Proposals in this band (AUS/10/40-42,44,48,49, CAN/14/90,91 and J/98/79) were withdrawn by the respective delegations in the light of previous results agreed upon by the Joint Working Group 5A/5E in the band 10.7-14.5 Gc/s.

7. **Frequency band**: 38-40 Gc/s

The Japanese Administration withdrew its Proposal J/98/80 concerning this band, and would consider this matter in Committee 5 where it had reserved the right to revert to its Proposal J/98/81 (see Document No. 254).
8. **Note to Committee 4**

The Working Group agreed to send to the Chairman of Committee 4 a note in the following terms:

"Working Group 5A, having difficulties in evaluating the sharing possibilities between Space Services and other Services in the band 14-14.5 Gc/s, requests Committee 4 to consider the possibility of supplying power flux-density limitations at the geostationary orbit which would be applicable to this band."

Luiz BAHIANA
Chairman
Working Group 5A

**FIXED-SATELLITE**  
(Space-to-earth)

| 374A 392C 392D 392G |

---

MOD 392G  
In Algeria, Austria, Brazil, Bulgaria, Cyprus, Cuba, Ethiopia, Finland, Hungary, Japan, Kuwait, Lebanon, Liberia, Malaysia, Morocco, the Philippines, Poland, the United Arab Republic, Yugoslavia, Roumania, Sweden, Switzerland, Czechoslovakia and the U.S.S.R. the band 7 250-7 300 Mc/s is also allocated to the fixed and mobile services.
THIRD REPORT BY SUB-WORKING GROUP 5E-1 TO WORKING GROUP 5E

BROADCASTING-SATELLITE SERVICE

Frequency band: 2 300-2 690 Mc/s

1. The Group had before it Proposals CAN-USA/164/4 in part, CAN-USA/164/5, 6, 7 and 10, IND/39/31 and 32, B/71/81 and 82. These Proposals were thoroughly examined and the Sub-Working Group provisionally agreed the revised provisions appearing in the Annex to the present Report.

2. The Delegation of India agreed to adjust the lower limit of their Proposal from 2 400 Mc/s to 2 690 Mc/s in the interests of obtaining unanimity.

3. Proposals AUS/190/1 and 2 were not supported and the Delegation of Australia reserved the right to revert to them in Working Group 5E or in Committee 5, if it still so desired.

4. The Delegation of Cuba was against the addition of regional with or without a capital "R" in the ADD 361B (No. 125.1 of the Radio Regulations refers), and reserved the right to revert to this question later, if it still so desired.

5. The Delegations of Bulgaria, Poland, Portugal, Federal Republic of Germany, Czechoslovakia and the U.S.S.R. explained the heavy use of the band by the services to which it is at present allocated and the serious difficulties involved by the proposed additional allocation to the Broadcasting-Satellite Service for community-type reception. While preferring the status quo for Region 1, they insisted upon receiving sound guarantees from Committee 4 on technical criteria and adequate provisions for co-ordination procedures from Committee 6 before a final agreement could be considered.
6. The Delegation of Japan also explained the heavy use of this band by Terrestrial Services and the serious difficulties the proposed allocations would cause. The Delegation reserved the right to revert to this question later, if it still so desired.

7. The Delegations of the U.A.R. and Uganda recalled the unanimously adopted United Nations resolution reproduced by the Secretary-General in Document No. 58.

8. The Delegation of Denmark explained that it was quite conceivable that Scandinavian countries might wish to develop a system in the future at this order of frequency and consequently urged the adoption of world-wide provisions.

9. The Delegation of the United Kingdom recalled the unanimous agreement reached in Working Group 5B the day before concerning the band 2 670-2 690 Mc/s ADD 365A (G/54/93) by which administrations should bear in mind the needs of the Radio Astronomy Service in their future planning of this band. In connection with the deletion of Radiolocation on a secondary basis from the band 2 500-2 550 Mc/s in the Region 1, the Delegation's request for retention of this allocation was not supported. Consequently, it reserved the right to revert to this question later.

10. In the resumed study of the provisional agreement, the following Delegations declared no support for an allocation to the Broadcasting-Satellite Service at this order of frequency and no support for the footnote 364C by which new tropospheric scatter systems are prohibited in the band 2 500-2 690 Mc/s as of the entry into force of the Final Acts of the present Conference: Poland, the Ukraine, Roumania, Czechoslovakia, the U.S.S.R., Bulgaria and Belorussia. However, a show of hands resulted in 19 in favour and 39 against the deletion of footnote ADD 364C. The Delegations of Italy, Portugal, the U.S.S.R., Pakistan, Australia, Brazil and Poland reserved the right to revert to this question in Committee 5 should they still so desire.

11. There was a motion for the exclusion of an allocation of the Broadcasting-Satellite Service in the European Broadcasting Area, which was rejected by 11 for and 34 against the motion.

12. Thus the provisionally agreed revisions of the Table for these bands were confirmed by the Sub-Group as shown in the Annex to the present Report.
In view of these decisions, various suggestions were made in an attempt to give wider satisfaction. Among these was the suggestion of a foot-note along the lines of No. 145 of the Radio Regulations to be worded:

"In the U.S.S.R., Iran, the band 2 500-2 590 Mc/s is allocated to the Fixed and Mobile Services."

It was pointed out that in view of the decision to retain foot-note 364C and in view of the terms of No. 147 of the Radio Regulations, the suggested foot-note should include the sense of the restriction contained in ADD 364C.

The Chairman and the Secretary were requested to draw up a text for consideration.

14. The Delegation of U.S.S.R. reserved the right to revert to the question of excluding the European Broadcasting Area from the allocation to the Broadcasting-Satellite Service and declared that, in any event, this allocation would not be used in the U.S.S.R.

15. Finally, the Delegation of Cuba objected strongly against various aspects of foot-note No. 361B and reserved the right to revert to this question later should it still so desire. The Delegation of India also reserved the right to revert to these questions later should it still so desire.

16. The Group agreed that exceptionally the Report may be sent directly to Working Group 5E.

Per ÅKERLIND
Chairman
Sub-Working Group 5E-1

In France and the United Kingdom, the band 2 450-2 500 Mc/s is allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services.

In France and the United Kingdom the band 2 500-2 550 Mc/s is also allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services. In Canada, the band 2 500-2 550 Mc/s is also allocated on primary basis to the Radiolocation Service.

The use of the band 2 500-2 690 Mc/s by the Broadcasting-Satellite Service is limited to domestic and regional systems for community reception and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected (see Articles 9 and 9A or Resolution No. xxx). The power flux-density at the surface of the earth shall not exceed those given in Article 7 Nos. 47ONH-47ONK.

New tropospheric scatter systems are prohibited in the band 2 500-2 690 MHz. Existing tropospheric scatter systems may continue to operate in this band.

The use of the bands 2 500-2 535 Mc/s and 2 655-2 690 Mc/s by the Fixed-Satellite Service is limited to domestic and regional systems and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected. In the direction Space-to-Earth, the power flux-density at the surface of the earth shall not exceed .......... see Article 7.

Note to Committee 7:

Text of foot-note A is to be adjusted with a view to having a single foot-note for application according to the results of the work of the present Conference pertinent to this subject.
PROPOSED AMENDMENTS TO ARTICLES 6 AND 27
OF THE RADIO REGULATIONS

The Radio Regulations provide for aircraft stations to communicate with stations of the Maritime Mobile Service. For this purpose aircraft should use frequencies allocated to the Maritime Mobile Service. (See Nos. 951 and 952.) One reason for this provision is that frequencies allocated to the Aeronautical Mobile Service cannot be used for public correspondence. (See No. 432.)

The same concept should be applicable to aircraft desiring to communicate with stations in the Maritime Mobile Satellite Service. (See S.J.M. 4.2.1.3) To effect this, consequential amendments to the Regulations are proposed in the attached.

Annex : 1.

*) C.C.I.R. S.J.M. 4.2.1.3 "In relation to public correspondence for ships and aircraft, provision should be made in the frequency allocation table for world-wide mobile public correspondence, by means of satellite. These allocations should be sufficient to meet the needs of the Maritime Mobile Service with provision for expansion and, should it prove necessary, its extension to aviation."
ANNEX

ARTICLE 6

§ 5. In certain cases provided for in Articles 32 and 35, aircraft stations are authorized to use frequencies in the bands allocated to the Maritime Mobile Service or Maritime Mobile-Satellite Services for the purpose of communicating with stations of those Services (see No. 952).

ARTICLE 27

§ 3. (1) Aircraft stations may communicate with stations of the Maritime Mobile or Maritime Mobile-Satellite Services. They shall then conform to those provisions of these Regulations which relate to the Maritime Mobile Service.

§ (2) For this purpose aircraft stations should use the frequencies allocated to the Maritime Mobile or Maritime Mobile-Satellite Services. However, having regard to interference which may be caused by aircraft stations at high altitudes, maritime mobile frequencies in the bands above 30 Mc/s shall not be used by aircraft stations in any specific area in which interference is likely to be caused. In particular, aircraft stations operating in Region 1 should not use frequencies in the bands above 30 Mc/s allocated to the Maritime Mobile Service by virtue of any agreement between administrations in that Region.
A significant number of lives could be saved each year from ship disasters and downed aircraft if emergency position-indicating radiobeacons (EPIRB's) using space techniques were available to mobile stations. The EPIRB's, when activated, could alert a shore based rescue co-ordination centre by satellite relay, identify the mobile station in distress and provide location information. The combination of these functions provides a means for essentially eliminating the search phase of the search and rescue problem. Thus, lives and valuable property could be saved by minimizing the time interval between the occurrence of a mishap and the initiation of rescue efforts.

Tests conducted by the United States have clearly shown the feasibility of an EPIRB system as described above. These tests are continuing; however the results to this date indicate the following features of such a system:

a) EPIRB devices can be manufactured with a small physical size and at a low cost to the user;

b) the system and the user devices would be completely independent of any other communications system or equipment, and would operate entirely within a single, narrow frequency band (100 kHz is the width of the proposed band);

c) the EPIRB can reliably and immediately access the satellite with a simple antenna and not more than 5 watts of power;

d) the EPIRB transmission will be a short data burst (no voice capability) with a narrow emission bandwidth;

e) frequencies in the vicinity of 400 kHz are most suitable for an EPIRB system based upon tests to date.

The experiments referred to above are now being supplemented by conceptual studies for a world-wide EPIRB system.
In view of the importance of distress alerting and survivor location, particularly for ships at sea and aircraft over the sea or in remote parts of the world, the United States is proposing that an allocation be made for this specific purpose. Due to the nature of the system, it is necessary that the allocation be on an exclusive, world-wide basis. In arriving at the proposed band, it was considered that the low power, short duration and narrow bandwidth of the EPIRB emission, together with the low probability of an EPIRB transmission occurring in any particular part of the world, would have negligible effect on radio astronomy observations in this portion of the spectrum.

The proposal is as follows:

Ref.

USA/323/298  
MOBILE-SATELLITE (Earth-to-Space)  
317A

ADD 317A This band is reserved on a world-wide, exclusive basis solely for the use and development of emergency position-indicating radiobeacon (EPIRB) systems using space techniques.
The modifications and additions to the provisions of Article 7, Section VIII, relating to limits of power flux-density from space stations, appearing in the Annex hereto have been approved by Committee 4.

The texts in question have been forwarded to the Drafting Committee.

E.F. SANDBACH
Chairman
Committee 4

ARTICLE 7

PROPOSED PARTIAL TEXT OF SECTION VIII

MOD
ADD 470MA
ADD 470MB

Limits of power flux-density from space-stations

§22.bis(0) Power flux-density limits [below 1 G [c/s]]

(a) In the band [614-960 M [c/s]] where the broadcasting-satellite service shares the frequency band with equal rights with the fixed service using tropospheric scatter, and where there is insufficient frequency separation there must be sufficient angular separation between the direction to the broadcasting-satellite space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed -168 dBW in any 4 k [c/s] band.
§23. (1) Power flux-density limits [between 1.67 and 1.7 G(c/s)].

ADD 470NA

(a) The power flux-density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed $-133$ dBW/m$^2$ in any $1.5$ M[c/s] band. This limit relates to the power flux-density which would be obtained under assumed free-space propagation conditions.

ADD 470NB

(b) The limit given in 470NA applies in frequency band(s) listed in 470NC which is(are) allocated to transmission by space stations in the meteorological-satellite service and [ earth exploration-satellite service] where this(these) band(s) is(are) shared with equal rights with the meteorological aids service :

ADD 470NC

(c) - [ ]
- [ ]
- [ ] etc.

ADD 470ND

§23. (2) Power flux-density limits [between 1.67 G[c/s] and 2.3 G[c/s]].

ADD 470NE

(a) The power flux-density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- $-154$ dBW/m$^2$ in any $4$ k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $-154 + \frac{5}{2} \cdot \delta$ dBW/m$^2$ in any $4$ k[c/s] band for angles of arrival ($\delta$) between 5 and 25 degrees above the horizontal plane;
-144 dBW/m\(^2\) in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux-density which would be obtained under assumed free-space propagation conditions.

ADD 47ONF
(b) The limits given in 47ONE apply in the frequency bands listed in 47ONG which are allocated to transmission by space stations in the following space services:

- [ ]
- [ ]
- [ ]
- [ ]
- [ ] etc.

where these bands are shared with equal rights with the fixed or mobile services:

ADD 47ONG
- [ ]
- [ ]
- [ ]
- [ ]
- [ ] etc.

ADD 47ONGA
(c) The power flux-density values of 47ONE are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the bands listed in 47ONG and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed -168 dBW in any 4 kHz band.
ADD 47ONH (3) Power flux-density limits [between 2.3 G[c/s] and 3 G[c/s]].

ADD 47ONI (a) The power flux-density at the earth's surface produced by emissions from a space station in the Broadcasting-Satellite Service for all conditions and for all methods of modulation shall not exceed the following values:

-152 dBW/m² in any 4 k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

-152 + \frac{3(\theta - 5)}{4} dBW/m² in any 4 k[c/s] band for angles of arrival (\theta) between 5 and 25 degrees above the horizontal plane;

-137 dBW/m² in any 4 k[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux-density which would be obtained under assumed free-space propagation conditions.

ADD 47ONJ (b) The limits given in 47ONI apply in the frequency band:

\[
\left[ \quad \right]
\]

which is shared by the Broadcasting-Satellite Service with equal rights with the [Fixed or Mobile Service].

ADD 47ONK (c) The power flux-density values of 47ONI are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the band mentioned in 47ONJ and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed -168 dBW in any 4 k[c/s] band.
(4) Power flux-density limits [between 3 G[c/s] and 8 G[c/s]]

(a) The power flux-density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:
-152 dBW/m$^2$ in any 4 k/$\sqrt{f}$/s band for angles of arrival between 0 and 5 degrees above the horizontal plane;

\[-152 + \frac{(6 - 5)}{2} \text{ dBW/m}^2\] in any 4 k/$\sqrt{f}$/s band for angles of arrival (6) between 5 and 25 degrees above the horizontal plane;

-142 dBW/m$^2$ in any 4 k/$\sqrt{f}$/s band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux-density which would be obtained under assumed free-space propagation conditions.

(b) The limits given in 47ONM apply in the frequency bands listed in 47ONO which are allocated to transmission by space stations in the following space services:

- \[\square\]
- \[\square\]
- \[\square\] etc.

where these bands are shared with equal rights with the fixed or mobile services:

ADD 47ONQ (a) The power flux-density at the earth's surface, produced by emissions from a space station, or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

ADD 47ONP (5) Power flux-density limits between 8 and 11.7 G/$\sqrt{f}$/s
-150 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

-150 + \( \frac{(6 - 5)}{2} \) dBW/m² in any 4 kHz band for angles of arrival (δ) between 5 and 25 degrees above the horizontal plane;

-140 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux-density which would be obtained under assumed free-space propagation conditions.

ADD 47ONR (b) The limits given in 47ONR apply in the frequency bands listed in 47ONS which are allocated to transmission by space stations in the following space services:

- ...
- ...
- ...
- etc.

where these bands are shared with equal rights with the fixed or mobile services:

ADD 47ONS

- ...
- ...
- ...
- etc.

ADD 47ONT (6) Power flux-density limits between 11.7 and 15.4 GHz

ADD 47ONU (a) The power flux-density at the earth's surface, produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:
-148 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

\[-148 + \frac{(\delta - 5)}{2} \text{ dBW/m}^2\] in any 4 kHz band for angles of arrival (\(\delta\)) between 5 and 25 degrees above the horizontal plane;

-136 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux-density which would be obtained under assumed free-space propagation conditions.

ADD 47ONV

(b) The limits given in 47ONV apply in the frequency bands listed in 47ONW which are allocated to transmission by space stations in the following space services:

- \[
\frac{\text{J}}{\text{J}}\]
- \[
\frac{\text{J}}{\text{J}}\]
- \[
\frac{\text{J}}{\text{J}}\]
- etc.

where these bands are shared with equal rights with the \([\text{fixed or mobile}]\) services:

ADD 47ONW

- \[
\frac{\text{J}}{\text{J}}\]
- \[
\frac{\text{J}}{\text{J}}\]
- \[
\frac{\text{J}}{\text{J}}\]
- etc.

ADD 47ONX

(7) Power flux-density limits \([\text{between } 15.4 \text{ GHz} \text{ and } 23 \text{ GHz}]\)

ADD 47ONY

(a) The power flux-density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:
-115 dBW/m² in any 1 MHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

\[-115 + \frac{\Delta - 5}{2} \text{ dBW/m}^2\] in any 1 MHz band for angles of arrival (\(\theta\)) between 5 and 25 degrees above the horizontal plane;

-105 dBW/m² in any 1 MHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux-density which would be obtained under assumed free-space propagation conditions.

**ADD 47ONZ**

(b) The limits given in 47ONY apply in the frequency bands listed in 47ONZA which are allocated to transmission by space stations in the following space services:

- [ ]
- [ ]
- [ ] etc.

where these bands are shared with equal rights with the Fixed or mobile services:

**ADD 47ONZA**

- [ ]
- [ ]
- [ ] etc.

**ADD 47ONZB**

(b) The limits given in 47ONA, 47ONE, 47ONI, 47ONM, 47ONQ, 47ONU and 47ONY may be exceeded subject to the agreement of any administration in whose territory the power flux-density may be higher than the limits indicated above.

**SUP 4700 to 470U**
In order to avoid certain difficulties which were raised with respect to Document No. JT/71, the French delegation proposes the following modifications:

it is proposed to suppress the second paragraph of item 4, Section C and the second paragraph of item 4, Section D, to account for the case where the translation frequency of the interfering simple frequency changing transponder is different from that of the wanted simple frequency changing transponder,

similarly, a modification is proposed to item 6, Section D, to avoid the difficulties that may be encountered when considering the term "category of carrier".

Annex : 1
ANNEX

PROPOSED MODIFICATIONS TO THE TEXT OF DOCUMENT NO. /DT/777

1. Suppress the second paragraph of a) of item 4, Section C, and of item 4, Section D. Suppress the words "in all cases" in the first paragraph of a) of item 4, Section C, and also in item 4, Section D.

2. Replace the second paragraph of a) of item 6, Section D, and the footnote by:

"For each /space-to-earth/ service area and for each foreseen usage*), indicate, when simple frequency changing transponders are used on the space station, the smallest equivalent satellite link noise temperature and the highest associated value of link gain evaluated from the output of the receiving antenna of the space station to the output of the receiving antenna of the earth station. For each foreseen usage, indicate also the receiving antenna(e) of the space station to which each simple frequency changing transponder will be connected."

3. Replace the last sentence of b) of item 6, Section D, by:

"When a simple frequency changing transponder is used on the space station, indicate also, if available, the pattern associated with each equivalent satellite link noise temperature indicated above."

*) A different usage will be considered to take place when different types of carriers are employed (different by virtue of maximum power spectral density), or when different types of receiving earth stations are employed (different by virtue of receiving antenna gain)."

MOD 112 § 7. The radio spectrum shall be subdivided into nine frequency bands, which shall be designated by progressive whole numbers in accordance with the following Table. Frequencies shall be expressed:

- in kilohertz (kHz) up to and including 3 000 kHz
- in megahertz (MHz) thereafter up to and including 3 000 MHz
- in gigahertz (GHz) thereafter up to and including 3 000 GHz.

However, where adherence to these provisions would introduce serious difficulties, for example in connection with the notification and registration of frequencies, the lists of frequencies and related matters, reasonable departures may be made.

Power Flux Density Limits

ADD

Limits of Power Flux Density from Space Stations

ADD 470MA § 22A. Power flux density limits [below 1 G[c/s]].

ADD 470MB In the portions of the band [614-960 M[c/s]] shared with equal rights by the broadcasting-satellite service and the fixed service using tropospheric scatter, where there is insufficient frequency separation there must be sufficient angular separation between the direction to the broadcasting-satellite space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed —168 dBW in any 4 k[c/s] band.

MOD 470N § 23. (1) Power flux density limits [between 1-67 and 1-7 G[c/s]].

ADD 470NA a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed —133 dBW/m² in any 1-5 M [c/s] band. This limit relates to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NB b) The limit given in No. 470NA applies in frequency band[s] listed in No. 470NC which is [are] allocated to transmission by space stations in the earth explora-
tion satellite service and the meteorological-satellite service where this [these] band[s] is [are] shared with equal rights with the meteorological aids service.

ADD 470NC
c) — [ ]
   — [ ]
   — [ ]

ADD 470ND § 23. (2) Power flux density limits [between 1-67 G[c/s] and 2-3 G[c/s]].

ADD 470NE
a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

   —154 dBW/m² in any 4 k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

   —154 + \( \frac{8 - 5}{2} \) dBW/m² in any 4 k[c/s] band for angles of arrival (\( \theta \)) between 5 and 25 degrees above the horizontal plane;

   —144 dBW/m² in any 4 k[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NF
b) The limits given in No. 470NE apply in the frequency bands listed in No. 470NG which are allocated to B4—03
transmission by space stations in the following space radiocommunication services:

- [ ]
- [ ]
- [ ]
- [ ]
- [ ]

where these bands are shared with equal rights with the [fixed or mobile] services:

ADD 470NG

- [ ]
- [ ]
- [ ]
- [ ]
- [ ]

ADD 470NGA

c) The power flux density values given in No. 470NE are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the bands listed in No. 470NG and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed —168 dBW in any 4 k[c/s] band.

B4—04
ADD 470NH (3) Power flux density limits [between 2-3 G[c/s] and 3 G[c/s]].

ADD 470NI  

a) The power flux density at the earth's surface produced by emissions from a space station in the broadcasting-satellite service for all conditions and for all methods of modulation shall not exceed the following values:

- $-152 \text{ dBW/m}^2$ in any 4 k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $-152 + \frac{3(\theta - 5)}{4} \text{ dBW/m}^2$ in any 4 k[c/s] band for angles of arrival ($\theta$) between 5 and 25 degrees above the horizontal plane;

- $-137 \text{ dBW/m}^2$ in any 4 k[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NJ  

b) The limits given in No. 470NI apply in the frequency band:

- [ ]

which is shared by the broadcasting-satellite service with equal rights with the [fixed or mobile service].

ADD 470NK  

c) The power flux density values given in No. 470NI are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the band mentioned in No. 470NJ and where there is insufficient frequency
separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed $-168$ dBW in any 4 k[c/s] band.

**ADD 470NL (4)** Power flux density limits [between 3G[c/s] and 8 G[c/s]].

**ADD 470NM**

a) The power flux density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

$-152$ dBW/m² in any 4 k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

$-152 + \frac{(8-5)}{2}$ dBW/m² in any 4 k[c/s] band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

$-142$ dBW/m² in any 4 k[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane. These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

**ADD 470NN**

b) The limits given in No. 470NM apply in the frequency bands listed in No. 470NO which are allocated to transmission by space stations in the following space radiocommunication services:

B4—06
where these bands are shared with equal rights with the [fixed or mobile] services:

ADD 470NO

— [ ]
— [ ]
— [ ]

ADD 470NP

(5) Power flux density limits [between 8 and 11.7 G[c/s]]:

ADD 470NQ

a) The power flux density at the earth’s surface, produced by emissions from a space station, or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

—150 dBW/m² in any 4 k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

—150 + \( \frac{(8-5)}{2} \) dBW/m² in any 4 k[c/s] band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

—140 dBW/m² in any 4 k[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.
b) The limits given in No. 470NQ apply in the frequency bands listed in No. 470NS which are allocated to transmission by space stations in the following space radiocommunication services:

- [ ]
- [ ]
- [ ]

where these bands are shared with equal rights with the [fixed or mobile] services:

ADD 470NS

- [ ]
- [ ]
- [ ]

ADD 470NT

(6) Power flux density limits [between 11·7 and 15·4 G[c/s]]:

ADD 470NU

a) The power flux density at the earth's surface, produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- $-148 \text{ dBW/m}^2$ in any 4 k[c/s] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $-148 + \frac{(8-5)}{2} \text{ dBW/m}^2$ in any 4 k[c/s] band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

- $-138 \text{ dBW/m}^2$ in any 4 k[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane.
These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NV

b) The limits given in No. 470NU apply in the frequency bands listed in No. 470NW which are allocated to transmission by space stations in the following space radiocommunication services:

- [ ]
- [ ]
- [ ]

where these bands are shared with equal rights with the [fixed or mobile] services:

ADD 470NW

- [ ]
- [ ]
- [ ]

ADD 470NX

(7) Power flux density limits [between 15.4 G[ c/s ]] and 23 G[ c/s ]].

ADD 470NY

a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- $-115 \text{ dBW/m}^2$ in any 1 M[ c/s ] band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $-115 + \frac{(8-5)}{2} \text{ dBW/m}^2$ in any 1 M[ c/s ] band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;
—105 dBW/m² in any 1 M[c/s] band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NZ  

b) The limits given in No. 470NY apply in the frequency bands listed in No. 470NZA which are allocated to transmission by space stations in the following space radiocommunication services:

- [ ]
- [ ]
- [ ]

where these bands are shared with equal rights with the [fixed or mobile] services:

ADD 470NZA

- [ ]
- [ ]
- [ ]

ADD 470NZB (8) The limits given in [470NA, 470NE, 470NI, 470NM, 470NQ, 470NU and 470NY] may be exceeded on the territory of any administration which has so agreed.

SUP 470O to 470U
[ARTICLE 7]

ADD Section [...]. Power flux density at the geostationary satellite orbit

ADD 470 [...] In the frequency band [8.025 to 8.400 Mc/s] which the Earth Exploration-Satellite Service using non-geostationary satellites shares with the Fixed-Satellite Service (earth-space transmissions), the maximum power flux density produced at the geostationary satellite orbit by any Earth Exploration-Satellite Service space station shall not exceed —174 dBW/m² in any 4 kHz band.
RECOMMENDATION No. Spa BB

Relating to Carrier Energy Dispersal in Systems in the Fixed Satellite Service

considering

a) that use of carrier energy dispersal techniques in systems in the fixed satellite service can result in a substantial reduction of interference to stations of a terrestrial service operating in the same frequency bands;

b) that the use of such techniques can result in a substantial reduction in the level of interference between systems in the fixed satellite service operating in the same frequency bands;

c) that such techniques are being regularly and successfully employed in systems in the fixed satellite service without noticeable deterioration of the quality of operation;

recommends

1. that systems in the fixed satellite service employing angle modulation by analogue signals should use carrier energy dispersal techniques as far as is practicable with a view to spreading energy at all times and in a manner consistent with the satisfactory operation of the systems;

2. that systems in the fixed satellite service employing digital modulation should use carrier energy dispersal techniques when this becomes technically feasible and is practical.

B4—12
SUMMARY RECORD
OF THE
SEVENTH MEETING OF COMMITTEE 4
(TECHNICAL)
Wednesday, 7 July 1971, at 0940 hrs
Chairman : Mr. E.F. SANDBACH (Australia)

1. Corrigendum to page 4 of Document No. 327, last sentence of second paragraph reads:

"Nevertheless, the Working Group had thought it advisable to insert a definition in Article 1, since equivalent satellite link noise temperature was referred to in Appendices 1A, 1B and 29 and Article 9A of the Regulations."

2. Corrigendum to page 5, first sentence of the first paragraph reads:

"The Delegate of France pointed out that there was the need of alignment of texts in Appendices 1B and 29 where methods of calculating increase of equivalent satellite link noise temperature were concerned."

E.F. SANDBACH
Chairman
Committee 4
SUMMARY RECORD
OF THE
SEVENTH MEETING OF COMMITTEE 4
(TECHNICAL)
Wednesday, 7 July 1971, at 0940 hrs
Chairman: Mr. E.F. SANDEACH (Australia)

Subjects discussed
1. Approval of summary record of sixth meeting

2. Progress report by Working Group Chairmen

3. Consideration of documents from Working Groups
   a) Working Group 4A
   b) Working Group 4D
   c) Working Group 4F
   d) Working Group 4B

4. Document from Committee 4 Drafting Group

5. Documents referred to other Committees

6. Completion of work of Working Group 4A

Document No.

287

295

194 Addendum No. 2

198 Addendum No. 1(Rev.), 274, 275

285

288, 289
1. Approval of summary record of sixth meeting (Document No. 287)

In response to a suggestion by the Delegate of Syria, the Chairman proposed the following wording for the third sentence in the third paragraph on page 3 of Document No. 287: "Concern was expressed by several delegates as to whether the present Conference was competent to adopt a resolution proposing alteration of the Radio Regulations in contradiction to Nos. 206 and 267 of the Convention".

Document No. 287, as thus amended, was approved.

2. Progress report by Working Group Chairman

3. Consideration of documents from Working Groups

a) Working Group 4A (Document No. 295)

The Chairman of Working Group 4A, introducing the document, said that Working Group 4A had considered definitions submitted by other Groups and had submitted some definitions, contained in the Annex, to be added to Article 1 and proposed in paragraphs 3 and 5 that the C.C.I.R. should study a clear definition of "system noise temperature" within the framework of the "omnibus" Recommendation and should study the concept of "acceptable" (or unacceptable) interference jointly with that of "harmful interference".

At the proposal of the Delegate of the U.S.S.R., it was agreed to consider paragraph 3 of the document together with section 3 of the Annex.

The Delegate of the United States of America said he could accept the note at the end of paragraph 5, but suggested that the words "in particular, in Documents Nos. 174, 209, 210 and DT/87," should be inserted after "at the present Conference" in the penultimate sentence.

The Chairman pointed out that Document No. DT/87 was a temporary document, which would be issued in final form later. Since that document was of concern to Committee 6, Committee 4 should for the time being merely draw the attention of that Committee to the proposed change.

It was so agreed.

In response to a criticism of the last paragraph by the Delegate of Chile, the Chairman of Working Groups 4A and 4E explained that the proposed note was a provisional solution of a problem which had been studied
in greater detail in Working Group 4E than in Working Group 4A. The notion of "harmful interference", which had been introduced into the Radio Regulations a long time previously, was qualitative, rather than quantitative, and it had proved impossible to link that concept with that of "inadmissible interference" or to find a definition of the latter term which would provide the I.F.R.B. with a sound basis for making a favourable or unfavourable finding.

The Director of the C.C.I.R. added that an International Working Party was studying the problem in detail and pointed out that equivalent noise temperature was only one factor in defining acceptable or unacceptable interference. C.C.I.R. Reports 413 and 414 contained useful information on the subject.

Paragraphs 1, 2, 4 and 5 of Document No. 295 were approved.

Definition ADD 84ALA in the Annex was approved.

At the suggestion of the Delegate of the U.S.S.R., the inverted commas round the words "up path", "down path" and "satellite-to-satellite paths" in definitions ADD 84ALB and ADD 84ALC were deleted.

Definitions ADD 84ALB and ADD 84ALC, as amended, were approved.

The Delegate of Australia pointed out that definition ADD 84BFA should begin with the word "An".

The Chairman of Working Group 4A said that the word "earth" in the English text should begin with a capital letter.

The Director of the C.C.I.R. suggested that the definition of "Geosynchronous satellite" should follow the more detailed one given in the report of the C.C.I.R. Special Joint Meeting.

The Chairman of Working Group 4A, supported by the Delegate of the United States of America and the representative of the I.F.R.B., considered that the definition should be as simple as possible, so as not to confuse the less technically minded readers of the Radio Regulations.

Definition ADD 84BFA, as amended, was approved.

The Delegate of the U.S.S.R. pointed out that ADD 103A was not strictly a definition. Moreover, it was stated in paragraph 3 of the document that the term "system noise temperature" was generally well
understood, whereas that was not the case: indeed, the C.C.I.R. Special Joint Meeting had produced a more detailed and accurate definition in the footnote to page 127 of its report. Perhaps something along the lines of that text should be used in the relevant parts of the Radio Regulations, pending further study of the subject by the C.C.I.R., and ADD 103A should be deleted.

The Chairman of Working Group 4A said that the definition was in any case provisional and was to be studied further by the C.C.I.R. Nevertheless, the Working Group had thought it advisable to insert a definition in Article 1, since system noise temperature was referred to in Appendices 1A, 1B and 19 and Article 9A of the Regulations.

After a brief discussion, the Committee provisionally approved a text proposed by the Delegate of Spain, based on the S.J.M. proposal on page 3 of Document No. 194, which would be discussed by the Drafting Group.

In response to a comment by the Delegate of the U.S.S.R., it was agreed to replace the word "omnibus" in paragraph 3 of Document No. 295 by "collective".

After a discussion on the difference between the terms "allowable" and "acceptable" in definition ADD 103B and on the need to refer to "fixed and mobile" stations in the note to ADD 103C, it was decided to leave the definitions in section 4 of the Annex in abeyance until Document No. 294, which contained relevant information, was available.

On that understanding, Document No. 295, as amended, was approved.

b) Working Group 4D (Document No. 194, Addendum No. 2)

At the proposal of the Delegate of France, it was decided to delete the third paragraph on page 3 of the document.

After a brief discussion, it was decided to insert the words "for example" after "using" in the third sentence of the first paragraph of the conclusions on page 7.

At the proposal of the Delegate of France, it was decided to delete the second paragraph of the conclusions.

In response to comments by the Delegate of Syria, it was agreed to replace the word "maximum" in the second sentence of the first paragraph by "predetermined".
The Delegate of France pointed out that there was a discrepancy between Appendices 1B and 29 where methods of calculating increase of noise temperature were concerned. He would therefore submit to the Drafting Group a proposed additional paragraph to Document No. 194. Furthermore, it might be useful to refer to Appendix 1B in that document and to replace the sentence at the bottom of page 6, introducing Table I, by an indication that the essential information concerned should be provided by using Appendix 1B.

The Chairman said that the Drafting Group would deal with the points raised by the Delegate of France.

On that understanding, Document No. 194, Addendum No. 2, as amended, was approved.

c) Working Group 4F (Document No. 286)

The Delegate of the United Kingdom on behalf of Working Group 4F introduced the cover sheet of Document No. 286, which reflected the discussion that had taken place in Committee 4, resulting in the decision to refer the annexed draft resolution to Committee 6.

Document No. 286 was adopted for transmission to Committee 6.

The Chairman of Working Group 4B said that subsequent to the approval of Document No. 198, Working Group 4B had considered the third report of Working Group 5C (Document No. 237), dealing, inter alia, with proposals for the allocation of frequency bands to the Meteorological Satellite Service. He pointed out that in paragraph ADD 470ND (Document No. 198, page 2) "between 1.7 Gc/s and 2.3 Gc/s" should be changed to "between 1.67 Gc/s and 2.3 Gc/s," in case Committee 5 decided to allocate that band to a space service shared on an equal basis with fixed and mobile services.

It was so agreed.

The Chairman of Working Group 4B introduced Documents Nos. 274 and 275, which were closely related, and drew attention to paragraph 2 of Document No. 275. He also pointed out an editorial change in Document No. 275: the middle sub-paragraph of paragraph ADD 470NI in the Annex to the Document should read:
"-152 \left(\frac{3(6-5)}{4}\right) dBW/m^2 in any 4 kc/s band for angles of arrival (\theta) between ..."

Document No. 274 was adopted, for transmission to Committee 5.

After questions by the Director of the C.C.I.R. and the Delegate of Pakistan had been answered to their satisfaction by the Chairman of Working Group 4B, Document No. 275 was approved.

The Chairman of Working Group 4B introduced Document No. 198 Add. No. 1(Rev.), which proposed two additions to Article 7 to cover required protection for trans-horizon systems. In answer to a question by the Delegate of Roumania on paragraph ADD 470 MB (Document No. 198 Add. No. 1(Rev.), Annex, page 3), he explained that the figures in \(\frac{}{}\) were not final, and might be altered as a result of decisions taken in other Committees.

Document No. 198 Add. No. 1(Rev.) was approved.

The Chairman of Working Group 4B introduced Document No. DT/93 and announced three editorial changes in it made at the Working Group's most recent meeting.

It was agreed that the Committee 4 Drafting Group be asked to include the material contained in the Document in the proposed "omnibus" recommendation to the C.C.I.R.

4. Document from Committee 4 Drafting Group (Document No. 285)

The Chairman invited consideration of Document No. 285

The Delegate of France pointed out that the terms kc/s and Mc/s appeared in brackets after kHz and MHz in the existing French text of Radio Regulation 112, and the French version of Document No. 285 should indicate that those terms should be deleted.

The Director of the C.C.I.R. proposed that the third sentence on page 1 of Document No. 285 should read "... it was recognized by Committee 4 that the use of the term "hertz" has been recommended by the C.C.I.R. and has been adopted ..."

Document No. 285 was approved with the amendments proposed.
5. Documents referred to other Committees (Documents Nos. 288 and 289)

The Chairman drew attention to Documents Nos. 288 and 289, which had been referred to other Committees.

The documents were noted.

6. Completion of work by Working Group 4A

The Chairman of Working Group 4A stated that in Document No. 146, paragraph 4 and Annex, Document No. 160, paragraph 2, and Document No. 166, paragraph 4, the Working Group had invited other Working Groups and Committees to express their views on the advisability of including definitions of certain terms in the Radio Regulations. The only term the Working Group had been asked to define was "noise temperature". He therefore took it that none of the other terms listed were required to be defined for the Radio Regulations and Working Group 4A had completed its task.

The meeting rose at 1300 hrs.

The Secretary: I. DOLEZEL

The Chairman: E.F. SANDBACH
ARTICLE 7 - SECTION IX - SPACE SERVICES

Ref.

ARG/328/73 ADD 470W

Sites and frequencies for stations of the space services operating in frequency bands shared with equal rights with other services, shall be selected having regard to the latest recommendations of the C.C.I.R., and, where appropriate, with the procedure laid down in Resolution E and after co-ordination with stations of the terrestrial service and of the various space services.

Reason: The steady expansion of both space and terrestrial services makes it necessary for the Radio Regulations to stress the need for co-ordination, before sites are chosen and frequencies allocated, not only with terrestrial services but also with the space services.
REPORT OF WORKING GROUP 6A

On 7 July 1971, Working Group 6A considered draft Appendix 1B prepared by Sub-Working Group 6A-A and contained in Document No. DT/77. After having examined it, Working Group 6A approved the document as a whole and submits, herewith, to Committee 6 a draft Appendix 1B, in which, in addition to some drafting amendments, it incorporated the amendments proposed by Working Group 4E in Document No. 311.

P.E. WILLEMS
Chairman
Working Group 6A

PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX

DRAFT

APPENDIX 1B

ADVANCE PUBLICATION INFORMATION
TO BE FURNISHED FOR A
SATELLITE NETWORK

Section A - General instructions

Item 1 - Information shall be provided separately for each satellite network.

Item 2 - Information to be furnished for each satellite network shall include general characteristics (Section B), and, as applicable, characteristics in the earth-to-space direction (Section C), characteristics in the space-to-earth direction (Section D), and characteristics for space-to-space relay (Section E).

Section B - General characteristics to be furnished for a satellite network.

Item 1 - Identity of the satellite network.

Provide a separate and clear identity of the satellite network and, if applicable, the identity of the satellite system of which it will form a part.
Item 2 - Operational date

Indicate the date by which the satellite network is expected to be brought initially into operation.

Item 3 - Administration or group of administrations submitting the advance information

Give the name of the administration or the names of the administrations of the group submitting the advance information on the satellite network and the postal and telegraphic addresses of the administration(s) to which any communication should be sent.

Item 4 - Orbital information relating to the space station(s)

a) In the case of a space station aboard a geostationary satellite, give the planned nominal geographical longitude on the geostationary satellite orbit and the planned longitudinal and inclination tolerances. Indicate also

1) the arc of the geostationary orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth's surface, from its associated earth stations or service areas; and

2) the arc of the geostationary orbit within which the space station could, in accordance with Resolution No. Space C, provide the required service to its associated earth stations or service areas; and
d) in the event that the arc stated in paragraph 2) above is less than the arc stated in paragraph 1) above, provide the reasons therefor:

Note: The arcs specified in 1) and 2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period and the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites having the same characteristics used in the satellite network.

Section C - Characteristics of the satellite network in the earth-to-space direction

Item 1 - Earth-to-space service area(s)

Indicate the service area(s) on the earth associated with each receiving antenna of the space station.

Item 2 - Class of stations and nature of service

For each earth-to-space service area, indicate the class of the stations in the satellite network and the nature of the service to be performed, using the symbols shown in appendix 10.
Item 3 - Frequency range

For each earth-to-space service area, indicate the frequency range within which the carriers will be located.

Item 4 - Power characteristics of the transmitted wave

a) For each earth-to-space service area in all cases indicate the maximum spectral power density (W/Hz) to be delivered to the antenna of the transmitting earth stations (the bandwidth over which this is averaged depends on the nature of the service concerned).

When a simple frequency changing transponder is used aboard the space station, indicate, if available, the maximum spectral power density (W/Hz) delivered to the antenna of the transmitting earth station for each category of carrier received by the space station. When applicable, indicate also the parts of the earth-to-space service area and the frequency range within which each category of carrier received by the space station is confined.

b) If available, indicate, for each earth-to-space service area, the actual radiation pattern (relative to isotropic) of the transmitting earth station antenna having the highest offbeam equivalent isotropically radiated spectral power density.
Item 5 - Characteristics of space station receiving antennae

For each earth-to-space service area,

a) in the case of a space station aboard a geostationary satellite, indicate the estimated gain of the space station receiving antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 db and 10 db intervals thereafter as necessary, below the maximum gain, shall be indicated.

b) in the case of a space station aboard a non-geostationary satellite, indicate the estimated isotropic gain of the space station receiving antenna in the main direction of reception and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of reception as a reference.

Item 6 - Noise temperature of the receiving space station

For each earth-to-space service area, indicate, when other than simple frequency changing transponder is used aboard the space station, the lowest total receiving system noise temperature.
Section D - Characteristics of the satellite network in the space-to-earth direction

Item 1 - Space-to-earth service area(s)
Indicate the service area(s) on the earth associated with each transmitting antenna of the space station.

Item 2 - Class of stations and nature of service
For each space-to-earth service area, indicate the class of the stations in the satellite network and the nature of the service to be performed, using the symbols shown in appendix 10.

Item 3 - Frequency range
For each space-to-earth service area, indicate the frequency range within which the carriers will be located.

Item 4 - Power characteristics of the transmission
For each space-to-earth service area, indicate in all cases the maximum spectral power density (W/Hz) to be delivered to the transmitting antenna of the space station (the bandwidth over which this is averaged depends on the nature of the service concerned).

When a simple frequency changing transponder is used aboard the space station, indicate, if available, the maximum spectral power density (W/Hz) delivered to the transmitting antenna of the space station for each category of carrier (supplied under item 4, Section C) received by the
space station at the input of this simple frequency changing transponder. When applicable, indicate also the parts of the space-to-earth service area and the frequency range within which the transmissions associated with each category of carrier received by the space station are confined.

**Item 5 - Characteristics of space station transmitting antennae**

For each space-to-earth service area,

a) in the case of a space station aboard a geostationary satellite, indicate the estimated gain of the space station transmitting antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 dB and 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

b) in the case of a space station aboard a non-geostationary satellite, indicate the estimated isotropic gain of the space station transmitting antenna in the main direction of transmission and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of transmission as a reference.
Item 6 - Characteristics of receiving earth stations

a) For each space-to-earth service area, indicate, when other than simple frequency changing transponder is used aboard the space station, the lowest total receiving system noise temperature of the earth stations.

When a simple frequency changing transponder is used aboard the space station, indicate the lowest equivalent satellite link noise temperature associated with each category of carrier (supplied under item 4, Section C) received by the space station*. Indicate also in this case the highest transmission gain measured from the output of the space station receiving antenna to the output of the earth station receiving antenna, associated with each category of carrier received by the space station*).

*) In the event of there being several combinations of values of equivalent satellite link noise temperature and transmission gain for a particular category of carrier received by the space station, the values of each of the combinations will be indicated.
b) If available, indicate for each space-to-earth service area the actual radiation pattern (relative to isotropic) of the receiving earth station antenna having the highest offbeam level. When a simple frequency changing transponder is used aboard the space station, the pattern associated with each category of carrier (supplied under item 4, Section C) received by the space station should be indicated where appropriate.

Section E - Characteristics to be furnished for space-to-space relay

Where the satellite network is connected to another satellite network by means of space-to-space relay, indicate the following:

a) name(s) of the satellite network(s) to which the satellite network is connected

b) transmit and receive frequency bands

c) class of emission

d) nominal e.i.r.p. on the beam axis.
NOTE FROM THE CHAIRMAN OF COMMITTEE 4
TO THE CHAIRMAN OF COMMITTEE 6

During its Seventh Meeting on 7 July 1971, Committee 4 agreed the following text for a Note relating to the level of unacceptable interference:

"The level of unacceptable interference shall be fixed by agreement between the Administrations concerned, using the relevant C.C.I.R. Recommendations as a guide."

Your attention is drawn to this text, because you may find it applicable also for Note (1) on page 6 of Document No. DT/87.

E.F. SANDBACH
Chairman
Committee 4
PROPOSALS FOR AMENDMENT OF ARTICLE 5 OF THE RADIO REGULATIONS
IN RESPECT OF BROADCASTING SATELLITE SERVICE

Modify proposal IND/39/30 as follows:

1) Add 339B (in the frequency box 845-935, Region 3)

2) ADD 339B

In India, the band 845-935 Mc/s is also allocated for experimentation of satellite broadcasting subject to agreement with the administrations having services operating in accordance with the Table which may be affected. The following flux-densities would not be exceeded during the experiments:

<table>
<thead>
<tr>
<th>Power flux-density</th>
<th>Angle of arrival</th>
</tr>
</thead>
<tbody>
<tr>
<td>-128 dBW/m²</td>
<td>0 &lt; 20°</td>
</tr>
<tr>
<td>-128 + 0.4(6-20°) dBW/m²</td>
<td>20° &lt; 6 &lt; 60°</td>
</tr>
<tr>
<td>-111 dBW/m²</td>
<td>60° &lt; 6 &lt; 90°</td>
</tr>
</tbody>
</table>

Reason: India had submitted the proposal IND/39/30 for allocation of the band 845-935 Mc/s for Broadcasting Satellite Service in Region 3. India would like to conduct live experiment in satellite broadcasting for domestic coverage in this band without causing harmful interference to services of other administrations operating in accordance with the Table. The results of this experiment will be useful to the whole world. Many countries are looking forward to the success and outcome of the experiment.
MEMORANDUM BY THE CHAIRMAN

The Head of the Delegation of the Czechoslovak Socialist Republic has sent me the letter reproduced in the Annex.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
Geneva, 8 July 1971

Dear Sir,

I am sending you herewith a statement by the Delegation of the Czechoslovak Socialist Republic on the participation in the Conference of the German Democratic Republic, the Democratic Republic of Viet-Nam and the Korean People's Democratic Republic. I request you to publish the text of this statement as an official conference document.

Yours sincerely,

J. MARSICEK
Head of the Delegation of the Czechoslovak Socialist Republic

Mr. Gunnar PEDERSEN
Chairman of the World Administrative Radio Conference for Space Telecommunications

Geneva

Annex : 1
Annex

The Delegation of the Czechoslovak Socialist Republic to the World Administrative Radio Conference for Space Telecommunications expresses its profound regret that delegations from the German Democratic Republic, the Democratic Republic of Viet-Nam and the Korean People's Democratic Republic have not been invited to take part in the Conference.

The absence of delegations from these countries is at variance with the principle of the universality of international organizations and reduces the chances of finding an effective solution to the problems falling within the terms of reference of the Conference.

J. MARSICEK
Head of the Delegation of
the Czechoslovak Socialist Republic
DRAFT

RECOMMENDATION No. Spa 3

TO THE C.C.I.R. AND TO ADMINISTRATIONS

relating to frequency bands shared between
space services and between space and terrestrial services

recognizing

a) the value to the Conference of the material contained in Document No. 64 (Results of C.C.I.R. studies relating to space telecommunications concluded at its Special Joint Meeting);

b) that further studies on a wide range of problems dealing with space communications form the subject of C.C.I.R. Questions and Study Programmes approved by the XIIth Plenary Assembly;

considering however

a) that certain of the C.C.I.R. Recommendations, listed below, are provisional and call for further work and study before they can become definite:

Recommendation 355-1

"FREQUENCY SHARING BETWEEN ACTIVE COMMUNICATION-SATELLITE SYSTEMS AND TERRESTRIAL RADIO SERVICES IN THE SAME FREQUENCY BANDS"

Recommendation 465

"GENERALIZED EARTH-STATION ANTENNA RADIATION PATTERN FOR USE IN INTERFERENCE CALCULATIONS, INCLUDING COORDINATION PROCEDURES, IN THE FREQUENCY RANGE 2-10 GHz"
Recommendation 466

"COMMUNICATION-SATELLITE SYSTEMS FOR TELEPHONY USING FREQUENCY-DIVISION MULTIPLEX - Maximum allowable values of interference in a telephone channel of a geostationary communication-satellite system employing frequency-modulation, cause by other geostationary communication-satellite systems."

b) that as a result of the deliberations of this Conference, particularly in relation to the provisions of Article 7 Sections relevant sections, and to other relevant Articles, further information is required in reply to the following Questions and Study Programmes already set for study by the C.C.I.R. :

Question 1-1/4

under Decides 2
the state of development in antenna design and fabrication;

under Decides 3
the state of development of antennae with improved side- and back-lobe characteristics;

under Decides 4
the polarization characteristics of antennae, particularly in the side-lobe regions and in planes other than the principal planes;

Question 2-1/4

under Decides 3
under what conditions and to what extent would it be feasible for communication-satellites, operating in the same system or operating in different systems, to share preferred frequency bands;

under Decides 4
under what conditions and to what extent would it be feasible for communication-satellite systems to share preferred frequency bands with terrestrial services;
"FEASIBILITY OF FREQUENCY SHARING BETWEEN COMMUNICATION-SATELLITE SYSTEMS AND TERRESTRIAL SERVICES"

Under Decides 2

the determination of preferred technical characteristics of transmitting and receiving antennae for earth stations at fixed locations, from the standpoint of spectrum sharing with other radio services;

Under Decides 1

"COMMUNICATION-SATELLITE SYSTEMS" - Feasibility of frequency sharing among communication-satellite systems/

the criteria which affect interference among communication-satellite systems in a given system and between communication-satellite systems, taking into account the two directions of transmission;

Under Decides 2

the preferred technical characteristics of transmitting and receiving antennae for earth stations, from the standpoint of frequency sharing within the same system and with other communication-satellite systems/

"COMMUNICATION-SATELLITE SYSTEMS" - Technical factors influencing the efficiency of use of the geostationary satellite orbit by communication-satellite systems sharing the same frequency bands

Under Decides 1

the technical characteristics of communication-satellite systems which affect the utilization of the geostationary satellite orbit, and the inter-relationships between them;

Under Decides 3

the extent to which it may be feasible and desirable to adopt preferred technical characteristics for different geostationary communication-satellite systems and earth stations;
particularly, to take account of the following factors in carrying the above studies:

- the tolerable levels of interference noise in different communication-satellite systems;
- the radiation patterns of the earth station and satellite antennae;
- factors affecting the multiple use of the same frequencies within a single communication-satellite;
- polarization discrimination;

c) that under the terms of Article 9A of the Radio Regulations frequency assignments to earth stations in certain bands shared with equal rights with Fixed and Mobile or Terrestrial Services must be co-ordinated with a view to preventing mutual harmful interference;

d) that the calculation method described in Appendix 28 applies solely to frequencies in the 1-40 GHz range;

e) that Tables I, Ia and II in Appendix 28 do not show numerical values for the parameters of certain Space Radiocommunication Services and Terrestrial Services, sharing frequency bands with equal rights;

f) that the method of determining the co-ordination area of an earth station as described in Appendix 28 is probably still open to improvement and simplification;

g) that frequency bands have been allocated to the broadcasting satellite service and that the use of satellite transmissions for reception by the general public of sound and television broadcasts may be possible in the future;

h) that the C.I.R. is studying the conditions under which sharing between the broadcasting satellite service and other services may be possible;

i) that it would be useful to have a clear definition of the term "system noise temperature";
j) that it would be useful to have clear definitions of the terms "acceptable" (or unacceptable) interference" and "harmful interference" for the Space, Radio Astronomy, and Terrestrial Services;

k) that it would be useful to have specific numerical values of power flux-density from space stations in the Broadcasting Satellite Service which would permit differentiation between "individual reception" and "community reception" in the Broadcasting Satellite Service;

l) frequency sharing between the Aeronautical Radionavigation Service and the Communication Satellite Service (satellite-to-earth) has been proposed for the band 4 200 to 4 400 MHz;

recommends

1. that all administrations and recognized private operating agencies, through their participation in the work of the C.C.I.R., consider as a matter of priority, the submission of contributions on these subjects, so that definite Recommendations can be prepared at the Interim Meetings of the relevant Study Group for adoption by the XIIIth Plenary Assembly of the C.C.I.R.;

2. that the C.C.I.R. should study or, as appropriate, continue to study:

2.1 the reference antenna patterns, for earth station antennae, which may be appropriate for setting minimum standards of performance, and to recommend specific patterns for this purpose, in order to improve utilization of the frequency bands shared between communication satellite systems and terrestrial services, and taking into account the effect of such reference patterns on frequency sharing between communication satellite systems;

2.2 the reference antenna patterns, for satellite antennae, which may be appropriate for setting minimum standards of performance, particularly outside the main beam, in order to improve the utilization of the geostationary orbit and to foster the possibilities for frequency re-use;

2.3 the reference cross-polarization antenna patterns which may be appropriate for setting minimum standards of performance and, in this connection, further study:

2.3.1 the portions of the spectrum within which linear-orthogonal or circular-orthogonal polarizations might be most appropriate;
2.3.2 the relative desirability, accounting for technical and orbit utilization factors, of using orthogonal polarizations within a single satellite as against between two satellites;

2.4 the necessary limitation of spurious emissions and the frequency tolerances to be observed in both the Terrestrial and Space Services insofar as they may affect sharing of frequency bands.

2.5 the permissible interference criteria for the various Space and Terrestrial Services sharing the frequency bands allocated by the WARC-ST, Geneva, 1971, in order to permit the determination of:

2.5.1 the co-ordination distance and the probability of interference between stations within that distance;

2.5.2 the necessary limits of power flux-density set up at the earth's surface by space stations.

2.6 the maximum permissible amount of interference into a geostationary satellite /link/ from any other single interfering geostationary satellite /system/ and from the aggregate of all other geostationary satellite /systems/, particularly in the case of:

2.6.1 frequency-modulated telephony signals;

2.6.2 frequency-modulated television signals;

2.6.3 digitally-modulated signals;

and the most appropriate manner in which permissible interference should be specified in these and other cases;

2.7 the interference criteria applicable to frequency sharing between non-geostationary satellite /systems/;

2.8 the possibility of establishing a technical criterion for expressing the efficiency of use of the geostationary satellite orbit;

2.9 the data which are not included in Tables I, Ia and II of Appendix 28, relating to the Space Radiocommunication Services or Terrestrial Services sharing frequency bands with equal rights;
2.10 the possibility of improving and simplifying the method of determining the co-ordination area as described in Appendix 28;

2.11 the formulation of a calculation method for determining the co-ordination area of earth stations at frequencies below 1 Ge/s or above 40 Ge/s;

2.12 and make early recommendations regarding the conditions for sharing in those bands allocated to the Broadcasting Satellite Service by the W.A.R.C. in order that administrations and the International Frequency Registration Board shall have the necessary technical data required to carry out examination procedures, in particular regarding Articles 9 and 9A of the Radio Regulations;

2.13 and formulate the definition of the term "system noise temperature" applicable to space systems;

2.14 and formulate definitions of the terms "acceptable (or unacceptable) interference" and "harmful interference" for the various space and terrestrial services;

2.15 the power flux-densities required for individual and community reception in the Broadcasting Satellite Service, with the object of specifying the numerical values which will differentiate between these types of reception;

2.16 the technical feasibility and sharing criteria of frequency sharing between the Aeronautical Radiocommunication Service and the Communication Satellite Service (satellite-to-earth) for frequencies in the vicinity of 4 300 M[Hz].

3. that until the next competent Administrative Conference all administrations should use:

- any C.C.I.R. Recommendation, if applicable, for the values missing from Tables I, Ia and II of Appendix 28;

- the methods of determining the co-ordination area for frequencies below 1 Ge/s and above 40 Ge/s, which may be the subject of a C.C.I.R. Recommendation.
EIGHTH REPORT OF WORKING GROUP 4E

TO COMMITTEE 4

Working Group 4E examined the Appendix 1A jointly with Sub-Working Group 6A-4 and agreed on the proposed text prepared by that Sub-Working Group with appropriate changes. The final draft of that Appendix will be submitted to Committee 6 for its approval.

Working Group 4E considers that it has discharged all the tasks assigned to this Working Group.

N. OHYAMA
Chairman
Working Group 4E
SIXTH REPORT FROM COMMITTEE 4

Additions to Article 7 appearing in the Annexes hereto have been approved by Committee 4.

The texts in question have been forwarded to the Drafting Committee.

E.F. SANDBACH
Chairman
Committee 4

Annexes:

1. Station keeping of space stations
2. Pointing accuracy of antennae on geostationary satellites
3. Control of interference between geostationary-satellite systems and non-synchronous inclined orbit-satellite systems
ANNEX I

PROPOSED ADDITION TO ARTICLE 7

(New Section)

ADD 470[...]

Space stations on geostationary satellites

ADD 470[a] shall have the capability of maintaining their positions within ± 1° of the longitude of their nominal positions, but they shall endeavour to achieve the capability of maintaining their positions within at least ± 0.5° of the longitude of their nominal positions,

ADD 470[b] shall maintain their positions within ± 1° of longitude of their nominal positions irrespective of the cause of variation, but

ADD 470[c] need not comply with [b] as long as the [space system] to which the space station belongs does not produce an unacceptable interference[*)] into any other [space system] whose space station complies with the limits given in [b].

Notes:

*) In the case of space stations on [geosynchronous] satellites in orbits having an angle of inclination greater than 5° the positional tolerance shall relate to the nodal point.

**) The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 2

PROPOSED ADDITION TO ARTICLE 7
(New Section)

ADD 470 Section 7

Pointing accuracy of antennae on geostationary satellites

The pointing direction of maximum radiation of any earthward beam of space station antennae on geostationary satellites shall be capable of being maintained within at least:

- 10% of the half power beamwidth relative to the nominal pointing direction,
- 0.5° relative to the nominal pointing direction,

whichever is greater when these beams are intended only for less than global coverage.

In the event that the beam is not rotationally symmetrical about the axis of maximum radiation the tolerance in any plane containing this axis shall be related to the half power beamwidth in that plane.

This accuracy shall be maintained only if it is required to avoid unacceptable interference(*) to other systems.

Note:

*) The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 3

PROPOSED ADDITION TO ARTICLE 7
(New Section)

ADD

Control of interference between geostationary satellite/systems/ and non-synchronous inclined orbit satellite/systems/

ADD 470VA

Non-geostationary space stations in the [fixed satellite service/] shall cease or suppress radio emissions, and their associated earth stations shall not transmit to them whenever there is insufficient angular separation between space stations and [unacceptable interference/*) to space/systems/] using geostationary satellite operating in accordance with the Radio Regulations.

Note:

*) The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.
A METHOD OF CALCULATION TO DETERMINE THE DEGREE OF INTERFERENCE BETWEEN GEOSTATIONARY SATELLITE SYSTEMS SHARING THE SAME FREQUENCY BANDS

1. Introduction

The method of calculating interference is based on the concept that the noise temperature of the system suffering interference increases as the level of the interference increases. It can, therefore, be applied irrespective of the modulation characteristics of these systems, and of the precise frequencies used.

In this method, the apparent increase in the equivalent link noise temperature of an earth station receiver resulting from interference caused by a given system is calculated and this value is compared with a predetermined increase in the noise temperature.

2. Calculation of the increase in noise temperature of the link suffering interference

As used in this section, the term link denotes the entire connection consisting of a transmitting earth station, a satellite and a receiving earth station.

Let A and A' be the links of the two systems considered. Primes indicate the parameters of link A'; the notation without primes is used for the parameters of link A.

*) Exact title will depend on the outcome of Committee 6 deliberations.

**) The equivalent link noise temperature is taken to mean the noise temperature at the input of the earth station receiver corresponding to the RF noise power which produces the total observed noise at the output of the link excluding interference coming from links using other satellites and terrestrial systems.
The parameters are defined as follows (for link A):

\( \Delta T_s \): increase in the receiving noise temperature of the satellite S caused by interference in the receiver of this satellite; (°K)

\( \Delta T_e \): increase in the receiving noise temperature of the earth station \( e_p \) caused by interference in the receiver of this station; (°K)

\( P_s \): maximum power density per Hz delivered to the antenna of satellite S (averaged over the worst 4 kHz band); (W/Hz)

\( g_3(\delta'_e) \): transmitting antenna gain of satellite S in the direction of the receiving earth station \( e'_R \) of link A; (numerical power ratio)

Note: the product \( p_s g_3(\delta'_e) \) is the maximum equivalent isotropic radiated power per Hz of satellite S in the direction of the receiving earth station \( e'_R \) of link A.

\( P_e \): maximum power density per Hz delivered to the antenna of the transmitting earth station \( e_p \) (averaged over the worst 4 kHz band); (W/Hz)

\( g_2(\delta'_e) \): receiving antenna gain of satellite S in the direction of the transmitting earth station \( e'_T \) of link A; (numerical power ratio)

\( g_1(\theta) \): transmitting antenna gain of the earth station \( e_T \) in the direction of satellite S; (numerical power ratio)

\( g_4(\theta) \): receiving antenna gain of the earth station \( e_R \) in the direction of satellite S; (numerical power ratio)

\( k \): Boltzmann's constant; (Joules/K)

\( l_d^* \): free-space transmission loss on the down-path; (numerical power ratio)

\( l_u^* \): free-space transmission loss on the up-path; (numerical power ratio)

*) See Note on page 3
\[ \gamma \] : transmission gain of the system from the satellite receiver input to the earth station receiver input; (numerical power ratio, usually less than 1)

\[ \Theta \text{e} \) : geocentric angular separation between two satellites [degrees].

The parameters \( \Delta T_s \) and \( \Delta T_c \) are given by the following equations:

\[
\Delta T_s = \frac{p_s' g_1' (\Theta) g_2 (\delta_c')}{k u} \tag{1}
\]

\[
\Delta T_c = \frac{p_s' g_3' (\delta_e) g_4 (\Theta)}{k d} \tag{2}
\]

The symbol \( \Delta T \) will be used to denote the apparent increase in the equivalent noise temperature for the entire link at the receiver input of the receiving station due to interference from system \( A \).

This increase is the result of interference entering at both the satellite and earth station receivers of system \( A \) and can accordingly be expressed as:

\[
\Delta T = \gamma \Delta T_s + \Delta T_c \tag{3}
\]

Hence,

\[
\Delta T = \frac{\gamma p_s' g_1 (\Theta) g_2 (\delta_e')}{k u} + \frac{p_s' g_3 (\delta_e) g_4 (\Theta)}{k d} \tag{4}
\]

Equation (4) combines both the up-path and the down-path interference. If there is a change of modulation in the satellite or if the translation frequencies of the wanted and interfering satellites are different then it may be necessary to treat up and down paths separately using equations (1) and (2).

Note: *) In the interest of simplification it was assumed that:

- basic transmission loss on the down-path is the same regardless of the satellite and earth station considered;
- basic transmission loss on the up-path is the same regardless of the earth station and satellite considered;
- the topocentric angular separation between the two satellites as seen from any earth station is identical to the geocentric angular separation between the two satellites.
In the foregoing equations, the gains $g_1^e$ and $g_4^e$ are those of the earth stations concerned.

Unless more precise actual data are available, an appropriate reference radiation pattern may be used to express the gain $g_1^e(\theta)$ and $g_4^e(\theta)$ in a direction forming an angle $\theta$ with the direction of maximum radiation.

In the event that precise numerical data are not available, the reference radiation pattern $22.5 \log_{10}(\theta)$ shall be used for earth station antennae for which the ratio of effective diameter to wavelength exceeds 100.

In the same way, the increase $\Delta T'$ in the equivalent noise temperature for the entire link at receiver input of the receiving earth station $e'$ under the effect of the interference caused by link $A$ is given by the following equations:

$$\Delta T'_e = \frac{p_e g_1(\theta) g_2'(\delta_e')}{kT_u}$$

$$\Delta T'_e = \frac{p_s g_3(\delta_e') g_4'(\theta)}{kT_d}$$

$$\Delta T' = \frac{p_e g_1(\theta) g_2'(\delta_e')}{kT_u} + \frac{p_s g_3(\delta_e') g_4'(\theta)}{kT_d}$$

For two multiple-access satellites, this calculation must be made for each of the links established via one satellite in relation to each of the links established via the other satellite.

3. Comparison between calculated and predetermined percentage increase in equivalent link noise temperature

The calculated values of $\Delta T$ and $\Delta T'$ shall be compared with the corresponding predetermined values. These predetermined values are taken as 2% of the appropriate equivalent link noise temperatures.

- If the calculated value of $\Delta T$ is less than the predetermined one, the interference level from link $A$ to link $A'$ is acceptably small irrespective of the modulation characteristics of the two links and of the precise frequencies used.
if the calculated value of $\Delta T$ is more than the predetermined one, a detailed calculation shall be carried out following the methods and techniques set out in the relevant current C.C.I.R. Reports and Recommendations.

The comparison of $\Delta T'$ with the predetermined value shall be carried out in a similar manner.

As an example, it can be seen that in the case of a satellite system operating in accordance with current C.C.I.R. Recommendations using FM telephony and having a total noise in a telephone channel of 10 000 pWop including 1 000 pWop interference noise from terrestrial radio-relay systems and 1 000 pWop interference noise from other satellite systems, a 2% increase in equivalent noise temperature would correspond to 160 pWop of interference noise.

The list of basic characteristics to be furnished for each network is given in Appendix IB. A detailed illustration of the interference calculation in the case of two geostationary satellite systems is given in the Annex to this Appendix.

Determination of the links to be considered in calculating the increase in equivalent link noise temperature from the data furnished for the advance publication of a satellite network

The greatest increase in equivalent link noise temperature caused to any link of another satellite network, existing or planned, by interference produced by the proposed satellite network must be determined.

The most unfavourably sited transmitted earth station of the interfering satellite network should be determined for each satellite receiving antenna of the network suffering interference by superimposing the earth-to-space service area of the interfering network on the space station transmitting antenna gain contours plotted on a map of the earth's surface. This station is the one for which the satellite receiving antenna gain of the network interfered with, in the direction of the site, is the greatest.

The most unfavourably sited receiving earth station of the network suffering interference should be determined in an analogous manner for each space-to-earth service area of that network. This station is the one for which the satellite transmitting antenna gain of the interfering network in the direction of the site is greatest.

* Note: For description of these terms see Appendix IB Doc. 27/71
When the satellite of the network suffering interference is equipped with simple frequency-translating transponders these determinations are made in pairs, one for the satellite receiving antenna associated with the repeater and one for the "space-to-earth" service area connected to the satellite transmitting antenna associated with the repeater.

The calculation procedure described above may be used to determine the greatest increase in equivalent noise temperature caused to any link in a proposed satellite network by interference produced by any other satellite network.

Note: *) For description of these terms see Appendix IB

Annex: 1
ANNEX

EXAMPLE OF AN INTERFERENCE CALCULATION BETWEEN TWO GEOSTATIONARY SATELLITE SYSTEMS SHARING THE SAME FREQUENCY BAND

A. GENERAL

In this example for simplicity two identical satellite systems are assumed with \( \theta = 6^\circ \) geocentric angular spacing between the satellites. For this angular separation the reference radiation pattern of the earth station antenna gives a gain of 12.5 dB in the direction of the other satellite.

The calculations have been performed in dB, which means that numerical multiplications thus become dB additions and numerical divisions become dB subtractions. In each step the contributing factors have been introduced in a sequence corresponding to the propagation direction. The first three steps define the system parameters for each system. Steps 4, 5 and 6 perform the actual interference calculations.

To determine the equivalent link noise temperature it is necessary to know the ratio between the total internal link noise and the thermal noise of the down-path. The noise budget for this example is assumed as follows:
Noise budget

<table>
<thead>
<tr>
<th>Internal noise</th>
<th>8000 pWOp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thermal noise down-path</td>
<td>5000 pWOp</td>
</tr>
<tr>
<td>Thermal noise up-path</td>
<td>1000 pWOp</td>
</tr>
<tr>
<td>Intermodulation noise</td>
<td>2000 pWOp</td>
</tr>
<tr>
<td>Interference noise from systems using other satellites</td>
<td>1000 pWOp</td>
</tr>
<tr>
<td>Interference noise from terrestrial systems</td>
<td>1000 pWOp</td>
</tr>
<tr>
<td>External noise</td>
<td>2000 pWOp</td>
</tr>
<tr>
<td>Total noise</td>
<td>10000 pWOp</td>
</tr>
</tbody>
</table>

It may be noted that since both satellites use global beams, essentially no antenna discrimination between wanted and unwanted signals is obtained at the satellite and that this constitutes a worst case.

B. SYSTEM PARAMETERS

Step 1) UP-path at 6.175 MHz

<table>
<thead>
<tr>

\]
### C. INTERFERENCE CALCULATION

#### Step 4) UP-path interference
- **Interfering earth station power density** (as in Step 1)
  \[ p'_e \]
- **Interfering earth station antenna gain towards interfered satellite** (6° off beam)
  \[ g'_1(\theta) \]
- **Free space loss for 38 500 km at 6 175 MHz** (see Step 1)
  \[ L_u \]
- **Satellite antenna gain in the direction from the interfering earth station**
  \[ g'_2(\delta'e) \]
- **Boltzmann's constant**
  \[ k = 1.38 \times 10^{-23} \text{ Joule/°K} \]
- **Increase in receiver noise temperature at the satellite**
  \[ p'_e + g'_1(\theta) - L_u + g'_2(\delta'e) - k \]
- **Absolute value of increase in satellite noise temperature**
  \[ \Delta T_s \]

#### Step 5) DOWN-path interference
- **Interfering satellite transmitter power density** (Step 1)
  \[ p'_s \]
- **Interfering satellite antenna gain towards interfered earth station**
  \[ g'_3(\delta_e) \]
- **Free space loss for 38 500 km at 3 950 MHz**
  \[ L_d \]
- **Earth station antenna gain in the direction from the interfering satellite** (6° off beam)
  \[ g'_4(\theta) \]
- **Boltzmann's constant**
  \[ k = 1.38 \times 10^{-23} \text{ Joule/°K} \]
- **Increase in receiver noise temperature at the earth station**
  \[ p'_s + g'_3(\delta_e) - L_d + g'_4(\theta) - k \]
- **Absolute value of increase in earth station noise temperature**
  \[ \Delta T_e \]
Step 6) Total link interference

<table>
<thead>
<tr>

<td>$\gamma$</td>
<td>0.01</td>
<td>numerical</td>
</tr>
<tr>
<td>$\Delta T_e$</td>
<td>2.24</td>
<td>°K</td>
</tr>
<tr>
<td>$\Delta T = \gamma \Delta T_s + \Delta T_e$</td>
<td>3.15</td>
<td>°K</td>
</tr>
<tr>
<td>$\Delta T/T \times 100%$</td>
<td>3.29</td>
<td>%</td>
</tr>
</tbody>
</table>

Increase in link noise due to interference $3.29/100 \times 8 \ 000 \ \mu Wp$ | 263 | \mu Wp |

D. CONCLUSIONS

In the example shown the increase in equivalent link noise temperature is 3.29%. Since it exceeds the predetermined value of 2%, the amount of noise introduced can no longer be considered negligible and therefore co-ordination between the two systems is required. More precise calculations should now be made using for example the actual antenna patterns of the earth stations, the topocentric angular separation of the satellites, and the precise basic transmission losses. There may be additional factors such as polarization isolation, frequency interleaving, spectral distribution of the interfering noise which all reduce the actual interference experienced.

It can be shown that for this example a larger satellite spacing of 7.5° would have caused only 2% increase in equivalent link noise temperature and thus obviated the need for any co-ordination.
SUMMARY RECORD
OF THE
SIXTH MEETING OF COMMITTEE 5
(ALLOCATIONS)
Thursday, 8 July 1971, at 1500 hrs
Chairman : Mr. H.A. KIEFFER (Switzerland)

Subjects discussed

1. Adoption of the following Reports :
   
   Fifth Report of Working Group 5D
   Sixth Report of Working Group 5D
   Second Report of Working Group 5D, point 1
   Fourth Report of Working Group 5C,
   paragraph 1.2
   First Report of Working Group 5A

   318 & Corr.
   236 (Rev.)
   238 (Rev.)
   225
Fifth Report of Working Group 5D (Document No. 317 & Corr.)

1. 117.975-136 Mc/s band
   Approved.

2. 890-960 Mc/s band
   Following statements by the Delegates of the United Kingdom and Canada concerning the reasons for the proposed amendment and the competence of the Conference in the matter, point 2 and the relevant part of Appendix A on the band limits were approved, subject to the adoption of foot-note 340 to be submitted by Working Group 5B.

3. 1525-1535 Mc/s band
   The band limits were approved; the Committee agreed to deal with foot-note 350A (Appendix A) when it was submitted by Working Group 5B.

4. 1535-1660 Mc/s band
   Paragraphs 4.1 and 4.2 and the relevant part of Appendix B gave rise to a long discussion during which the Delegate of Austria explained why his country would be obliged to request the insertion of a foot-note indicating that Austria operated the fixed and mobile services in that band. The Delegate of the U.S.S.R., supported by the Delegates of the Ukrainian S.S.R. and Czechoslovakia, urged that there should be no change in the situation in that band, the proposal was rejected by 34 votes to 12, with 22 abstentions. In view of that decision, the Delegate of the U.S.S.R. reserved the right to reopen the question in plenary.

   The Committee approved paragraph 4.1 and took note of paragraph 4.2 and adopted the relevant part of Appendix B (page 11) without amendment. It maintained foot-note 352D as it stands in the Radio Regulations.

   Paragraph 4.3 and Appendix B as a whole were approved.

4.4 I.C.A.O. and I.A.T.A. statements

   I.C.A.O. - Annex 1. It was decided to include the I.C.A.O. statement in the summary record of the meeting.
I.A.T.A. - Annex 2. The I.A.T.A. statement gave rise to a discussion in which a large number of delegations took part.

Referring to paragraph 5 of the I.A.T.A. statement, the Delegate of Italy, supported by the Delegates of Chile, India and Israel, said that his Delegation did not recognize the right of I.A.T.A. to judge the conduct of the Conference and the latter's competence to deal with the problems before it.

It was unanimously decided not to include the I.A.T.A. statement in the summary record.

Paragraph 4.5 was approved.

5. 2 400-2 550 Mc/s band
Approved.

6. 4 200-4 400 Mc/s band

The text of the paragraph was approved on the understanding that the name of Brazil would be inserted in foot-note 383, referring to that band.

7. 5 000-5 250 Mc/s band (Corr. to Document No. 317)

The text of point 7, as amended in the Corrigendum, and Appendix C were approved.

8. 7 250-7 300 Mc/s and 7 975-8 025 Mc/s bands

Point 8 and the provisions relating to it gave rise to a long discussion during which the Delegates of Cameroon, India, Pakistan and Senegal requested that the names of their countries should be added to those appearing in foot-note 392G.

The Delegate of Italy, supported by the Delegates of the United Kingdom, New Zealand and the United States, opposed any change in Appendix D.

Appendix D was approved on the understanding that foot-note 392G should be maintained as it stood in the Radio Regulations. Administrations which saw fit might raise the question in plenary.

Document No. 317 and its Corrigendum were approved as a whole.
The Chairman of Working Group 5D said that the reference to the United States Delegation in the Spanish version of paragraph 2.3 in the Corrigendum should be deleted. There had been wide agreement within the Group on the use of space techniques in the 235-400 Mc/s bands. No agreement, however, could be reached on the possibility of allocating any part of the bands between 432 and 615 Mc/s exclusively, or even on a secondary basis, to the maritime mobile-satellite service. It was unanimously decided to continue studying the problem.

1. Bands 235-328.6 Mc/s and 335.4-399.9 Mc/s

   Paragraph 1.2

   At the suggestion of the Delegate of Poland, it was decided that the text should be amended to read: "The Delegation of Poland stated that it could accept the bands 240-300 Mc/s and 344-399.9 Mc/s as a compromise, though its original proposal referred to the bands 230-300 Mc/s and 344-390 Mc/s".

   Paragraph 1.4

   The Chairman pointed out that the number of the footnote referred to in the third line of the paragraph was "310A" and not "810A" as in the English version.

Appendix A

   The Chairman said that, as Working Group 5D had agreed to submit footnote 310A at the request of the Delegate of India, the square brackets should be removed.

   The question gave rise to an exchange of views in which the Delegates of Poland, Venezuela, Pakistan, Syria and Sweden took part.

   The Chairman of Working Group 5D said that, after a long discussion and in view of the new amendments to footnote 310 adopted by Working Group 5B, a majority of the members of Working Group 5D had preferred to apply the provisions of footnote 308A up to the limit of 328.6 Mc/s.

   Appendix A was adopted.
2. Bands 432-615 Mc/s

Paragraph 2.2

In reply to a question from the Delegate of Sweden, the Delegate of the United Kingdom said that, during the vote in Working Group 5D on the joint proposal submitted by Sweden and the United Kingdom (Document No. 293), there had been 15 votes in favour and 15 against. The two Delegations were now preparing a new Proposal in the light of the discussions which had taken place in Working Group 5D and he suggested that Committee 5 should postpone consideration of paragraph 2.2 and Appendix B until it had seen the new solution proposed.

It was so decided. Consideration of Document No. 318 was therefore postponed to a later meeting.

Document No. DT/99, Annex

The Chairman said that the document had been prepared on the basis of the results obtained by several working groups and was designed to facilitate the Committee's work. With reference to the bottom of page 2, the band 23.6-24 Gc/s would be allocated to radiolocation and there would be the footnote MOD 407; in addition, the band 24.25-25.25 Gc/s, which was allocated to radionavigation and in which no change had been made, should be added at the bottom of page 3.

Second Report of Working Group 5C, paragraph 1 (Document No. 236(Rev.))

The Secretary pointed out that the first figure in Appendix A should be "24,0" and not "24,1" as in the French and Spanish versions.

Paragraph 1, as amended, and Appendix A were adopted.

Fourth Report of Working Group 5C, point 1.2 (Document No. 238(Rev.))

At the proposal of the United Kingdom Delegate, supported by the Delegate of the United States, it was decided to delete the square brackets around the words "fixed" and "mobile" in Appendix B.

Point 1.2 and Appendix B, as amended, were adopted.
Replying to the Delegate of Cuba, the Chairman explained that the questions in the various documents which were still outstanding or had been the subject of reservations would be included in the agenda of the Committee's next meeting and would therefore be re-examined in good time.

First Report of Working Group 5A (Document No. 225)

The Chairman of Working Group 5A said that the Group had held 12 meetings and agreement had been reached by a large majority, particularly on point 3; he therefore proposed that the Committee should adopt the allocations in the Annex to Document No. 225.

1. Frequency band : 4200-4400 Mc/s

   The Delegate of India requested that Proposal IND/37/9 submitted by his Administration but not adopted by the Working Group should be transmitted to the C.C.I.R. for study.

   The Delegate of France said that the subject had also been raised in Committee 4, which considered that the question was a very delicate one since it touched on the safety of life. It had therefore included it in the "omnibus" Recommendation so that it should be brought to the notice of the C.C.I.R.

   The Delegate of India said he was satisfied with that reply.

2. Frequency band : 6425-7250 Mc/s

   In view of the fact that a new proposal on that band would be submitted later by the Delegation of the United States, it was decided to postpone consideration of point 2.

3. Frequency band : 17.7-31 Gc/s

   The Delegate of Japan requested the insertion of a foot-note reading: "In Japan, the bands 19.7-21.2 and 29.5-31 Gc/s are also allocated to the Fixed and Mobile Services."

   In reply to a question by the Chairman, he said that he could not agree to those bands being allocated to the Fixed and Mobile Services on a secondary basis.

   The Delegates of the United Kingdom, the United States, the Federal Republic of Germany and Greece insisted on the need to allocate part of the spectrum exclusively to the Communication-Satellite Service.
The Delegate of Japan, explaining his request, said that in 1972 his country intended to set up a high-capacity experimental radio-relay system which would need a higher bandwidth and would use frequencies in the neighbourhood of 20 Gc/s. The network would be used for the improvement of techniques such as videophony, high-speed data transmission, etc. It was planned to put it into commercial operation in 1974. Moreover, frequency sharing between communication-satellite and radio-relay systems in the bands above 15.4 Gc/s seemed possible and the power flux-density fixed by the Special Joint Meeting for the 15.4-23 Gc/s range was apparently enough to ensure that the limits adopted would not have to be exceeded. Japan had adhered to the directives given in the Radio Regulations and it would be unfair to penalize it.

The Delegates of India, Malaysia, Kenya (speaking also on behalf of Tanzania and Uganda), Pakistan, Syria, the Philippines and Indonesia stressed the importance of technical development and the need to avoid adopting any provisions which might hamper it in any way.

The Delegates of the United Kingdom and the United States said that they had no desire to obstruct the progress now being made in Japan.

The Delegate of the United States suggested that the following sentence might be added to the note proposed by the Japanese Delegate: "This additional use shall not involve limitations of power flux-density in space stations in the Fixed-Satellite Service."

The Delegate of Japan asked for time to consider the proposal. It was decided to postpone a decision on the point till the Committee's next meeting.

The meeting rose at 1845 hours.

H.A. KIEFFER
Chairman

Annex : 1
ANNEX

I.C.A.O. STATEMENT

1. I.C.A.O. is the United Nations Specialized Agency universally recognized as empowered to establish and present international civil aviation requirements in respect of applications of space technology. Over the past two years your own Governments, under the aegis of I.C.A.O., have made a careful and co-ordinated assessment of the future needs of civil aviation for space services. Aided by its ASTRA Panel, I.C.A.O. finally developed a well-founded and conservative statement of the bandwidths needed between 1 535 and 1 660 MHz to assure, in the future, the safety, regularity and efficiency of air transport, which are its primary aims under the terms of its Convention. Whilst manifestly civil aviation does not carry the bulk of world freight, it does carry the great majority of human beings who travel across the broad deserts and oceans of the world, and the safety of human life is its constant concern.

2. This Conference has, I believe, made a real effort to satisfy these aeronautical requirements in the face of conflicting and competing demands from another service. In my personal opinion these competing requirements are not of a nature which justifies the comparatively large allocations which have been made to them at the expense of aviation. However, the decision reached shows that, collectively, you do not yet share this opinion.

3. The effect of these decisions on the future operational and technical development of international civil aviation will have to be carefully studied in the coming months. It is quite likely that, at a future I.T.U. Conference, civil aviation may be forced to seek an upward revision of the allocations made here, and I trust that, at that time you will be able to accord a more appropriate priority to the requirements of what is, after all, essentially a safety service.
THIRD REPORT OF COMMITTEE 5 (ALLOCATIONS)

ARTICLE 5 - TABLE OF FREQUENCY ALLOCATIONS

Frequency bands above 40 Go/s

Committee 5 adopted the allocations reproduced in the Annex to the present Report which are submitted to the Plenary for first reading.

ADD 412J Radio Astronomy observations on the carbon monoxide line at 115.271 Gc/s are carried out in a number of countries under national arrangements. In making assignments to other services in the Table, administrations should bear in mind the need to protect Radio Astronomy observations from harmful interference in the band 115.16-115.38 Gc/s.

SIXTH AND LAST REPORT OF WORKING GROUP 5B
TO COMMITTEE 5 (ALLOCATIONS)

TELEMETERING, TELECOMMAND AND TRACKING

**Frequency bands**: 136-137 Mc/s

- **137-138 Mc/s**
- **143-144 Mc/s**
- **148-149.9 Mc/s**
- **154.2 Mc/s ± 15 kc/s**
- **434 Mc/s ± 0.25 Mc/s**
- **449.75-450.25 Mc/s**
- **1,525-1,535 Mc/s**
- **1,535-1,540 Mc/s**

**RADIO ASTRONOMY SERVICE**

**Frequency band**: 2,690-2,700 Mc/s

Telemetering, telecommand and tracking

1. **Frequency band**: 136-137 Mc/s

1.1 The Group recalled its discussion of this band when dealing with the Space Research Service and its agreement in principle to the replacement of "(Telemetering and tracking)" by "(Space-to-Earth)", subject to the modification to the definition of the Space Operation Service, Document No. 218, page 6.

1.2 The Group agreed that the detail of the revision of this band would be dealt with when reaching agreement on the revised allocations for the various services and that insofar as telemetering and tracking were concerned, the Group had no objection to their deletion nominally subject to their inclusion in the definition of the Service.
2. **Frequency band**: 137-138 Mc/s

   The Group agreed to the replacement "(Telemetering and tracking)" in relation to the Space Research Service by "(Space-to-Earth)" subject to the same conditions as for the band 136-137 Mc/s (para. 1 above).

3. **Frequency band**: 143-144 Mc/s

   3.1 Proposals D/5/56 and 57, insofar as they sought an additional allocation on a secondary basis to the Space Service for Telecommand both in the planned part of the Table and a foot-note ADD 283A with respect to the effective date of change from telemetering and tracking to telecommand were not supported and consequently not considered further.

   3.2 The Delegation of the F.R. of Germany reserved the right to revert to this subject later should it still so desire.

4. **Frequency band**: 148-149.9 Mc/s

   4.1 Discussion polarized on Proposal CAN/14/55 MOD 285A which sought to provide for the use of the band 148-149.9 Mc/s for space telecommand, subject to agreement. The bandwidth of an individual transmission became the main division of opinion. Some delegations were in favour of ± 20 kc/s, the majority ± 15 kc/s.

   4.2 The Group agreed by a majority to recommend the adoption by Committee 5 of the revised provisions appearing in the Annex to the present Report.

   4.3 The Delegation of India could agree only if this use was put on a secondary basis.

   4.4 The Delegations of the F.R. of Germany, Finland, India and Israel reserved the right to revert to this subject later should they still so desire.

5. **Frequency band**: 154.2 Mc/s ± 15 kc/s

   5.1 By a large majority, the Group agreed to recommend the deletion of the band 154.2 Mc/s ± 15 kc/s from No. 285A of the Radio Regulations (see paragraph 4.2 above).

   5.2 The Delegation of Japan reserved the right to revert to this subject later should it still so desire.
6. **Frequency band**: 434 ± 0.25 Mc/s

Proposal F/41/82 (ADD 316B), seeking to make provision at the above frequency for space telecommand subject to agreement, was not supported and fell. The Delegation of France reserved the right to revert to this question in Committee 5 if it still so desired.

7. **Frequency band**: 1 525-1 535 Mc/s

7.1 Proposals CAN/14/50 in part, F/41/86 and 87 replaced by F/197/322, 0/54/71, HOL/49/52 and 53 and USA/28/54 were virtually each conflicting with the others as to the final revision of this band, as may be conveniently seen from pages 14 and 15 of Document No. DI/17 together with Document No. 197. The Group was informed that Proposal F/197/322 had been considered by Working Group 5C with respect to the Earth Exploration-Satellite Service (ex-Earth Resources Survey by Satellite) and referred to Committee 5 for disposal.

7.2 The Group agreed to refer the proposed MOD 550A (F/197/322) with respect to the Earth Exploration Service, to Committee 5 for disposal. However, the amendment of No. 350A to apply to 1 525-1 535 Mc/s was unanimously agreed as shown in the Annex to the present Report.

7.3 The Delegation of the F.R. of Germany could agree only to status quo. The Delegation of Canada, with respect to CAN/14/50 by which the band would be allocated exclusively to the Fixed-Satellite Service on a world-wide basis, reserved the right to revert to this question later if it still so desired.

8. **Frequency band**: 1 535-1 540 Mc/s

Several proposals were common in foreseeing the deletion of "SPACE (Telemetering)" from this band, which the Group agreed unanimously. The Group invited the attention of Working Group 5D to this agreement.

9. **Frequency band**: 1 535-1 600 Mc/s

The Group unanimously agreed to the deletion of No. 351 Spa of the Radio Regulations.

10. **Frequency band**: 2 550-2 690 Mc/s

10.1 Discussion formed around modification to foot-notes 374A and 392A and it was unanimously agreed to send a Note to Working Groups 5A and 5E advising that "it had no objection to the inclusion of foot-notes along the
lines of No. 392A for the upward direction and of No. 374A for the downward
direction for the bands allocated by the present Conference for the
Communication-Satellite Service and the Broadcasting-Satellite Service.

"374A
Spa  This band may also be used for the transmission
of tracking and telemetering signals associated with
communication-satellite space stations operating in the
same band.

"392A
Spa  This band may also be used for the transmission
of telecommand signals associated with communication-
satellite earth stations operating in the same band."

The above text was communicated by Document No. 226.

10.2 It was noted that the new service definitions may cover the
requirements for telemetering, telecommand and tracking and consequently
the direction would be indicated against the allocation by using the terms
"(Space-to-Earth)" and "(Earth-to-Space)".

11. **Frequency band:** 7,450-7,550 Mc/s

Proposal F/41/117 (MOD 392F) was examined and the Group
unanimously agreed with the last sentence as shown in the Annex to the
present Report.

12. The Group decided to expedite its work on the basis of
Document No. 226 (see paragraph 10 above) and proceeded with the disposal
of Proposals concerning the following bands as shown.

12.1 **Frequency band:** 11.7-12.2 Gc/s

The Group unanimously agreed ADD 405BB (Proposal CAN/14/89) as shown
in the Annex to the present Report.

12.2 **Frequency band:** 14.575-15.075 Gc/s

The Group unanimously agreed ADD 409G (Proposal AUS/10/43) as shown
in the Annex to the present Report.

12.3 **Frequency band:** 14.575-15.075 Gc/s

The Group unanimously agreed ADD 407A (Proposal CAN/14/91) as shown
in the Annex to the present Report.
12.4 **Frequency bands**: 17.7–21.2 GHz and 27.5–31 GHz

The Group **unanimously agreed** that the contents of Document No. 226 applied (paragraph 10 above).

12.5 **Frequency band**: 29–31 GHz

Proposal F/41/135 ADD 408A was examined. The Group was informed that Working Group 5A (Fixed-Satellite Service) had agreed to including directions in the Table. In the light of this information, the Proposal was withdrawn.

13. **Service definitions**

The Group took note of Document No. 218 page 6 ADD 84ACA Space Operation Service.

14. The Group took note of the need to arrange for applying the same solution with respect to telemetering, telecommand and tracking for the Broadcasting-Satellite Service as for the Fixed-Satellite Service.

15. **Radio Astronomy Service in the frequency band** 2690–2700 MHz

The Delegation of the United Kingdom introduced Document No. 291 which had been distributed that morning and which motivated the proposal of a new foot-note to read:

```
ADD J***/
```

"To protect the Radio Astronomy Service, transmissions in the Broadcasting-Satellite Service in this band shall not result in spurious emissions in the band 2690–2700 MHz with a power flux-density at the earth's surface exceeding \(-277\) dBW/m²/Hz."

The Delegation of Australia supported the proposal and the Group **unanimously agreed** to pass the document for examination in Committee 5. In this manner delegations would have time to consider the proposal.

B. DESTA
Chairman

---

**Appendix**: 1

\(\sum SE \text{ and } 0.7\)
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
MOD 285A

The band 148.149.9 Mc/s may be authorized for space telecommand, subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected. The bandwidth of an individual transmission shall not exceed 15 kc/s.

MOD 350A

Space stations employing frequencies in the band 1 525-1 535 Mc/s for telemetering purposes may also transmit tracking signals in this band, and transmit and receive signals for the Earth Exploration-Satellite Service.

Note to Committee 5:

Paragraph 7 of the present Report refers. /

MOD 392F

The Meteorological-Satellite Service may use the band 7 450-7 590 Mc/s for space-to-earth transmissions on a primary basis. This band may also be used for the transmission of tracking and telemetering signals associated with meteorological-satellite space stations operating in this band.

ADD 405BB

These bands may also be used for the transmission of tracking and telemetering signals associated with broadcasting-satellite space stations and fixed-satellite space stations operating in the same band.

ADD 409G

The fixed-satellite band 14.575-15.075 Mc/s is also used to provide the earth-to-space link to any broadcasting-satellite space station and also to provide for the transmission of telecommand signals associated with the functions of space stations in the Fixed-Satellite or Broadcasting-Satellite Service.
ADD 407A  The band 14.575-15.075 GHz may also be used to provide for the transmission of telecommand signals associated with earth stations operating in this band.

Note from Working Group 5B to Committee 5:

MOD 392F, ADD 405BB and ADD 409G appear to need editing concerning space stations.

Note to Committee 5 and Committee 7: ADD 405BB is adopted provisionally pending decisions in Committee 5 on the allocations to the services concerned.
SUMMARY RECORD
OF THE
SEVENTH MEETING OF COMMITTEE 5
(ALLOCATIONS)

Thursday, 8 July 1971, at 2030 hrs.

Chairman: Mr. H.A. KIEFFER (Switzerland)

Subjects discussed

1. Adoption of the following reports:
   a) First Report W.G. 5A (continued)  225
   b) Second Report W.G. 5A  254
   c) Joint Report W.G. 5A/5E  273 (Rev.)
   d) Third Report W.G. 5E  281
1. Adoption of Reports

a) First Report of Working Group 5A (contd.) (Document No. 225)

The Delegate of Japan said that his Delegation was prepared to accept the compromise proposal put forward by the United States Delegation at the previous meeting of Committee 5. The proposal was adopted.

The Chairman pointed out that since the 24.0-24.05 GHz band had been allocated exclusively to the amateur and amateur satellite services the figures "23.6-24.25 GHz" in MOD 407 Spa, fourth line, should be replaced by "23.6-24.0 GHz, 24.05-24.25 GHz". It was so agreed.

The Chairman further pointed out that SUP 410 concerned the transfer of frequencies for industrial, scientific and medical purposes from 22.125 GHz to 24.125 GHz. The Delegate of the U.S.S.R., supported by the Delegate of India, objected to the proposed change on the grounds that such a decision was outside the terms of reference of the Conference. The Delegate of the United States of America, supported by the Delegates of the Federal Republic of Germany, Sweden and France, said that the importance of the 22.125 GHz frequency to radio astronomy was such that the Conference was justified in making the transfer. Industrial, scientific and medical activities, which did not belong to any particular service, had made little use of 22.125 GHz and would be equally well placed at 24.125 GHz in the next highest radiolocation band. It was agreed to maintain SUP 410.

The Delegate of Sweden confirmed that his Delegation wished to maintain MOD 408.

The Secretary drew the Committee's attention to the fact that, as a result of its decisions to include provisions for tracking, telemetering and telecommand in the definitions of the services concerned, foot-notes 374 A and 392 A were obsolete and should be deleted from the present document (and all other documents where they occurred) together with the foot-note in square brackets to Committee 7.

The document, as amended and with the exception of section 2, page 1, which was held for further discussion at a later meeting, was adopted.
b) Second Report of Working Group 5A (Document No. 254)

Page 1, paragraph 1

In view of the fact that proposal J/98/8l had not received majority support in Working Group 5A, the Delegation of Japan put forward a modified proposal to allocate the following bands to the fixed satellite service: 40-41 Gc/s (earth-to-space), and 50-51 Gc/s (space-to-earth). The proposal was adopted.

Annex 1, pages 3 and 4

After a lengthy discussion in which the Delegate of Iraq, supported by the Delegates of Ethiopia and Syria, objected to the allocation of such a wide range of frequencies to the Space Service, which could not make full use of them in the immediate future, and in which the Delegates of the United States of America, Brazil, the United Kingdom and New Zealand upheld the allocation since, outside the atmosphere, the bands concerned could be used only by the Inter-Satellite Service due to atmospheric absorption and the consequent shielding of terrestrial communications, it was decided by 45 votes to 9 with 12 abstentions to adopt Annex 1.

Annex 2, page 5

The following amendments were agreed. Delete the words "the SPACE (Space-to-space)" on the third line, the square brackets in the fourth line and sub-paragraph a), third line, and the words "to the SPACE (Space-to-space) Service" in sub-paragraph a), second line. Replace the words "largely screens ... Terrestrial Services;" in the first and second lines under "recognising" by "may act as a screen between the Inter-Satellite and Terrestrial Services" and the words "the Fixed and ... Services" in the third and fourth lines under "recognising" and the second and third lines under "recommends" by "terrestrial radiocommunications (except the Aeronautical Service)."

The document, as amended, was adopted.

c) Joint Report of Working Groups 5A and 5E (Document No. 273(Rev.))

It was agreed to postpone examination of Section 7 and Annex 2 to the final meeting of Committee 5. The remainder of the document was then considered.
With regard to foot-notes /A_/ and /D__/, the Chairman of Joint Working Party 5A/5E explained that although the texts were quite different the intention behind them was the same. It had not been possible to reach agreement on a single text in the Joint Working Group, hence the note at the bottom of the page referring the matter to Committee 5. Foot-note /E_/ was completely different in nature and should remain as a separate foot-note.

After prolonged discussion the Committee was unable to agree on what action to take on foot-notes /A/ and /D/ and it was agreed, by 54 votes to 9 with 4 abstentions, to postpone discussion of all three foot-notes to the appropriate Plenary meeting.

A proposal by the Delegate of the U.S.S.R., supported by the Delegate of Spain, to include the Fixed and Mobile Services in the 12.5-12.75 Gc/s band for Region 1 and eliminate foot-notes /B/ and /C/ was rejected by 24 votes to 20 with 2 abstentions.

It was agreed to add the words "(Earth-to-space)" as a third line in the 12.5-12.75 Gc/s band for Region 1, and the words "(except aeronautical mobile)" as a fifth line in the 12.5-12.75 Gc/s band for Region 3.

As their proposal to use the 12.75-13.25 Gc/s band for the Fixed Satellite Service (Earth-to-space) received no support, the Delegation of Japan reserved its right to revert to the matter in the Plenary.

It was agreed to insert the words "(except aeronautical mobile)" after "mobile" on the last lines of foot-notes /B/ and /C/. The following Delegations wished their countries to be included in foot-note /B/: Austria, Cameroon, Congo, Ghana, Israel, Jordan, Libya, Spain and Sweden.

The following delegations wished their countries to be included in foot-note /C/: Algeria, Belgium, Greece, Luxembourg, Monaco and Nigeria.

The document, as amended and with the exception of Section 7, page 2, and Annex 2, page 7, was adopted.
In introducing the document, the Chairman of Working Group 5E drew attention to two corrections to the text: "J/30/81" on page 2, paragraph 2.1, first line, should read "J/30/18", and "J/30/81" in paragraph 3.1, first line, "J/98/81".

The Delegation of the United Kingdom withdrew its reservation on page 2, paragraph 1.4, explaining that it was doing so not on technical grounds but in deference to the majority opinion.

Since proposal J/30/18 had not been supported in the Working Group (page 2, Section 2), the Delegation of Japan proposed instead to add the Broadcasting and Broadcasting Satellite Services to the framed part of the table for 22.5-23 GHz for Region 3, together with a new additional foot-note as follows: "The Broadcasting Satellite Service is also authorized in the band 22.5-23 GHz, subject to power flux-density limits for the protection of the Terrestrial Services in this band.". The proposal was adopted.

Since a Recommendation had been drafted covering the intent of the foot-note mentioned in paragraph 3.1, page 2, it was agreed to delete the last sentence in that paragraph and the references to the foot-note in the Annex, page 5.

The document as amended was adopted.

The meeting rose at 0040 hours.

The Chairman:

H.A. KIEFFER
DRAFT RECOMMENDATIONS ON THE USE OF FREQUENCY BANDS ABOVE 40 Gc/s

- Draft Recommendation No. ... on the future use of certain bands between 40 and 275 Gc/s by the Radiocommunication Services.

- Draft Recommendation No. ... on the future use of the 41-43 Gc/s band by the Fixed and Mobile Services.

Annexes : 2
DRAFT RECOMMENDATION ON THE FUTURE USE
OF CERTAIN BANDS BETWEEN 40 AND 275 Gc/s
BY THE RADIOCOMMUNICATION SERVICES

considering

that the 43-48 Gc/s, 66-71 Gc/s, 95-101 Gc/s, 142-150 Gc/s, 190-200 Gc/s and 250-265 Gc/s bands have been allocated to the following services:

- Aeronautical Mobile-Satellite
- Maritime Mobile-Satellite
- Aeronautical Radionavigation-Satellite
- Maritime Radionavigation-Satellite;

recognizing

that it is not desirable for compatibility considerations that at a later date these bands should be shared with Terrestrial Radio-communication Services other than those of interest to the Aeronautical and Maritime Mobile Services and/or the aeronautical and Maritime Radionavigation Services;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 43-48 Gc/s, 66-71 Gc/s, 95-101 Gc/s, 142-150 Gc/s, 190-200 Gc/s and 250-265 Gc/s bands to the following services:

AERONAUTICAL RADIONAVIGATION
AERONAUTICAL MOBILE
MARITIME MOBILE
MARITIME RADIONAVIGATION
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 2

DRAFT RECOMMENDATION ON THE FUTURE USE OF THE 41-43 Gc/s BAND BY THE FIXED AND MOBILE SERVICES

considering

that the 41-43 Gc/s band has been allocated to the Broadcasting-Satellite Service;

recognizing

that it is possible, by appropriate co-ordination, for a frequency band to be shared by the Broadcasting-Satellite Service, on the one hand, and the Fixed and Mobile Services, on the other;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 41-43 Gc/s band to the Fixed and Mobile Services.
PROPOSITIONS CONCERNANT L'ATTRIBUTION DE PETITES BANDES DE FREDUENCES AU SERVICE D'AMATEUR PAR SATELLITE ENTRE 1 ET 10,5 GHz

A la première page, premier paragraphe, quatrième ligne, remplacer :

"contre l'attribution à ce service, à titre exclusif, de bandes au voisinage de 144 MHz et de 24 GHz"

par

"contre l'attribution à ce service de bandes comprises entre la bande exclusive à 144 MHz et celle proposée à 24 GHz"

A la première page, troisième alinéa, troisième ligne, remplacer :

"et qu'on choisisse exactement l'emplacement de ces fréquences"

par

"l'exact emplacement de ces portions ayant été choisi".

Does not concern the English text.

No concierne al texto español.
ITALY

PROPOSALS CONCERNING THE ALLOCATION OF SMALL BANDS TO THE AMATEUR-SATELLITE SERVICE BETWEEN 1 AND 10.5 GHz

At the Fourth Meeting of Committee 5, when proposals for the Amateur Satellite Service came up in the Working Group reports, a majority voted against any provision for this Service between the exclusive amateur bands at 144 MHz and that proposed at 24 GHz. When dealing with the possibility of amateur space operation in the shared bands in this part of the spectrum, it was decided to deal with all bands together and on this basis no provision for amateur space operations was made. Italy pointed out that the study of these bands on a separate, more detailed approach might well yield small bands that would not inconvenience those delegations opposed to general sharing. We consider that this has not been adequately studied at this Conference.

This matter is raised at this stage of the Conference in the belief that to be effective in their operations of experimentation and self-training the amateurs need at least some possibility of operating at representative parts of the spectrum, to give them wider scope.

Accordingly, Italy proposes that small portions of three bands be allocated for amateur space techniques and the exact locations of these small bands are chosen following discussions with some other delegations as ones that are eminently suitable for this purpose.

Proposal A

In the band 5 650-5 925 Mc/s, add a foot-note:

"The band 5 650-5 670 MHz is also allocated to the Amateur Satellite Service on a secondary basis."
Coming between the provisions for Communications Satellites in the 4 000 and 6 000 MHz parts of the spectrum, this would give amateurs the opportunity of developing simplified and small earth stations and contributing in design techniques.

Proposal B

In the band 1 215-1 300 Mc/s, add a foot-note:

"The band 1 215-1 230 Mc/s is also allocated to the Amateur Satellite Service on a secondary basis."

This is in a part of the spectrum in which attenuation of signals passing through the ionosphere is significantly less than at lower frequencies and is accordingly of special use and interest to amateur propagation studies.

Proposal C

In the band 10 000-10 500 Mc/s, add a foot-note:

"The band 10 350-10 400 Mc/s is also allocated to the Amateur Satellite Service on a secondary basis."

This is regarded as a useful intermediate band for developing millimeter wave techniques and giving experience between the lower frequencies and the proposed provisions at 24 Gc/s.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

Annex: Pages B5/01-03
[ARTICLE 7]

ADD  

Station Keeping of Space Stations

ADD 470 [...] § [...] Space stations on geostationary satellites:

ADD 470 [a] — shall have the capability of maintaining their positions within ± 1° of the longitude of their nominal positions, but efforts should be made to achieve a capability of maintaining their positions at least within ± 0.5° of the longitude of their nominal positions,

ADD 470 [b] — shall maintain their positions within ± 1° of longitude of their nominal positions irrespective of the cause of variation, but

ADD 470 [c] — need not comply with [b] as long as the space system to which the space station belongs does not produce an unacceptable interference into any other space system whose space station complies with the limits given in [b].

---

1 In the case of space stations on geosynchronous satellites in orbits having an angle of inclination greater than 5° the positional tolerance shall relate to the nodal point.

ADD 470 [c.1] 2 The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

B5—01
ADD 470 [...] § [...]. The pointing direction of maximum radiation of any earthward beam of antennae on geostationary satellites shall be capable of being maintained within:

- 10% of the half power beamwidth relative to the nominal pointing direction; or
- 0.5° relative to the nominal pointing direction,

whichever is greater, when these beams are intended only for less than global coverage.

In the event that the beam is not rotationally symmetrical about the axis of maximum radiation, the tolerance in any plane containing this axis shall be related to the half power beamwidth in that plane.

This accuracy shall be maintained only if it is required to avoid unacceptable interference ¹ to other systems.

ADD 470 [...] ¹ The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.
Control of Interference between Geostationary Satellite Systems and Non-Synchronous Inclined Orbit Satellite Systems

ADD § [ ... ]. Non-geostationary space stations in the fixed satellite services shall cease or reduce to a negligible level radio emissions, and their associated earth stations shall not transmit to them whenever there is insufficient angular separation between the non-geostationary satellite and geostationary satellites and unacceptable interference to geostationary satellite space systems operating in accordance with these Regulations.

ADD § [ ... ].1 The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.
NOTE FROM THE CHAIRMAN OF COMMITTEE 4

TO THE CHAIRMAN OF COMMITTEE 5

1. Your attention is drawn to the following documents of Committee 4, which were approved as amended at its eighth meeting on 9 July 1971 and agreed to be brought to the attention of Committee 5.

2. Document No. 278 relating to the criteria to be applied for sharing between Satellite Broadcasting Service and the Terrestrial Broadcasting Service in the band [614-790 MHz].

2.1 The document was approved with the following amendments:

2.1.1 In both Report and draft Recommendation to be added definition on δ:

"... where δ is the angle of arrival above the horizontal plane."

2.1.2 Under Item 1 of "recommends" the values of maximum power flux-density read:

-129 dBW/m²  δ < 20°

-129 + 0.4 (δ - 20°) dBW/m²  20° < δ < 60°

-113 dBW/m²  60° < δ < 90°

2.1.3 Item 3 of "recommends" reads:

"that the transmissions of unmodulated carrier shall be avoided;"

and following items be renumbered correspondingly.
3. Document No. 302 relating to the sharing feasibility of a Maritime-Satellite Service with other Services in the frequency range 450-614 Mc/s

3.1 This document was approved with the following amendment:

3.1.1 On page 2, last sentence of first paragraph reads:

"Examples of interference calculations are shown in the attached Annex and show that sharing in some cases would be very difficult."

E.F. SANDBACH
Chairman
Committee 4
NOTE FROM THE CHAIRMAN OF
COMMITTEE 4 TO THE CHAIRMAN OF COMMITTEE 6

During its 8th meeting on 9 July 1971, Committee 4 noted Report of Working Group 4E on examination of the technical content and amendment to Document No. DT/77 prepared by Sub-Group 6A-4 and also Document No. 325 (France).

Committee 4 thought that it may be desirable to draw the attention of Committee 6 to this amendment given in the Annex to Document No. 311 and Document No. 325 when taking deliberation on the Appendix 1B to Article 9A.

E.F. SANDRACH
Chairman
Committee 4
REPORT OF WORKING GROUP 6A ON ARTICLE 9

Working Group 6A has held a meeting, during which the proposals submitted to the Conference by Administrations with respect to Article 9 were examined, and modifications subsequent to the new draft Article 9A were incorporated.

The Working Group was able to reconcile the views expressed in the various proposals and to submit to Committee 6 one text for Article 9. Some parts of this text are put within square brackets, which refer to definitions which have to be adopted by other Committees.

This result could be obtained only thanks to the spirit of co-operation shown by all delegates.

P.E. WILLEMS
Chairman
Working Group 6A

Annex : 1
ANNEX

DRAFT

ARTICLE 9

Notification and recording in the Master International Frequency Register of Frequency Assignments to Terrestrial Radiocommunication Stations.

Notification of Frequency Assignments and Co-ordination Procedure to be Applied in Appropriate Cases

1) The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).

* For the notification and recording in the Master International Frequency Register of frequency assignments to stations in the space radiocommunication and the radio astronomy service, see Article 9A.
§ 1. (1) Any frequency assignment to a fixed, land, broadcasting, radionavigation land, radiolocation land or standard frequency station, or to a ground-based station in the meteorological aids service, shall be notified to the International Frequency Registration Board.

1 In the case where a frequency is used by numerous stations under the jurisdiction of the same administration, see Appendix 1 (Section E, II, Column 5a, paragraphs 2c and 2d).

2 With respect to assignments to broadcasting stations in the bands allocated exclusively to the broadcasting service between 5950 kc/s and 26100 kc/s, see Article 10.
a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration; or

b) if the frequency is to be used for international radiocommunication; or

c) if it is desired to obtain international recognition of the use of the frequency.

The attention of administrations is specifically drawn to the application of the provisions of Nos. 486 a) and 486 c) in those cases where they make a frequency assignment to a station in the fixed or mobile service, located within co-ordination area of an earth station (see No. 492A), in a band which these services share with equal rights with the space radiocommunication in the frequency spectrum above 1 Gc/s.
(2) Similar notice shall be given for any frequency to be used for the reception of mobile stations by a particular land station in each case where one or more of the conditions specified in No. 486 are applicable.

(3) Specific frequencies prescribed by these Regulations for common use by stations of a given service (for example, international distress frequencies 500 kc/s and 2182 kc/s, frequencies of ship radiotelegraph stations operating in their exclusive high frequency bands, etc.), shall not be notified to the Board.

§ 2. (1) For any notification under Nos. 486 or 487 an individual notice for each frequency assignment shall be drawn up as prescribed in Sections A or B of Appendix 1, which specify the basic characteristics to be furnished, according to the case.
It is recommended that the notifying administration should also supply the additional data called for in that Appendix, together with such further data as it may consider appropriate.

(2) When stations of the same service, such as the land mobile service, use a band of frequencies above 28 000 kc/s in a specific area or areas, an individual notice should be drawn up, as prescribed in Section C of Appendix 1, which specifies the basic characteristics to be furnished, for each frequency on which there are assignments within the band; however, the particulars should relate only to a typical station. This does not apply to broadcasting stations or to stations in the fixed or mobile service to which the provisions of Sub-Section IIB of this article apply.
§ 3. (1) Whenever practicable each notice should reach the Board before the date on which the assignment is brought into use. It must reach the Board not earlier than ninety days before the date on which it is to be brought into use, but in any case not later than thirty days after the date it is actually brought into use.

However, for a frequency assignment to a station in the [fixed or mobile] service mentioned in Sub-Section IIb of this article and in No. 639A0, the notice must reach the Board not earlier than three years and not later than ninety days before the date on which the assignment is to be brought into use.

(2) Any frequency assignment, the notice of which reaches the Board more than thirty days after the notified date of putting into use, or in the case of a notice concerning an assignment to a station in the [fixed or mobile] service mentioned in Sub-Section IIb of this article and which reached the Board less than ninety days before it is taken into use, shall, where it is to be recorded, bear a remark in the Master Register to indicate that it is not in conformity with No. 491.
§ 3A. (1) Before an administration notifies to the Board, or brings into use any frequency assignment to a station in the fixed or mobile service for transmitting in a band allocated with equal rights to the space radiocommunication (Space-to-Earth) and the fixed or mobile service in the frequency spectrum above 1 GHz, it shall initiate co-ordination of the proposed assignment with the administration responsible for the receiving earth station concerned if the assignment is for use within the co-ordination area of an existing receiving earth station or of one for which the co-ordination procedure referred to in No. 639AN has been initiated. For the purpose of effecting co-ordination, it shall send to any other such administration, by the fastest possible means, a copy of a diagram drawn to an appropriate scale indicating the location of the station in the fixed or mobile service and all other pertinent details of the proposed frequency assignment, and the approximate date on which it is planned to begin operations.

1) Calculated in accordance with the procedures described in appendix 28.
MOD 492B

(2) An administration with which co-ordination is sought under No. 492A shall immediately by telegram acknowledge receipt of the co-ordination data. If no acknowledgement is received within fifteen days of despatch the sender may despatch a telegram requesting acknowledgement of receipt of the co-ordination data, to which the receiving administration shall respond. Upon receipt of the co-ordination data an administration shall promptly examine the matter with regard to interference which would be caused to the services rendered by its earth stations operating in accordance with the Convention and these Regulations, or to be so operated within the next three years, with the proviso that in this latter case co-ordination specified in No. 639AN has been affected or that the co-ordination procedure has already been initiated; and shall, within an overall period of sixty days from despatch of the co-ordination data, either notify the administration requesting co-ordination of its agreement to the proposals or, if this is not possible,

ADD 492B.1

1) Criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
indicate the reasons therefor and make such suggestions as it may be able to offer with a view to a satisfactory solution to the problem.

(3) No co-ordination under No. 492A is required when an administration proposes:

a) to bring into use a station in the fixed or mobile service which is located, in relation to an earth station, outside co-ordination area; or

b) to change characteristics of an existing assignment in such a way as not to exceed the permissible level of interference to the earth stations of other administrations.
MOD 492D

(4) An administration seeking co-ordination may request the Board to endeavour to effect co-ordination, in those cases where:

a) an administration with which co-ordination is sought under No. 492A fails to acknowledge receipt under No. 492B within a period of thirty days of despatch of the co-ordination data;

b) an administration which has acknowledged receipt under No. 492B fails to give a decision within a period of ninety days of despatch of the co-ordination

c) there is a disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference, or

d) co-ordination between administrations is not possible for any other reason.
In so doing, it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

MOD 492E

(5) Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.

MOD 492F

(6) Where the Board receives a request under No. 492D a), it shall forthwith send a telegram to the administration concerned requesting immediate acknowledgement.

ADD 492FA

(7) Where the Board receives an acknowledgement following its action under No. 492F, or where the Board receives a request under No. 492D b), it shall forthwith send a telegram to the administration concerned requesting an early decision in the matter.
ADD 492FB

(8) Where the Board receives a request under No. 492D d), it shall endeavour to effect co-ordination in accordance with the provisions of No. 492A. Where the Board receives no acknowledgement to its request for co-ordination within the period specified in No. 492B, it shall act in accordance with the provisions of No. 492F.

ADD 492FC

(9) Where an administration fails to reply within thirty days of the Board's telegram requesting an acknowledgement sent under No. 492 F, or fails to give a decision in the matter within sixty days of the Board's telegram of request sent under No. 492FA, it shall be deemed that the administration with which co-ordination was sought has undertaken that no complaint will be made in respect of any harmful interference which may be caused by the stations in the [fixed or mobile service] to the services rendered by its earth station.
MOD 492G

(10) Where necessary, as part of the procedure under No. 492D, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

ADD 492GA

(11) In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after sixty days from the date of the request for the assistance of the Board, taking into consideration the provisions of No. 491, send its notice concerning the proposed assignment to the Board.
ADD 492GB § 3 B. Where the Board receives information from an administration in accordance with the provisions of No. 639AQ in reply to a request for co-ordination for an earth station, it shall consider as notifications under the present Section only that information relating to assignments to existing stations in the fixed or mobile service or to stations of these services to be brought into use within the time limits defined in No. 491. Such notifications shall be examined by the Board with respect to the provisions of Nos. 570AB and 570AD, as appropriate, and shall be treated accordingly.

(MOD) 493 § 3 C. (1) Whatever the means of communication, including telegraph, by which a notice is transmitted to the Board, it shall be considered complete if it contains at least those appropriate basic characteristics specified in Appendix 1.

NOC 494 (2) Complete notices shall be considered by the Board in the order of their receipt.
§ 4. When a service or regional agreement has been concluded, the Board shall be informed of the details of this agreement.

MOD Sub-section IIA Procedure to be followed in cases not covered by Sub-section IIB of this article

MOD Sub-section IIB Procedure to be followed in cases where stations in the fixed or mobile service are in the same frequency band as, and within the co-ordination area of, an established earth station or one for which co-ordination has been effected or initiated.

§ 23A. The Board shall examine each notice.
NOC 570AB

a) with respect to its conformity with the Convention, the Table of Frequency Allocations and other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and the probability of harmful interference);

NOC 570AC

b) with respect to its conformity with the provisions of No. 492A relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

NOC 570AD
c) where appropriate, with respect to the probability of harmful interference to the service rendered by an earth receiving station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639BM, and if the corresponding frequency assignment
to the space-transmitting station has not, in fact, caused harmful interference to any frequency assignment in conformity with No. 501 or 570AB, as appropriate, previously recorded in the Master Register.

NOC 570AE § 23 B. Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 570AB, 570AC and 570AD, further action shall be as follows:

NOC 570AF § 23 C.(1) Finding unfavourable with respect to No. 570AB.

MOD 570AG (2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be examined immediately with respect to Nos. 570AC and 570AD.
(3) If the finding is favourable with respect to No. 570AC or 570AD, as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

(4) If the finding is unfavourable with respect to No. 570AC or 570AD, as appropriate, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.
ADD 570AGC

(5) The period of one hundred and twenty days mentioned in Nos. 570AG3 and 570AX shall count from:

- the date when the assignment to the station in the fixed or mobile service which received an unfavourable finding is brought into use, if the assignment to the earth station is then in use;

- otherwise, from the date when the assignment to the earth station is brought into use.

But if the assignment to the earth station has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance may be made for the additional period mentioned in No. 570BF.
NOC 570AH  
(6) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

NOC 570AI  
(7) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 570AH.

MOD 570AJ  
(8) If the notifying administration resubmits the notice with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of Nos. 570AG and 570AGA or 570AGB, as appropriate.
(9) If the notifying administration resubmits the notice with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 570AB, the notice shall be treated under the provisions of Nos. 570AL to 570AX. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in Column 2d.

§ 23D. (1) Finding favourable with respect to No. 570AB.

(2) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has been successfully completed with all administrations whose earth stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
(3) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take the appropriate action necessary and shall inform the administrations concerned of the results obtained. If the Board's efforts are successful, the notice shall be treated in accordance with No. 570AM. If the Board's efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of No. 570AD.

(4) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.
NOC 570AP

(5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedure mentioned in No. 570AC has been successfully completed with all administrations whose earth stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

NOC 570AQ

(6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination, it shall be treated in accordance with the provisions of No. 570AN. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.
(7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, it shall be examined by the Board with respect to the provisions of No. 570AD. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

§ 23E.(1) Finding favourable with respect to Nos. 570AB and 570AD.

(2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

§ 23F.(1) Finding favourable with respect to No. 570AB but unfavourable with respect to No. 570AD.
(2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

(3) Should the notifying administration resubmit the notice with modifications which result, after re-examination, in a favourable finding by the Board with respect to No. 570AD, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be indicated in the Remarks Column.

(4) Should the notifying administration resubmit the notice, either unchanged, or with modifications which decrease the probability of harmful interference, but not sufficiently to permit the provisions of No. 570AW to be applied, and should that administration insist upon reconsideration of the notice, but should
the Board's finding remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column. The period of one hundred and twenty days shall count from the date indicated in No. 570AGC.

SUP 570AY

NOC 570AZ  § 23 G.(1) Changes in the Basic Characteristics of Assignments already recorded in the Master Register
(2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix 1 (except those entered in Columns 3 and 4a of the Master Register), shall be examined by the Board according to Nos. 570AB and 570AC and, where appropriate, No. 570AD, and the provisions of Nos. 570AP to 570AX inclusive applied. Where the change should be recorded, the assignment shall be amended according to the notice.

(3) However, in the case of a change in the basic characteristics of an assignment which is in conformity with No. 570AB, should the Board reach a favourable finding with respect to No. 570AC, and, where its provisions are applicable, with respect to No. 570AD, or find that the change does not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. In addition, the date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.
§ 23 H. In applying the provisions of the whole of this Sub-Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

§ 23 I.(1) Recording of Frequency Assignments notified before being brought into use.

(2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to Nos. 570AB and 570AC and, where appropriate, with respect to No. 570AD, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.
NOC 570BF

(3) If, within the period of thirty days after the projected date of bringing into service, the Board receives confirmation from the notifying administration of the date of putting into use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

MOD 570BG

(4) In the circumstances described in No. 570AX, and as long as an assignment which received an unfavourable finding cannot be resubmitted as a consequence of the provisions of No. 570AGC, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 570AX, the information relating to the absence of complaint of harmful interference.
If the Board does not receive this confirmation within the period referred to in No. 570BF or at the end of the period referred to in No. 570BG, as appropriate, the entry concerned shall be cancelled.

Section VIII - Miscellaneous provisions

If it is requested by any administration, particularly by an administration of a country in need of special assistance, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall render the following assistance:

a) preparation of the diagram showing co-ordination area referred to in No. 492A;

b) computation of the interference level, as referred to in No. 492B;

c) any other assistance of a technical nature for completion of the procedures in this article.

In making a request to the Board under 635A, the administration shall furnish the Board with the necessary information.
SECOND REPORT OF COMMITTEE 6

(REGULATIONS)

Article 9A

The revised text of Article 9A, appearing in the Annex to the present Report was adopted by Committee 6.

M.K. BASU
Chairman

Annex: 1
ANNEX

ARTICLE 9A

ADD Section I Procedure for the Advance Publication of information on planned Satellite Systems.

ADD 639AA §1. (1) An administration (or one acting on behalf of a group of named administrations) which intends to establish a satellite system shall, prior to the co-ordination procedure in accordance with No. 639AK where applicable, send to the Board not earlier than five years before the date of bringing into service each satellite network of the planned system, the information listed in Appendix 1B.

ADD 639AB (2) Any amendments to the information sent concerning a planned satellite system in accordance with No. 639AA shall, as soon as they become available, also be sent to the Board.

ADD 639AC (3) The Board shall publish the information sent under Nos. 639AA and 639AB in a special section of its weekly circular and shall also, when the weekly circular contains such information, so advise all administrations by circular telegram.

1) The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).
If, after studying the information published under No. 639AC, any administration is of the opinion that interference, which may be unacceptable, may be caused to its existing or planned space services, it shall within ninety days after the date of the weekly circular publishing the information listed in Appendix IB, send its comments to the administration concerned. A copy of these comments shall also be sent to the Board. If no such comments are received from an administration within the period mentioned above, it may be assumed that that administration has no basic objections to the planned satellite network(s) of that system on which details have been published.

An administration receiving comments sent in accordance with No. 639AD shall endeavour to resolve any difficulties that may arise.

In case of difficulties arising when any satellite network of a planned system is intended to use the geostationary orbit
a) The administration responsible for the planned system shall first explore all possible means of meeting its requirements, taking into account the characteristics of the significant geostationary satellite networks of other systems, and without considering the possibility of adjustments to systems of other administrations. If no such means can be found, the administration concerned is then free to apply to other administrations concerned to solve these difficulties;

b) An administration receiving a request under a) above shall, in consultation with the requesting administration, explore all possible means of meeting the requirements of the requesting administration, for example, by relocating one or more of its own geostationary space stations involved, or by changing the emissions, frequency usage (including changes in frequency bands) or other technical or operational characteristics;

c) If after following the procedure outlined in a) and b) above there are unresolved difficulties, the administrations concerned shall together make every possible effort to resolve these difficulties by means of mutually acceptable adjustments, for example,
to geostationary space station locations and to other characteristics of the systems involved in order to provide for the normal operation of both the planned and existing systems.

**ADD 639AG**

(7) In their attempts to resolve the difficulties mentioned above, administrations may seek the assistance of the Board.

**ADD 639AH**

(8) In complying with the provisions of Nos. 639AE to 639AG, an administration responsible for a planned satellite system shall, if necessary, defer its commencement of the co-ordination procedure, or where this is not applicable, the sending of its notices to the Board, until one hundred and fifty days after the date of the weekly circular containing the information on the relevant satellite network listed in Appendix 12B.7. However, in respect of those administrations with whom difficulties have been resolved or who have responded favourably, the co-ordination procedure, where applicable, may be commenced prior to the expiration of the one hundred and fifty days mentioned above.
ADD 639AI (9) An administration which has published in accordance with the provisions of Nos. 639AA to 639AC, details of satellite networks in its planned systems shall periodically inform the Board as to whether or not comments have been received and as to the progress made, with other administrations, in resolving any difficulties. The Board shall publish this information in a special section of its weekly circular and shall also, when the weekly circular contains such information, so inform all administrations by circular telegram.
ADD Section II Co-ordination Procedures to be Applied in Appropriate Cases

ADD 639AJ § 2. (1) Before an administration notifies to the Board or brings into use any frequency assignment to a space station on a geostationary satellite or to an earth station that is to communicate with a space station on a geostationary satellite, it shall effect co-ordination with any other administration whose assignment in the same band for a space station on a geostationary satellite or an earth station that communicates with a space station on a geostationary satellite is recorded in the Master Register, or had been co-ordinated or is being co-ordinated under the provisions of this paragraph. For this purpose, the administration requesting co-ordination shall send to any other such administration the information listed in Appendix [3A].

ADD 639AK (2) No co-ordination under No. 639AJ is required:

a) [where the increase in the equivalent noise temperature of an earth station's receiver of an administration caused by a frequency assignment to a station of any other administration is below the permissible increase in noise temperature as determined by the application of the method given in Appendix [29].]

1) If only the up link is involved, the increase in the equivalent noise temperature is determined at the space station receiver.

2) [For a broadcasting satellite space station, the technical data used to effect co-ordination should be based upon the latest Recommendations of the C.C.I.R., as accepted by the administrations concerned under Resolution No. Spa. In the absence of relevant C.C.I.R. Recommendations, the technical data to be used to effect co-ordination shall be agreed between the administrations concerned.]
b) when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase the equivalent noise temperature agreed during co-ordination of an earth station receiver of another administration.

ADD 639AL (3) An administration initiating the co-ordination procedure referred to in No. 639AJ shall at the same time send to the Board a copy of the request for co-ordination, with the information listed in Appendix IA and the name(s) of the administration(s) with which co-ordination is sought. The Board shall publish this information in a special section of its weekly circular, together with a reference to the weekly circular in which details of the satellite system were published in accordance with Section I of this Article. When the weekly circular contains such information, the Board shall so inform all administrations by circular telegram.

ADD 639AM (4) An administration believing that it should have been included in the co-ordination procedure under No. 639AJ shall have the right to request that it be brought into the co-ordination procedure.
§ 3. (1) Before an administration notifies to
the Board or brings into use any frequency assignment
 to an earth station, whether for transmitting or
 receiving, in a particular band allocated with equal
 rights to the space radiocommunication and the [fixed or mobile]/
 service in the frequency spectrum above one Gc/s, it
 shall effect co-ordination of the assignment with any other
 administration whose territory lies wholly or partly
 within the co-ordination area 1) [but only in respect of
 the fixed or the mobile service]. For this purpose
 it shall send to any other such administration a copy
 of a diagram drawn to an appropriate scale indicating
 the location of the earth station and showing the
 co-ordination areas of the earth station for the
 cases of transmission and reception by the earth
 station, and the data on which they
 are based, including all pertinent details of the
 proposed frequency assignment, as listed in Appendix [1A],
 and an indication of the approximate date on which it
 is planned to begin operations.

1) Calculated in accordance with the procedures
described in Appendix [28].
ADD 639A0

(2) An administration with which co-ordination is sought under No. 639AJ shall immediately by telegram acknowledge receipt of the co-ordination data. If no acknowledgement is received within thirty days after the date of the weekly circular publishing the information under No. 639AL, the sender shall despatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of thirty days. Upon receipt of the co-ordination data, an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested, promptly examine the matter with regard to interference 1) which would be caused to the service rendered by its stations in respect of which co-ordination is sought under No. 639AJ; and shall, within an overall period of ninety days from the date of the relevant weekly circular, notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree, it shall, within the same period, send to the administration seeking co-ordination the technical details upon which its disagreement is based, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem. A copy of these comments shall also be sent to the Board.

ADD 639A0.1

1) Criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
An administration with which co-ordination is sought under No. 639AN shall acknowledge receipt immediately by telegram of the co-ordination data. If no acknowledgement is received within fifteen days of despatch of the co-ordination data, the sender shall despatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of fifteen days. Upon receipt of the co-ordination data, an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested, promptly examine the matter both with regard:

a) interference\(^1\) which would be caused to the service rendered by its stations in the \[ fixed or mobile / \] service operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer, and

b) interference\(^1\) which would be caused to reception at the earth station by the service rendered by its stations in the \[ fixed or mobile / \] service operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer.

\(^1\) Criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
and shall, within an overall period of sixty days from despatch of the co-ordination data notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree it shall, within the same period, send to the administration seeking co-ordination a copy of a diagram drawn to an appropriate scale showing the location of its stations in the fixed or mobile service which are or will be within the co-ordination area of the earth transmitting or receiving station, as appropriate, together with all other relevant basic characteristics, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

ADD 639AQ

(4) When the administration with which co-ordination is sought sends to the administration seeking co-ordination the information mentioned in No. 639Ap, a copy thereof shall also be sent to the Board. The Board shall consider as notifications in accordance with Section I of Article 9 only that information relating to existing stations in the fixed or mobile service, or to those to be brought into use within the next three years.
MOD 639AR

(5) No co-ordination under No. 639AN is required when an administration proposes:

a) to bring into use an earth station, the co-ordination area of which does not include any of the territory of any other country;

b) to change the characteristics of an existing assignment in such a way as not to exceed the permissible level of interference to or from the stations in the fixed or mobile service of other administrations;

c) to bring into use an earth station in the band 4 400-4 700 Mc/s or the band 8 100-8 400 Mc/s (except Region 3); or

d) to operate a mobile earth station. However, if the co-ordination area associated with the operation of such a mobile earth station, in a frequency band referred to in No. 639AN, includes any of the territory of another country, it shall be subject to prior agreement between the administrations concerned in order to avoid harmful interference to existing stations with the fixed or mobile service of that country. This agreement shall cover the characteristics of the mobile earth station(s) or the characteristics of a typical mobile earth station, and shall apply to a specified service area; unless otherwise stipulated in the agreement, it shall apply to any mobile earth stations in the specified service area provided that the probability of harmful interference caused by them shall not be greater than that caused by the typical earth station.
§ 4. (1) An administration seeking co-ordination may request the Board to endeavour to effect co-ordination in those cases where:

a) an administration with which co-ordination is sought under No. 639AJ fails to acknowledge receipt, under No. 639AO, within sixty days after the date of the weekly circular publishing the information relating to the request for co-ordination;

b) an administration with which co-ordination is sought under No. 639AH fails to acknowledge receipt, under No. 639AP within thirty days of despatch of the co-ordination data;

c) an administration has acknowledged receipt under No. 639AO, but fails to give a decision within a period of ninety days from the date of the relevant weekly circular;

d) an administration has acknowledged receipt under No. 639AP but fails to give a decision within a period of sixty days from despatch of the co-ordination data;

e) there is disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference;

f) co-ordination between administrations is not possible for any other reason.

In so doing it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

MOD 639AT (2) Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.
(3) Where the Board receives a request under 639AS a) or b), it shall forthwith send a telegram to the administration concerned requesting immediate acknowledgement.

(4) Where the Board receives an acknowledgement following its action under No. 639AU, or where the Board receives a request under No. 639AS c) or d), it shall forthwith send a telegram to the administration concerned requesting an early decision in the matter.

(5) Where the Board receives a request under No. 639AS f), it shall endeavour to effect co-ordination in accordance with the provisions of Nos. 639AJ and 639AN, as appropriate. The Board shall also, where appropriate, act in accordance with No. 639AL. Where the Board receives no acknowledgement to its request for co-ordination within the period specified in No. 639AO or 639AP, as appropriate, it shall act in accordance with No. 639AU.

(6) Where an administration fails to reply within thirty days of the Board's telegram requesting an acknowledgement sent under No. 639AU, or fails to give a decision in the matter within thirty days of the Board's telegram of request sent under No. 639AV, it shall be deemed that the administration with which co-ordination was sought has undertaken:

a) that no complaint will be made in respect of any harmful interference which may be caused to the services rendered by its space radiocommunication stations or its stations in the fixed or mobile service by the use of the assignment for which co-ordination was requested;

b) that its space radiocommunication stations or its stations in the fixed or mobile service will not cause harmful interference to the use of the assignment for which co-ordination was requested.
Where necessary, as part of the procedure under No. 639AS, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after one hundred and fifty days from the date of the request for co-ordination, taking into consideration the provisions of No. 639BF, send its notice concerning the proposed assignment to the Board.

Section III Notification of frequency assignments

Any frequency assignment to an earth or space station shall be notified to the International Frequency Registration Board:

a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration; or
b) if the frequency is to be used for international radiocommunications; or

c) if it is desired to obtain international recognition of the use of the frequency.

(2) Similar notice shall be given for any frequency to be used for the reception of transmissions from earth or space stations by a particular space or earth station in each case where one or more of the conditions specified in No. 639BA are applicable.

(3) Similar notice may be given for any frequency or frequency band to be used for reception by a particular radio astronomy station, if it is desired that such data should be included in the Master Register.

(4) A notice submitted in accordance with No. 639BA or 639BB and relating to a frequency assignment to mobile earth stations in a satellite system shall include the technical characteristics either of each mobile earth station or of a typical mobile earth station and an indication of the service area within which these stations are to be operated.

MOD 639BE

§7 For any notification under No. 639BA, 639BB, 639BC, or 639BD, an individual notice for each frequency assignment shall be drawn up as prescribed in Appendix I.A, which specifies in Sections I.B, C, D, E or F the basic characteristics to be furnished, according to the case. It is recommended that the notifying administration should also supply the additional data called for in Section I.A of that Appendix, together with such further data as it may consider appropriate.
§ 8. (1) For a frequency assignment to an earth or space station, each notice must reach the Board not earlier than three years before the date on which the assignment is to be brought into use. The notice must reach the Board in any case not later than ninety days before this date, except in the case of assignments in the space research service in bands allocated exclusively to this service or in shared bands in which this service is the sole primary service. In the case of such an assignment in the space research service the notice should, whenever practicable, reach the Board before the date on which the assignment is brought into use, but it must in any case reach the Board not later than thirty days after the date it is actually brought into use.

(2) Any frequency assignment to an earth or space station, the notice of which reaches the Board after the applicable period specified in No. 639BF, shall, where it is to be recorded, bear a mark in the Master Register to indicate that it is not in conformity with No. 639BF.

1) The notifying administration shall take this limit into account when deciding, where appropriate, to initiate the co-ordination procedure(s).
Section IV Procedure for the examination of notices and the recording of frequency assignments in the Master Register

9. Any notice which does not contain at least those characteristics specified in Appendix I (Sections B, C, D, E, or F as appropriate) shall be returned by the Board immediately, by air-mail, to the notifying administration with the reasons therefor.

10. Upon receipt of a complete notice, the Board shall include the particulars thereof, with the date of receipt, in the weekly circular referred to in No. 497, which shall contain the particulars of all such notices received since the publication of the previous circular.

11. The circular shall constitute the acknowledgement to the notifying administration of the receipt of a complete notice.

12. Complete notices shall be considered by the Board in the order of their receipt. The Board shall not postpone the formulation of a finding unless it lacks sufficient data to render a decision in connection therewith; moreover, the Board shall not act upon any notice which has a technical bearing on an earlier notice still under consideration by the Board, until it has reached a finding with respect to such earlier notice.
The Board shall examine each notice:

a) with respect to its conformity with the Convention, the Table of Frequency Allocations and the other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and the probability of harmful interference);

b) where appropriate, with respect to its conformity with the provisions of No. 639AL, relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis space radiocommunication stations.

c) where appropriate, with respect to its conformity with the provisions of No. 639AM relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis stations in the Fixed or Mobile Service.
d) where appropriate, with respect to the probability of harmful interference to the service rendered by a space radiocommunication station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639BM if this frequency assignment has not in fact caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

e) where appropriate, with respect to the probability of harmful interference to the service rendered by a station in the fixed or mobile service for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 501 or 570AB, as appropriate, if this frequency assignment has not, in fact, caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

f) where appropriate, with respect to the probability of harmful interference caused to the receiving earth station by a station in the fixed or mobile service for which a frequency assignment already recorded in the Master Register is in conformity with No. 501 or 570AB, as appropriate.
When, following an examination of a notice with respect to No. 639BP, the Board reaches an unfavourable finding based upon the probability of harmful interference to a recorded assignment for a space station which the Board has reason to believe may not be in regular use, the Board shall forthwith consult the administration responsible for the registered assignment. If it is established, after such consultation and on the basis of the information available, that the recorded assignment has not been in use for two years, it shall not be taken into account for the purposes of the examination in progress and any other further examination under No. 639BP conducted before the date on which the assignment is brought back into use. This date shall be entered in the Master Register. Before the assignment is brought back into use, it shall be subject to further co-ordination in accordance with the provisions of No. 639AJ or further examination by the Board with respect to No. 639BP as appropriate.
MOD 639BT §14 Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 639BM, 639BN, 639BO, 639BP, 639BQ, 639BR, as appropriate, further action shall be as follows:

MOD 639BU §15 (1) Finding favourable with respect to No. 639BM in cases where the provisions of Nos. 639BN and 639BO are not applicable.

(MOD) 639BV (2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

(MOD) 639BW §16 (1) Finding unfavourable with respect to No. 639BM

MOD 639BX (2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, and the finding is favourable with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
ADD 639BY

(3) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115 and the finding is unfavourable with respect to No. 639BN, 639BO, 639BP, 639BQ or 639BR, as appropriate, the notice shall be returned immediately by air mail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.

ADD 639BZ

(4) The period of one hundred and twenty days mentioned in Nos. 639BY and 639CP shall count from:

- the date when the assignment to the space radiocommunication station which received an unfavourable finding is brought into use, if the assignment to the station which was the basis for the unfavourable finding is then in use;
otherwise, from the date when the assignment to the station which was the basis for the unfavourable finding is brought into use.

But if the assignment to the station which was the basis for the unfavourable finding has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance shall, if necessary, be made for the additional period mentioned in No. 639CY.

(MOD) 639CA

(5) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.
MOD 639CB  (6) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 639CA. If it is resubmitted with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of No. 639EX or 639BY, as appropriate. If it is resubmitted with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 639BM, it shall be treated as a new notice.

MOD 639CC  §17 (1) Finding favourable with respect to No. 639BM in cases where the provisions of No. 639BN or 639BO are applicable.

MOD 639CD  (2) Where the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BO have been successfully completed with all administrations whose space radiocommunication stations or stations in the fixed or mobile service may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
MOD 639CE

(3) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take the appropriate action necessary and shall inform the administrations concerned of the results obtained. If the Board's efforts are successful, the notice shall be treated in accordance with No. 639CD. If the Board's efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of Nos. 639BP, 639BQ and 639BR, as appropriate.

MOD 639CF

(4) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.
(5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BC have been successfully completed with all administrations whose space radiocommunication stations or stations in the fixed or mobile service may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

(6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination under No. 639AJ or 639AN, it shall be treated in accordance with the provisions of No. 639CE. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.
MOD 639CI

(7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, the Board shall inform the administrations concerned thereof. The notice shall be examined by the Board with respect to the provisions of Nos. 639BP and 639BQ, as appropriate. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

MOD 639CJ

§ 18. (1) Finding favourable with respect to Nos. 639BM, 639BP, 639BQ and 639BR, as appropriate.

(MOD) 639CK

(2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

ADD 639CL

(3) However, should the examination show that the level of the interference noise and the percentage of time during which it occurs have values slightly greater than those used for assessing the probability of harmful interference (extreme propagation conditions, abnormal atmospheric humidity, etc.), a remark shall be included in the Master Register to show that there may be a slight risk of harmful interference and hence additional precautions must be taken in the use of the assignment to avoid harmful interference to assignments already recorded in the Master Register.
\(\text{MOD} \ 639\text{CM}\)

§ 19. (1) Finding favourable with respect to No. 639BM but unfavourable with respect to Nos. 639BP, 639Bq or 639BR, as appropriate.

\(\text{(MOD)} \ 639\text{CM}\)

(2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

\(\text{MOD} \ 639\text{CO}\)

(3) Should the notifying administration resubmit the notice with modifications which result, after re-examination, in a favourable finding by the Board with respect to Nos. 639BP, 639Bq and 639BR, as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be indicated in the Remarks Column.
MOD 639CP

(4) Should the notifying administration resubmit the notice, either unchanged, or with modifications which decrease the probability of harmful interference, but not sufficiently to permit the provisions of No. 63900 to be applied, and should that administration insist upon reconsideration of the notice, but should the Board's finding remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column. The period of one hundred and twenty days shall count from the date indicated in No. 639BZ.
§20 (1) Notices relating to radio astronomy stations.

MOD 639CR

(2) A notice relating to a radio astronomy station shall not be examined by the Board with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR. Whatever the finding, the assignment shall be recorded in the Master Register with a date in Column 2c. The date of receipt by the Board of the notice shall be recorded in the Remarks Column.

§21 (1) Change in the basic characteristics of assignments already recorded in the Master Register.

MOD 639CT

(2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix A (except the name of the station or the name of the locality in which it is situated) shall be examined by the Board according to No. 639BM, and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, and the provisions of Nos. 639BU to 639CR inclusive applied. Where the change should be recorded, the assignment shall be amended according to the notice.
(3) However, in the case of a change in the characteristics of an assignee which is in conformity with No. 639BM, should the Board reach a favourable finding with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, where appropriate, or find that the change does not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. The date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.

§22 In applying the provisions of the whole of this Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

§23 (1) Recording of Frequency Assignments notified before being brought into use.

(2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to No. 639BM and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.
(3) If, within the period of thirty days after the projected date of bringing into use, the Board receives confirmation from the notifying administration of the date of putting into use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

(4) In the circumstances described in Nos. 639BY and 639CP, and as long as an assignment which received an unfavourable finding cannot be resubmitted as a consequence of the provisions of No. 639BZ, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 639BY or 639CP, as appropriate, the information relating to the absence of complaint of harmful interference.
(5) If the Board does not receive this confirmation within the period referred to in No. 639CY or at the end of the period referred to in No. 639BY or 639CP as appropriate, the entry concerned shall be cancelled. The Board shall advise the administration concerned before taking such action.

Section V. Recording of findings in the Master Register

Section VI. Categories of frequency assignments.

(1) The date in Column 2c shall be the date of putting into use notified by the administration concerned. It is given for information only.

(2) If harmful interference is actually caused to the reception of any space radiocommunication station whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to Nos. 639EM, 639DN, 639DO, 639DP, 639DQ and 639DR, as appropriate, by the use of a frequency assignment to a space radiocommunication station which has been recorded in the Master Register in accordance with the provisions of No. 639CP, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.
(MOD) 639DF §26 (1) The review of a finding by the Board may be undertaken:

- at the request of the notifying administration,
- at the request of any other administration interested in the question, but only on the grounds of actual harmful interference,
- on the initiative of the Board itself when it considers this is justified.
(2) The Board, in the light of all the data at its disposal shall review the matter, taking into account No. 639BM and Nos. 639BN, 639B0, 639BP, 639Bq and 639BR, where appropriate, and shall render an appropriate finding, informing the notifying administration prior either to the promulgation of its finding or to any recording action.

§ 27. (1) After actual use for a reasonable period of an assignment which has been entered in the Master Register on the insistence of the notifying administration, following an unfavourable finding with respect to Nos. 639BP, 639BQ or 639BR, this administration may request the Board to review the finding. Thereupon the Board shall review the matter, having first consulted the administrations concerned.

(2) If the finding of the Board is then favourable it shall enter in the Master Register the changes that are required so that the entry shall appear in the future as if the original finding had been favourable.
Section VIII. Modification, cancellation and review of entries in the Master Register.

### ADD 639DK

§ 28. (1) Where the use of a recorded assignment to a space station is suspended for a period of eighteen months, the notifying administration shall, within that eighteen month period, inform the Board of the date on which such use was suspended and of the date on which the assignment is to be brought back into regular use.

### ADD 639DL

(2) Whenever it appears to the Board, whether or not as a result of action under No. 639DK, that a recorded assignment to a space station has not been in regular use for more than eighteen months, the Board shall enquire of the notifying administration as to when the assignment is to be brought back into regular use.

### ADD 639DM

(3) If no reply is received within six months of action by the Board under No. 639DL, or if the reply does not confirm that the assignment to a space station is to be brought back into regular use within this six month limit, a mark shall be applied against the entry in the Master Register. Thereafter, the assignment shall be treated in accordance with No. 639BS as one which has been established as having been out of regular use for two years.
§ 29. In case of permanent discontinuance of the use of any recorded frequency assignment, the notifying administration shall inform the Board within ninety days of such discontinuance, whereupon the entry shall be removed from the Master Register.

§ 30. Whenever it appears to the Board from the information available that a recorded assignment has not been brought into regular operation in accordance with the notified basic characteristics, or is not being used in accordance with those basic characteristics, the Board shall consult the notifying administration and, subject to its agreement, shall either cancel or suitably modify the entry.
§ 31. If, in connection with an enquiry by the Board under No. 639D0, the notifying administration has failed to supply the Board within forty-five days with the necessary or pertinent information, the Board shall make suitable entries in the Remarks Column of the Master Register to indicate the situation.

Section IX. Studies and Recommendations

§ 32. (1) If it is requested by any administration, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall conduct a study of cases of alleged contravention or non-observance of these Regulations, or of harmful interference.

(2) The Board shall thereupon prepare and forward to the administration concerned a report containing its finding and recommendations for the solution of the problem.
In a case where, as a result of a study, the Board submits to one or more administrations suggestions or recommendations for the solution of a problem, and where no answer has been received from one or more of these administrations within a period of ninety days, the Board shall consider that the suggestions or recommendations concerned are unacceptable to the administrations which did not answer. If it was the requesting administration which failed to answer within this period, the Board shall close the study.

Section X. Miscellaneous Provisions

§ 34. (1) If it is requested by any administration, particularly by an administration of a country in need of special assistance, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall render the following assistance:

   a) computation of the increase in the equivalent noise temperature of an earth station receiver as in 639AK;

   b) preparation of the diagram showing co-ordination area as in 639AK;

   c) any other assistance of a technical nature for completion of the procedures in this Article;

(2) In making a request to the Board under 639DT, the administration shall furnish the Board with the necessary information.
§ 35. The technical standards of the Board shall be based upon the relevant provisions of these Regulations and the Appendices thereto, the decisions of Administrative Conferences of the Union as appropriate, the Recommendations of the C.C.I.R., the state of the radio art, and the development of new transmission techniques.

§ 36. The Board shall promulgate to administrations its findings and reasons therefor, together with all changes made to the Master Register, through the weekly circular referred to in No. 497.

§ 37. In case a Member or Associate Member of the Union avails itself of the provisions of Article 28 of the Convention, the Board shall, upon request, make its records available for such proceedings as are prescribed in the Convention for the settlement of international disputes.
SEVENTH REPORT FROM COMMITTEE 4

Additions to Sections IIA, IIB and III of Article 1 appearing in the Annex hereto have been approved by Committee 4.

The texts in question have been forwarded to the Drafting Committee.

E.F. SANDEBACH
Chairman
Committee 4

Annex : 1
ANNEX

1. Terms and definitions to be added in Section [IIA] :

ADD 84ALA Satellite network

A satellite system consisting of a single satellite and the co-operating earth stations.

ADD 84ALB Satellite link

A radio link between a transmitting earth station and a receiving earth station through one satellite.

A satellite link comprises one up-path and one down-path.

ADD 84ALC Multi-satellite link

A radio link between a transmitting earth station and a receiving earth station through two or more satellites, without any intermediate earth station.

A multi-satellite link comprises one up-path, one or more satellite-to-satellite paths and one down-path.

2. Term and definition to be added in Section IIIB :

ADD 84BFA Geosynchronous satellite

An earth satellite whose period of revolution is equal to the period of rotation of the Earth about its axis.

3. Terms and definitions to be added in Section III :

ADD 103A Equivalent satellite-link noise temperature

The noise temperature at the input of the earth station receiver corresponding to the radio frequency noise power which produces the total observed noise at the output of the satellite link excluding noise due to interference coming from satellite links using other satellites and from terrestrial systems.
ADD 103B Co-ordination distance

Distance from an earth station in a given azimuth within which a terrestrial station sharing the same frequency band may cause or be subject to more than a permissible level of interference.

ADD 103C Co-ordination contour

The line on a geographical map on which an earth station location is represented joining the points on all azimuths around this earth station which are at a distance equal to the co-ordination distance corresponding to each azimuth.

ADD 103D Co-ordination area

Area around an earth station enclosed by the co-ordination contour.
DRAFT RECOMMENDATION No.

(following the discussion in 3rd Plenary Meeting)

relating to the use of satellite communication systems in the event of natural disasters, epidemics, famines and similar emergency situations

considering

a) that in the case of natural disasters, epidemics, famines and similar emergency situations lives can be saved by prompt and effective relief;

b) that rapid and reliable telecommunications are essential for relief operations;

c) that, through damage or from other causes, the normal telecommunications facilities in disaster areas are often inadequate for relief operations and cannot be restored or supplemented quickly through local resources;

d) that use of communication-satellite systems is one of the means by which rapid and reliable telecommunications could be provided for relief operations;

noting

a) that known planning of communication-satellite systems makes no provision for specific frequencies or channels for emergency communications;

b) that in the absence of such planning it is not feasible to proceed with specifications for rapidly transportable universally operable earth stations;
recommends

1. that administrations, individually or in collaboration, provide for the needs of eventual relief operations in planning their communication-satellite systems, and identify for this purpose preferred radio-frequency channels and facilities which could quickly be made available for relief operations;

2. that administrations concerned waive the co-ordination procedures provided for in the Radio Regulations in the case of transportable earth stations used for relief operations;

requests

the C.C.I.R. to study standard specifications and preferred frequencies for transportable earth stations, and compatible mobile and transportable fixed communications for relief operations;

invites

the Secretary General to bring this Recommendation to the attention of the United Nations, the Specialized Agencies and other international organizations concerned, in order to ensure full co-operation in the implementation of this Recommendation.

EIGHTH REPORT FROM COMMITTEE 4

Additions and modifications to the Radio Regulations appearing in the Annexes hereto have been approved by Committee 4.

The texts in question have been forwarded to the Drafting Committee.

E.F. SANDBACH
Chairman
Committee 4

Annex 1: Partial text of Section VIII of Article 7.

2: New Recommendation No. \([\ldots]\) relating to the criteria to be applied for sharing between the Broadcasting-Satellite Service and the Terrestrial Broadcasting Service in the band \([614-790 \text{ Mc/s}])\.
ANNEX 1

/ARTICLE 7/

/PARTIAL TEXT OF SECTION VIII/

Section VIII. Space services sharing frequency bands with terrestrial services above 1 Gc/s

Choice of sites and frequencies

NOC 470E § 20. Sites and frequencies for earth stations, operating in frequency bands shared with equal rights between terrestrial and space services, shall be selected having regard to the relevant recommendations of the C.C.I.R. with respect to geographical separation from terrestrial stations.

Power limits

MOD 470F § 21.(1) Earth stations

MOD 470G (2) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands between 1 and 15 Gc/s, shall not exceed the following limits except for the provisions of Nos. 470H or 470HA:

+ 40 dBW in any 4 k/s band for \( \theta \leq 0^\circ \)

+ 40 + 3 \( \theta \) dBW in any 4 k/s band for \( 0 < \theta \leq 5^\circ \)

where \( \theta \) is the angle of elevation of the horizon viewed from the centre of radiation of the antenna of the earth station and measured as positive above the horizontal plane and negative below it.
Annex 1 to Document No. 351-E
Page 4

ADD 470GA  (2bis) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands above 15 GHz shall not exceed the following limits except for the provisions of Nos. 470H or 470HB:

\[ P_{\text{EIRP}} = 64 \text{ dBW} \text{ in any } 1 \text{ MHz band for } \theta = 0^\circ \]

\[ P_{\text{EIRP}} = 64 + 3 \theta \text{ dBW} \text{ in any } 1 \text{ MHz band for } 0 < \theta \leq 5^\circ \]

where \( \theta \) is as defined in 470G.

ADD 470GB  (2ter) For angles of elevation of the horizon greater than 5° there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

MOD 470H  (3) The limits of 470C or 470GA, as applicable, may be exceeded by up to a maximum of 10 dB. However, when the resulting co-ordination zone extends into the territory of another administration, such increase shall be subject to agreement by that administration.

ADD 470HA  (3bis) As an exception to the limits of 470G, the equivalent isotropically radiated power towards the horizon for a space research earth station (deep-space) shall not exceed +55 dBW in any 4 MHz band.

ADD 470HB  (3ter) As an exception to the limits of 470GA, the equivalent isotropically radiated power towards the horizon for space research earth station (deep-space) shall not exceed +79 dBW in any 1 MHz band.

SUP 470I
(3quarter) The limits given in No. 4700 apply in the following frequency bands allocated to transmission by earth stations in the Fixed-Satellite Service, where these are shared with equal rights with the Fixed or Mobile Service.

Minimum angle of elevation

MOD 470K § 22.(1) Earth stations

MOD 470L (2) Earth station antennae shall not be employed for transmission at elevation angles of less than 3° measured from the horizontal plane to the direction of maximum radiation, except when agreed to by administrations concerned or affected. In case of reception by earth station, the above value shall be used for co-ordination purposes if the operating angle of elevation is less than the above value.

ADD 470LA (2bis) As an exception to 470L, earth station antennae in the space research service (near-earth) shall not be employed for transmission at elevation angles of less than 5°, and earth station antennae in the space research service (deep-space) shall not be employed for transmission at elevation angles of less than 10°, both angles being those measured from the horizontal plane to the direction of maximum radiation. In case of reception by an earth station the above values shall be used for co-ordination purposes if the operating angle of elevation is less than the above values.
MOD 470M (2ter) The limit given in No. 470L applies in the following frequency bands allocated to transmission by earth stations in the fixed-satellite service, where these are shared with equal rights with the fixed or mobile services:

[ ] [ ]
[ ] [ ]
[ ] [ ]
[ ] [ ]
ANNEX 2

RECOMMENDATION NO.

relating to the criteria to be applied
for sharing between the Broadcasting-Satellite Service
and the Terrestrial Broadcasting Service
in the band 614-790 Mc/s.

considering

a) that this frequency band has been allocated to the
   Broadcasting-Satellite Service;

b) that it is necessary to have a power flux-density limit
   which will provide adequate protection to the Terrestrial
   Broadcasting Service;

	taking into account

a) the fact that the conclusions of the Special Joint
   Meeting of the C.C.I.R., Geneva, 1971, indicated a power flux-
   density limit of

\[-121 \text{ dBW/m}^2 \quad \delta < 20^\circ\]
\[-121 + 0.4 (\delta - 20^\circ) \text{ dBW/m}^2 \quad 20^\circ \leq \delta < 60^\circ\]
\[-105 \text{ dBW/m}^2 \quad 60^\circ \leq \delta < 90^\circ\]

where \(\delta\) is the angle of arrival above the horizontal plane;

b) that additional tests carried out by one administration
   after the Special Joint Meeting of the C.C.I.R., indicated that
   the following more conservative power flux-density limits may be
   necessary to protect the Terrestrial Broadcasting Service

\[-130 \text{ dBW/m}^2 \quad \delta < 20^\circ\]
\[-150 + 0.4 (\delta - 20^\circ) \text{ dBW/m}^2 \quad 20^\circ \leq \delta < 60^\circ\]
\[-114 \text{ dBW/m}^2 \quad 60^\circ \leq \delta < 90^\circ\]

where \(\delta\) is the angle of arrival above the horizontal plane;
c) additional information is required on the protection ratio for interference from a FM television signal into a VEB television signal for both the 625 and 525 line systems;
d) with terrestrial television receiving systems using current technology, the minimum field strength to be protected may in some cases be less than the values included in C.C.I.R. Recommendation 417-2;
e) account may have to be taken of ground reflections;
f) the use of energy dispersal may reduce the required protection ratio and should be used if shown to be effective;

recommends

1. that in view of the absence of sufficient information on tests under operational conditions and in order to provide for a preliminary co-ordination procedure, on a provisional basis, the maximum power flux-density produced at the surface of the earth within the service area of a terrestrial broadcasting service (vide C.C.I.R. Recommendation 417-2), by a broadcasting-satellite space station in the band 614-790 MHz shall not exceed:

\[ -129 \text{ dBW/m}^2 \quad \delta < 20^\circ \]
\[ -129 + 0.4 (\delta - 20^\circ) \text{ dBW/m}^2 \quad 20^\circ < \delta < 60^\circ \]
\[ -113 \text{ dBW/m}^2 \quad 60^\circ < \delta < 90^\circ \]

where \( \delta \) is the angle of arrival above the horizontal plane.

2. this limit may be exceeded subject to the agreement of administrations in whose territory the above limit is exceeded;

3. the transmission of unmodulated carriers shall be avoided;

4. the C.C.I.R. urgently study the sharing criteria to be applied to frequency sharing between the Broadcasting-Satellite Service and the Terrestrial Broadcasting Service in the band \( 614-790 \text{ MHz} \) and prepare a Recommendation on power flux-densities to be used in lieu of the above provisional limits.
5. that in its studies the C.C.I.R. consider in particular the following aspects:

a) the required protection ratio for both 525 and 625 line systems for interference from FM television signals into VSB television signals;

b) the minimum field strength to be protected for the Terrestrial Television Service taking into account current progress in technology;

c) the effect of ground reflections;

d) the number of broadcasting satellites that may be visible from a terrestrial broadcasting receiver;

e) the effect of polarization discrimination;

f) the effect of antenna directivity.

6. that in its studies the C.C.I.R. should consider the benefits of energy dispersal in the Broadcasting-Satellite Service for television.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

Francois Job  
Chairman of the Editorial Committee

Annex: Pages B6/01-28
ANNEX B

Revision of Article 9A of the Radio Regulations

The entire Article 9A is replaced by the following new text:

ARTICLE 9A

Co-ordination, Notification and Recording in the Master International Frequency Register of Frequency Assignments to Radio Astronomy and Space Radiocommunication Stations [except Stations in the Broadcasting Satellite Service]

Section I. Procedure for the Advance Publication of Information on Planned Satellite Systems

639AA §1. (1) An administration (or one acting on behalf of a group of named administrations) which intends to establish a satellite system shall, prior to the co-ordination procedure in accordance with No. 639AK where applicable, send to the Board not earlier than five years before the date of bringing into service each satellite network of the planned system, the information listed in Appendix [1B].

639AB (2) Any amendments to the information sent concerning a planned satellite system in accordance with No. 639AA shall also be sent to the Board as soon as they become available.

1 The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).

B6—01
639AC (3) The Board shall publish the information sent under Nos. 639AA and 639AB in a special section of its weekly circular and shall also, when the weekly circular contains such information, so advise all administrations by circular telegram.

639AD (4) If, after studying the information published under No. 639AC, any administration is of the opinion that interference, which may be unacceptable, may be caused to its existing or planned space radiocommunication services, it shall within ninety days after the date of the weekly circular publishing the information listed in Appendix [1B], send its comments to the administration concerned. A copy of these comments shall also be sent to the Board. If no such comments are received from an administration within the period mentioned above, it may be assumed that that administration has no basic objections to the planned satellite network(s) of that system [satellite networks of that planned system], on which details have been published.

639AE (5) An administration receiving comments sent in accordance with No. 639AD shall endeavour to resolve any difficulties that may arise.

639AF (6) In case of difficulties arising when any satellite network of a planned system is intended to use the geostationary orbit:

a) The administration responsible for the planned system shall first explore all possible means of meeting its requirements, taking into account the characteristics of the [significant] [potentially affected] geostationary satellite networks of other systems, and without considering the possibility of adjustments to systems of other administrations. If no such means can be found, the administration concerned is then free to
apply to other administrations concerned to solve these difficulties;

b) An administration receiving a request under a) above shall, in consultation with the requesting administration, explore all possible means of meeting the requirements of the requesting administration, for example, by relocating one or more of its own geostationary space stations involved, or by changing the emissions, frequency usage (including changes in frequency bands) or other technical or operational characteristics;

c) If after following the procedure outlined in a) and b) above there are unresolved difficulties, the administrations concerned shall together make every possible effort to resolve these difficulties by means of mutually acceptable adjustments, for example, to geostationary space station locations and to other characteristics of the systems involved in order to provide for the normal operation of both the planned and existing systems.

639AG (7) In their attempts to resolve the difficulties mentioned above administrations may seek the assistance of the Board.

639AH (8) In complying with the provisions of Nos. 639AE to 639AG, an administration responsible for a planned satellite system shall if necessary defer its commencement of the co-ordination procedure, or where this is not applicable, the sending of its notices to the Board, until one hundred and fifty days after the date of the weekly circular containing the information listed in Appendix [1B] on the relevant satellite network. However, in respect of those administrations with whom difficulties have been resolved or who have responded favourably, the co-ordination procedure, where applicable, may be commenced prior to the expiration of the one hundred and fifty days mentioned above.
639AI  (9) An administration on behalf of which details of satellite networks in its planned system have been published, in accordance with the provisions of Nos. 639AA to 639AC, shall periodically inform the Board whether or not comments have been received and of the progress made, with other administrations, in resolving any difficulties. The Board shall publish this information in a special section of its weekly circular and shall also, when the weekly circular contains such information, so inform all administrations by circular telegram.

Section II. Co-ordination Procedures to be Applied in Appropriate Cases

639AJ § 2. (1) Before an administration notifies to the Board or brings into use any frequency assignment to a space station on a geostationary satellite or to an earth station that is to communicate with a space station on a geostationary satellite, it shall effect co-ordination with any other administration whose assignment in the same band for a space station on a geostationary satellite or an earth station that communicates with a space station on a geostationary satellite is recorded in the Master Register, or has been co-ordinated or is being co-ordinated under the provisions of this paragraph. For this purpose, the administration requesting co-ordination shall send to any other such administration the information listed in Appendix [1A].

639AK  (2) No co-ordination under No. 639AJ is required:

[a] if the increase in the equivalent noise temperature of an earth station 1 receiver of an administration caused by a frequency assignment to a station of any other

639AK.1  1 If only the up path is involved, the increase in the equivalent noise temperature is determined at the space station receiver.
administration is below the permissible increase in noise temperature as determined by the application of the method given in Appendix [29].

(b) when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase equivalent noise temperature of an earth station receiver of another administration above the level agreed during co-ordination of the existing assignment.

639AL (3) An administration initiating the co-ordination procedure referred to in No. 639AJ shall at the same time send to the Board a copy of the request for co-ordination, with the information listed in Appendix [1A] and the name(s) of the administration(s) with which co-ordination is sought. The Board shall publish this information in a special section of its weekly circular, together with a reference to the weekly circular in which details of the satellite system were published in accordance with Section I of this Article. When the weekly circular contains such information, the Board shall so inform all administrations by circular telegram.

639AM (4) An administration believing that it should have been included in the co-ordination procedure under No. 639AJ shall have the right to request that it be brought into the co-ordination procedure.

639AK.2 [For a broadcasting satellite space station, the technical data used to effect co-ordination should be [based upon the most recent, Recommendations of the C.C.I.R., as accepted by the administrations concerned under Resolution No. Spa...]. In the absence of relevant C.C.I.R. Recommendations, the technical data to be used to effect co-ordination shall be agreed between the administrations concerned.]
§ 3. (1) Before an administration notifies to the Board or brings into use any frequency assignment to an earth station, whether for transmitting or receiving, in a particular band allocated with equal rights to the space radiocommunication service and the [fixed or mobile] service in the frequency spectrum above 1 Ge/s, it shall effect co-ordination of the assignment with any other administration whose territory lies wholly or partly within the co-ordination area of the planned earth station [but only with respect to the fixed or the mobile service]. For this purpose it shall send to any other such administration a copy of a diagram drawn to an appropriate scale indicating the location of the earth station and showing the co-ordination areas of the earth station for the cases of transmission and reception by the earth station and the data on which they are based, including all pertinent details of the proposed frequency assignment, as listed in Appendix [1A], and an indication of the approximate date on which it is planned to begin operations.

(2) An administration with which co-ordination is sought under No. 639AJ shall acknowledge receipt of the co-ordination data immediately by telegram. If no acknowledgement is received within thirty days after the date of the weekly circular publishing the information under No. 639AL, the administration seeking co-ordination shall dispatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of thirty days. Upon receipt of the co-ordination data, an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested,

1 Calculated in accordance with the procedures described in Appendix [28].
promptly examine the matter with regard to interference\(^1\) which would be caused to the service rendered by its stations in respect of which co-ordination is sought under No. 639AJ; and shall, within ninety days from the date of the relevant weekly circular, notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree, it shall, within the same period, send to the administration seeking co-ordination the technical details upon which its disagreement is based, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem. A copy of these comments shall also be sent to the Board.

639AP (3) An administration with which co-ordination is sought under No. 639AN shall acknowledge receipt of the co-ordination data immediately by telegram. If no acknowledgement is received within fifteen days of dispatch of the co-ordination data the administration seeking co-ordination shall dispatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of fifteen days. Upon receipt of the co-ordination data an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested, promptly examine the matter both with regard to:

\(a)\) interference\(^2\) which would be caused to the service rendered by its stations in the [fixed or mobile] service operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer, and

---

\(^1\) The criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.

\(^2\) The criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
b) interference which would be caused to reception at the earth station by the service rendered by its stations in the [fixed or mobile] service operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer.

Then, within sixty days from despatch of the co-ordination data shall notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree it shall, within the same period, send to the administration seeking co-ordination a copy of a diagram drawn to an appropriate scale showing the location of its stations in the [fixed or mobile] service which are or will be within the co-ordination area of the earth transmitting or receiving station, as appropriate, together with all other relevant basic characteristics, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

639AQ (4) When the administration with which co-ordination is sought sends to the administration seeking co-ordination the information mentioned in No. 639AP, a copy thereof shall also be sent to the board. The Board shall consider as notifications in accordance with Section 1 of Article 9 only that information relating to existing stations in the [fixed or mobile] service or to those to be brought into use within the next three years.

639AR (5) No co-ordination under No. 639AN is required when an administration proposes:

639AP.1 The criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.

B6—08
a) to bring into use an earth station, the co-ordination area of which does not include any of the territory of any other country;

b) to change the characteristics of an existing assignment in such a way as not to exceed the permissible level of interference to or from the stations in the [fixed or mobile] service of other administrations;

c) to bring into use an earth station in the band 4 400-4 700 Mc/s or the band 8 100-8 400 Mc/s; or

d) to operate a mobile earth station. However, if the co-ordination area associated with the operation of such a mobile earth station, in a frequency band referred to in No. 639AN, includes any of the territory of another country, it shall be subject to prior agreement between the administrations concerned in order to avoid harmful interference to existing stations in the [fixed or mobile] service of that country. This agreement shall cover the characteristics of the mobile earth station(s), of the characteristics of a typical mobile earth station, and shall apply to a specified service area; unless otherwise stipulated in the agreement, it shall apply to any mobile earth stations in the specified service area provided that the probability of harmful interference caused by them shall not be greater than that caused by the typical earth station.

639AS § 4. (1) An administration seeking co-ordination may request the Board to endeavour to effect co-ordination in those cases where:

639AR.1 The provisions of c) do not apply to Region 3.
a) an administration with which co-ordination is sought under No. 639AJ fails to acknowledge receipt, under No. 639AO, within sixty days after the date of the weekly circular publishing the information relating to the request for co-ordination;

b) an administration with which co-ordination is sought under No. 639AN fails to acknowledge receipt, under No. 639AP within thirty days of dispatch of the co-ordination data;

c) an administration has acknowledged receipt under No. 639AO, but fails to give a decision within ninety days from the date of the relevant weekly circular;

d) an administration has acknowledged receipt under No. 639AP but fails to give a decision sixty days from dispatch of the co-ordination data;

e) there is disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference;

f) co-ordination between administrations is not possible for any other reason.

In so doing, it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

639AT (2) Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.
639AU (3) Where the Board receives a request under 639AS a) or b),
it shall forthwith send a telegram to the administration concerned
requesting immediate acknowledgement.

639AV (4) Where the Board receives an acknowledgement following
its action under No. 639AU, or where the Board receives a request
under No. 639AS c) or d), it shall forthwith send a telegram to the
administration concerned requesting an early decision in the matter.

639AW (5) Where the Board receives a request under No. 639AS f),
it shall endeavour to effect co-ordination in accordance with the
provisions of Nos. 639AJ and 639AN, as appropriate. The Board
shall also, where appropriate, act in accordance with No. 639AL.
Where the Board receives no acknowledgement to its request for
co-ordination within the period specified in No. 639AO or 639AP,
as appropriate, it shall act in accordance with No. 639AU.

639AX (6) Where an administration fails to reply within thirty days
of dispatch of the Board’s telegram requesting an acknowledgement
sent under No. 639AU, or fails to give a decision in the matter within
thirty days of dispatch of the Board’s telegram of request under
No. 639AV, it shall be deemed that the administration with which co-
ordination was sought has undertaken:

a) that no complaint will be made in respect of any harm-
ful interference which may be caused to the services
rendered by its space radiocommunication stations or
its stations in the [fixed or mobile] service by the use of
the assignment for which co-ordination was requested;

b) that its space radiocommunication stations or its
stations in the [fixed or mobile] service will not cause
harmful interference to the use of the assignment for which co-ordination was requested.

639AY (7) Where necessary, as part of the procedure under No. 639AS, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

639AZ § 5. In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after one hundred and fifty days from the date of the request for co-ordination, taking into consideration the provisions of No. 639BF, send its notice concerning the proposed assignment to the Board.

Notification of Frequency Assignments

639BA § 6. (1) Any frequency assignment to an earth or space station shall be notified to the International Frequency Registration Board:

a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration; or

b) if the frequency is to be used for international radio-communications; or

c) if it is desired to obtain international recognition of the use of the frequency.

639BB (2) Similar notice shall be given for any frequency to be used for the reception of transmissions from earth or space stations by a particular space or earth station in each case where one or more of the conditions specified in No. 639BA are applicable.

B6—12
639BC  (3) Similar notice may be given for any frequency or frequency band to be used for reception by a particular radio astronomy station, if it is desired that such data should be included in the Master Register.

639BD  (4) A notice submitted in accordance with No. 639BA or 639BB and relating to a frequency assignment to mobile earth stations in a satellite system shall include the technical characteristics either of each mobile earth station, or of a typical mobile earth station, and an indication of the service area within which these stations are to be operated.

639BE  § 7. For any notification under No. 639BA, 639BB, 639BC, or 639BD, an individual notice for each frequency assignment shall be drawn up as prescribed in Appendix [1A], which specifies in Sections [B, C, D, E or F] the basic characteristics to be furnished, according to the case. It is recommended that the notifying administration should also supply the additional data called for in Section [A] of that Appendix, together with such further data as it may consider appropriate.

639BF  § 8. (1) For a frequency assignment to an earth or space station, each notice must reach the Board not earlier than three years before the date on which the assignment is to be brought into use. The notice must reach the Board in any case not later than ninety days ¹ before this date, except in the case of assignments in the space research service in bands allocated exclusively to this service or in shared bands in which this service is the sole primary service. In the case of such an assignment in the space research service the notice should, whenever practicable, reach the Board before the date on which the assignment is brought into use, but it must in any case reach the Board not later than thirty days after the date it is actually brought into use.

639BF.1  ¹ The notifying administration shall take this limit into account when deciding, where appropriate, to initiate the co-ordination procedure(s).
639BG  (2) Any frequency assignment to an earth or space station, the notice of which reaches the Board after the applicable period specified in No. 639BF, shall, where it is to be recorded, bear a mark in the Master Register to indicate that it is not in conformity with No. 639BF.

Section IV. Procedure for the Examination of Notices and the Recording of Frequency Assignments in the Master Register

639BH § 9. Any notice which does not contain at least those characteristics specified in Appendix [1A] (Sections [B, C, D, E, or F,] as appropriate) shall be returned by the Board immediately, by airmail, to the notifying administration with the reasons therefor.

639BI § 10. Upon receipt of a complete notice, the Board shall include the particulars thereof, with the date of receipt, in the weekly circular referred to in No. 497, which shall contain the particulars of all such notices received since the publication of the previous circular.

639BJ § 11. The circular shall constitute the acknowledgement to the notifying administration of the receipt of a complete notice.

639BK § 12. Complete notices shall be considered by the Board in the order of their receipt. The Board shall not postpone the formulation of a finding unless it lacks sufficient data to render a decision in connection therewith; moreover, the Board shall not act upon any notice which has a technical bearing on an earlier notice still under consideration by the Board, until it has reached a finding with respect to such earlier notice.

639BL § 13. The Board shall examine each notice:

639BM  a) with respect to its conformity with the Convention, the Table of Frequency Allocations and the other pro-
visions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and the probability of harmful interference);

639BN  b) where appropriate, with respect to its conformity with the provisions of No. 639AJ, relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis space radiocommunication stations;

639BO  c) where appropriate, with respect to its conformity with the provisions of No. 639AN relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis stations in the [fixed or mobile] service;

639BP  d) where appropriate, with respect to the probability of harmful interference to the service rendered by a space radiocommunication station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639BM if this frequency assignment has not in fact caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

639BQ  e) where appropriate, with respect to the probability of harmful interference to the service rendered by a station in the [fixed or mobile] service for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 501 or [570AB], as appropriate, if this frequency assignment has not, in fact, caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

B6—15
639BR  

f) where appropriate, with respect to the probability of harmful interference caused to the receiving earth station by a station in the [fixed or mobile] service for which a frequency assignment already recorded in the Master Register is in conformity with No. 501 or [570AB], as appropriate.

639BS  

When, following an examination of a notice with respect to No. 639BP, the Board reaches an unfavourable finding based upon the probability of harmful interference to a recorded assignment for a space station which the Board has reason to believe may not be in regular use, the Board shall forthwith consult the administration responsible for the registered assignment. If it is established, after such consultation and on the basis of the information available, that the recorded assignment has not been in use for two years, it shall not be taken into account for the purposes of the examination in progress and any other further examination under No. 639BP conducted before the date on which the assignment is brought back into use. Before the assignment is brought back into use, it shall be subject to further co-ordination in accordance with the provisions of No. 639AJ or further examination by the Board with respect to No. 639BP as appropriate. The date on which the assignment is brought back into use shall then be entered in the Master Register.

639BT § 14. Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 639BM, 639BN, 639BO, 639BP, 639BQ and 639BR, as appropriate, further action shall be as follows:

639BU § 15. (1) Finding favourable with respect to No. 639BM in cases where the provisions of Nos. 639BN and 639BO are not applicable.

639BV  

(2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
639BW § 16. (1) Finding unfavourable with respect to No. 639BM;

639BX (2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, and the finding is favourable with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

639BY (3) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115 and the finding is unfavourable with respect to Nos. 639BN, 639BO, 639BP, 639BQ or 639BR, as appropriate, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.

639BZ (4) The period of one hundred and twenty days mentioned in Nos. 639BY and 639CP shall count:

— from the date when the assignment to the space radio-communication station which received an unfavourable finding is brought into use, if the assignment to the station which was the basis for the unfavourable finding is then in use;

— otherwise, from the date when the assignment to the station which was the basis for the unfavourable finding is brought into use.
But if the assignment to the station which was the basis for the unfavourable finding has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance shall, if necessary, be made for the additional period mentioned in No. 639CY.

639CA (5) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

639CB (6) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 639CA. If it is resubmitted with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of No. 639BX or 639BY, as appropriate. If it is resubmitted with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 639BM, it shall be treated as a new notice.

639CC § 17. (1) Finding favourable with respect to No. 639BM in cases where the provisions of No. 639BN or 639BO are applicable.

639CD (2) Where the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BO have been successfully completed with all administrations whose space radiocommunication stations or stations in the [fixed or mobile] service may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
639CE  (3) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take appropriate action and shall inform the administrations concerned of the results obtained. If the Board’s efforts are successful, the notice shall be treated in accordance with No. 639CD. If the Board’s efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of Nos. 639BP, 639BQ and 639BR, as appropriate.

639CF  (4) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

639CG  (5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BO have been successfully completed with all administrations whose space radiocommunication stations or stations in the [fixed or mobile] service may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

639CH  (6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination under No. 639AJ or 639AN, it shall be treated in accordance with the provisions of No. 639CE. However, in any subsequent recording
of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

639CI (7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, the Board shall inform the administrations concerned thereof. The notice shall be examined by the Board with respect to the provisions of Nos. 639BP and 639BQ, as appropriate. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

639CJ § 18. (1) Finding favourable with respect to Nos. 639BM, 639BP, 639BG and 639BR, as appropriate.

639CK (2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

639CL (3) However, should the examination show that the level of the interference noise and the percentage of time during which it occurs have values slightly greater than those used for assessing the probability of harmful interference (extreme propagation conditions, abnormal atmospheric humidity, etc.), a remark shall be included in the Master Register to show that there may be a slight risk of harmful interference and hence additional precautions must be taken in the use of the assignment to avoid harmful interference to assignments already recorded in the Master Register.

639CM § 19. (1) Finding favourable with respect to No. 639BM but unfavourable with respect to Nos. 639BP, 639BQ or 639BR, as appropriate

639CN (2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this
finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

639CO  (3) Should the notifying administration resubmit the notice with modifications which result, after re-examination, in a favourable finding by the the Board with respect to Nos. 639BP, 639BQ and 639BR, as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be indicated in the Remarks Column.

639CP  (4) Should the notifying administration resubmit the notice, either unchanged, or with modifications which decrease the probability of harmful interference, but not sufficiently to permit the provisions of No. 639CO to be applied, and should that administration insist upon reconsideration of the notice, but should the Board’s finding remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column. The period of one hundred and twenty days shall count from the date indicated in No. 639BZ.

639CQ § 20. (1) Notices relating to radio astronomy stations.

639CR  (2) A notice relating to a radio astronomy station shall not be examined by the Board with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR. Whatever the finding, the assignment
shall be recorded in the Master Register with a date in Column 2c. The date of receipt by the Board of the notice shall be recorded in the Remarks Column.

639CS § 21. (1) Change in the basic characteristics of assignments already recorded in the Master Register.

639CT (2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix [1A] (except the name of the station or the name of the locality in which it is situated) shall be examined by the Board according to No. 639BM, and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, and the provisions of Nos. 639BU to 639CR inclusive applied. Where the change should be recorded, the assignment shall be amended according to the notice.

639CU (3) However, in the case of a change in the characteristics of an assignment which is in conformity with No. 639BM, should the Board reach a favourable finding with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, where appropriate, or find that the changes does not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. The date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.

639CV § 22. In applying the provisions of the whole of this Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

639CW § 23. (1) Recording of Frequency Assignments notified before being brought into use.
639CX  (2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to No. 639BM and, where appropriate, Nos. 639BN, 639BO, 639BF, 639BQ and 639BR, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.

639CY  (3) If, within thirty days after the projected date of bringing into use, the Board receives confirmation from the notifying administration of the date of putting unto use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

639CZ  (4) In the circumstances described in Nos. 639BY and 639CP, and as long as an assignment which received an unfavourable finding cannot be resubmitted as a consequence of the provisions of No. 639BZ, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 639BY or 639CP, as appropriate, the information relating to the absence of complaint of harmful interference.

639DA  (5) If the Board does not receive this confirmation within the period referred to in No. 639CY or at the end of the period referred to No. 639BY or 639CP, as appropriate, the entry concerned shall be cancelled. The Board shall advise the administration concerned before taking such action.

Section V. Recording of Findings in the Master Register

639DB § 24. In any case where a frequency assignment is recorded in the Master Register, the finding reached by the Board shall be indicated
by a symbol in Column 13a. In addition, a remark indicating the reasons for any unfavourable finding shall be inserted in the Remarks Column.

Section VI. Categories of Frequency Assignments

639DC § 25. (1) The date in Column 2c shall be the date of putting into use notified by the administration concerned. It is given for information only.

639DD  (2) If harmful interference is actually caused to the reception of any space radiocommunication station whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to Nos. 639BM, 639BN, 639BO, 639BP, 639BQ and 639BR, as appropriate, by the use of a frequency assignment to a space radiocommunication station which has been recorded in the Master Register in accordance with the provisions of No. 639CP, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

639DE  (3) If harmful interference to the reception of any station whose assignment is in accordance with No. 501, [570AB] or 639BM, as appropriate, is actually caused by the use of a frequency assignment which is not in conformity with No. 639BM, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

Section VII. Review of Findings

639DF § 26. (1) The review of a finding by the Board may be undertaken:

— at the request of the notifying administration,
— at the request of any other administration interested in the question, but only on the grounds of actual harmful interference,

— on the initiative of the Board itself when it considers this is justified.

639DG (2) The Board, in the light of all the data at its disposal shall review the matter, taking into account No. 639BM and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR and shall render an appropriate finding, informing the notifying administration prior either to the promulgation of its finding or to any recording action.

639DH § 27. (1) After actual use for a reasonable period of an assignment which has been entered in the Master Register on the insistence of the notifying administration, following an unfavourable finding with respect to Nos. 639BP, 639BQ or 639BR, this administration may request the Board to review the finding. Thereupon the Board shall review the matter, having first consulted the administrations concerned.

639DI (2) If the finding of the Board is then favourable it shall enter in the Master Register the changes that are required so that the entry shall appear in the future as if the original finding had been favourable.

639DJ (3) If the finding with regard to the probability of harmful interference remains unfavourable, no change shall be made in the original entry.

Section VIII. Modification, Cancellation and Review of Entries in the Master Register

639DK § 28. (1) Where the use of a recorded assignment to a space station is suspended for a period of eighteen months, the notifying administration shall, within that eighteen month period, inform the Board
of the date on which such use was suspended and of the date on which the assignment is to be brought back into regular use.

639DL (2) Whenever it appears to the Board, whether or not as a result of action under No. 639DK, that a recorded assignment to a space station has not been in regular use for more than eighteen months, the Board shall inquire of the notifying administration as to when the assignment is to be brought back into regular use.

639DM (3) If no reply is received within six months of action by the Board under No. 639DL, or if the reply does not confirm that the assignment to a space station is to be brought back regular use within this six month limit, a mark shall be applied against the entry in the Master Register. Thereafter, the assignment shall be treated in accordance with No. 639BS as one which has been established as having been out of regular use for two years.

639DN § 29. In case of permanent discontinuance of the use of any recorded frequency assignment, the notifying administration shall inform the Board within ninety days of such discontinuance, whereupon the entry shall be removed from the Master Register.

639DO § 30. Whenever it appears to the Board from the information available that a recorded assignment has not been brought into regular operation in accordance with the notified basic characteristics, or is not being used in accordance with those basic characteristics the Board shall consult the notifying administration and, subject to its agreement, shall either cancel or suitably modify the entry.

639DP § 31. If, in connection with an enquiry by the Board under No. 639DO, the notifying administration has failed to supply the
Board within forty-five days with the necessary or pertinent information, the Board shall make suitable entries in the Remarks Column of the Master Register to indicate the situation.

Section IX. Studies and Recommendations

639DQ § 32. (1) If it is requested by any administration, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall conduct a study of cases of alleged contravention or non-observance of these Regulations, or of harmful interference.

639DR (2) The Board shall thereupon prepare and forward to the administration concerned a report containing its finding and recommendations for the solution of the problem.

639DS § 33. In a case where, as a result of a study, the Board submits to one or more administrations suggestions or recommendations for the solution of a problem, and where no answer has been received from one or more of these administrations within a period of ninety days, the Board shall consider that the suggestions or recommendations concerned are unacceptable to the administrations which did not answer. If it was the requesting administration which failed to answer within this period, the Board shall close the study.

Section X. Miscellaneous Provisions

639DT § 34. (1) If it is requested by any administration, particularly by an administration of a country in need of special assistance, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall render the following assistance:

a) computation of the increase in the equivalent noise temperature of an earth station receiver as in No. 639AK;
b) preparation of the diagram showing the co-ordination area as in No. 639AN;

c) any other assistance of a technical nature for completion of the procedures in this Article.

639DU (2) In making a request to the Board under No. 639DT, the administration shall furnish the Board with the necessary information.

639DV § 35. The technical standards of the Board shall be based upon the relevant provisions of these Regulations and the Appendices thereto, the decisions of Administrative Conferences of the Union as appropriate, the Recommendations of the C.C.I.R., the state of the radio art, and the development of new transmission techniques.

639DW § 36. The Board shall promulgate to administrations its findings and reasons therefor, together with all changes made to the Master Register, through the weekly circular referred to in No. 497.

639DX § 37. In case a Member or Associate Member of the Union avails itself of the provisions of Article 28 of the Convention, the Board shall, upon request, make its records available for such proceedings as are prescribed in the Convention for the settlement of international disputes.
SUMMARY RECORD

OF THE

THIRD MEETING OF COMMITTEE 6

Thursday, 8 July 1971, at 2035 hrs

Acting Chairman: Mr. M.K. BASU (India)

Subjects discussed

1. Summary Record of the Second Meeting

2. Article 14

3. Article 9A

Document No.

307

195, 284

310, 48(Rev), 33
1. **Summary Record of the second meeting** (Document No. 307)

   Approved.

2. **Article 14** (Document No. 195, 284)

   The Chairman stated that paragraph 2 of Document No. 195 showed the modification proposed to Article 14 by Working Group 6B. Committee 4 had now finalized the new text of No. 470 V, as shown in Document No. 284, page 3.

   There being no comments, it was agreed that MOD RR 695 Spa (Document No. 195, paragraph 2) should be transmitted to the Drafting Group for submission to the Plenary.

3. **Article 9A** (Document No. 310, 48(Rev.))

   The Chairman of Working Group 6A introduced Document No. 310 which represented the result of several weeks of hard work by experts from a number of delegations, who had attempted to draft a new Article 9A on the basis of the six principles set out on pages 1 - 2 of Document No. 310. The square brackets in Document No. 310 were mostly around the names of services and the Working Group had considered that they should be retained until the new names of the services had been adopted by Committees 4 and 5. To save time, he proposed that the Committee should appoint a small drafting group to bring the names of services into conformity with the terms and definitions now agreed by Committees 4 and 5.

   The Chairman invited the Committee to consider Document No. 310 page by page. Any typographical errors pointed out in the course of discussion would be corrected before the document was submitted to the Plenary. As suggested by the Chairman of Working Group 6A, he appointed a small drafting group consisting of Mr. Davis (United Kingdom), Mr. Chaspoul (France) and Mr. Hernandez (Mexico) to remove the square brackets in Document No. 310, after consideration of Document No. 255 and "blue" Document B3.

Page 3

The Chairman of Working Group 6A explained that there had been a difference of opinion regarding the words "except the broadcasting satellite service" in square brackets in the title. Some delegates thought that pending
the convening at some future date of a broadcasting satellite planning conference, the broadcasting satellite service as a whole should be excluded from Article 9A, and should be covered by a resolution dealing with co-ordination procedure for broadcasting satellites vis-à-vis other space systems. Sub-Working Group 6A-2 was considering the point, and had almost reached agreement on it.

On the proposal of the delegate of the United States, supported by the delegates of Japan and the United Kingdom, it was agreed that square brackets should be retained round the words "except the broadcasting satellite service" until Sub-Working Group 6A-2 had finished its work.

In reply to a question by the delegate of Pakistan on ADD Section I, the representative of the I.F.R.B. said that existing satellite systems were notified and registered in accordance with existing regulations, and that would continue until the new regulations to be approved by the present Conference were brought into force.

Page 3 was approved.

Pages 4, 5, 6 and 7 were approved.

Pages 8 - 9

The Chairman of Working Group 6A pointed out that footnote 1) on page 8 was closely related to the words "except the broadcasting satellite service" on page 3, and proposed that in view of the treatment of page 3, footnote 1) should also be kept in square brackets till a further decision was taken. It might be necessary to re-word ADD 639AK in the light of Committee 4's decision.

The delegate of Denmark said that the words "in another \[system\]" in the third line of ADD 639AK, para. 2(a) should be "to another \[system\]", and that was accepted.

The delegate of Denmark further suggested that if the line in question read: "caused by a new frequency assignment to another \[system\]", it would be possible to delete sub-para. 2(b) of ADD 639AK. The representative of the I.F.R.B. pointed out that if sub-para. 2(b) was deleted, it would mean that administrations would have to effect co-ordination even in cases where it was not absolutely necessary, e.g. if noise temperature had been reduced.
It was agreed that the delegates of the United Kingdom and France should re-draft sub-para. 2(a) of ADD 639AK for submission to the Plenary without square brackets, and that the delegates of the United Kingdom, France and Denmark with the assistance of the representative of the I.F.R.B. should consider whether or not to retain sub-para. 2(b).

Page 10

The Chairman of Working Group 6A drew attention to the square brackets in the fifth, sixth, ninth and tenth lines of MOD 639AN, which had been retained pending a decision by Committee 5 on the terrestrial services which would share bands with space services.

The delegate of the Netherlands suggested that the fifth line should be altered to read "rights to space radiocommunication and terrestrial services" and that the phrase in square brackets in the ninth and tenth lines should be deleted.

The delegate of the United States of America said he was not sure that Appendix 28, setting out the co-ordination procedure, in fact dealt with all the terrestrial services sharing bands with space services. It would therefore be best to keep the square brackets until the new version of Appendix 28 was available. It was so agreed.

The delegate of Canada proposed that the words "distance from" in the fourteenth line should be replaced by "area around".

The delegate of the United Kingdom supported that proposal, but pointed out that two co-ordination areas were involved. The words should therefore be "areas around", and the phrase "as a function of azimuth" could then be deleted.

Page 10, as amended by the Canadian and United Kingdom delegates, was approved.

Pages 11, 12 and 13

At the invitation of the Chairman, the delegate of India who had participated in a small sub-group of Working Group 6A to reconcile divergent views on the use of the terms "acceptable", "admissible" and "permissible" interference levels, said that the sub-group had decided that the terms in Document No. DT/87(Rev.) could be improved upon and had consequently submitted Nos. ADD 639A0 and MOD 639AP for insertion in the Radio Regulations.

Pages 11, 12 and 13 were approved.
The delegate of Japan drew attention to his delegation's proposal on page 4 of Document No. 33, to the effect that the words "(except Region 3)" should be added after "the band 4,400-4,700 Mc/s" and "the band 8,100-8,400 Mc/s" in sub-paragraph c). In view of the microwave radio relay system being planned in Region 3, it was becoming increasingly desirable to effect co-ordination on the bands in question.

The delegates of India, Pakistan and Korea supported that proposal.

The delegate of Australia said he could not support the Japanese proposal and suggested that the square brackets round sub-paragraph c) be deleted.

The delegate of New Zealand said that he too could not support the Japanese proposal with regard to the whole of Region 3, although he would not object to the application of the co-ordination procedure north of the Equator.

In reply to a query by the delegate of the U.S.S.R., the Chairman of the I.E.R.B. said that, whereas Committee 5 had made no change in the provision, the question of effecting co-ordination fell within the terms of reference of Committee 6.

After a brief procedural discussion, it was decided to accept the Japanese proposal, on the understanding that the Australian delegation was entitled to raise the matter again in the Plenary Meeting.

Page 14, as amended, and pages 15 to 22 were approved.

The delegate of France pointed out that his Delegation had submitted some relevant proposals in Document No. 48 and, on finding that other delegations held different views on the subject, had sought a compromise solution by submitting the Draft Recommendation in Document No. 48(Rev.). That document would be considered in detail in Working Group 6A, but the French Delegation would like to know whether the Committee agreed on the principles of the Recommendation. If that were the case, it could give its unreserved support to ADD 639RS.

The delegate of Canada said he could support the principle and wording of the French Draft Recommendation, as well as Nos. ADD 639DK, ADD 639DL and ADD 639DM, which also constituted elements of a compromise solution for the problem of removing "deadwood" from the Master Register.
The delegates of the U.S.S.R., Mexico and Brazil also supported the idea contained in the French Draft Recommendation.

Pages 23 to 42 were approved.

The Chairman of Working Group 6A said that the Group had left it to the Committee itself to decide whether MOD 639DV should be aligned with No. 636 or No. 639CP of the existing Radio Regulations.

In reply to questions by the delegate of India, the Chairman of the I.F.R.B. explained that if MOD 639DV were aligned with No. 639CP, the Board would find itself in a dilemma in a case where technical information required for the examination of a notice received could not be found in the Recommendations of the C.C.I.R., and might be obliged to send back the notice. One case had already arisen where the necessary information could not be provided by the C.C.I.R., but the Board had been able to solve the problem by its own resources. With the development of space techniques, however, more and more such cases could be expected to arise, and the work of the I.F.R.B. would be facilitated and the interests of administrations would be best served by aligning MOD 639DV with No. 636.

At the proposal of the delegate of India, supported by the delegates of the United States of America, the United Kingdom and the Netherlands, it was decided to remove the square brackets from MOD 639DV.

Page 43 was approved.

The Chairman observed that the only passages remaining in square brackets were those in the title and on pages 8 and 9. Working Group 6A would try to solve the problems concerned and would communicate the results to the Editorial Committee. The brackets would, however, be retained if the Working Group failed to reach agreement.

On that understanding, Document No. 310, as amended, was approved.

The meeting rose at 2240 hrs.

The Secretary: W. GARCIA-RIOS

The Chairman: M.K. BASU
THIRD REPORT FROM COMMITTEE 6

(REGULATIONS)

Article 14

The revised text of the provisions of No. 695 of the Radio Regulations appearing in the Annex to the present Report were adopted by Committee 6.

M. K. BASU
Chairman

Annex : 1
ANNEX

Article 14

MOD RR695

Replace the text of the last sub-paragraph Spa by the following:

- the conditions specified under No. 470V shall be fulfilled.
REPORT OF WORKING GROUP 6A

On 10 July 1971, Working Group 6A considered draft Appendices 1 and 1A prepared by Sub-Working Group 6A-4/4E and contained in Documents Nos. DT/103 and DT/102 respectively. After having examined them, Working Group 6A approved these documents provisionally as a whole and submits herewith to Committee 6 in Annexes I and II draft Appendices 1 and 1A.

P.E. Willems
Chairman
Working Group 6A

Annexes: I and II
ANNEX I

DRAFT MODIFICATIONS TO APPENDIX 1

In view of the addition of an item in Sections B, C, D and E of Appendix 1A related to "Agreements", it is necessary to introduce the same item in Sections A, B and C of Appendix 1, as follows:

1) At the end of Section A of Appendix 1, to read:

"Supplementary information:

a) Reference frequency, if any, and any co-ordination required by No. 492A.

b) Indicate any administration with which an agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement."

2) At the end of Sections B and C of Appendix 1, to read:

"Supplementary information:

a) Any co-ordination required by 492A.

b) Indicate any administration with which an agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement."
ANNEX II

DRAFT APPENDIX IA

Spa

NOTICES RELATING TO STATIONS IN THE SPACE AND RADIO ASTRONOMY SERVICES (see Article 9A)

Section A. General instructions

1. A separate notice shall be sent to the International Frequency Registration Board for notifying:
   - each new frequency assignment,
   - any change in the characteristics of a frequency assignment recorded in the Master International Frequency Register (hereinafter called the Master Register),
   - any total deletion of a frequency assignment recorded in the Master Register.

2. When submitting notices under No. / 639BA / for earth and space transmitting assignments and under No. / 639BB / for space and earth receiving assignments, separate notice shall be submitted to the Board for each assignment to an earth or space station. In the case of a passive satellite system, only earth transmitting and receiving assignments shall be notified.

3. In the case of a satellite system employing multiple space stations with the same general characteristics, a separate notice shall be submitted for each space station:
   - when it is aboard a geostationary satellite, or
when it is aboard a non-geostationary satellite except when a number of satellites have the same radio frequency characteristics and orbital characteristics (excluding the ascending node position). In this case one notice covering all such space stations may be submitted.

4. The following basic information shall be shown on the notice:

(a) the serial number of the notice and the date on which the notice is sent to the Board;

(b) the name of the notifying administration;

(c) sufficient data to identify the particular satellite network in which the earth or space station will operate;

(d) whether the notice reflects:

(1) the first use of a frequency by a station,

(2) a change in the characteristics of a frequency assignment recorded in the Master Register (indicate whether the change is a replacement, addition or deletion of existing characteristics), or

(3) a deletion of an assignment in all of its notified characteristics;

(e) reference to the weekly circular providing the advance publication information required in accordance with No. 639AA;

(f) basic characteristics as outlined in section B, C, D, E or F as appropriate;

(g) any other information which the administration considers to be relevant, e.g. any factors taken into account when applying Appendix 28 for the determination of co-ordination area and also an indication that the assignment concerned would be operating in accordance with No. 115, information concerning the use of the notified frequency if such use is restricted, or, in the case of notices pertaining to space stations, if the transmissions of the station are to be permanently switched off after a certain period.
Section B. Basic characteristics to be furnished in notices relating to frequencies used by earth stations for transmitting

Item 1  Assigned frequency

Indicate the assigned frequency as defined in Article 1, in kHz up to 30 000 kHz inclusive, and in MHz above 30 000 kHz (see number 85).

Item 2  Assigned frequency band

Indicate the bandwidth of the assigned frequency band in kHz (see number 89).

Item 3  Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) of putting the frequency assignment into use.

(b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4(a)), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4  Identity and location of the transmitting earth station.

(a) Indicate the name by which the station is known or the name of the locality in which it is situated.

(b) Indicate the country in which the station is located. Symbols from the Preface to the International Frequency List should be used.

(c) Indicate the geographical co-ordinates (in degrees and minutes) of the transmitter site.

Item 5  Station(s) with which communication is to be established

Identify the associated receiving space station(s) by reference to the notification thereof or in any other appropriate manner, or, in the case of a passive satellite, the identity of the satellite and the location of the receiving earth station(s).
Item 6  Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 7  Class of emission, necessary bandwidth and description of transmission

(a) Indicate the class of emission of the assignment

(b)* Indicate the carrier frequency or frequencies of the emission(s)

(c)* Indicate for each carrier the class of emission, necessary bandwidth and description of transmission, in accordance with Article 2 and Appendix 5.

Item 8  Power characteristics of the transmission

(a)* Indicate for each carrier the peak power supplied to the input of the antenna;

(b) Indicate the total peak power and the maximum power density per c/s supplied to the input of the antenna averaged over the worst 4 kHz band, for carriers below 15 GHz or averaged over the worst 1 MHz band, for carriers above 15 GHz.

Item 9*  Transmitting antenna characteristics

(a) Indicate the isotropic gain (dB) of the antenna in the direction of maximum radiation (see number 100).

(b) Indicate the beamwidth in degrees between the half power points (describe in detail if not symmetrical).

(c) Either attach the measured radiation diagram of the antenna (taking as a reference the direction of maximum radiation) or indicate the reference radiation diagram to be used for co-ordination.

(d) Indicate graphically the horizon elevation angle for each azimuth around the earth station.

(e) Indicate in degrees from the horizontal plane the planned minimum operating angle of elevation of the antenna in the direction of maximum radiation;

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(f) Indicate in degrees clockwise from true North the planned range of operating azimuthal angles for the direction of maximum radiation.

(g) Indicate the type of polarization of the transmitted wave in the direction of maximum radiation; also indicate the sense in the case of circular polarization and the plane in the case of linear polarization.

(h) Indicate the altitude (metres) of the antenna above mean sea level.

Item 10* Modulation characteristics

For each carrier, according to the nature of the signal modulating the carrier and the type of modulation, indicate the following characteristics:

(a) Carrier frequency-modulated by a frequency-division multichannel telephony baseband (FDM-FM) or by a signal that can be represented by a multichannel telephony baseband; indicate the lowest and highest frequencies of the baseband and the r.m.s. frequency deviation of the test tone as a function of baseband frequency.

(b) Carrier frequency-modulated by a television signal; indicate the standard of the television signal (including, where appropriate, the standard used for colour), the frequency deviation for the reference frequency of the pre-emphasis characteristic and the pre-emphasis characteristic itself. Also indicate, where applicable, the characteristics of the multiplexing of the video signal with the sound signal(s) or other signals.

(c) Carrier phase-shift-modulated by a pulse code modulation signal (PCM/FSK); indicate the bit rate and the number of phases.

(d) Amplitude-modulated carrier (including single sideband); indicate as precisely as possible the nature of the modulating signal and the kind of amplitude modulation used.

(e) For all other types of modulation, provide such particulars as may be useful for an interference study.

(f) For any type of modulation as applicable indicate the characteristics of energy dispersal.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
Item 11 Maximum hours of operation

Indicate in GMT the maximum hours of operation on the frequency of each carrier.

Item 12 Co-ordination

Give the name of any administration with which the use of this frequency has been successfully co-ordinated in accordance with Nos. 639AJ and 639AN and, if appropriate, the name of any administration with which co-ordination has been sought but not effected.

Item 13 Agreements

Give also, if appropriate, the name of any Administration with which agreement has been effected to exceed the limits prescribed in these Regulations, and the contents of such agreement.

Item 14 Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic address of the administration to which communications should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of stations (see Article 15).

Section C. Basic characteristics to be furnished in notices relating to frequencies to be received by earth stations

Item 1 Assigned frequency

Indicate the assigned frequency of the emission to be received, as defined in Article 1, in kc/s up to 30 000 kc/s inclusive, and in Mc/s above 30 000 kc/s. (See number 85)

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band (see number 89).

Item 3 Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) when reception of the assigned frequency begins.
(b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4 (a)), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity and location of the receiving earth station

(a) Indicate the name by which the receiving earth station is known or the name of the locality in which it is situated.

(b) Indicate the country in which the receiving earth station is located. Symbols from the Preface to the International Frequency List should be used.

(c) Indicate the geographical co-ordinates (in degrees and minutes) of the receiver site.

Item 5 Station(s) with which communication is to be established

Identify the associated transmitting space station(s) by reference to the notification thereof or in any other appropriate manner, or, in the case of a passive satellite, the identity of the satellite(s) and the associated transmitting earth station(s).

Item 6 Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 7 Class of emission, necessary bandwidth and description of the transmission to be received

(a) Indicate the class of emission of the assignment to be received.

(b)* Indicate the carrier frequency or frequencies to be received.

(c)* Indicate, for each carrier to be received, the class of emission, necessary bandwidth and description of the transmission, in accordance with Article 2 and Appendix 5.

Item 8 Earth station receiving antenna characteristics

(a) Indicate the isotropic gain (dB) of the antenna in the direction of maximum radiation (see number 100).

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(b) Indicate the beamwidth in degrees between the half power points (describe in detail if not symmetrical).

(c) Either attach the measured radiation diagram of the antenna (taking as a reference the direction of maximum radiation) or indicate the reference radiation diagram to be used for co-ordination.

(d) Indicate graphically the horizon elevation angle for each azimuth around the earth station.

(e) Indicate in degrees from the horizontal plane the planned minimum operating angle of elevation of the antenna in the direction of maximum radiation.

(f) Indicate in degrees, clockwise from true North, the planned range of operating azimuthal angles for the direction of maximum radiation.

(g) Indicate the altitude (metres) of the antenna above mean sea level.

Item 9 Noise temperature

Indicate the lowest equivalent satellite link noise temperature in degrees Kelvin (see number ..) under "quiet sky conditions". This value shall be indicated for the nominal value of the angle of elevation when the associated transmitting station is aboard a geostationary satellite and, in other cases, for the minimum value of angle of elevation.

Item 10 Maximum hours of reception

Indicate in GMT the maximum hours of reception of the frequency of each carrier.

Item 11 Co-ordination

Give the name of any administration with which the use of this frequency has been successfully co-ordinated in accordance with Nos. [639AJ] and [639AN] and, if appropriate, the name of any administration with which co-ordination has been sought but not effected.

Item 12 Agreements

Give also, if appropriate, the name of any Administration with which agreement has been effected to exceed the limits prescribed in these Regulations, and the contents of such agreement.
Item 13  Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference and questions referring to the technical operation of stations (see Article 15).

Section D. Basic characteristics to be furnished in notices relating to frequencies used by space stations for transmitting

Item 1  Assigned frequency

Indicate the assigned frequency as defined in Article 1, in $k[c/s]$ up to 30,000 $k[c/s]$ inclusive, and in $m[c/s]$ above 30,000 $k[c/s]$ (see number 85). At least one separate assignment notice should be made out for each antenna radiation beam.

Item 2  Assigned frequency band

Indicate the bandwidth of the assigned frequency band in $k[c/s]$ (see number 89).

Item 3  Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) of putting the frequency assignment into use.

(b) Whenever the assignment is changed in any of its basic characteristics as shown in this Section (except in the case of a change in Item 4), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4  Identity of the space station(s)

Indicate the identity of the space station(s).

Item 5  Orbital information

(a) In the case of a space station aboard a geostationary satellite indicate the nominal geographical longitude on the geostationary satellite orbit and the longitudinal and inclination tolerances. Indicate also:
(1) the arc of the geostationary satellite orbit over which
the space station is visible, at a minimum angle of
elevation of 10° at the earth's surface, from its
associated earth stations or service areas; and

(2) the arc of the geostationary satellite orbit within
which the space station could provide the required
service to its associated earth stations or service
areas; and

(3) in the event that the arc stated in paragraph (2) above
is less than the arc stated in paragraph (1) above,
provide the reasons therefor.

Note: The arcs specified in (1) and (2) will be
indicated by the geographical longitude of the
projection of the extremes of these arcs on the
surface of the earth.

(b) In the case of space station(s) aboard non-geostationary
satellite(s), indicate the angle of inclination of the orbit, the
period and the altitudes in kilometres of the apogee and perigee of
the space station(s) and the number of satellites used.

Item 6 Service area

Indicate the service area or areas on the earth or the
name of the locality and country in which the associated receiving
station(s) is (are) located.

Item 7 Class of station and nature of service

Indicate the class of station and nature of service
performed, using the symbols shown in Appendix 10.

Item 8 Class of emission, necessary bandwidth and description of
transmission

(a) Indicate the class of emission of the assignment.

(b) Indicate the carrier frequency or frequencies.

* This information need only be supplied in the notice when such information
has been used as a basis to effect co-ordination with another
administration.
(c) Indicate, for each carrier, the class of emission, necessary bandwidth and description of transmission, in accordance with Article 2 and Appendix 5.

Item 9  
Power characteristics of the transmission

(a) Indicate for each carrier the peak power supplied to the input of the antenna.

(b) Indicate the total peak power and the maximum power density per cycle per second input of the antenna averaged over the worst 4 kHz band for carriers below 15 GHz or averaged over the worst 1 MHz band for carriers above 15 GHz.

Item 10  
Space station transmitting antenna characteristics

For each service area:

(a) In the case of a space station aboard geostationary satellite, indicate the gain of the space station transmitting antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

(b) In the case of a space station aboard non-geostationary satellite, indicate the isotropic gain of the space station transmitting antenna in the main direction of radiation and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of radiation as a reference.

(c) Indicate the type of polarization of the antenna, the sense in the case of circular polarization, and the plane in the case of linear polarization; also indicate the worst case axial ratio in the half power beamwidth.

(d) Indicate for geostationary satellite, the pointing accuracy of the antenna.

* This information need only be supplied in the notice when such information has been used as a basis to effect de-ordination with another administration.
Item 11* Modulation characteristics

For each carrier, according to the nature of the signal modulating carrier and the type of modulation, indicate the following characteristics:

(a) Carrier frequency-modulated by a frequency-division multichannel telephony baseband (FDM-FM) or by a signal that can be represented by a multichannel telephony baseband; indicate the lowest and highest frequencies of the baseband and the r.m.s. frequency deviation of the test tone as a function of baseband frequency.

(b) Carrier frequency-modulated by a television signal; indicate the standard of the television signal (including, where appropriate, the standard used for colour), the frequency deviation for the reference frequency of the pre-emphasis characteristic and the pre-emphasis characteristic itself. Also indicate, where applicable, the characteristics of the multiplexing of the video signal with the sound signal(s) or other signals.

(c) Carrier phase-shift-modulated by a pulse code modulation signal (PCM/PSK); indicate the bit rate and the number of phases.

(d) Amplitude-modulated carrier (including single sideband); indicate as precisely as possible the nature of the modulating signal and the kind of amplitude modulation used.

(e) For all other types of modulation, provide such particulars as may be useful for an interference study.

(f) For any type of modulation as applicable indicate the characteristics of energy dispersal.

Item 12 Maximum hours of operation

Indicate in GMT the maximum hours of operation on the frequency of each carrier.

Item 13 Co-ordination

Give the name of any administration or group of administrations with which the use of the space system to which the space station belongs has been successfully co-ordinated in accordance with No. 839A/17.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
Item 14 Agreements

Give also, if appropriate, the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement.

Item 15 Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of stations (see Article 15).

Section E. Basic characteristics to be furnished in notices relating to frequencies to be received by space stations.

Item 1 Assigned frequency

Indicate the assigned frequency of the emission to be received, as defined in Article 1, in kHz up to 30,000 kHz inclusive, and in MHz above 30,000 kHz (see number 85). At least one separate assignment notice should be made out for each antenna radiation beam.

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in kHz (see number 89).

Item 3 Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) when reception of the assigned frequency begins.

(b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).
Item 4  Identity of the receiving space station(s)

Indicate the identity of the receiving space station(s).

Item 5  Orbital information

(a) In the case of a space station aboard a geostationary satellite, indicate the planned nominal geographical longitude on the geostationary satellite orbit and the planned longitudinal and inclination tolerances. Indicate also:

(1) the arc of the geostationary orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth's surface, from its associated earth stations or service areas; and

(2) the arc of the geostationary orbit within which the space station could provide the required service to its associated earth stations or service areas; and

(3) in the event that the arc stated in paragraph (2) above is less than the arc stated in paragraph (1) above, provide the reasons therefor.

Note: The arcs specified in (1) and (2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

(b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period and the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites used.

Item 6  Associated transmitting earth station(s)

Identify the associated transmitting earth station(s) by reference to the notification thereof or in any other appropriate manner.
Item 7  Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 8  Class of emission, necessary bandwidth and description of the transmission(s) to be received

(a) Indicate the class of emission of the assignment to be received.

(b)* Indicate the carrier frequency or frequencies of the transmissions(s) to be received.

(c)* Indicate, for each carrier to be received, the class of emission, necessary bandwidth and description of the transmission(s) to be received, in accordance with Article 2 and Appendix 5.

Item 9  Space station receiving antenna characteristics

For each receiving beam:

(a) In the case of a space station aboard geostationary satellite, indicate the gain of the space station receiving antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

(b) In the case of a space station aboard non-geostationary satellite, indicate the isotropic gain of the space station receiving antenna in the main direction of radiation and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of radiation as a reference.

(c)* Indicate the type of polarization of the antenna, the sense in the case of circular polarization, and the plane in the case of linear polarization, also indicate the worst case axial ratio in the half power beamwidth.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(d) Indicate, for geostationary satellite, the pointing accuracy capability of the antenna.

Item 10 Noise temperature

Indicate the total receiving system noise temperature (°K) at the input of the space station receiver.

Item 11 Maximum hours of reception

Indicate in GMT the maximum hours of reception of the frequency of each carrier.

Item 12 Co-ordination

Give the name of any administration or group of administrations with which the use of the space system to which the space station belongs has been successfully co-ordinated in accordance with No. 639AJ_7.

Item 13 Agreements

Indicate also if appropriate the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement.

Item 14 Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference and questions referring to the technical operation of stations (see Article 15).

Following a discussion on Document No. 183, which took place in Working Group 6A on 10 July 1971, the attached list of draft amendments to be made to Appendix 10 of the Radio Regulations is submitted to Committee 6 for consideration.

P.E. WILLEMS
Chairman
Working Group 6A
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
1. **New symbols**

- **EA**: Space station in the Amateur Satellite Service
- **TA**: Space operation earth station in the Amateur Satellite Service
- **EB**: Space station in the Broadcasting-Satellite Service (sound broadcasting)
- **EV**: Space station in the Broadcasting-Satellite Service (television)
- **TF**: Fixed earth station in the Radiodetermination Satellite Service
- **TL**: Mobile earth station in the Radiodetermination Satellite Service
- **TT**: Earth station in the Space Operation Service
- **TP**: Receiving earth station

2. **Amendments to existing symbols**

   Replace:

   - **FE**: Earth station (Earth-Space Service)

   by

   - **TE**: Transmitting earth station
3. The Drafting Committee will have to amend the following symbols to adapt them to the new definitions for the services:

Replace:

EC: Communication-satellite space station
   by
   Space station in the Fixed Satellite Service

TC: Communication-satellite earth station
   by
   Earth station in the Fixed Satellite Service

TH: Space research earth station
   by
   Earth station in the Space Research Service

TM: Meteorological-satellite earth station
   by
   Earth station in the Meteorological-Satellite Service

TN: Radionavigation-satellite earth station
   by
   Earth station in the Radionavigation-Satellite Service
NINTH REPORT OF COMMITTEE 4

New Appendix 29 to the Radio Regulations appearing in the Annex hereto has been approved by Committee 4.

The text in question has been forwarded to the Drafting Committee.

E.F. SANDBACH
Chairman
Committee 4

A METHOD OF CALCULATION TO DETERMINE THE DEGREE OF INTERFERENCE BETWEEN GEOSTATIONARY SATELLITE SYSTEMS SHARING THE SAME FREQUENCY BANDS

1. Introduction

The method of calculating interference is based on the concept that the noise temperature of the system suffering interference increases as the level of the interference increases. It can, therefore, be applied irrespective of the modulation characteristics of these systems, and of the precise frequencies used.

In this method, the apparent increase in the equivalent satellite link noise temperature** of an earth station receiver resulting from interference caused by a given system is calculated and this value is compared with a predetermined increase in the noise temperature. (See paragraph 3.)

2. Calculation of the increase in noise temperature of the link suffering interference

As used in this section, the term satellite link denotes the entire connection consisting of a transmitting earth station, a satellite and a receiving earth station.

Let A and A' be the satellite links of the two systems considered. Primes indicate the parameters of satellite link A'; the notation without primes is used for the parameters of satellite link A.

**) Exact title will depend on the outcome of Committee 6 deliberations.

**) The equivalent satellite link noise temperature is taken to mean the noise temperature at the input of the earth station receiver corresponding to the RF noise power which produces the total observed noise at the output of the satellite link excluding noise due to interference coming from satellite links using other satellites and terrestrial systems.
The parameters are defined as follows (for satellite link $A$):

- $\Delta T_s$: increase in the receiving noise temperature of the satellite $S$ caused by interference in the receiver of this satellite; ($^\circ$K)

- $\Delta T_e$: increase in the receiving noise temperature of the earth station $e^t$ caused by interference in the receiver of this station; ($^\circ$K)

- $P_s$: maximum power density per Hz delivered to the antenna of satellite $S$ (averaged over the worst 4 kHz band); (W/Hz)

- $g_s(\delta_e')$: transmitting antenna gain of satellite $S$ in the direction of the receiving earth station $e^t$ of satellite link $A'$; (numerical power ratio)

  Note: the product $P_s g_s(\delta_e')$ is the maximum equivalent isotropic radiated power per Hz of satellite $S$ in the direction of the receiving earth station $e^t$ of satellite link $A'$.

- $P_e$: maximum power density per Hz delivered to the antenna of the transmitting earth station $e^t$ (averaged over the worst 4 kHz band); (W/Hz)

- $g_e(\delta_e')$: receiving antenna gain of satellite $S$ in the direction of the transmitting earth station $e^t$ of satellite link $A'$; (numerical power ratio)

- $g_1(\theta)$: transmitting antenna gain of the earth station $e^t$ in the direction of satellite $S'$; (numerical power ratio)

- $g_2(\theta)$: receiving antenna gain of the earth station $e^t$ in the direction of satellite $S'$; (numerical power ratio)

- $k$: Boltzmann's constant; (Joules/$^\circ$K)

- $\ell_d(x)$: free-space transmission loss on the down-path; (numerical power ratio)

- $\ell_u(x)$: free-space transmission loss on the up-path; (numerical power ratio)

* See Note on page 3
\( \gamma \) : transmission gain of the system from the satellite receiver input to the earth station receiver input; (numerical power ratio, usually less than 1)

\( \Theta \) : geocentric angular separation between two satellites (degrees).

The parameters \( \Delta T_s \) and \( \Delta T_e \) are given by the following equations:

\[
\Delta T_s = \frac{\gamma'}{k} \left( \frac{g_1 (\theta)}{g_2 (\delta_e)} \right) \quad (1)
\]

\[
\Delta T_e = \frac{\gamma'}{k} \left( \frac{g_1 (\theta)}{g_3 (\delta_e)} \right) \quad (2)
\]

The symbol \( \Delta T \) will be used to denote the apparent increase in the equivalent noise temperature for the entire satellite link at the receiver input of the receiving station due to interference from system A'.

This increase is the result of interference entering at both the satellite and earth station receivers of system A and can accordingly be expressed as:

\[
\Delta T = \gamma \Delta T_s + \Delta T_e \quad (3)
\]

Hence,

\[
\Delta T = \frac{\gamma'}{k} \left( \frac{g_1 (\theta)}{g_2 (\delta_e)} + \frac{g_1 (\theta)}{g_3 (\delta_e)} \right) \quad (4)
\]

Equation (4) combines both the up-path and the down-path interference. If there is a change of modulation in the satellite or if the translation frequencies of the wanted and interfering satellites are different then it may be necessary to treat up and down paths separately using equations (1) and (2).

**Note:** In the interest of simplification it was assumed that:

- basic transmission loss on the down-path is the same regardless of the satellite and earth station considered;
- basic transmission loss on the up-path is the same regardless of the earth station and satellite considered;
- the topocentric angular separation between the two satellites as seen from any earth station is identical to the geocentric angular separation between the two satellites.
In the foregoing equations, the gains $g'_1(\theta)$ and $g'_2(\theta)$ are those of the earth stations concerned.

Unless more precise actual data are available, an appropriate reference radiation pattern may be used to express the gain $g'_1(\theta)$ and $g'_2(\theta)$ in a direction forming an angle $\theta$ with the direction of maximum radiation.

In the event that precise numerical data are not available, the reference radiation pattern $32.25 \log_{10}(\theta)$ shall be used for earth station antennae for which the ratio of effective diameter to wavelength exceeds 100.

In the same way, the increase $\Delta T'$ in the equivalent noise temperature for the entire satellite link $A'$ at receiver input of the receiving earth station $e_R$ under the effect of the interference caused by satellite link $A$ is given by the following equations:

$$\Delta T'_e = \frac{p_e g'_1(\theta) g'_2(\delta_e)}{k \ell'_u} \quad (5)$$

$$\gamma \Delta T'_e = \frac{p_s g'_2(\delta_{e'}) g'_4(\theta)}{k \ell'_u} \quad (6)$$

$$\gamma \Delta T'_e = \frac{p_e g'_1(\theta) g'_2(\delta_e)}{k \ell'_u} + \frac{p_s g'_2(\theta) g'_4(\theta)}{k \ell'_u} \quad (7)$$

For two multiple-access satellites, this calculation must be made for each of the satellite links $A'$ established via one satellite in relation to each of the satellite links $A$ established via the other satellite.

3. **Comparison between calculated and predetermined percentage increase in equivalent link noise temperature**

The calculated values of $\Delta T$ and $\Delta T'$ shall be compared with the corresponding predetermined values. These predetermined values are taken as $2\%$ of the appropriate equivalent link noise temperatures.

If the calculated value of $\Delta T$ is less than the predetermined one, the interference level from satellite link $A'$ to satellite link $A$ is acceptably small irrespective of the modulation characteristics of the two satellite links and of the precise frequencies used.
if the calculated value of $\Delta T$ is more than the predetermined one, a detailed calculation shall be carried out following the methods and techniques set out in the relevant current C.C.I.R. Reports and Recommendations.

The comparison of $\Delta T$ with the predetermined value shall be carried out in a similar manner.

As an example, it can be seen that in the case of a satellite system operating in accordance with current C.C.I.R. Recommendations using FM telephony and having a total noise in a telephone channel of 10 000 pWOp including 1 000 pWOp interference noise from terrestrial radio-relay systems and 1 000 pWOp interference noise from other satellite systems, a 2% increase in equivalent noise temperature would correspond to 150 pWOp of interference noise.

The list of basic characteristics to be furnished for each network is given in Appendix 1B. A detailed illustration of the interference calculation in the case of two geostationary satellite systems is given in the Annex to this Appendix.

4. Determination of the links to be considered in calculating the increase in equivalent link noise temperature from the data furnished for the advance publication of a satellite network

The greatest increase in equivalent link noise temperature caused to any link of another satellite network, existing or planned, by interference produced by the proposed satellite network must be determined.

The most unfavourably sited transmitted earth station of the interfering satellite network should be determined for each satellite receiving antenna of the network suffering interference by superimposing the earth-to-space service areas of the interfering network on the space station transmitting antenna gain contours plotted on a map of the earth's surface. This station is the one for which the satellite receiving antenna gain of the network interfered with, in the direction of the site, is the greatest.

The most unfavourably sited receiving earth station of the network suffering interference should be determined in an analogous manner for each space-to-earth service area of that network. This station is the one for which the satellite transmitting antenna gain of the interfering network in the direction of the site is greatest.
When the satellite of the network suffering interference is equipped with simple frequency-translating transponders these determinations are made in pairs, one for the satellite receiving antenna associated with the repeater and one for the space-to-earth service area connected to the satellite transmitting antenna associated with the repeater.

The calculation procedure described above may be used to determine the greatest increase in equivalent noise temperature caused to any link in a proposed satellite network by interference produced by any other satellite network.
Annex

Example of an interference calculation between two geostationary satellite systems sharing the same frequency band

A. GENERAL

In this example for simplicity two identical satellite systems are assumed with $\theta = 6^\circ$ geocentric angular spacing between the satellites. For this angular separation the reference radiation pattern of the earth station antenna $32 - 25 \log_{10} \theta$ gives a gain of $12.5 \text{ dB}$ in the direction of the other satellite.

The calculations have been performed in dB, which means that numerical multiplications thus become dB additions and numerical divisions become dB subtractions. In each step the contributing factors have been introduced in a sequence corresponding to the propagation direction. The first three steps define the system parameters for each system. Steps 4, 5 and 6 perform the actual interference calculations.

To determine the equivalent link noise temperature it is necessary to know the ratio between the total internal link noise and the thermal noise of the down-path. The noise budget for this example is assumed as follows:
Noise budget

<table>
<thead>
<tr>
<th>Internal noise</th>
<th>8 000 pW/op</th>
<th>(Thermal noise down-path) 5 000 pW/op</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>(Thermal noise up-path) 1 000 pW/op</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Intermodulation noise) 2 000 pW/op</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Interference noise from terrestrial systems) 1 000 pW/op</td>
</tr>
<tr>
<td>External noise</td>
<td>2000 pW/op</td>
<td>Total noise 10 000 pW/op</td>
</tr>
</tbody>
</table>

It may be noted that since both satellites use global beams essentially no antenna discrimination between wanted and unwanted signals is obtained at the satellite and that this constitutes a worst case.

D. CONCLUSIONS

In the example shown the increase in equivalent link noise temperature is 3.29%. Since it exceeds the predetermined value of 2%, the amount of noise introduced can no longer be considered negligible and therefore co-ordination between the two systems is required. More precise calculations should now be made using, for example, the actual antenna patterns of the earth stations, the topocentric angular separation of the satellites, and the precise basic transmission losses. There may be additional factors such as polarization isolation, frequency interleaving, spectral distribution of the interfering noise which all reduce the actual interference experienced.

It can be shown that for this example a larger satellite spacing of 7.5° would have caused only 2% increase in equivalent link noise temperature and thus obviated the need for any co-ordination.
REPORT OF SUB-WORKING GROUP 6A-2

TO COMMITTEE 6

Sub-Working Group 6A-2 has held six meetings, in the course of which it has examined the proposal concerning satellite broadcasting and which fall under the competence of Committee 6.

Due to time limitations, it was not possible to submit to Working Group 6A the outcome of the work of the Sub-Working Group. Following a proposal by the Chairman of Working Group 6A, these results are submitted to Committee 6 directly.

The following documents are submitted as a result of the Sub-Working Group's work:

- the draft of a provision to be added to Article 7 (Annex 1)
- a draft Resolution (Annex 2)
- a draft Resolution (Annex 3)
- a draft Recommendation (Annex 4).

The Sub-Working Group was not able to come to one solution with regard to paragraph 2 of Annex 2 and the whole of Annex 4, these two elements being connected.

F. JOB
Convenor, Sub-Working Group 6A-2

Annexes: 4
ANNEX 1

DRAFT

ARTICLE 7

Satellite Broadcasting

§ 2A. In devising the characteristics of a broadcasting space station, all technical means available shall be used to reduce as much as possible the radiation over the territory of neighbouring countries unless an agreement has been previously reached with such countries.
ANNEX 2

DRAFT RESOLUTION

on the establishment of agreements and associated plans for satellite broadcasting

The World Administrative Radio Conference for Space Telecommunications, Genova 1971,

considering

a) that it is important to make the best possible use of the geostationary satellite orbit and of the frequency bands allocated to the Broadcasting-Satellite Service;

b) that the great number of receiving installations using such directional antennae as could be set up for a Broadcasting-Satellite Service may be an obstacle to changing the location of broadcasting space stations on the geostationary satellite orbit, from the date of their bringing into use;

c) that satellite broadcasts may create harmful interference over a large area of the earth's surface;

d) that the other services with allocations in the same band need to use the band before the Broadcasting-Satellite Service is set up;

resolves

1. that satellite broadcasting stations shall be established and operated in accordance with agreements and associated plans adopted by World or Regional Administrative Conferences, as the case may be, in which all the administrations concerned and the administrations whose services are liable to be affected may participate;

2. that the Administrative Council be requested to examine as soon as possible the question of a World Administrative Conference, or Regional Administrative Conferences as required, with a view to fixing suitable dates, places and their agenda.

3. that during the period before the entry into force of such agreements and associated plans the administrations and the I.F.R.B. shall apply the procedure contained in Resolution E.
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 3

DRAFT RESOLUTION No. E

on the bringing into service of broadcasting space stations, prior to the entry into force of agreements and associated plans for satellite broadcasting

considering

a) that while Resolution No. D has been adopted by this Conference, envisaging plans for satellite broadcasting, some administrations might nevertheless feel the need to bring such stations into service prior to such plans being established;

b) that administrations should, as far as possible, avoid proliferation of broadcasting space stations before such plans have been established;

c) that a broadcasting space station may cause harmful interference to stations in the Terrestrial Service operating in the same frequency band, even if the latter are outside the service area of the space station;

d) that the procedure specified in Article 9A of the Radio Regulations contains no provisions for the co-ordination between broadcasting space stations and terrestrial stations and between broadcasting space stations and space systems of other administrations.

resolves

1. that the following procedure shall be applied until agreements and associated plans pursuant to Resolution No. D enter into force:

Section A : Co-ordination procedure between broadcasting space stations and terrestrial stations

2.1. Before an administration notifies to the Board or brings into service any frequency assignment to a broadcasting space station in a frequency band where this frequency band is allocated, with equal rights,
to the Broadcasting-Satellite Service and to a /"Terrestrial Service/,
either in the same Region or sub-Region or in different Regions or
sub-Regions, it shall co-ordinate the use of this assignment with any
other administration whose /"Terrestrial Service/ may be affected. For
this purpose, it shall inform the Board of all the technical characteristics
of the station, as listed in Appendix 1A, Sections /A and D/7, which are
necessary to assess the risk of interference to a /"Terrestrial Service/]

2.2 The Board shall publish this information in a special section of
its weekly circular and shall also, when the weekly circular contains such
information, so advise all administrations by circular telegram.

2.3 Any administration which considers that its /"Terrestrial Service/
may be affected shall forward its comments to the administration seeking
co-ordination and, in any case, to the Board. These comments must be
received within /ninety/ days from the date of the relevant I.F.R.B.
weekly circular. It shall be deemed that any administration which has not
forwarded comments within that period does not consider that its
/"Terrestrial Service/ is likely to be affected.

2.4 Any administration which has forwarded comments on the projected
station shall either give its agreement to the co-ordination, or, if this
is not possible, send to the administration seeking co-ordination all the
data on which its comments are based as well as any such suggestions as it
may be able to offer with a view to a satisfactory solution of the
problem.

2.5 The administration which plans to bring into use a space station
as well as any other administration which believes that its /"Terrestrial
Service/ is likely to be affected by the station in question may request
the assistance of the Board at any time during the co-ordination procedure.

2.6 If the assistance of the Board has been sought and there is a
continuing disagreement between the administration seeking co-ordination
and the administration which has forwarded its comments, the administration
seeking co-ordination may, after a total period of /one hundred and fifty/
days, send to the Board its notice concerning the frequency assignment in
question.

1) The technical data to be used in effecting co-ordination should be
based on the most recent C.C.I.R. Recommendations /as accepted by the
administrations concerned under the terms of Resolution No. .../.
In the absence of relevant C.C.I.R. Recommendations, the technical data
to be used in effecting co-ordination shall be determined by agreement
among the administrations concerned.
Section B: Co-ordination procedure between broadcasting space stations and space systems of other administrations.

3. An administration intending to establish a service of broadcasting by satellite shall, for the purpose of co-ordination with space systems of other administrations, apply the following provisions of Article 9A of the Radio Regulations:

3.1 Numbers 639AA to 639AI inclusive.

3.2.1 Number 639AJ.¹

3.2.2 No co-ordination under paragraph 2.1 is required when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase the probability of harmful interference to stations in the Space Service of other administrations.

3.2.3 Numbers 639AL, 639AM, 639AO, 639AS(a), (c), (e), (f), 639AT, 639AU, 639AV, 639AW, 639AX, 639AY, 639AZ.

Section C: Notification, examination and recording in the Master Register of assignments to broadcasting space stations, treated under this Resolution.

4.1 When notifying frequency assignments to broadcasting space stations, the notifying administration shall apply the provisions of the first paragraph of Number 639BA and those of Numbers 639BE, 639BF and 639BG of the Radio Regulations.

4.2 Notices made under paragraph 4.1 shall initially be treated in accordance with Number 639BH.

¹) The technical data to be used in effecting co-ordination should be based on the most recent C.C.I.R. Recommendations as accepted by the administrations concerned under the terms of Resolution No. ... 

In the absence of relevant C.C.I.R. Recommendations, the technical data to be used in effecting co-ordination shall be determined by agreement among the administrations concerned.

²) See Number 639AA.1 of the Radio Regulations.
5.1 The Board shall examine each notice with respect to:

5.2 a) its conformity with the Convention, the Table of Frequency Allocations and the other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and to the probability of harmful interference);

5.3 b) its conformity, where applicable, with the provisions of paragraph 2.1 and Section B below relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

5.4 c) where appropriate, the probability of harmful interference to the service rendered by a station in a Space or Terrestrial Service for which a frequency assignment has already been recorded in the Master Register in conformity with the provisions of Number 501 or 639BM as appropriate, if that assignment has not, in fact, caused harmful interference to the service rendered by a station for which an assignment has been previously recorded in the Master Register and which itself is in conformity with Number 501 or Number 639BM as appropriate.

5.5 Depending upon the findings of the Board subsequent to the examination prescribed in paragraphs 5.2, 5.3 and 5.4, further action shall be as follows:

5.6 Where the Board reaches an unfavourable finding with respect to paragraph 5.2 the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.7 Where the Board reaches a favourable finding with respect to paragraph 5.2, or where it reaches the same finding after resubmission of the notice, it shall examine the notice with respect to the provisions of paragraph 5.3 above.

5.8 Where the Board finds that the co-ordination procedures mentioned in paragraph 5.3 have been successfully completed with all administrations whose services may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in the column 2d of the Master Register with entry in the Remarks Column indicating that such recording does not prejudice in any way the decisions to be included in the agreements and associated plans referred to in Resolution No. D. /D/.
5.9 Where the Board finds that the co-ordination procedures mentioned in paragraph 5.3 have not, as appropriate, been applied or have been unsuccessfully applied, the notice shall be returned immediately by airmail to the notifying administration with the reason for its return and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.10 Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures, as appropriate, have been successfully completed with all administrations whose services may be affected, the assignment shall be treated as indicated in paragraph 5.8.

5.11 Where the notifying administration resubmits the notice and states that it has been unsuccessful in endeavouring to effect the co-ordination, the notice shall be examined by the Board with respect to paragraph 5.4.

5.12 Where the Board reaches a favourable finding with respect to paragraph 5.4, the assignment shall be recorded in the Master Register. The appropriate symbol indicating the finding by the Board shall indicate that the co-ordination procedures, as appropriate, referred to in paragraph 2.1 were not successfully completed. The date of receipt by the Board of the notice shall be entered in the column 2d of the Master Register, with the remark mentioned in paragraph 5.8.

5.13 Where the Board reaches an unfavourable finding with respect to paragraph 5.4, the notice shall be returned immediately by airmail to the notifying administration with the reasons for the Board's finding and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.14 If the administration resubmits the notice unchanged with the insistence that it be reconsidered, but should the Board's unfavourable finding under paragraph 5.4 remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in column 2d of the Master Register, with the remark mentioned in paragraph 5.8. An appropriate remark shall be placed in column 13 to indicate that the assignment is not in conformity with the provisions of paragraphs 5.2, 5.3 or 5.4, as appropriate. In the event that the administration concerned receives no complaint of harmful interference concerning the operation of the station in question for a period of one year from the commencement of operation, the Board shall review its finding.
5.15 If harmful interference is actually caused to the reception of any station in the Space Service whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to paragraphs 5.2, 5.3 and 5.4 of this Resolution, as appropriate, by the use of a frequency assignment in the Space Service which has been recorded in the Master Register in accordance with the provisions of paragraph 5.14 of this Resolution or of No. 639CP of the Radio Regulations, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

5.16 If harmful interference to the reception of any station whose assignment is in accordance with paragraph 5.2 of this Resolution, is actually caused by the use of a frequency assignment which is not in conformity with paragraph 5.2 of this Resolution, or with Numbers 501, 570AB or 639SM of the Radio Regulations, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.
ANNEX 4

DRAFT RECOMMENDATION No. 1

concerning the use of the band \( 11.95-12.75 \text{ GHz} \) in the European Broadcasting Area

considering,

a) that ultimately the Broadcasting-Satellite Service may be one of the prime users of the band \( 11.95-12.75 \text{ GHz} \) in the European Broadcasting Area;

b) that the Broadcasting-Satellite Service will not be fully developed for many years;

c) that other services in the European Broadcasting Area having allocations in this band need to use the band in advance of the development of the Broadcasting-Satellite Service;

d) that the disposition of these services, including the planning of the terrestrial broadcasting stations, is dependent upon assignments made in the Broadcasting-Satellite Service, as the existence of plans for fixed and mobile services must in no way inhibit the planning of the Broadcasting-Satellite Services;

e) that Resolution No. D specifies that the broadcasting-satellite stations are to be established and operated in accordance with agreements and associated plans adopted by appropriate Administrative Conferences;

recommends

1. that an Administrative Conference, in which all the Administrations concerned and the Administrations whose services are liable to be affected may participate, be convened to establish an agreement and an associated assignment plan for stations of the Broadcasting-Satellite Service for the European Broadcasting Area with the following objectives:

   a) to agree the technical characteristics of channels to be assigned within the band \( 11.95-12.75 \text{ GHz} \) and the number of channels available for assignment;
b) to assign channels to individual Administrations without taking into account existing or planned Fixed, Mobile and Broadcasting Services;

c) to frame any necessary procedures to replace those in the Radio Regulations and to ensure the successful implementation of assignments in this band;

2. that such a conference be held not later than 1975;

3. that this conference be immediately followed by a further conference to establish an agreement and an associated plan for stations of the Broadcasting Service;

4. that the Administrative Council determine the exact date and place of such a conference or conferences, in accordance with No. 69 of the International Telecommunication Convention, Montreux, (1965).
FINAL REPORT BY THE CHAIRMAN OF WORKING GROUP 6A
TO THE CHAIRMAN OF COMMITTEE 6

In its last two meetings, Working Group 6A:

I agreed on the texts of Annexes 1, 2 and 3 to this Document;

II with reference to the terms and definitions mentioned in Documents Nos. 146, 160, 166 and 195, considered that it was not necessary to include the following terms in the Radio Regulations, as they are not used in Appendices 1, 1A and 1B:

IIA Frequency band
Allocated frequency band
Shared (allocated) (frequency) band
Geographically allocated frequency band
Shared assigned (frequency band)
Frequency allotment plan
Pre-assigned frequency
Demand-assigned frequency
Figure of merit of a system
Noise temperature
Energy-dispersal frequency
Multiplex operation
Multi-destination transmission
Multiple access operation
Phase-shift telegraphy
Data transmission
Primary body
Unperturbed orbit
Orbital elements
Orbital plane
Direct orbit
Circular orbit
Elliptical orbit
Equatorial orbit
Polar orbit
Inclined orbit
Apoastra
Periastra
Period (anomalistic)
Nodal period
Sidereal period of revolution
Sidereal period of rotation
Station-keeping satellite
Synchronized satellite
Attitude-stabilized satellite
Synchronous satellite
Sub-synchronous satellite
Object in space
Principal plane of reference

IIB agreed that the definition of "noise temperature" is needed and the Working Group took note that Committee 4 had referred the matter to the C.C.I.R.;

IIC noted that the following terms are used in Appendices 1A or 1B:

- ascending node
- apogee
- perigee

but that they are defined in the technical literature and at this time, it was not considered necessary to have their definitions included in the Radio Regulations;

IID with reference to the definition of "harmful interference" the Working Group considered that the addition of the words "the effect of" at the beginning of the existing definition was not needed, because the text has to be the same as it is in the I.T.U. Convention;

IIE with regard to the definition of "assigned frequency band": the Working Group agreed on the following text:

MOD 89 assigned Frequency Band: The frequency band (the centre of which coincides with the frequency assigned to the station) the width of which equals the necessary bandwidth plus twice the absolute value of the frequency tolerance;
III the Working Group also examined Document No. 188(Rev.) from the French Administration dealing with Resolution No. J. The Working Group decided to transmit this Document No. 188(Rev.) to Committee 6 for further examination because it was not able to reach an agreement.

P.E. WILLEMES
Chairman

Annexes : 3
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 1

DRAFT

RESOLUTION No. Spa/7

on the use by all countries with equal rights of frequency bands for space services.

considering

that all countries have equal rights in the use of both the radio frequencies, allocated to various space services, and the geostationary satellite orbit for these services;

taking into account

that radio frequency spectrum and the geostationary satellite orbit are limited natural resources and should be most effectively and economically used;

having in mind

that the use of the allocated frequency bands and definite fixed satellite positions in the geostationary orbit by individual countries or groups of countries can start at various dates depending on requirements and readiness of technical facilities of countries,

decides

1) that the registration in the I.T.U. of frequency assignments for space services and their use should not provide any permanent priority for any individual country or groups of countries and should not create an obstacle to the establishment of space systems by other countries,
2) that, in this connection, a country or a group of countries, having registered in the I.T.U. frequencies for their [space services], should take all practicable measures in order to realize the possibility of the use of new [space systems] by other countries or groups of countries so desiring

and

3) that the provisions contained in items 1 and 2 of this Resolution should be taken into account by the Administrations and the permanent organs of the Union.
ANNEX 2

DRAFT

RECOMMENDATION No. [EB/7

concerning the examination by the Administrative Radio Conferences of the situation with regard to occupation of the frequency spectrum in space communications

considering

a) that the frequency bands available for space applications are limited in number and size;

b) that the possible positions for satellites whose main purpose is to establish telecommunication links are limited in number and that certain positions are more favourable than others for certain links;

c) that all administrations should be enabled to establish the space links which they deem necessary;

d) that the scale and cost of space networks or systems are such that their operation and development must be hindered as little as possible;

e) that technology is steadily and rapidly evolving and that the best possible use should be made of resources in space telecommunications;

f) that administrations should ensure that frequency assignments for space applications are utilized in the most efficient practicable manner consistent with developing technology and that such assignments are relinquished when no longer in use;

g) that despite the provisions of Article 9A and the principles adopted by this Conference, which provide for full consultation and co-ordination between administrations with a view to the maximum accommodation of all space systems, it is possible that as the use of frequencies and orbital
locations increases administrations may encounter undue difficulties in one or more frequency bands in meeting their requirements for space radiocommunication;

recommends

that, if this situation arises, it will need to be examined by the next appropriate Administrative Radio Conference which should be empowered to deal with the situation;

invites

the Administrative Council, in the event of such a situation arising, to include in the agenda for the next appropriate Administrative Radio Conference specific provisions enabling it to examine all aspects of the use of the frequency band(s) concerned including, for example, the relevant frequency assignments recorded in the Master International Frequency Register and to find a solution to the problem.
ANNEX 3

DRAFT

RECOMMENDATION [No. H_?]
relating to technical standards for the assessment of harmful interference in the frequency bands above 28 Mc/s

considering

a) that the definition of harmful interference (RR No. 93), of a qualitative nature, leads to a purely subjective estimation of the nuisance;

b) that, for the accomplishment of its regulatory tasks, the I.F.R.B. has adopted in its technical standards, for the frequency bands below 28 Mc/s, values for the ratio between the wanted signal and the interfering signal, below which harmful interference may be expected;

c) that "harmful interference" implies a degree of interference or a probability of interference which is considerable;

d) that, as a consequence, it is desirable to determine the level of interference by which any emission, radiation or induction affects a Radio-communication Service beyond specific limits established for its performance with regard to the quality and reliability required by the nature of the service;

e) that the assessment of interference values is related to various factors such as: nature of the services concerned, number of interference sources, percentages of time during which the interfering signal affects the wanted signal, etc.
and noting:

a) that the I.F.R.B. has been considering the maximum allowable values of interference given in the pertinent C.C.I.R. Recommendations, as values which ensure a satisfactory service;

b) that, however, the I.F.R.B. does not possess data on the increases of these recommended values and on the associated percentages of time affecting a service beyond the specific limits established for its performance with regard to the quality and reliability required by the nature of the service;

invites the C.C.I.R.

to study this subject and to recommend the technical performance criteria for the frequency bands above 28 Mc/s, allocated to Space, Radio Astronomy, and /the concerned/ Terrestrial Services, in order to enable the I.F.R.B. and administrations to apply such criteria for these bands;

and invites the I.F.R.B.

to publish its technical standards, for the information of administrations, based upon the relevant provisions of the Radio Regulations and Appendices thereto, decisions of Administrative Conferences of the Union as appropriate and the Recommendations of the C.C.I.R., the state of the radio art and the development of transmission techniques.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

Annex: Pages B7/01—12
[ARTICLE 1]

[1. Terms and definitions to be added in Section [IIA]]

ADD 84ALA  Satellite network
A satellite system consisting of a single satellite and the co-operating earth stations.

ADD 84ALB  Satellite link
A radio link between a transmitting earth station and a receiving earth station through one satellite.
A satellite link comprises one up path and one down path.

ADD 84ALC  Multi-satellite link
A radio link between a transmitting earth station and a receiving earth station through two or more satellites, without any intermediate earth station.
A multi-satellite link comprises one up path, one or more satellite-to-satellite paths and one down path.

[2. Term and definition to be added in Section IIB]

ADD 84BFA  Geosynchronous satellite
An earth satellite whose period of revolution is equal to the period of rotation of the Earth about its axis.

[3. Terms and definitions to be added in Section III]

ADD 103A  Equivalent satellite-link noise temperature
The noise temperature at the input of the earth station receiver corresponding to the radio frequency noise power which
produces the total observed noise at the output of the satellite link excluding noise due to interference coming from satellite links using other satellites and from terrestrial systems.

**ADD 103B Co-ordination distance**

Distance from an earth station in a given azimuth within which a terrestrial station sharing the same frequency band may cause or be subject to more than a permissible level of interference.

**ADD 103C Co-ordination contour**

The line, on a geographical map on which an earth station location is represented, joining the points on all azimuths around this earth station which are at a distance equal to the co-ordination distance corresponding to each azimuth.

**ADD 103D Co-ordination area**

Area around an earth station enclosed by the co-ordination contour.
RECOMMENDATION No. Spa CC

Relating to the Use of Space Radiocommunication Systems in the Event of Natural Disasters, Epidemics, Famines and Similar Emergencies

considering

a) that in the case of natural disasters, epidemics, famines and similar emergencies lives can be saved by prompt and effective relief;

b) that rapid and reliable telecommunications are essential for relief operations;

c) that, through damage or from other causes, the normal telecommunications facilities in disaster areas are often inadequate for relief operations and cannot be restored or supplemented quickly through local resources;

d) that use of space radiocommunication systems is one of the means by which rapid and reliable telecommunications could be provided for relief operations;

noting

a) that known planning of space radiocommunication systems makes no provision for specific frequencies or channels for emergency communications;

b) that in the absence of such planning it is not feasible to proceed with specifications for rapidly transportable, universally operable earth stations;

recommends

1. that administrations, individually or in collaboration, provide for the needs of eventual relief operations in planning their [international] space radiocommunication systems and identify for this purpose preferred

B7—03
radio-frequency channels and facilities which could quickly be made available for relief operations;

2. that administrations concerned waive the coordination procedures provided for in the Radio Regulations in the case of transportable earth stations used for relief operations;

requests

the C.C.I.R. to study standard specifications and preferred frequencies for transportable earth stations and for compatible mobile and transportable fixed radiocommunications equipment for relief operations;

invites

the Secretary General to bring this Recommendation to the attention of the United Nations, the specialized agencies, and other international organizations concerned, in order to ensure full cooperation in the implementation of this Recommendation.
[ARTICLE 7]

[Partial text of Section VIII]

MOD 470E § 20. Sites and frequencies for earth stations, operating in frequency bands shared with equal rights between terrestrial and space radiocommunication services, shall be selected having regard to the relevant recommendations of the C.C.I.R. with respect to geographical separation from terrestrial stations.

Power Limits

MOD 470F § 21. (1) Earth stations

MOD 470G (2) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands between 1 and 15 G[c/s], shall not exceed the following limits except as provided in Nos. 470H or 470HA:

\[ +40 \text{ dBW in any } 4 \text{ k}[c/s] \text{ band for } \theta \leq 0^\circ \]

\[ +40 + 3 \theta \text{ dBW in any } 4 \text{ k}[c/s] \text{ band for } 0^\circ < \theta \leq 5^\circ \]

where \( \theta \) is the angle of elevation of the horizon viewed from the centre of radiation of the antenna of the earth station and measured as positive above the horizontal plane and negative below it.
ADD 470GA (2A) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands above 15/G[c/s] shall not exceed the following limits except as provided in Nos. 470H or 470HB:

\[ +64 \text{ dBW in any 1 M[c/s] band for } \theta \leq 0^\circ \]
\[ +64 + 3 \theta \text{ dBW in any 1 M[c/s] band for } 0^\circ < \theta \leq 5^\circ \]

where \( \theta \) is as defined in No. 470G.

ADD 470GB (2B) For angles of elevation of the horizon greater than 5° there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

MOD 470H (3) The limits given in No. 470G or No. 470GA, as applicable, may be exceeded by not more than 10 dB. However, when the resulting coordination area extends into the territory of another administration, such increase shall be subject to agreement by that administration.

ADD 470HA (3A) As an exception to the limits given in No. 470G, the equivalent isotropically radiated power towards the horizon for an earth station in the space research (deep-space) shall not exceed +55 dBW in any 4 k[c/s] band.

ADD 470HB (3B) As an exception to the limits given in No. 470GA, the equivalent isotropically radiated power towards the horizon for space research earth station (deep-space) shall not exceed +79 dBW in any 1 M[c/s] band.

SUP 470I

B7—06
MOD 470J  (3C) The limits given in No. 470G apply in the following frequency bands allocated to the fixed-satellite service for transmission by earth stations where these bands are shared with equal rights with the [fixed or mobile service]:

[ ]

[ ]

[ ]

Minimum Angle of Elevation

MOD 470K § 22. (1) Earth stations.

MOD 470L  (2) Earth station antennae shall not be employed for transmission at elevation angles of less than 3° measured from the horizontal plane to the direction of maximum radiation, except when agreed to by administrations concerned or affected. In case of reception by an earth station, the above value shall be used for coordination purposes if the operating angle of elevation is less than that value.

ADD 470LA  (2A) As an exception to No. 470L, earth station antennae in the space research service (near-earth) shall not be employed for transmission at elevation angles of less than 5°, and earth station antennae in the space research service (deep-space) shall not be employed for transmission at elevation angles of less than 10°, both angles being those measured from the horizontal plane to the direction of maximum radiation. In case of reception by an earth station, the above values shall be used for coordination purposes if the operating angle of elevation is less than those values.

MOD 470M  (2B) The limit given in No. 470L applies in the following frequency bands allocated to the fixed-satellite service for transmission
by earth stations where these bands are shared with equal rights with the [fixed or mobile services]:

[   ]
[   ]
[   ]
RECOMMENDATION No. Spa DD

Relating to the Criteria to be Applied for Sharing
between the Broadcasting-Satellite Service and the Terrestrial
Broadcasting Service in the Band [614-790 Mc/s]

considering

a) that the band [614-790 Mc/s] has been allocated to the broadcasting-satellite service;

b) that it is necessary to have a power flux-density limit which will provide adequate protection to the terrestrial broadcasting service;

taking into account

a) that the conclusions of the Special Joint Meeting of the C.C.I.R. Geneva, 1971, indicated that the following power flux-density limits are necessary to protect the terrestrial broadcasting service:

\[
\begin{align*}
-121 \text{ dBW/m}^2 & \quad \delta < 20^\circ \\
-121 + 0.4 (\delta - 20^\circ) \text{ dBW/m}^2 & \quad 20^\circ < \delta < 60^\circ \\
-105 \text{ dBW/m}^2 & \quad 60^\circ < \delta < 90^\circ 
\end{align*}
\]

where \( \delta \) is the angle of arrival above the horizontal plane;

b) that additional tests carried out by one administration after the Special Joint Meeting of the C.C.I.R., indicated that the following more conservative power flux-density limits may be necessary:

\[
\begin{align*}
-130 \text{ dBW/m}^2 & \quad \delta < 20^\circ \\
-130 + 0.4 (\delta - 20^\circ) \text{ dBW/m}^2 & \quad 20^\circ < \delta < 60^\circ \\
-114 \text{ dBW/m}^2 & \quad 60^\circ < \delta \leq 90^\circ 
\end{align*}
\]

where \( \delta \) is the angle of arrival above the horizontal plane;

B7—09
c) that additional information is required on the protection ratio for interference from an FM television signal into a VSB television signal for both the 625 and 525 line systems;

d) that with terrestrial television receiving systems using current technology, the minimum field strength to be protected may in some cases be less than the values included in C.C.I.R. Recommendation 417-2;

e) that account may have to be taken of ground reflections;

f) that energy dispersal techniques may reduce the required protection ratio and should be used if shown to be effective;

recommends

1. that in view of the absence of sufficient information on tests under operational conditions and in order to provide for a preliminary [co-ordination procedure], on a provisional basis, the maximum power flux-density produced at the surface of the earth within the service area of a terrestrial broadcasting station (see C.C.I.R. Recommendation 417-2), by a space station in the broadcasting-satellite service in the band [614-790 Mc/s] should not exceed:

\[
\begin{align*}
-129 \text{ dBW/m}^2 & \quad \delta < 20^\circ \\
-129 + 0.4 (\delta-20^\circ) \text{ dBW/m}^2 & \quad 20^\circ < \delta < 60^\circ \\
-113 \text{ dBW/m}^2 & \quad 60^\circ < \delta < 90^\circ 
\end{align*}
\]

where \( \delta \) is the angle of arrival above the horizontal plane;

2. that these limits be not exceeded on the territory of an administration except with the latter’s agreement;

3. that the transmission of unmodulated carriers should be avoided.

4. that the C.C.I.R. urgently study the sharing criteria to be applied to frequency sharing between the broadcasting-satellite service and the terrestrial broadcasting service in the band [614-790 Mc/s] and prepare a Recommendation on power flux densities to be used in lieu of the above provisional limits;
5. that in its studies the C.C.I.R. consider in particular the following aspects:

   5.1 the required protection ratio for both 525 and 625 line systems for interference from an FM television signal into a VSB television signal;

   5.2 the minimum field strength to be protected for the terrestrial television service taking into account the current state of the art;

   5.3 the effect of ground reflections;

   5.4 the number of broadcasting satellites that may be visible from a terrestrial broadcasting receiver;

   5.5 the effect of polarization discrimination;

   5.6 the effect of antenna directivity;

6. that in its studies the C.C.I.R. should consider the advantages of energy dispersal in the broadcasting-satellite service (television).
MOD 695 § 3. In order to avoid interference:

— locations of transmitting stations and, where the nature of the service permits, locations of receiving stations shall be selected with particular care;

— radiation in and reception from unnecessary directions shall be minimized, where the nature of the service permits, by taking the maximum practical advantage of the properties of directional antennae;

— the choice and use of transmitters and receivers shall be in accordance with the provisions of Article 12;

— the conditions specified under No. 470V shall be fulfilled.

Francois Job
Chairman of the Editorial Committee

Annex: Pages B8/01
1. **Introduction**

The method of calculating interference is based on the concept that the noise temperature of the system receiving interference increases as the level of the interference increases. It can, therefore, be applied irrespective of the modulation characteristics of these systems, and of the precise frequencies used.

In this method, the apparent increase in the equivalent satellite-link noise temperature \( \Delta T_s \) [of an earth station receiver] resulting from interference caused by a given system is calculated and this value is compared with a predetermined increase in the noise temperature (see section 3 below).

2. **Calculation of the Increase in Noise Temperature of the Satellite Link\(^2\) receiving Interference.**

[As used in this section, the term satellite link denotes the entire connection consisting of a transmitting earth station, a satellite and a receiving earth station.]

Let A and A' be the satellite links of the two systems considered. Primes indicate the parameters of satellite link A'; the notation without primes is used for the parameters of satellite link A.

The parameters are defined as follows (for satellite link A):

\[ \Delta T_s : \text{increase in the receiving noise temperature of the satellite S caused by interference in the receiver of this satellite (°K)} \]

---

\(^1\) See No. 103A.
\(^2\) See No. 84ALB.
\( \Delta T_e \): increase in the receiving noise temperature of the earth station \( e_R \) caused by interference in the receiver of this station (\(^\circ\)K);

\( p_s \): maximum power density per Hz delivered to the antenna of satellite S (averaged over the worst 4 k[c/s] band) (W/[c/s]);

\( g_s(\beta_e') \): transmitting antenna gain of satellite S in the direction of the receiving earth station \( e'_R \) of satellite link \( A' \) (numerical power ratio);

Note: the product \( p_s g_s(\beta_e') \) is the maximum equivalent isotropic radiated power per [c/s] of satellite S in the direction of the receiving earth station \( e'_R \) of satellite link \( A' \).

\( p_e \): maximum power density per [c/s] delivered to the antenna of the transmitting earth station \( e_T \) (averaged over the worst 4 k[c/s] band) (W/[c/s]);

\( g_s(\beta_e') \): receiving antenna gain of satellite S in the direction of the transmitting earth station \( e_T' \) of satellite link \( A' \) (numerical power ratio);

\( g_t(\theta) \): transmitting antenna gain of the earth station \( e_T \) in the direction of satellite S' (numerical power ratio);

\( g_t(\theta) \): receiving antenna gain of the earth station \( e_R \) in the direction of satellite S' (numerical power ratio);

\( k \): Boltzmann's constant (Joules/\(^\circ\)K);

\( l_d^* \): free-space transmission loss on the down-path (numerical power ratio);

\( l_u^* \): free-space transmission loss on the up-path (numerical power ratio);

*) To simplify the calculation it was assumed that:

- basic transmission loss on the down-path is the same regardless of the satellite and earth station considered;
- basic transmission loss on the up-path is the same regardless of the earth station and satellite considered;
- the topocentric angular separation between the two satellites as seen from any earth station is identical to the geocentric angular separation between the two satellites.
\( \gamma \) : transmission gain of the [system] from the satellite receiver input to the earth station receiver input (numerical power ratio, usually less than 1);

\( \theta^* \) : geocentric angular separation between two satellites (degrees).

The parameter \( \Delta T_e \) and \( \Delta T_s \) are given by the following equations:

\[
\Delta T_e = \frac{p_e^s g_1'(\theta) g_5(\delta_e')}{kI_a}
\]

\[
\Delta T_s = \frac{p_e^s g_3'(\delta_\theta) g_4(\theta)}{kI_a}
\]

The symbol \( \Delta T \) will be used to denote the apparent increase in the equivalent noise temperature for the entire satellite link at the receiver input of the receiving station \( e_R \) due to interference from [system] \( A' \).

This increase is the result of interference entering at both the satellite and earth station receivers of [system] \( A \) and can accordingly be expressed as:

\[
\Delta T = \gamma \Delta T_e + \Delta T_s
\]

Hence, \( \Delta T = \frac{\gamma p_e^s g_1'(\theta) g_5(\delta_e')}{kI_a} + \frac{p_e^s g_3'(\delta_\theta) g_4(\theta)}{kI_a} \)

Equation (4) combines both the up-path and the down-path interference. If there is a change of modulation in the satellite or if the translation frequencies of the wanted and interfering satellites are different then it may be necessary to treat up and down paths separately using equations (1) and (2).

In the foregoing equations, the gains \( g_1'(\theta) \) and \( g_5(\theta) \) are those of the earth stations concerned. Unless more precise actual data are available, an appropriate reference radiation pattern may be used to express the gain \( g_1'(\theta) \) and \( g_5(\theta) \) in a direction forming an angle \( \theta \) with the direction of maximum radiation. In the event that precise numerical data are not avail-
able, the reference radiation pattern $32 - 25 \log_{10}(\omega)$ shall be used for earth station antennae for which the ratio of effective diameter to wavelength exceeds 100.

In the same way, the increase $\Delta T'$ in the equivalent noise temperature for the entire satellite link at the receiver input of the receiving earth station $e_r'$ under the effect of the interference caused by satellite link $A$ is given by the following equations:

$$\Delta T'_{e} = \frac{p_x \ e_t (\theta) g' (\beta_e)}{kL_u}$$  \hspace{1cm} (5)

$$\Delta T'_{e} = \frac{p_x \ e_t (\beta_e) g' (\theta)}{kL_d}$$  \hspace{1cm} (6)

$$\Delta T' = \gamma \frac{p_x \ e_t (\theta) g' (\beta_e)}{kL_u} + \frac{p_x \ e_t (\beta_e) g' (\theta)}{kL_d}$$  \hspace{1cm} (7)

For two multiple-access satellites, this calculation must be made for each of the satellite links established via one satellite in relation to each of the satellite links established via the other satellite.

3. **Comparison between Calculated and Predetermined Percentage Increase in Equivalent Satellite Link Noise Temperature**

The calculated values of $\Delta T$ and $\Delta T'$ shall be compared with the corresponding predetermined values. These predetermined values are taken as 2% of the appropriate equivalent satellite link noise temperatures:

- if the calculated value of $\Delta T$ is less than the predetermined one, the interference level from satellite link $A'$ to satellite link $A$ is acceptably small irrespective of the modulation characteristics of the two satellite links and of the precise frequencies used;

- if the calculated value of $\Delta T$ is more than the predetermined one, a detailed calculation shall be carried out following the methods and techniques set out in the relevant C.C.I.R. Reports and Recommendations.
The comparison of $\Delta T'$ with the predetermined value shall be carried out in a similar manner.

As an example, it can be seen that in the case of a satellite system operating in accordance with current C.C.I.R. Recommendations, using FM telephony and having a total noise in a telephone channel of 10 000 pWOp including 1 000 pWOp interference noise from terrestrial radio-relay systems and 1 000 pWOp interference noise from other satellite [systems], a 2% increase in equivalent noise temperature would correspond to 160 pWOp of interference noise.

The list of basic characteristics to be furnished for each [network] is given in Appendix 1B. A detailed illustration of the interference calculation in the case of two geostationary satellite [systems] is given in the Annex to this Appendix.

4. **Determination of the Satellite Links to be Considered in Calculating the Increase in Equivalent Satellite Link Noise Temperature from the Data Furnished for the Advance Publication of a Satellite Network**

The greatest increase in equivalent satellite link noise temperature caused to any link of another satellite network, existing or planned, by interference produced by the proposed satellite network must be determined.

The most unfavourably sited transmitting earth station of the interfering satellite network should be determined for each satellite receiving antenna of the network suffering interference by superimposing the earth-to-space service areas of the interfering network on the space station receiving antenna gain contours plotted on a map of the earth's surface. This station is the one for which the satellite receiving antenna gain of the network interfered with, in the direction of the site, is the greatest.

The most unfavourably sited receiving earth station of the network suffering interference should be determined in an analogous manner for each space-to-earth service area of that network. This station is the one for which the satellite transmitting antenna gain of the interfering network in the direction of the site is greatest.

B8—05
When the satellite of the network suffering interference is equipped with simple frequency-translating transponders the above determinations are made in pairs, one for the receiving antenna of the transponder and one for the space-to-earth service area associated with the transmitting antenna of the transponder.

The calculation procedure described above may be used to determine the greatest increase in equivalent noise temperature caused to any satellite link in a proposed satellite network by interference produced by any other satellite network.
ANNEX

Example of an Interference Calculation Between Two Geostationary Satellite Systems Sharing the Same Frequency Band

A. General

In this example, for simplicity, two identical satellite networks are assumed with \( \theta = 6^\circ \) geocentric angular spacing between the satellites. For this angular separation the reference radiation pattern of the earth station antenna \((32 - 25 \log_{10} \theta)\) gives a gain of 12.5 dB in the direction of the satellite of the other network.

The calculations have been performed in dB, which means that numerical multiplications thus become dB additions and numerical divisions become dB subtractions. In each step, the contributing factors have been introduced in a sequence corresponding to the propagation direction. The first three steps define the system parameters for each [system]. Steps 4, 5 and 6 perform the actual interference calculations.

To determine the equivalent link noise temperature it is necessary to know the ratio between the total internal link noise and the thermal noise of the down-path. The noise budget for this example is assumed as follows:

\[
\text{Noise budget} \\
\begin{align*}
\text{Internal noise} & \quad 8 \, 000 \, \text{pWOp} \\
\text{Thermal noise (down-path)} & \quad 5 \, 000 \, \text{pWOp} \\
\text{Thermal noise (up-path)} & \quad 1 \, 000 \, \text{pWOp} \\
\text{Intermodulation noise} & \quad 2 \, 000 \, \text{pWOp} \\
\text{Interference noise from} & \quad 1 \, 000 \, \text{pWOp} \\
\text{systems using other satellites} & \quad 1 \, 000 \, \text{pWOp} \\
\text{Interference noise from} & \quad 1 \, 000 \, \text{pWOp} \\
\text{terrestrial systems} & \quad \text{Total noise} \\
\text{Total noise} & \quad 10 \, 000 \, \text{pWOp}
\end{align*}
\]
It may be noted that since both satellites use global beams, essentially no antenna discrimination between wanted and unwanted signals is obtained at the satellite and that this constitutes a worst case.

C. Interference calculation

### Step 4) Up-path interference
- Interfering earth station power density (as in Step 1)
- Interfering earth station antenna gain towards interfered satellite (6° off beam)
- Free space loss for 38 500 km at 6 175 M[c/s] (see Step 1)
- Satellite antenna gain in the direction of the interfering earth station
- Boltzmann’s constant 1.38 × 10⁻²³ Joule/°K
- Increase in receiver noise temperature of the satellite
  \[ P_e' + g_e(0) - l_a + g_i(\delta_e) - k \]

### Step 5) Down-path interference
- Interfering satellite transmitter power density (As in Step 2)
- Interfering satellite antenna gain towards interfered earth station
- Free space loss for 38 500 km at 3 950 M[c/s] (see Step 2)
- Earth station antenna gain in the direction of the interfering satellite (6° off beam)
## D. Conclusions

In the example shown, the increase in equivalent satellite link noise temperature is 3.29%. Since it exceeds the predetermined value of 2%, the amount of noise introduced can no longer be considered negligible and therefore co-ordination between the two systems is required. More precise calculations should now be made using, in particular, the actual antenna patterns of the earth stations, the topocentric angular separation of the satellites, and the precise basic transmission losses. There may be addi-
tional factors such as polarization discrimination, frequency interleaving, spectral distribution of the interference which all reduce the calculated interference.

It can be shown that for this example a larger satellite spacing of 7.5° would have caused only 2% increase in equivalent link noise temperature and thus obviated the need for any co-ordination.
FOURTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

On page 8 in the framed part of the Table for the frequency band 37.75 - 38.25 MHz replace foot-note "233A" by "233AA" and renumber "ADD 233A" by "ADD 233AA"

[Note: ADD 233A on page 7 applies to the bands mentioned therein]
FOURTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

ARTICLE 5 - TABLE OF FREQUENCY ALLOCATIONS

Frequency bands between 1,600 kc/s and 174 Mc/s

Committee 5 adopted the revised provisions reproduced in the Annex to the present Report which are submitted to the Plenary for first reading.

In Bulgaria, Japan, Poland, Portugal, Portuguese Overseas Provinces in Region 1 south of the equator, Roumania, Sweden, Czechoslovakia and the U.S.S.R., existing stations in the aeronautical mobile service (OR) will continue to operate for an unspecified period, on a primary basis.

In Regions 2 and 3, stations of the fixed and mobile services may continue to use this band until 1 January 1976.

Until that date, frequency assignments to the aeronautical mobile (R) service shall be co-ordinated between the administrations concerned and shall be protected from harmful interference.

In Cuba and Mexico, the band 132-136 Mc/s is also allocated to the fixed and mobile services.

In Burundi, Ethiopia, Nigeria, Sierra Leone, Gambia, Portuguese Overseas Provinces in Region 1 south of the equator, Rhodesia, Rwanda, and the Rep. of South Africa, the band 138-144 Mc/s is allocated to the fixed and mobile services. In these countries, existing stations in the fixed and mobile services may continue to operate in the band 132-136 Mc/s until 1.1.1976.
In New Zealand the band 138–144 Mc/s is allocated to the aeronautical mobile (OR) service.

In Bulgaria, China, Cyprus, Korea, Cuba, Spain, Ethiopia, Ghana, Hungary, India, Indonesia, Iran, Iraq, Kuwait, Pakistan, Philippines, Poland, Portugal, the United Arab Republic, Roumania, Senegal, Syria, Czechoslovakia and the U.S.S.R., the band 136–137 Mc/s is also allocated to the fixed and mobile services.

MOD 286

In making assignments to stations of other services to which this band is allocated, administrations are urged to take all practicable steps to protect radio astronomy observations from harmful interference.

Note to Committee 7: MOD 286 contains the same text as ADD 233A at 37.75-38.25 Mc/s and MOD 317 at 406-410 Mc/s.

ADD 287A

In the frequency bands designated for the maritime mobile service in accordance with Appendix 18 of the Radio Regulations, the use of satellite systems for safety and distress may be authorized on certain channels on an exclusive basis in the band 157.3125-157.4125 Mc/s for transmissions from ships to satellites and in the band 161.9125-162.0125 Mc/s for transmissions from satellites to ships. The date on which satellite systems may be brought into use shall not be earlier than 1 January 1976 (see Resolution No. ...).
FINAL REPORT BY THE BUDGET CONTROL COMMITTEE

The Budget Control Committee held three meetings at which it considered the various points arising out of its terms of reference.

Its first report (Document No. 228) was prepared in accordance with No. 675 of the General Regulations which provides that, before a conference budget is exhausted, the Budget Control Committee should present an interim statement of expenditure to the Plenary Meeting.

The General Regulations also provide that, at the end of each conference, the Budget Control Committee shall present a report to the Plenary Meeting showing as accurately as possible the estimated total expenditure of the conference. After consideration and approval by the Plenary Meeting, this report must be transmitted to the Secretary-General for submission to the Administrative Council at its next annual session.

To facilitate consideration of these reports by the Plenary Meeting and the Administrative Council, the information contained in the first report has been brought up to date and included in the final report.

1. **Budget of the Conference** (Document No. 156)

The Budget Control Committee took note of the budget of the Conference adopted by the Administrative Council of the Union at its 25th Session, 1970. This budget constitutes Annex 1 to the present Report.

2. **Cost of printing the Final Acts** (Document No. 158)

The Space Conference is printing, for its own use, documents of which the type set-up can subsequently be used, in whole or in part, for the printing of the Final Acts. Administrative Council Resolution No. 83 (amended) specifies that in such case the budget of the Conference must bear a percentage of the composition costs and the whole of the printing costs of such documents and that this percentage of the composition costs shall be decided by the Plenary Assembly.
The Budget Control Committee proposes that the Plenary Meeting adhere to the practice followed by all the conferences held in the past few years and adopt the principle of charging one-third of the cost of typographical composition to the Budget of the Conference and two-thirds to the I.T.U. supplementary publications budget. The accounts situation described in point 3 below takes account of this proposal.

3. Situation concerning expenditure for the Space Conference

The Budget Control Committee was informed that it would probably be impossible to meet the entire expenditure for the Space Conference from the budget approved in 1970 by the Administrative Council and adjusted in 1971 to take account of intervening salary increases. In this connection, the Secretariat pointed out that, in order to keep Members' contributions as low as possible, the Union budgets provide virtually no margin, so that substantial unforeseen expenditure meant that the credits estimated more than a year before their use were exceeded.

A position of the Conference accounts as at 7 July 1971, compiled by the General Secretariat (Annex 2 attached), shows that an excess of expenditure over credits of about 158,000 Swiss francs may now be expected. This excess relates to the following items:

a) Printing of Report of C.C.I.R. Special Joint Meeting: 92,000 Swiss francs;

b) share of cost of typographical composition of documents used for printing of Final Acts: 75,000 Swiss francs;

c) overtime worked by Conference staff: 115,000 Swiss francs;

d) postage for despatch of Conference preparatory documents: 40,000 Swiss francs.

The Budget Control Committee studied point a) with particular attention in the light of the explanations contained in Document No. 159 in order to determine whether the sum of 92,000 Swiss francs should be debited to the budget of the Conference or to the budget of C.C.I.R. meetings, on the grounds that it was spent on printing the Report drawn up in February 1971 by the C.C.I.R. Joint Meeting for the Space Conference. However, the Budget Control Committee failed to reach any conclusion, since it was informed by the General Secretariat that the budget for C.C.I.R. meetings was completely exhausted. Consequently, the sum of 92,000 Swiss francs will remain in excess of the allocated credits and, as such, must be brought to the notice of the Administrative Council at its next Session.
In connection with point b), the Budget Control Committee has taken note of the considerable increases in printing costs since the budget of the Space Conference was established; these increases have resulted in an expenditure of 75,000 Swiss francs beyond the credits provided for the share of typographical composition costs chargeable to the Conference. On the basis of information given by the Secretariat, the Committee felt itself unable to recommend a reduction in printing work to the Plenary Meeting.

The Secretariat informed the Budget Control Committee that the pace of work at the Conference had caused an unusual amount of staff overtime. Under this head, the budget provides for 58,000 Swiss francs, whereas overtime expenditure amounted to 90,000 Swiss francs for the first three weeks alone, so that overtime costs can be expected to total about 173,000 Swiss francs.

The attention of the Budget Control Committee was also drawn to the excess expenditure of 40,000 Swiss francs for postage of documents before the start of the Conference. The Secretariat informed the Committee that, since a number of proposals arrived too late to reach all participants by ordinary mail in time, they had had to be despatched by airmail to destinations outside Europe, which meant a very substantial increase in postage.

The total excess expenditure under these four heads amounts to 322,000 Swiss francs, part of which could be offset by economies, so that the budget of 1,545,000 Swiss francs is now expected to be exceeded by some 158,000 Swiss francs.

* * *

After a lengthy study of this situation, the Budget Control Committee concluded that Conference expenditure should be kept within the limits of the budget approved by the Administrative Council.

Under No. 675 of the Convention, the Budget Control Committee therefore drew the Plenary Meeting's attention to the situation.
The Budget Control Committee nevertheless recognizes that the excess expenditure mentioned above could not be cut without jeopardizing the smooth running of the Conference and was therefore justified.

Under these conditions, the Committee recommends the approval of this report for transmission to the Secretary-General for submission to the Administrative Council at its next annual session, in accordance with No. 677 of the Convention.

4. Contributions of recognized private operating agencies and international organizations not enjoying exemption (Document No. 157)

Under No. 251 of the International Telecommunication Convention, Montreux, 1965, the amount of the contributory unit for recognized private operating agencies and international organizations not enjoying exemption was fixed at 2,226 Swiss francs.

A list of agencies and organizations in question, together with an indication of the number of contributory units chosen to date, constitutes Annex 3 to the present document.

L. CONSTANTINESCU
Chairman
Budget Control Committee

Annex: Pages B9/01-15
[ARTICLE 1, Section IIA]

ADD 84AQA  Aeronautical Radionavigation-Satellite Service.
A radionavigation-satellite service in which mobile earth stations are located on board aircraft.

ADD 84AQB  Maritime Radionavigation-Satellite Service.
A radionavigation-satellite service in which mobile earth stations are located on board ships.

ADD 84ATC  Time Signal Satellite Service.
A radiocommunication service using space stations on earth satellites for the same purposes as those of the time signal service.
ARTICLE 6

MOD 415 § 2. (1) When special circumstances make it indispensable to do so, an administration may, as an exception to the normal methods of working authorized by these Regulations, have recourse to the special methods of working enumerated below, on the sole condition that the characteristics of the stations still conform to those inserted in the Master International Frequency Register:

a) a fixed station in the terrestrial radiocommunication service or fixed satellite service may, [on a secondary basis], transmit to mobile stations on its normal frequencies;

b) a land station may communicate, [on a secondary basis], with fixed stations in the terrestrial radiocommunication service or fixed satellite service or other land stations of the same category.

MOD 417 § 3. Any administration may assign a frequency in a band allocated to the fixed service or allocated to the fixed satellite service to a station authorized to transmit, unilaterally, from one specified fixed point to one or more specified fixed points provided that such transmissions are not intended to be received directly by the general public.

ADD 419A § 5A. Aircraft earth stations are authorized to use frequencies in the bands allocated to the maritime mobile satellite service for the purpose of communicating, via the stations of that service, with the public telegraph and telephone networks.
[ARTICLE 27]

MOD 951 § 3. (1) Aircraft stations may communicate with stations of the maritime mobile or maritime mobile satellite services. They shall then conform to those provisions of these Regulations which relate to these services.

MOD 952 (2) For this purpose aircraft stations should use the frequencies allocated to the maritime mobile or maritime mobile satellite services. However, having regard to interference which may be caused by aircraft stations at high altitudes, maritime mobile frequencies in the bands above 30 MHz shall not be used by aircraft stations in any specific area [without the prior agreement of all the administrations of the area] in which interference is likely to be caused. In particular, aircraft stations operating in Region 1 should not use frequencies in the bands above 30 MHz allocated to the maritime mobile service by virtue of any agreement between administrations in that Region.
RESOLUTION No. Spa B

Relating to the Use of the Band 156-174 M[c/s] by the Maritime Mobile Satellite Service

considering

a) that there is a need to develop the use of space radiocommunication techniques to meet the future requirements of the maritime mobile service;

b) that, of the bands used at present by the maritime mobile service, there may be advantages in using for the maritime mobile satellite service narrow channels between 156-174 M[c/s] for safety and distress;

recognizing

a) that the maritime mobile bands between 156-174 M[c/s] are also used for other services;

b) that the power flux densities laid down by maritime satellites in this band may cause harmful interference to terrestrial receivers and that the satellite receiver may suffer harmful interference from terrestrial radiocommunication transmissions;

c) that the terrestrial maritime mobile service makes extensive use of the channels given in Appendix 18 of the Radio Regulations;

is of the opinion

that it is important for the maritime mobile satellite service to be able to use some narrow channels, on an exclusive basis, for safety and distress as soon as practicable;
having provided for
the possible use of narrow channels for safety and distress by the
maritime mobile satellite service in bands 157-3125-157-4125 MHz and
161-9125-162-0125 MHz not earlier than 1 January 1976 (see No. 287A
of the Radio Regulations);

resolves
that the World Administrative Maritime Radio Conference to be
held in 1974 be invited to consider this matter further and to decide if and
to what extent the maritime mobile satellite service should be introduced
in the above bands on an exclusive basis and to make any consequential
changes in the Radio Regulations and in the provisions governing the use
of the channels in Appendix 18;

request the Secretary-General
to transmit this Resolution to Members and Associate Members
and to the Administrative Council for inclusion in the draft agenda for the
1974 Maritime Conference.
RECOMMENDATION No. Spa. EE

Relating to a Revised Presentation of the Sections of Article 1 of the Radio Regulations

considering

a) that, as a result of the amendments made to the Article 1 of the Radio Regulations, the terms specified in that Article are no longer arranged in logical order;

b) that it would therefore be desirable to rearrange Article 1 of the Radio Regulations in a more appropriate form;

recognizing

that this Conference was unable to perform this task;

recommends

that the next world administrative conference which is competent to revise Article 1 of the Radio Regulations should consider the rearrangement of Article 1 in a more logical manner, for example, on the lines of the Annex to this Recommendation, and further amendments to this Article, as necessary.

ANNEX TO RECOMMENDATION No. Spa EE

ARTICLE 1

Section I. General Terms

Section II. Radio Systems

B9—06
Section III. Radio Services and Stations

Sub-Section IIIA. Terrestrial Radiocommunication

Sub-Section IIIB. Space Radiocommunication

Sub-Section IIIC. Radio Astronomy

Section IV. Technical Characteristics
RECOMMENDATION No. Spa FF

Relating to the Future Use of Bands Allocated to the Inter-Satellite Service

considering

a) that the bands 54-25-58-2 G[cy/s], 59-64 G[cy/s], 105-130 G[cy/s], 170-182 G[cy/s] and 185-190 G[cy/s] have been allocated to the inter-satellite service;

b) that all the foregoing bands are located in parts of the radio-frequency spectrum close to peaks of atmospheric absorption;

and recognizing

that the inter-satellite and terrestrial radiocommunication services are protected from mutual interference by the attenuation due to atmospheric absorption;

recommends

that a future world administrative radio conference should consider allocating these bands also to terrestrial radiocommunication (except the aeronautical mobile) services.

B9—08
RECOMMENDATION No. Spa GG

Relating to the Future Use of Certain Frequency Bands between 40 and 275 G[c/s]

considering

that the 43-48 G[c/s], 66-71 G[c/s], 95-101 G[c/s], 142-150 G[c/s], 190-200 G[c/s] and 250-265 G[c/s] bands have been allocated to the following services:

— Aeronautical mobile satellite
— Maritime mobile satellite
— Aeronautical radionavigation-satellite
— Maritime radionavigation-satellite;

recognizing

that it is not desirable for compatibility considerations that at a later date these bands should be shared with terrestrial radiocommunication services other than those of interest to the aeronautical and maritime mobile services and/or the aeronautical and maritime radionavigation services;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 43-48 G[c/s], 66-71 G[c/s], 95-101 G[c/s], 142-150 G[c/s], 190-200 G[c/s] and 250-265 G[c/s] bands to the following services:

— Aeronautical mobile
— Maritime mobile
— Aeronautical radionavigation
— Maritime radionavigation

in an appropriate manner.
RECOMMENDATION No. Spa HH

Relating to the Future Use of the 41-43 G[c/s] Band by the Fixed and Mobile Services

considering

that the 41-43 G[c/s] band has been allocated to the broadcasting-satellite service;

· recognizing

that it is possible, by appropriate co-ordination, for a frequency band to be shared by the broadcasting-satellite service, on the one hand, and the fixed and mobile services, on the other;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 41-43 G[c/s] band to the fixed and mobile services.
[RECOMMENDATION No. Spa II]

Relating to Future Frequency Allocation Requirements for the Maritime Mobile Satellite Service

having noted

that the Inter-Governmental Maritime Consultative Organization (I.M.C.O.) has stated a requirement for frequencies of the order of 400 M[c/s], believing that small vessels in particular may be unable to use satellite radiocommunications if such frequencies are not made available;

further noting

that the C.C.I.R. Special Joint Meeting, Geneva, 1971, concluded that the present Conference should be invited to examine the possibility of providing exclusive channels for the maritime mobile satellite service at about 400 M[c/s] and that provision of such channels is desirable;

considering

a) that ship stations and survival craft stations are completely dependent upon the use of radio for communication;

b) that the use of space techniques will provide the maritime mobile satellite service with a reliable and more efficient method of communication;

c) that reliable maritime mobile satellite service communications will greatly assist in the saving of lives and property;

d) that although the Conference has made certain provisions for the maritime mobile satellite service, there is some uncertainty with respect to the adequacy and usefulness of these provisions, particularly insofar as small ships and survival craft are concerned;
that general participation of small ships in a service using space techniques would not only benefit the efficient and safe operation of these ships but would also improve the safety service for larger ships and survival craft;

that future conferences might find it necessary to make additional allocations for such uses nearer to the optimum portions of the spectrum;

that for some communications functions, such as certain broadcasting and fixed applications, other means than radio could be used, thereby making portions of the spectrum available for services which are dependent on radio;

recommends

1. that administrations and appropriate international organizations continue to review the requirements for the maritime mobile satellite service and the suitability of current frequency allocations in meeting those requirements;

2. that the C.C.I.R. should continue its studies to determine the optimum portions of the frequency spectrum and related sharing conditions to accommodate maritime mobile satellite service requirements, taking into consideration advances in space radiocommunication technology;

3. that a competent administrative radio conference should review the requirements of the maritime mobile satellite and safety services, and if necessary, provide the frequency allocation to satisfy these requirements.]
RECOMMENDATION No. Spa JJ

Relating to the Protection of Radio Astronomy Observations on the Shielded Area of the Moon

considering

a) that radio astronomy observations at frequencies below the ionospheric critical frequencies and above 100 G[c/s] are hampered or prevented by absorption in the Earth’s atmosphere;

b) that successful radio astronomy observations require complete freedom from harmful interference;

c) that the shielded area of the Moon offers unique opportunities for observations which are not affected by such absorption;

d) that the shielded area of the Moon appears to be the potentially most useful area accessible to man which is completely free from interference from terrestrial transmissions;

e) that the shielded area of the Moon refers to the area of the Moon which is more than 23.2° beyond the mean limb of the Moon as seen from the centre of the Earth;

f) that the transmissions by radio of data from observation stations to collection points will be in the bands allocated for this purpose;

noting

the desirability of maintaining the shielded area of the Moon as an area of maximum value for observations by the radio astronomy service and by passive space research and consequently as free as possible from transmissions;
recommends

1. that the C.C.I.R. study the frequency bands most suitable for radio astronomy observations on the shielded area of the Moon and work out recommendations concerning these bands as well as criteria for their application and protection;

2. that in the meantime, administrations, in accordance with the intent of this Recommendation, take all practicable steps to ensure that there will be no interference to radio astronomy observations on the shielded area of the Moon; and

3. that administrations apply such Recommendations as may be provided on this matter by the C.C.I.R. pending the convening of the next World Administrative Radio Conference.
RECOMMENDATION No. Spa KK

considering

a) the requirements of the radio astronomy service, as expressed by the Inter-Union Commission on Frequency Allocations for Radio Astronomy and Space Science (IUCAF), for a frequency allocation near 10 M[c/s];

b) that the use of the standard frequency guard bands has not satisfied the needs of the radio astronomy service at a frequency near 10 M[c/s];

c) that propagation conditions at a frequency near 10 M[c/s] are such that a transmitter operating anywhere on the Earth might cause interference to the radio astronomy service and as a consequence an exclusive world-wide allocation is necessary for long term observations;

d) that successful radio astronomical measurements have, at times, been made at frequencies near 10 M[c/s];

e) that IUCAF is co-ordinating the needs of radio astronomers for frequency allocations;

recommends

1. that administrations keep under review the possibility of releasing a band of frequencies 50 k[c/s] wide for the use of the radio astronomy service between 10 M[c/s] and 15 M[c/s];

2. that administrations give close attention to any future recommendation of the IUCAF concerning the specific frequency band between 10 M[c/s] and 15 M[c/s] required by the radio astronomy service;

3. that a future world administrative radio conference consider granting to the radio astronomy service an exclusive allocation in this region of the spectrum.

B9—15
TENTH REPORT OF COMMITTEE 4

Modified Recommendation No. Spa 3 appearing in the Annex hereto has been approved by Committee 4.

The text in question has been forwarded to the Drafting Committee.

E.F. SANDBACH
Chairman
Committee 4

MOD

RECOMMENDATION No. Spa 3

TO THE C.C.I.R. AND TO ADMINISTRATIONS

relating to frequency bands shared between
space services and between space and terrestrial
services

The World Administrative Radio Conference for Space
Telecommunications, Geneva, 1971,

recognizing

a) the value to the Conference of the material contained in
Document No. 64 (Results of C.C.I.R. studies relating to space telecommuni-
cations concluded at its Special Joint Meeting);

b) that further studies on a wide range of problems dealing with
space communications form the subject of C.C.I.R. Questions and Study
Programmes approved by the XIith Plenary Assembly;

considering—however—

a) that certain C.C.I.R. Recommendations, listed below, call
for further work and study:

Recommendation 355-1 "FREQUENCY SHARING BETWEEN ACTIVE COMMUNICATION-
sATELLITE SYSTEMS AND TERRESTRIAL RADIO SERVICES
IN THE SAME FREQUENCY BANDS"

Recommendation 465 "GENERALIZED EARTH-STATION ANTENNA RADIATION
PATTERN FOR USE IN INTERFERENCE CALCULATIONS,
INCLUDING COORDINATION PROCEDURES, IN THE
FREQUENCY RANGE 2-10 GHz"
Recommendation 466

"COMMUNICATION-SATELLITE SYSTEMS FOR
TELEPHONY USING FREQUENCY-DIVISION
MULTIPLEX - Maximum allowable values of
interference in a telephone channel of a
geospatial communication-satellite
system employing frequency-modulation,
caused by other geospatial communication-
satellite systems"

b) that as a result of the deliberations of this Conference,
particularly in relation to the provisions of Article 7 Sections relevant
sections, and to other relevant Articles, further information is
required in reply to the following current Questions and Study Programmes
of the C.C.I.R.:

Question 1-1/4
under Decides 2
under Decides 3
under Decides 4

"ANTENNAE FOR SPACE SYSTEMS"

the state of development in antenna design
and fabrication;
the state of development of antennae with
improved side- and back-lobe characteristics;
the polarization characteristics of antennae,
particularly in the side-lobe regions and in
planes other than the principal planes;

Question 2-1/4
under Decides 3
under Decides 4

"TECHNICAL CHARACTERISTICS OF COMMUNICATION-
SATELLITE SYSTEMS FOR FIXED AND MOBILE,
EXCLUDING AERONAUTICAL AND MARITIME MOBILE,
SERVICES"

under what conditions and to what extent
would it be feasible for communication-
satellites, operating in the same system
or operating in different systems, to
share preferred frequency bands;
under what conditions and to what extent
would it be feasible for communication-
satellite systems to share preferred
frequency bands with terrestrial services;
<table>

<td>&quot;COMMUNICATION-SATELLITE SYSTEMS - Technical factors influencing the efficiency of use of the geostationary satellite orbit by communication-satellites sharing the same frequency bands&quot;</td>
</tr>
<tr>
<td>under Decides 1</td>
<td>the technical characteristics of communication-satellite systems which affect the utilization of the geostationary satellite orbit, and the inter-relationships between them;</td>
</tr>
<tr>
<td>under Decides 3</td>
<td>the extent to which it may be feasible and desirable to adopt preferred technical characteristics for different geostationary communication-satellites and earth stations;</td>
</tr>
</tbody>
</table>
under Note 1 some of the factors which should be taken into account in carrying out these studies:

- the tolerable levels of interference noise in different communication-satellite systems;
- the radiation patterns of the earth station and satellite antennae;
- factors affecting the multiple use of the same frequencies within a single communication-satellite;
- polarization discrimination;

(c) that under the terms of Article 9A of the Radio Regulations frequency assignments to earth stations in certain bands shared with equal rights with Fixed and Mobile or Terrestrial Services must be co-ordinated with a view to preventing mutual harmful interference;

d) that the calculation method described in Appendix 28 applies solely to frequencies in the 1-40 GHz range;

e) that Tables I, Ia and II in Appendix 28 do not show numerical values for the parameters of certain Space Radiocommunication Services and Terrestrial Services, sharing frequency bands with equal rights;

f) that the method of determining the co-ordination area of an earth station as described in Appendix 28 is probably still open to improvement and simplification;

g) that frequency bands have been allocated to the broadcasting satellite service and that the use of satellite transmissions for reception by the general public of sound and television broadcasts may be possible in the future;

h) that the C.C.I.R. is studying the conditions under which sharing between the broadcasting satellite service and other services may be possible;

i) that it would be useful to have a clear definition of the term "system noise temperature";
j) that it would be useful to have clear definitions of the terms "acceptable (or unacceptable) interference" and "harmful interference" for the Space, Radio Astronomy and Terrestrial Services;

k) that it would be useful to have specific numerical values of power flux-density from space stations in the Broadcasting-Satellite Service which would permit differentiation between "individual reception" and "community reception" in the Broadcasting-Satellite Service;

l) that frequency sharing between the Aeronautical Radionavigation Service and the Communication-Satellite Service (satellite-to-earth) has been proposed for the band 4200 to 4400 MHz;

m) that frequency sharing between the Radionavigation Service and the Fixed-Satellite Service (Earth-to-space) has been proposed for the frequency band 14.0 to 14.3 GHz, and between the Radionavigation-Satellite Service and the Fixed-Satellite Service (Earth-to-space) for the frequency band 14.3 to 14.4 GHz;

recommends

1. that administrations, recognized private operating agencies, and other participants in the work of the C.C.I.R., consider as a matter of priority, the submission of contributions on these subjects, so that corresponding draft Recommendations can be prepared at the meetings of the relevant Study Groups for consideration by the XIIIth Plenary Assembly of the C.C.I.R.;

2. that the C.C.I.R. should study or, as appropriate, continue to study:

2.1 the reference antenna patterns, for earth station antennae, which may be appropriate for setting minimum standards of performance, and to recommend specific patterns for this purpose, in order to improve utilization of the frequency bands shared between communication-satellite systems and terrestrial services and bands shared by space services, and to improve the utilization of the geostationary orbit;

2.2 the reference antenna patterns, for satellite antennae, which may be appropriate for setting minimum standards of performance, particularly outside the main beam, in order to improve the utilization of the geostationary orbit and to foster the possibilities for frequency re-use;

2.3 the reference cross-polarization antenna patterns which may be appropriate for setting minimum standards of performance and, in this connection, further study:
2.3.1 the portions of the spectrum within which linear-orthogonal or circular-orthogonal polarizations might be most appropriate;

2.3.2 the relative desirability, accounting for technical and orbit utilization factors, of using orthogonal polarizations within a single satellite as against between two satellites;

2.4 the necessary limitation of spurious emissions and the frequency tolerances to be observed in both the Terrestrial and Space Services insofar as they may affect sharing of frequency bands;

2.5 the permissible interference criteria for the various space and terrestrial services sharing the frequency bands allocated by the WARC-ST, Geneva, 1971, in order to permit the determination of:

2.5.1 the co-ordination distance and the probability of interference between stations within that distance;

2.5.2 the necessary limits of power flux-density set up at the earth's surface by space stations;

2.6 the maximum permissible level of interference into a geostationary satellite link from any other single interfering geostationary satellite system and from the aggregate of all other geostationary satellite systems, particularly in the case of:

2.6.1 frequency-modulated telephony signals;

2.6.2 frequency-modulated television signals;

2.6.3 digitally-modulated signals;

and the most appropriate manner in which permissible interference should be specified in these and other cases;

2.7 the interference criteria applicable to frequency sharing between non-geostationary satellite systems and geostationary satellite systems;

2.8 the possibility of establishing a technical criterion for expressing the efficiency of use of the geostationary satellite orbit;

2.9 the data which are not included in Tables I, Ia and II of Appendix 28, relating to the Space Radiocommunication Services or Terrestrial Services sharing frequency bands with equal rights;
2.10 the possibility of improving and simplifying the method of determining the co-ordination area as described in Appendix 28;

2.11 the formulation of a calculation method for determining the co-ordination area of earth stations at frequencies below 1 G/c/s and above 40 G/c/s;

2.12 the conditions for frequency sharing in those bands allocated to the Broadcasting-Satellite Service by the W.A.R.C. and make appropriate recommendations as soon as possible in order that Administrations and the International Frequency Registration Board shall have the necessary technical data required to carry out examination procedures, in particular regarding Articles 9 and 9A of the Radio Regulations;

2.13 the term "system noise temperature" and formulate a clear definition of this term applicable to space systems;

2.14 the terms "acceptable (or unacceptable) interference" and "harmful interference" and formulate clear definitions appropriate to the Radio Astronomy Service and to the various space and terrestrial services;

2.15 the power flux-densities required for individual and community reception in the Broadcasting-Satellite Service, with the object of specifying numerical values which will differentiate between these types of reception;

2.16 the criteria for frequency sharing between the Aeronautical Radionavigation Service and the Communication-Satellite Service (Satellite-to-earth) for frequencies in the vicinity of 4 300 M/Hz;

2.17 the criteria for frequency sharing between the Radionavigation Service and the Fixed-Satellite Service (Earth-to-space) in the frequency band 14.0 to 14.3 G/Hz, and between the Radionavigation-Satellite Service and the Fixed-Satellite Service (Earth-to-space) in the frequency band 14.3 to 14.4 G/Hz;

3. that until the next competent Administrative Conference all Administrations should use:

- any C.C.I.R. Recommendation, if applicable, for the values missing from Tables I, Ia and II of Appendix 28,

- the methods of determining the co-ordination area for frequencies below 1 G/c/s and above 40 G/c/s, which may be the subject of a C.C.I.R. Recommendation.
NEW ZEALAND

DRAFT RESOLUTION

relating to the technical criteria recommended
by the C.C.I.R. for sharing between the
Space and Terrestrial Services and
within the Space Service

considering:

a) that, in frequency bands shared with equal rights by Space and Terrestrial Services, it is necessary to impose certain technical limitations and co-ordination procedures on each of the sharing services in the interest of controlling mutual interference;

b) that, in frequency bands shared by space stations located on geostationary satellites, it is necessary to impose co-ordination procedures in the interest of controlling mutual interference;

c) that the technical criteria and co-ordination procedures referred to in a) and b) above, and as set forth in the Radio Regulations, are mainly based upon recommendations of the C.C.I.R.;

d) that, in recognition of the successful sharing of frequency bands by Space and Terrestrial Services, and the continuing improvements in space technology, each Plenary Assembly of the C.C.I.R. subsequent to the Xth Plenary Assembly, Geneva 1965, has improved upon some of the technical criteria recommended by the preceding Plenary Assembly;

e) that Plenary Assemblies of the C.C.I.R. are held triennially whereas Administrative Radio Conferences, which are empowered to modify the Radio Regulations making substantial use of the recommendations of the C.C.I.R. are in practice held less frequently and with much less regularity;
f) that the International Telecommunication Convention of Montreux 1965, recognizes the right of Members and Associate Members of the I.T.U. to make special agreements on telecommunication matters; however, such agreements shall not be in conflict with the terms of the Convention or of the Regulations annexed thereto, so far as concerns the harmful interference to the radio services of other countries;

is of the opinion

that subsequent Plenary Assemblies of the C.C.I.R. are likely to make further changes in the recommended technical criteria; and

that administrations should be afforded the opportunity to take advantage of the current C.C.I.R. Recommendations on sharing criteria when planning systems for use in frequency bands, shared with equal rights by Space and Terrestrial Services, or between space systems;

therefore resolves that

1) each Plenary Assembly of the C.C.I.R. should arrange for the Secretary-General to be informed of those Recommendations of the C.C.I.R. affecting the technical criteria relating to sharing between the Space and Terrestrial Services and within the Space Services;

2) following the distribution to administrations of the relevant C.C.I.R. texts, the Secretary-General shall write to administrations asking them to indicate within 60 days, to which of the C.C.I.R. Recommendations or to which specific technical criteria defined in the Recommendations referred to in 1) above they agree for use in the application of the pertinent Radio Regulations;

3) the administrations which do not respond to the Secretary-General's inquiry within 60 days shall, for the time being, be deemed to prefer the application of the specific technical criteria referred to in the existing Regulations;

4) such administrations described in paragraph 3) may, however, at a later stage communicate their views to the Secretary-General on the applications of the technical criteria referred to in paragraph 1) above;
5) in those cases where an administration, in its reply to the Secretary-General's inquiry, indicates that a specific C.C.I.R. Recommendation or a specific technical criteria defined in those Recommendations is not acceptable to it, the relevant technical criteria defined in the Radio Regulations shall continue to apply with respect to cases involving that administration;

6) the Secretary-General shall publish, for the information of all administrations, a consolidated list prepared on the basis of the replies to the inquiry, of the C.C.I.R. Recommendations or of the specific relevant technical criteria defined in those Recommendations, and to which administrations each of those Recommendations or specific relevant technical criteria are acceptable or are not acceptable. This list shall also include those administrations mentioned in paragraph 3) above; the list shall be revised if any administration forwards its views in accordance with paragraph 4) above;

7) the I.F.R.B. be directed to take into account:

   a) the applicability of the C.C.I.R. technical criteria consonant with the list referred to in 6) above when making technical examinations with respect to cases involving only administrations to which such criteria are acceptable;

   b) the applicability of the technical criteria defined in the Radio Regulations consonant with the list referred to in 6) above when making technical examinations with respect to cases involving an administration which does not accept the relevant C.C.I.R. technical criteria;

8) if at a later time questions arise concerning the application of the relevant technical criteria to a case involving administrations which are described in paragraph 3) and which have not communicated their views in accordance with paragraph 4) above, the Secretary-General shall inquire of such administrations as to whether or not they would agree to the application of the technical criteria defined in the relevant C.C.I.R. Recommendations referred to in paragraph 1) above. If the answer is in the affirmative, the Secretary-General shall revise the list published pursuant to paragraph 5) above;

9) Administrations in planning the introduction of new services shall ensure that no harmful interference is caused or likely to be caused to the services of stations of those administrations which have not indicated their agreement to the application of the specific technical criteria in the relevant C.C.I.R. Recommendations referred to in paragraph 1) above.
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of the People's Republic of Bulgaria the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
Dear Mr. Chairman,

I wish to bring to your notice the attached statement by the Delegation of the People's Republic of Bulgaria concerning the participation of the German Democratic Republic, the Democratic Republic of Viet-Nam and the Korean People's Democratic Republic in the work of the Conference.

I request you to publish the text of this statement as an official conference document.

Yours sincerely,

D. ROUSSEV
Deputy Head, Bulgarian Delegation
Annex

The Delegation of the Bulgarian People's Republic to the World Administrative Radio Conference for Space Telecommunications expresses its profound regret that delegations from the sovereign States of the German Democratic Republic, the Democratic Republic of Viet-Nam and the Korean People’s Democratic Republic were not invited to take part in the Conference.

The absence of delegations from these countries constitutes a serious infringement of the principles proclaimed by the United Nations and reduces the possibilities of finding an effective solution to the problems confronting this Conference.

D. ROUSSEV
Deputy Head, Bulgarian Delegation
SUMMARY RECORD
OF THE
EIGHTH MEETING OF COMMITTEE 4
(TECHNICAL)
Friday, 9 July 1971, at 0930 hrs
Chairman: Mr. E.F. SANDBACH (Australia)

Subjects discussed:

1. Approval of Summary Record of Seventh Meeting 327, 287, 287 Corr. 1

2. Progress report by Working Group Chairman

3. Consideration of documents from Working Groups
   a) Working Group 4A
   b) Working Group 4B
   c) Working Group 4C
   d) Working Group 4E

4. Documents from Committee 4 Drafting Group
   Collective Recommendation
   Appendix 29 + Annex

5. Documents referred to other Committees

6. Completion of the work of Committee 4
The delegate of France announced that he had been authorized to vote by proxy for the French Overseas Territories (see Annex).

1. Approval of Summary Record of Seventh Meeting (Document No. 327)

The delegate of France pointed out the following corrections:

Page 4, paragraph 2, line 4: replace "system" by "equivalent satellite link", and in line 5, replace "19" by "29".

Page 5: replace the first two lines by "The delegate of France said that it was necessary to adapt the texts of Appendices 1B and 29 where methods of calculating increase of equivalent satellite link noise ...".

The Summary Record was approved subject to those amendments.

The Chairman drew attention to Corrigendum 1 to Document No. 287 which contained an amendment to the Summary Record of the Sixth Meeting. The document was noted.

2. a) Working Group 4A (Document No. 295)

The Chairman took up the outstanding terms and definitions:

ADD 103B Proposal to replace "an allowable amount" by "a permissible level" in the English text - adopted.

ADD 103C The delegate of the United States of America proposed to rearrange the word order to read "... joining, on all azimuths around this earth station, the points which ..." - adopted.

ADD 103D At the suggestion of the delegate of the Federal Republic of Germany it was decided to delete the Note altogether.

Document No. 295 as a whole was adopted, as amended.

b) Working Group 4B (Document Nos. 301, 303, 302, 278)

Document No. 301 was adopted.

Document No. 303 was adopted.
Following a query by the delegate of Denmark, the Chairman of Working Group 4B explained why it had been thought unnecessary to go into detail and why an aggregate value had been given to facilitate comparison.

The delegate of Uganda, supported by the delegate of Nigeria, thought that the wording of paragraph 1.3 was rather weak and did not reflect sufficiently the Working Group's conclusion that sharing was not feasible.

Following a discussion in which proposals for an additional phrase were made by the delegates of Australia and the United Kingdom, it was finally agreed that the following should be added at the end of the paragraph: "... and this shows that sharing in some cases would be very difficult".

Document No. 302 was adopted, as amended.

Document No. 278

The Chairman of Working Group 4B introduced the document, pointing out four instances in which the following phrase should be inserted: "where \( \delta \) is the angle of arrival above the horizontal plane".

The delegate of Sweden urged the adoption of conservative limits and proposed that the figures -127 dB/W/m\(^2\) and -111 dB/W/m\(^2\) be altered to -129 dB/W/m\(^2\) and -113 dB/W/m\(^2\) respectively.

The delegate of the United Kingdom expressed his appreciation of the efforts of the Chairman of Working Group 4B to reach agreement but stressed that for Western Europe the protection of UHF television services was of paramount importance. He agreed to the Swedish proposal with the addition of a new paragraph 3 to read:

"3. that the transmission of unmodulated carriers shall be avoided;"

The delegate of Sweden associated himself with that proposal, as did the delegates of France and the Federal Republic of Germany.
The delegate of Nigeria said that it was not a question which concerned only the European area; he saw no justification for departing from the value of -127 dBW/m² but he was prepared to accept -128 dBW/m² for the sake of compromise and reserved the right to make a further intervention if -129 dBW/m² were accepted.

The delegate of the United States of America endorsed the position of the delegate of Nigeria which seemed a reasonable compromise.

The delegate of Italy pointed out that whatever figure were introduced it would be provisional, but he did consider it important to have a lower limit of power flux-density and especially to use an energy dispersal system on the satellite carrier.

The delegate of the U.S.S.R. shared the concern expressed by countries which wished to protect their terrestrial services; although his delegation considered -129 dB perhaps over-conservative, they would support it for the sake of reaching agreement.

The Chairman put to the vote the proposal to alter the figures to -129 dBW/m² and -113 dBW/m², 21 delegations voting for the proposal, 20 against and 3 abstaining. Some confusion having arisen on the voting procedure, the Chairman then asked delegations to vote for either -129 dB or -128 dB.

The result of that vote was 27 in favour of -129 dB and 22 in favour of -128 dB. The limits of -129 dBW/m² and -113 dBW/m² were therefore adopted.

The additional paragraph proposed by the delegate of the United Kingdom was adopted.

The Chairman of Working Group 4C introduced the draft new Appendix 28, stating that amendments of detail would be incorporated in the blue documents submitted to the Plenary. The Working Group had convened a small Sub-Working Group, 4C-2, under the chairmanship of Mr. Temple (United Kingdom), to deal with the Tables and Calculations. He suggested that the document be considered in three parts: pages 3-22 with Annex B, pages 23-71 (tables and diagrams) and Annex A (simplified calculation method).
Pages 3-22, Annex B + Corr.2 - adopted, with drafting amendments indicated by the delegate of the United States of America.

Tables and diagrams, pages 23-71 + Corr.1 - adopted, subject to minor drafting changes.

The Chairman of Sub-Working Group 4C-2 said that his Group was reasonably satisfied that the flow diagram correctly interpreted the outcome of the discussions, he did intend, however, to change the presentation slightly, taking into account suggestions from the Secretariat of the I.F.R.B. If the Committee agreed to the principle of the values indicated on pages 73 and 74, the Sub-Working Group could carry out the simple but tedious calculations and submit the tables to the Plenary meeting.

The delegate of Cameroon pointed out minor corrections on pages 73 and 75 (French text).

The delegate of France noted a discrepancy between Tables I and IA and it was agreed that the figures in Table I should be aligned to those in Table IA. There was a lengthy discussion on a point raised by the delegate of France with regard to Table II in which he felt there should be separate columns for transhorizon and line-of-sight figures. He also said that the question should be considered in association with the Resolution in Document No. 188(Rev.) as the two were closely associated.

At the suggestion of the Chairman, it was agreed to authorize Sub-Working Group 4C-2 (the delegates of the United Kingdom, Turkey and the United States of America together with the delegate of France) to include suggestions offered by the Representative of the I.F.R.B. and finalize the document.

The delegate of the United States of America expressed his appreciation of Mr. del Moral's work as Chairman of Working Group 4C and the latter thanked the members of the Working Group chaired by Mr. Weiss and its Sub-Groups as well as Mr. Sonesson from the Technical Secretariat.

d) Working Group 4E (Document Nos. 311, 325, 334)

Document No. 311 - adopted.

Document No. 325 - adopted, with small corrections indicated by the delegates of France and the United States of America.
On behalf of the Committee, the Chairman thanked the Chairman of Working Group 4E.

4. Documents from Committee 4 Drafting Group

Collective recommendation (Document No. 333)

The Chairman pointed out drafting amendments on pages 1, 2, 5 and 7, all of which were approved.

The delegate of the United States of America said that "recommends 2.1" should read at the end:

"terrestrial services, and bands shared by space services and to improve utilization of the geostationary satellite orbit".

That amendment was approved.

The delegate of the United Kingdom suggested adding a paragraph "considering m" and a corresponding sentence in the "recommends" part to cover the point that sharing was proposed in the 14-14.3 MHz and 14.3-14.4 MHz band but that no criteria had been established. He said he would hand the text to the Committee 4 Drafting Group.

In reply to the delegate of Austria, the Director of the C.C.I.R. said that additional work needed to be done on sharing criteria in the 149.9-150.05 MHz band for radionavigation and fixed services, in other words Recommendation No. Spa 8 should be retained.

Document No. 333 was adopted, as amended.

Appendix 29 + Annex (Document No. 336) - adopted, subject to correction of any minor errors.

5. Documents referred to other committees (Document Nos. 308, 309, 330)

Document Nos. 308, 309 and 330 were noted.
It was agreed that the Chairman of the Committee should himself approve the Summary Record of the final meeting.

The delegate of the United States of America expressed his gratitude to the Chairman for the able way in which he had succeeded in completing the Committee's schedule. Seconding that motion, the delegate of the United Kingdom added his thanks to the Representative of the I.F.R.B., the Director of the C.C.I.R. and the Secretary of the Committee.

The meeting rose at 1330 hrs.

The Secretary:
I. DOLEZEL

The Chairman:
E.F. SANDBACH

Annex: 1
I, the undersigned, CONSTANTIN Jean Louis André, Head of the Delegation of the I.T.U. member Group of Territories represented by the French Overseas Post and Telecommunication Agency at the World Administrative Radio Conference for Space Telecommunications, authorize the Delegation of France to vote on behalf of my delegation in the Committee 4 meeting convened at 0930 hrs, 9 July 1971.

Geneva, 9 July 1971

(Sgd.) CONSTANTIN
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

Chairman of the Editorial Committee

Annex: Pages B10/01-08
RECOMMENDATION No. Spa 3

To the C.C.I.R. and to Administrations
Relating to Frequency Bands Shared between Space Services and between
Space and Terrestrial Services

recognizing

a) the value to the Conference of the material contained in Document No. 64 (results of C.C.I.R. studies relating to space telecommunications concluded at its Special Joint Meeting);

b) that further studies on a wide range of problems dealing with space radiocommunications form the subject of C.C.I.R. Questions and Study Programmes approved by the XIIth Plenary Assembly;

considering however

a) that certain C.C.I.R. Recommendations, listed below, call for further work and study:

Recommendation 355-1 "FREQUENCY SHARING BETWEEN ACTIVE COMMUNICATION-SATELLITE SYSTEMS AND TERRESTRIAL RADIO SERVICES IN THE SAME FREQUENCY BANDS"

Recommendation 465 "GENERALIZED EARTH-STATION ANTENNA RADIATION PATTERN FOR USE IN INTERFERENCE CALCULATIONS, INCLUDING COORDINATION PROCEDURES, IN THE FREQUENCY RANGE 2-10 GHz"

Recommendation 466 "COMMUNICATION-SATELLITE SYSTEMS FOR TELEPHONY USING FREQUENCY-DIVISION MULTIPLEX — Maximum allowable values of interference in

B10—01
a telephone channel of a geostationary communication-satellite system employing frequency modulation, caused by other geostationary communication-satellite systems.

b) that as a result of the deliberations of this Conference, particularly in relation to the provisions of Article 7 Sections [...], and to other relevant Articles of the Radio Regulations, further information is required to reply to the following current Questions and Study Programmes of the C.C.I.R.:

**Question 1-1/4**

- under Decides 2: "Antennae for space systems" the state of development in antenna design and fabrication;

- under Decides 3: the state of development of antennae with improved side- and back-lobe characteristics;

- under Decides 4: the polarization characteristics of antennae, particularly in the side-lobe regions and in planes other than the principal planes;

**Question 2-1/4**

- under Decides 3: "Technical characteristics of communication-satellite systems for fixed and mobile, excluding aeronautical and maritime mobile, services" under what conditions and to what extent would it be feasible for communication-satellites, operating in the same system or operating in different systems, to share preferred frequency bands;

- under Decides 4: under what conditions and to what extent would it be feasible for communication-satellite systems to share preferred frequency bands with terrestrial services;
Study Programme 2-A-1/4 "Feasibility of frequency sharing between communication-satellite systems and terrestrial services"

under Decides 2 the determination of the preferred technical characteristics of transmitting and receiving antennae for earth stations at fixed locations, from the standpoint of spectrum sharing with other radio services;

Study Programme 2-1C/4 "Communication-satellite systems—Feasibility of frequency sharing among communication-satellite systems"

under Decides 1 the criteria which affect interference among communication-satellites in a given system and between communication-satellite systems, taking into account the two directions of transmission;

under Decides 2 the preferred technical characteristics of transmitting and receiving antennae for earth stations, from the standpoint of frequency sharing within the same system and with other communication-satellite systems;

Study Programme 2-1J/4 "Communication-satellite systems—Technical factors influencing the efficiency of use of the geostationary satellite orbit by communication-satellites sharing the same frequency bands"

under Decides 1 the technical characteristics of communication-satellite systems which affect the utilization of the geostationary satellite orbit, and the inter-relationships between them;

under Decides 3 the extent to which it may be feasible and desirable to adopt preferred technical char-
acteristics for different geostationary communication-satellites and earth stations;

under note 1:

Some of the factors which should be taken into account in carrying out these studies:

— the tolerable levels of interference noise in different communication-satellite systems;
— the radiation patterns of the earth station and satellite antennae;
— factors affecting the multiple use of the same frequencies within a single communication satellite;
— polarization discrimination;

c) that under the terms of Article 9A of the Radio Regulations, frequency assignments to earth stations in certain bands shared with equal rights with [fixed and mobile services] or [terrestrial radiocommunication services] must be co-ordinated with a view to preventing mutual harmful interference;

d) that the calculation method described in Appendix 28 applies solely to frequencies in the 1-40 G [c/s] range;

c) that Tables I, [Ia] and II in Appendix 28 do not show numerical values for the parameters of certain space radiocommunication services and terrestrial radiocommunication services sharing frequency bands with equal rights;

f) that the method of determining the co-ordination area of an earth station as described in Appendix 28 is probably open to improvement and simplification;

g) that frequency bands have been allocated to the broadcasting satellite service and that the use of satellite transmissions for reception by the general public of sound and television broadcasts may be possible in the future;
that the C.C.I.R. is studying the conditions under which sharing between the broadcasting satellite service and other services may be possible;

that it would be useful to have a clear definition of the term “system noise temperature”;

that it would be useful to have clear definitions of the terms “acceptable (or unacceptable) interference” and “harmful interference” for the space radiocommunication, radio astronomy, and terrestrial radiocommunication services;

that it would be useful to have specific numerical values of power flux density from space stations of the broadcasting-satellite service which would permit differentiation between “individual reception” and “community reception” in the broadcasting-satellite service;

that frequency sharing between the aeronautical radionavigation service and the fixed-satellite service (space-to-Earth) has been proposed for the band 4 200 to 4 400 M [c/s];

that frequency sharing between the radionavigation service and the fixed-satellite service (Earth-to-space) has been proposed in the frequency band 14-0 to 14-3 G [c/s], and between the radionavigation-satellite service and the fixed-satellite service (earth-to-space) in the frequency band 14-3 to 14-4 G [c/s];

recommends

1. that administrations, recognized private operating agencies, and other participants in the work of the C.C.I.R., consider as a matter of priority, the submission of contributions on these subjects, so that draft Recommendations on them can be prepared at the Meetings of the relevant Study Groups for consideration by the XIIIth Plenary Assembly of the C.C.I.R.;

2. that the C.C.I.R. should study or, as appropriate, continue to study:

2.1 the reference antenna patterns for earth station antennae, which may be appropriate for setting minimum standards of performance
with a view to recommending specific patterns for this purpose, in order to improve utilization of the bands shared between the fixed-satellite service and terrestrial radiocommunication services, and of the bands shared by space radiocommunication services, and to improve the utilization of the geostationary satellite orbit;

2.2 the reference antenna patterns for satellite antennae, which may be appropriate for setting minimum standards of performance, particularly outside the main beam, in order to improve the utilization of the geostationary satellite orbit and to increase the possibilities for frequency re-use;

2.3 the reference cross-polarization antenna patterns which may be appropriate for setting minimum standards of performance and, in this connection, further study:

2.3.1 the portions of the spectrum within which linear-orthogonal or circular-orthogonal polarizations might be most appropriate;

2.3.2 the relative desirability, taking into account technical and orbit utilization factors, of using orthogonal polarizations within a single satellite as against with two satellites;

2.4 the necessary limitation of spurious emissions and the frequency tolerances to be observed in both the terrestrial and space radiocommunication services insofar as they may affect sharing of frequency bands;

2.5 the criteria of acceptable interference for the various space radiocommunication services and terrestrial radiocommunication services sharing the frequency bands allocated by the present Conference, in order to permit the determination of:

2.5.1 the co-ordination distance and the probability of interference between stations within that distance;

2.5.2 the necessary limits of power flux density set up at the Earth’s surface by space stations;
2.6  the maximum acceptable level of interference into a geostationary satellite link from any other single interfering geostationary satellite [system] [network] and from the aggregate of all other geostationary satellite [systems] [networks], particularly in the case of:

2.6.1 frequency-modulated telephony signals;

2.6.2 frequency-modulated television signals;

2.6.3 digitally-modulated signals;

and the most appropriate manner in which acceptable interference should be specified in these and other cases;

2.7  the interference criteria applicable to frequency sharing between non-geostationary satellite [systems] [networks] and geostationary satellite [systems] [networks];

2.8  the possibility of establishing a technical criterion for expressing the efficiency of use of the geostationary satellite orbit;

2.9  the data which are not included in Tables I, [Ia] and II of Appendix 28, relating to the space radiocommunication services or terrestrial radiocommunication services sharing frequency bands with equal rights;

2.10 the possibility of improving and simplifying the method of determining the co-ordination area as described in Appendix 28.;

2.11 the formulation of a calculation method for determining the co-ordination area of earth stations at frequencies below 1 G[c/s] and above 40 G[c/s];

2.12 the conditions for frequency sharing in those bands allocated to the broadcasting-satellite service by the present Conference with a view to making appropriate recommendations as soon as possible so that administrations and the International Frequency Registra-
tion Board shall have the necessary technical data required to carry out examination procedures, in particular regarding Articles 9 and 9A of the Radio Regulations;

2.13 the term "system noise temperature" with a view formulating a clear definition of this term applicable to space radiocommunication systems;

2.14 the terms "acceptable (or unacceptable) interference" and "harmful interference" with a view to formulating clear definitions appropriate to the radio astronomy service and to the various space radiocommunication and terrestrial radiocommunication services;

2.15 the power flux densities required for individual and community reception in the broadcasting-satellite service, with a view to specifying numerical values which will differentiate between these types of reception;

2.16 the criteria for frequency sharing between the aeronautical radionavigation service and the fixed-satellite service (space-to-Earth) for frequencies in the vicinity of 4 300 M[c/s];

2.17 the criteria for frequency sharing between the radionavigation service and the fixed-satellite service (Earth-to-space) in the frequency band 14-0 to 14-3 G[c/s] and between the radionavigation-satellite service and the fixed-satellite service (Earth-to-space) in the frequency band 14-3 to 14-4 G[c/s].

3. that until the next competent Administrative Conference all administrations should use:

— applicable C.C.I.R. Recommendations for the values missing from Tables I, [1a] and II of Appendix 28,

— the methods of determining the co-ordination area for frequencies below 1 G[c/s] and above 40 G[c/s], which may be the subject of a C.C.I.R. Recommendation.

B10—08
APPENDIX 9

At the meeting of Working Group 6A which took place on 10 July 1971, the representative of the I.F.R.E. raised the question of the amendments to be made to Appendix 9 to the Radio Regulations (List I, International Frequency List and List VIIIA. List of Stations in the Space Service and in the Radio Astronomy Service, pages 481 and 497 to 505 of the Radio Regulations), in particular as a consequence of the new or amended definitions adopted by the Conference, as well as of the revision of Appendix IA.

A subsequent study has shown that not only the headings of the present 9 Sections of List VIIIA should be amended, but that new Sections should be added.

Time did not permit the preparation of all such amendments in a tabular form. However, Annex I hereto attached indicates the amendments to be made to List I as well as to the existing sections of List VIIIA.

As far as the additional Sections required in List VIIIA are concerned, a draft Resolution is submitted, as Annex 2, to Committee 6 for consideration.

P.E. WILLEMS
Chairman
Working Group 6A

Present text
ANNEX 2

DRAFT RESOLUTION No. Spa 7

The World Administrative Radio Conference for Space
Telecommunications, Geneva, 1971,

considering
a) that it has modified the definitions which appeared in the
Radio Regulations and has adopted a series of new definitions for the
services and the various categories of earth and space stations;
b) that, within the framework of these modifications, it has
changed the headings and the contents of the existing nine Sections of
List VIIIA (List of Stations in the Space Service and in the Radio
Astronomy Service);
c) that however, in List VIIIA so modified, it is not possible
to include all the categories of earth and space stations notified to
the I.F.R.B. for inclusion in the Master International Frequency Register;
d) that the Conference has not had the time to make the required
modifications;

decides

to invite the Secretary-General, in collaboration with the
I.F.R.B. to take the necessary measures, on the basis of the existing
Sections of List VIIIA, to have additional Sections added to this List,
so that the particulars of all the earth and space stations notified to
the I.F.R.B. under Article 9A of the Radio Regulations, for recording in
the Master International Frequency Register, be included.
### SUMMARY RECORD

**OF THE EIGHTH MEETING OF COMMITTEE 5 (ALLOCATIONS)**

Saturday, 10 July 1971, at 1100 hrs

Chairman: Mr. H.A. KIEFFER (Switzerland)

#### Subjects discussed

1. Approval of the Summary Records of the third and fifth meetings
   (Documents Nos. 256 and 305)
   
a) Document No. 256

   The Chairman said that the words "Delegate of the United Kingdom"
   should be replaced by "Delegate of the United States" at the top of page 3
   and that the bottom of page 8 of the French and Spanish texts should read
   "Sous-Groupe de travail 5 ad hoc-1" and "Subgrupo de trabajo 5 ad hoc-1"
   respectively.

b) Document No. 305

   The Chairman said that, in the second line of the paragraph
   immediately preceding point 3 on page 7, "proposal F/28/280" should read
   "proposal F/85/280".

   The Delegate of Cuba stated that, with regard to ADD 274B
   referred to on page 2 of Document No. 305, Cuba wished, the present
   band 132-137 Mc/s to be reduced to 132-136 Mc/s.

   The Delegate of Mexico, whose country also was referred to in
   the note, made the same comment.

   The Delegate of Cuba requested that his country should be deleted
   from MOD 281E referred to at the bottom of page 3 of Document No. 305.

   The Chairman invited the speaker to submit the list to the
   Secretariat in writing.

   It was so agreed.

   The Delegate of Cuba referred to ADD 287A reproduced on page 4
   of the Fourth Report of Working Group 5D (Document No. 241). His country
   could not accept the new allocation of the band 161.9125-162.0125 Mc/s,
   since such a measure would require other limitations on the fixed and mobile
   services, which were very widely used in that band in Cuba.

   The comment was noted and the Chairman said that the Committee
   would, if necessary, revert to the subject later.

2. Adoption of the following Reports :
   
   Third Report of Working Group 5 ad hoc (Document No. 312)

   The Chairman of Working Group 5 ad hoc briefly introduced the
   document and described the measures adopted by the Group following
   deliberations.
At the suggestion of the Delegate of the Federal Republic of Germany, supported by the Delegate of France, it was decided to supplement the operative part of the recommendation contained in Annex 1 as follows: "... Recommendation, and to consider further consequential amendments to this Article, as necessary."

Thus amended, Annex 1 was adopted.

Annex 2: adopted

Document No. 312 having thus been approved, the Chairman cordially thanked the Chairmen of Working Group 5 ad hoc and Sub-Working Group 5 ad hoc-1 for the substantial and admirable contribution they had made to the Committee's work in collaboration with the members of their respective Groups.

First Report of Working Group 5A (Document No. 225)

The Chairman recalled that point 2 of the document had been left in abeyance for later consideration.

Third Report of Working Group 5A (Document No. 264)

The Chairman of Working Group 5A submitted the document, together with various details concerning the work carried out by the Group and on the Annexes to Document No. 264.

The Delegates of Canada and Chile, who had entered reservations in the Working Group, said that, having explained their reservations, they would not revert to the subject.

Pages 1 and 2 of the document were adopted

Annex 1

The Delegate of Cuba, supported by the Delegate of Canada, pointed out that no mention was made of the mobile service on a primary basis in the box relating to the band 2 655-2 690 Mc/s for Region 2.

The Chairman of Working Group 5A replied that the matter was dealt with in Document No. 316, which had been studied by Working Group 5E.

It was therefore decided to revert to the subject when Document No. 316 was considered.
With regard to Region 3, the Delegate of India said that he reserved the right to raise at the Plenary Meeting the question of the term "earth-to-space" between brackets which should, in his opinion, be reversed to read "space-to-earth".

Subject to that reservation, Annex 1 was adopted.

Annex 2

The Delegate of Syria, supported by the Delegate of the United Kingdom, pointed out that Korea was not entitled to be mentioned in MOD 377.

The comment gave rise to an exchange of views by the Delegates of Korea and Italy, the Representative of the I.F.R.B. and the Secretary of the Committee, the latter explaining that the question was whether the present Conference was empowered to make the new allocation to Korea.

As a result of the discussion, it was decided to delete Korea from MOD 377.

Fourth Report of Working Group 5A (Document No. 320)

The Chairman of Working Group 5A introduced the document, which represented the last report of that Group, and provided some additional details.

Page 1 of the document was adopted.

Page 2

4. Frequency band: 6 425-7 750 Mc/s

Paragraph 4.1

Following a comment by the Delegate of Italy, the Secretary of the Committee said that there was in fact no need to amend 392G and that, in the Annex, the abbreviation "MOD" should be replaced by "NOC".

It was so agreed.

The Delegate of the United States expressed concern about the new situation created in the band 7 250-7 300 at present allocated to the Communication-Satellite Service (Space-to-earth) by the Conference's decision to split the definition up into "Fixed-Satellite Service" and
"Mobile-Satellite Service", which meant that it would no longer be possible to use a mobile or movable earth station in the band allocated to the Fixed-Satellite Service. The same problem arose in all cases where the operative regulations provided for the allocation of frequencies to the "Communication-Satellite Service", whereas henceforth only the "Fixed-Satellite Service" would be authorized by virtue of the change of definition. His Delegation therefore proposed the addition in this band, likewise on a primary basis, of "mobile-Satellite (Space-to-earth)" and to make corresponding changes in those parts of the Table of Frequency Allocations which mentioned the "Fixed-Satellite Service", particularly to take account of ship stations and any other type of transportable station.

The Delegate of Italy considered that the United States proposal was equally valid for uplinks.

The Delegate of the U.S.S.R., supported by the Delegates of Chile and Cuba, opposed adoption of the proposal, which he considered untimely, as it would require a lengthy and thorough study which the Conference could not undertake.

The Delegate of New Zealand said that he would be in favour of the United States proposal if it did not call into question the definition of mobile stations and movable or transportable stations.

The Secretary of the Committee pointed out that the Master International Frequency Register contained notices of movable stations operating in the fixed service but not operating when in motion. They were hence not regarded as "mobile", since they were only used between fixed points in the Terrestrial Service.

The Delegate of France considered that the comparison could not apply to the Space Services, since the Mobile Terrestrial Services, operating in VHF and UHF, were subject to power limits such that, in its operating zone, a station would have to be immobilized for the requisite co-ordination to be effected. The situation was quite different for a satellite station.

The United Kingdom Delegate, on the basis of Nos. 639AF and 639AD of the Radio Regulations, considered, on the other hand, that the Secretary of the Committee had drawn an extremely just parallel with the situation which obtained in the Fixed Terrestrial Service between mobile stations and movable stations used, for example, in the event of national disaster or catastrophe. However, he supported the view of the U.S.S.R. Delegate and considered that the matter should be shelved owing to the complex nature of the study required and the length of the discussions to which it might give rise.
It was so decided.

Foot-notes 329C and 374A were deleted.

The Delegate of India requested that India should be added to the countries listed in foot-note 392G, but the Chairman pointed out that, in view of the decision which had just been adopted, the text should not be amended.

It was also decided to delete the last paragraph of foot-note 392D.

Paragraph 4.1 was thus approved, as was the Annex to Document No. 320, subject to the amendments introduced.

With regard to paragraph 4.2, the Delegate of the United States, supported during the discussion by the Delegate of Canada, requested the inclusion of a foot-note 393A worded as follows (DT/36 and DT/45):

393A In Canada and the United States of America the band 6 625-7 125 Mc/s is also allocated on a secondary basis to the Fixed-Satellite Service for Space-to-earth transmission. The power flux-density produced by space stations in this band shall be in accord with Article 7, Section VIII, for Region 2. It shall be at least 6 db lower with respect to Regions 1 and 3. Earth stations receiving signals in this band may not impose restrictions on the physical location or technical parameters of existing or future terrestrial stations of other Administrations.

The Delegate of Cuba, supported by the Delegates of Mexico and the U.S.S.R., opposed inclusion of the text, whereas the Delegates of Japan, the United Kingdom and Brazil supported the proposal, which was finally adopted by 37 votes to 16, with 13 abstentions.

Paragraph 4.2 was thus approved.

Paragraph 4.3 was also approved.

5. Frequency band : 8025-8400 Mc/s

Approved.

6. Frequency band : 14.4-15.25 Gc/s
The Delegate of Australia confirmed the withdrawal of Proposal AUS/10/43 in addition to those mentioned in that paragraph, which was then approved.

7. Frequency band: 38–40 GHz

The Delegate of Japan said that he withdrew Proposal J/98/31, on which agreement had already been reached in the Committee.

Paragraph 8 was noted.

Consideration of the Fourth Report of Working Group 5A was thus concluded and the document was approved.

The meeting rose at 1310 hours.

H.A. KIEFFER
Chairman
SUMMARY RECORD
OF THE
NINTH MEETING OF COMMITTEE 5
(ALLOCATIONS)
Saturday, 10 July 1971, at 1500 hrs
Chairman : Mr. H.A. KIEFFER (Switzerland)

Subjects discussed

1. Joint Report by Working Groups 5A and 5E
   (Section 7 and Annex 2)  
   Document No. 273(Rev.)

2. Third Report of Working Group 5B  
   Document No. 279

3. United Kingdom : Proposed new foot-note relating to
   the protection of radio astronomy observations in the
   band 2 690-2 700 Mc/s  
   Document No. 291

4. Fourth Report of Working Group 5B  
   Document No. 280

5. Fifth Report of Working Group 5B  
   Document No. 299

6. Sixth and last report of Working Group 5B  
   Document No. 339
1. **Joint Report by Working Groups 5A and 5E (Section 7 and Annex 2)**

   (Document No. 273(Rev.))

   In view of the effect the revised text of foot-note 364C (Document No. 316) would have on the fixed satellite service, the Delegate of New Zealand, supported by the Delegate of Canada, proposed a further foot-note, 364D, as follows: "In the bands 2 500-2 535 Mc/s and 2 655-2 690 Mc/s new tropospheric scatter systems are not permitted. Existing tropospheric scatter systems may continue to operate in these bands." The proposal was opposed by the Delegates of the U.S.S.R., Portugal, Spain and Chile and it was decided to postpone further discussion of Document No. 273(Rev.) until Document No. 316 was examined.

2. **Third Report of Working Group 5B (Document No. 279)**

   **Page 5**

   The Delegate of the United Kingdom wished to withdraw the reservations expressed by his country in paragraphs 20.2 and 21.2.

   The Committee took note of the additional technical information provided by the Delegation of Japan with respect to Proposal J/98/81 which had not been supported.

   **Annex A, pages 7 and 8**

   The following corrections to the text were agreed. Replace "ADD 352E" on page 7 by "ADD 352K", and on the third line of that foot-note insert the words "radical at" before "rest" and replace the word "of" by "at". Delete foot-note 353 from the 1 660-1 670 Mc/s band, page 7.

   The Delegate of Morocco requested that his country's name be deleted from foot-note 354A to the 1 660-1 650 Mc/s band.

   **Annex B, pages 9 and 10**

   The Secretary pointed out the following correction to be made to the French text only: the figures "4 700-4 900" in the first table on page 9 should read "4 700-4 990".
Annex C, pages 11 and 12

The Delegate of the Federal Republic of Germany said that in his country, due to the number of mobile stations operating in the 10.6-10.68 Ge/s band, the Radio Astronomy Service could not be guaranteed protection in that band. He proposed the addition of the following foot-note: "In the Federal Republic of Germany the 10.6-10.68 Ge/s band is allocated to the Radio Astronomy Service on a secondary basis". The foot-note was accepted.

The Delegates of Australia and the United Kingdom requested that their countries' names be withdrawn from foot-note 405A. It was agreed that foot-note 405A could, as a result, be deleted from the Radio Regulations.

The document, as amended, was adopted.

The Chairman of Committee 7 drew Committee 5's attention to the fact that Committee 7, in consultation with the Delegation concerned, had decided to delete RR 326 in view of the protection afforded the Radio Astronomy Service in the 600 Ge/s band by RR 332.

3. United Kingdom: Proposed new foot-note relating to the protection of radio astronomy observations in the band 2 690-2 700 Mc/s (Document No. 291)

The Chairman of I.U.C.A.F. made the statement which appears at the Annex to the present document. The statement was noted.

In introducing Document No. 291, which dealt with the problems mentioned in the statement by the Representative of I.U.C.A.F., the Delegate of the United Kingdom said that the words "or out of band radiation" should be inserted in the third line, second paragraph, on page 2 after "emissions". He explained that the proposed power flux-density limitation would probably curtail the upper edge of the Broadcasting Satellite band by about 10 Mc/s.

The Delegate of Denmark, supported by the Delegates of the United States of America, Syria, France and Sweden, said that although he understood the problems faced by the Radio Astronomy Service he thought the figure of -277 dbW/m²/Hz unrealistic and impossible to obtain in practice and, furthermore, that RR 116A precluded the Radio Astronomy Service from claiming a higher degree of protection than any other service.
In view of the lack of support for its proposal, the Delegation of the United Kingdom reserved its right to revert to the matter in the Plenary.

Fourth Report of Working Group 5B (Document No. 280)

Annex, page 9

The Delegation of Cuba requested that MOD 218 be deleted.

It was decided by 36 votes to 16 with 10 abstentions that Alternative B would appear in the final text for the 136–137 Mc/s band.

The following countries requested to be deleted from foot-note ADD 281AA: Italy, Japan and Mexico.

Other countries requested to be included in foot-note ADD 281AA, in which the list of countries now reads: Bulgaria, China, Cuba, Cyprus, Czechoslovakia, Ethiopia, Ghana, Hungary, Indonesia, India, Iran, Iraq, Korea, Kuwait, Pakistan, Phillipines, Poland, Portugal, Roumania, Senegal, Spain, Syria, the United Arab Republic and the U.S.S.R.

Page 10

It was agreed to delete the mention "(Space-to-space)" which had been included in error under the Meteorological Satellite Service in the 137-138 Mc/s band.

After several countries had indicated their wish to be included or deleted from foot-notes MOD 281C and MOD 281E, it was agreed that, since the services in those foot-notes did not come under the terms of reference of the Conference and as there had been no change of substance in the 137-138 Mc/s band, Committee 5 was not competent to include additional countries in those foot-notes. Committee 5 was, however, competent to delete countries from foot-notes where this would improve the situation for the services concerned.

The Delegation of Morocco requested that Morocco be deleted from foot-note MOD 218C, and the Delegation of Cuba requested that Cuba be deleted from foot-note MOD 281E.

The Delegation of Belgium requested that Belgium be included in foot-note /***/.
It was agreed that foot-note \(143.65-144\) Mc/s band for Region 1 should have the same text as foot-note \(143.65-144\) Mc/s band at the foot of page 10.

It was agreed that the words "space telecommand and" in MOD 319A, second line, be placed in square brackets to draw the attention of the drafting group to the fact that this mention should be deleted as it was now included in the definition of the Space Research Service.

It was agreed to delete the square brackets and words "existing or planned" in MOD 356A, tenth line.

It was agreed to put the words "and earth sciences satellite" in ADD 356AB, fourth line, in square brackets and to delete the words "existing or planned" in the same foot-note, eighth line, and the 2 290-2 300 Mc/s band for Region 2. The Chairman of Working Group 5C pointed out that the foot-note in question would be discussed when Document No. 237(Rev.) was examined later.

The Delegation of Cuba wished its reservations on the additional allocation mentioned in MOD 365A and MOD 356AB to be recorded.

The document, as amended, was adopted.

5. **Fifth Report of Working Group 5B (Document No. 299)**

Annex A, page 5

The following amendments were agreed. Delete the words "operating or planned" from ADD 405BA fifth line, and ADD 405BAA fifth line. Replace the figures "14.4-15.25 Ge/s" in ADD 405BAA, first line, by "14.4-15.35 Ge/s". Insert the foot-note 405BAA in the framed part of the Table for the 15.25-15.35 Ge/s band.

The Delegation of Cuba reserved its right to revert to the question of including ADD 405BAA in the 15.25-15.35 Ge/s band for the Fixed and Mobile Services.
Page 6

It was agreed to replace the words "METEOROLOGICAL-SATELLITE" in the 51-52 Ge/s band and both "METEOROLOGICAL-SATELLITE" and "EARTH SCIENCES-SATELLITE" in the 65-66 Ge/s band by "EARTH EXPLORATION SATELLITE".

Page 13

Following an objection from the Delegate of Cuba, it was agreed to delete paragraph e).

6. Sixth and last report of Working Group 5B (Document No. 339)

Page 2, Sections 4 and 5

After some discussion on the effects of the proposed modification of foot-note 285A it was decided to maintain the text of that foot-note as it appeared in the Annex, page 7. The Delegations of Japan, the Federal Republic of Germany and Finland maintained their right to revert to this subject later.

Page 3, Section 6

As Proposal F/41/82 (ADD 318B) had received no support in the Working Group, the Delegation of France put forward the following modified proposal for a foot-note (ADD 318B) to be placed in the framed part of the Table for Regions 1 and 2: "In France and the Department of Guyane the frequency 434 Mc/s ± 0.25 Mc/s may be used for space operations Earth-to-space subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected.". The proposal was adopted.

Page 3, Section 7

The Delegate of France said that if the part of the text of MOD 350A in square brackets referred by Working Group 5B to Committee 5 for decision was approved his delegation was prepared to withdraw its proposal in Document No. 197. It was agreed to defer discussion on that point until Documents Nos. 197 and 214 were examined.
Page 4, Section 11

The Chairman pointed out that Working Group 5B had only been concerned with the last sentence of MOD 392F. The Chairman of Working Group 5C which had considered the first sentence, in square brackets in the text, said it had been decided not to use that part of the text, but instead to put the Meteorological Satellite Service as a primary service in the framed part of the Table for the band 7 450-7 550 Mc/s.

Page 4, paragraphs 12.2 and 12.3

The Delegate of the United States of America suggested that, in view of the definitions adopted by the Plenary meeting the previous day, foot-note 405BB was no longer required.

The Chairman of Working Group 5C said that, as a result of the withdrawal of Proposals AUS/10/43 and CAN/14/80 by their respective Delegations, foot-notes ADD 409G and ADD 470A were no longer required.

It was agreed to delete all three foot-notes from the Annex (pages 7 and 8).

The Chairman pointed out that Section 15 had already been dealt with under item 3 of the agenda.

The Document, as amended, was adopted.

The Chairman, on behalf of Committee 5, thanked the Chairman of Working Group 5B and Working Group 5B for their very useful work.

The meeting rose at 1850 hrs.

The Chairman
H.A. KIEFFER

Annex : 1
Mr. Chairman, the Inter-Union Commission for the Allocation of Frequencies was set up by the International Council of Scientific Unions to represent the scientific interests of the International Scientific Radio Union, the International Astronomical Union, and the Committee for Space Research. As Chairman, I have sent to you a telegram which, with your permission, I would like to read:

"I.U.C.A.F. views with dismay the proposals to allocate the band 2 670 to 2 690 MHz to the Broadcasting Satellite Service. Serious consequences to the Radio Astronomy Service cannot be avoided without an adequate interval between frequencies allocated to satellite-borne transmitters and the band 2 690 to 2 700 MHz allocated to the Radio Astronomy Service. Further, an extension of this radio astronomy band to include 2 670 to 2 690 MHz shared with Ground Service has been requested by I.U.C.A.F. and proposed by administrations of several countries. I.U.C.A.F. asks that the urgent needs of the Radio Astronomy Service should be given full consideration in this band."

I would like to explain that this telegram is based on the work of the Special Joint Meeting of Study Groups of the C.C.I.R. in February 1971. In their report they draw attention to Recommendation No. Spa 11 of the E.A.R.C., Geneva, 1963, which states that the next Administrative Radio Conference should give further consideration to the provision of improved frequency allocations to radio astronomy. The report continues - Therefore the S.J.M. concludes that administrations, in seeking to afford protection to particular radio astronomical observations should take all practical steps to reduce, to the absolute minimum amplitude, harmonic radiations and other spurious emissions falling within the bands of frequencies to be protected for radio astronomy taking into account, in particular, the signal levels causing interference, which are given in Annex I to Report 224.2."
My Commission, I.U.C.A.F., has noted proposals that the band 2,690 to 2,700 MHz, which is at present allocated exclusively to radio astronomy, should be extended by a further 20 MHz on a shared basis. It would then be possible for some observatories to make observations with great sensitivity over the band 2,670 to 2,700 MHz. There are difficulties in sharing with Ground-based Services, but there are very much greater difficulties in sharing with satellite-borne transmitters. I.U.C.A.F. is therefore seriously concerned about proposals to allocate frequencies to the Broadcasting Satellite Service which would include the band 2,670 to 2,690 MHz. There would be two serious consequences if these proposals were adopted in their present form. Within the presently allocated band, 2,690 to 2,700 MHz, there may be spurious transmissions from the Broadcasting Satellite Service at adjacent frequencies. These broadcasts cannot be avoided by siting the radio observatory away from populated areas. Secondly, the extension of the band 2,670-2,690 MHz on a shared basis would present very great difficulties if there are powerful transmissions from space directly within this band.

I would like to suggest that the main consideration is to project the band already exclusively allocated to radio astronomy, namely 2,690 to 2,700 MHz. If it is possible to apply to that band the interference criteria set out by C.C.I.R. in the Report of the Special Joint Meeting, then it will be possible to continue radio astronomical observations within that band. If those criteria can be applied specifically to the band 2,690-2,700 MHz, it seems possible that some limited form of sharing will be useful in the extended band including 2,670-2,690 MHz.
SUMMARY RECORD
OF THE
TENTH MEETING OF COMMITTEE 5
(ALLOCATIONS)
Saturday, 10 July 1971, at 2100 hrs
Chairman: Mr. H.A. KIEFFER (Switzerland)

Subjects discussed

1. Note from Working Group 5C
   214, 197
2. Third Report from Working Group 5C (continued)
   237(Rev.), DT/100
3. Fourth Report from Working Group 5C (continued)
   238(Rev.)
4. Third Report from Working Group 5D (continued)
   240
   and Draft Recommendation
   341
5. Sixth Report from Working Group 5D (continued)
   Proposal from United Kingdom/Sweden/Norway
   318
   293(Rev.)
6. Proposals from France
   319
7. Proposal from United States of America
   323
8. Second Report from Working Group 5B (continued)
   187(Rev.)
9. Proposals for Article 6, France, India,
   United States of America
   85, 245, 322
10. Fourth Report from Working Group 5E
    Proposal from India
    316(Rev.)
    273(Rev.)
11. Statement by Observer from the International
    Press Telecommunications Committee
    115, 201
12. Completion of Committee's work
1. Note from Working Group 5C (Documents Nos. 214, 197)

The Delegate of France said he now wished to propose the text of 350A as given in Document No. 339, with the deletion of the square brackets, i.e. the addition of "and transmit and receive signals for the earth exploration satellite service".

That proposal was supported by the Delegates of Belgium and Spain.

The Delegate of the United Kingdom understood that the reference inside the square brackets had been deleted and asked whether the French delegation could consider a secondary allocation for the earth exploration service. The Delegate of France said he could agree to that suggestion.

The Delegates of New Zealand, the United States of America and Kenya also supported the proposal, as modified by the United Kingdom.

The Secretary of the Committee reassured the Delegate of Poland that his records showed that for Region 1 the Fixed Service remained in the Table on a primary basis.

The modified proposal was adopted.

2. Third Report from Working Group 5C (Document No. 237(Rev.))

Paragraph 1.1 and Appendix A

The Secretary of the Committee confirmed the comment by the Delegate of Cuba that FIXED MOBILE except Aeronautical Mobile would appear in the Table for Region 2.

With reference to foot-note 324A, the Delegate of Australia felt that with the new definition of the Meteorological Satellite Service 324A could be deleted in both the 1 670-1 690 and the 1 690-1 700 MHz bands. The Delegate of the United Kingdom on the contrary thought the foot-note was useful in the 1 670-1 690 band, because the Fixed and Mobile Services were on an equal primary basis but that it could be removed from the 1 690-1 700 MHz band where those services were on a secondary basis. The Delegate of the Federal Republic of Germany preferred the retention of 324A in both bands.

The Chairman put to the vote the inclusion of foot-note 324A in the 1 670-1 690 MHz band and it was decided to retain it by 20 votes to 3 with 18 abstentions.

In the 1 690-1 700 MHz band it was decided to delete the foot-note, 9 votes in favour of retention, 12 against and 9 abstentions.
Appendix C

The Chairman of Working Group 5C said the square brackets around space research and Earth Exploration Satellite Services should be removed.

The Delegate of Sweden said that his country should not appear in foot-note 356A on page 9 of DT/100 and also in Document No. 280.

With regard to foot-note 356AB, the Delegate of the United States of America referred to the action already taken on Document No. 280 in relation to the Space Research Service and thought that Space Research and Earth Exploration Satellite Services should be treated separately. The Delegate of Spain shared that view.

The Secretary referred to page 9 of DT/100 which gave two alternatives for the text of 356AB and the Chairman explained that if figures could be agreed upon for Region 1 the other points could be dealt with by the Editorial Committee. The 2 096-2 120 MHz band had been suggested and those figures were finally adopted, subject to objection by the Delegates of India, Pakistan and the United Arab Republic who thought the Earth Exploration Satellite Service should be on a secondary basis and the preference of the Delegate of the United Kingdom for a foot-note "Subject to agreement between the Administrations concerned".

The Chairman assured the Delegate of Syria that the Secretariat would produce a document showing all the allocations.

Appendix D - adopted

3. Fourth Report from Working Group 5C (continued) (Document No. 238(Rev.))

Appendix A

The Chairman noted that there were divergencies of opinion: the Delegate of Cuba supported by the Delegates of Chile and Venezuela proposed that the service be on a secondary basis in Region 2, and the Delegate of Australia, supported by the Delegates of New Zealand, Japan and the Philippines proposed primary status in Region 3, with a foot-note that the location of earth stations would be subject to agreement between the Administrations concerned.

The Australian proposal was put to the vote and was rejected (12 votes in favour, 12 against).

The Cuban proposal was put to the vote and was also rejected (13 votes in favour, 13 against and 11 abstentions).

The Table was therefore maintained without change.
The Delegates of New Zealand and Cuba reserved the right to raise Document No. 238.

The Delegates of the Federal Republic of Germany, Italy and Roumania referred to footnote 394E in which they would prefer to see "subject to agreement between the Administrations concerned", the Delegate of Roumania asking whether the W.M.O. really needed a bandwidth of 40 MHz. The representative from the W.M.O. said that after thorough discussion it had been concluded that 40 or even 45 MHz was required for the service. The Delegate of the Federal Republic of Germany agreed not to press his point.

The foot-note was adopted.

4. Third Report from Working Group 5D (continued) (Documents Nos. 240, 341)

The Delegates of France and Greece agreed not to press for the adoption of foot-note 402A (in Document No. 240).

Annex 1 to Document No. 341 - Draft Recommendation on the future use of certain bands between 40 and 275 GHz by the Radiocommunication Services

The Observer from I.C.A.O. suggested an additional paragraph under "recommends" to read as follows:

"... should consider

a) allocating, in addition, ...

b) the advantages to be gained by allocating all or part of each of the bands concerned to either the Aeronautical Service or the Maritime Service on an exclusive basis."

That suggestion was supported by the Delegates of Denmark, France, Belgium, Sweden, India and Kenya.

The Delegate of New Zealand felt that future Conferences should be given complete freedom to take whatever action they considered appropriate; the Delegates of the United States of America, Iraq, and the United Kingdom shared that view.

The Chairman suggested that the Annex be adopted as it stood, with a small amendment proposed by the Delegate of Italy.

It was so agreed.
Annex 2 - Draft Recommendation on the future use of the 41 - 43 GHz band by the fixed and mobile services

Adopted.

5. Sixth Report from Working Group 5D (continued) (Document No. 318) and Proposal by the United Kingdom/Sweden/Norway (Document No. 293(Rev.))

The Delegate of the United Kingdom introduced the proposal in Document No. 293 which replaced the original proposal in Documents Nos. 108 and 244; in his view the introduction of such a Maritime Mobile Satellite Service on a secondary basis (thus causing no harm to other services) and the inclusion of the allocation in the frequency Table would be a demonstration of the Conference's wisdom and foresight.

The Delegate of Sweden added that the draft Recommendation represented only a gesture whereas action was required soon.

The proposal was supported by the Delegates of New Zealand, Pakistan, Argentina, Greece, and the Observer from the C.I.R.M., the latter saying that his own organization and I.M.C.O. had practical experience and know that the service could work on a secondary basis.

The proposal was opposed by the Delegates of France, Italy, United Arab Republic, Uganda, the United States of America and Japan, who thought that the 400 MHz band was an inappropriate allocation in view of its congestion.

The proposal was put to the vote and rejected (17 votes in favour, 40 against and 3 abstentions).

The draft Recommendation in Appendix B to Document No. 318 was adopted, subject to drafting amendments.

6. Proposals from France (Document No. 319)

The Delegate of France indicated that the figures in the first line of ADD 354D should be altered to "1 700-1 700.2 MHz" and that the last part of the note should read "... for the requirements of geodesy and ionospheric research".

As a consequence, the reference to 354D was to be deleted in the upper half of the table.

The proposals to add foot-notes 285C and 354D were adopted.
Proposal from the United States of America (Document No. 323).

The Delegate of the United States of America introduced the document, which was supported by the Delegates of Denmark, the Federal Republic of Germany and Austria. The Delegate of New Zealand agreed with the proposal but would prefer it to be on an equal primary basis with the existing services in the band.

The Delegate of the U.S.S.R. had no objection provided the service did not appear on an exclusive basis.

The Chairman put to the vote the allocation of the bandwidth on an exclusive basis, and it was adopted by 31 votes to 21 with 3 abstentions.

The Delegate of the United Kingdom asked for footnote 314 (secondary basis) to be included in the Table.

The Delegate of the U.S.S.R. proposed the introduction of a note stating that in the Soviet Union the band 406-406.1 MHz was also allocated to the Fixed and Mobile except Aeronautical Mobile Service.

The Delegate of Denmark found the United Kingdom addition acceptable but not the U.S.S.R. proposal, as it was in contradiction with ADD 317A; perhaps a solution would be to indicate a certain timetable for the operation of the Fixed and Mobile Services. The Delegate of the U.S.S.R. said he could not accept that.

The Delegates of Poland, Czechoslovakia, Cuba, Iraq, Syria, Hungary, Sweden, Uganda, Kenya, Tanzania, the United Arab Republic, Bulgaria and Ethiopia asked to be included in the note proposed by the Delegate of the U.S.S.R.

The Delegate of Norway, in reply to the Delegate of Austria, said that he had calculated that the second harmonic of video carriers of channel 9 in Europe added up to 406.50 MHz and he wondered whether the United States had taken that into account as radiation from high-power TV stations might make operation difficult in the bands proposed.

The Delegate of the United States of America proposed modifying 317A by deleting "on a world-wide exclusive basis solely".
The Chairman pointed out that if the Radio Astronomy Services were to begin at 406.1 MHz the foot-note would not be needed. That suggestion was supported by the Delegates of the United Kingdom, Italy and the U.S.S.R. and opposed by the Delegate of New Zealand.

The Chairman put to the vote the proposal to include both Radio Astronomy and the Mobile Satellite Service in the 406-406.1 MHz band, the result of the vote was 15 in favour, 29 against and 2 abstentions.

It was therefore decided that the Radio Astronomy Service would be shown in the table as starting at 406.1 MHz.

The foot-notes 314, 317A and the foot-note requested by the U.S.S.R. and other delegations would be included.

The Delegate of Poland remarked that a solution might have been arrived at more easily had all the allocations been presented together. The Delegate of Sweden supported by the Delegate of Syria wished to place on record that the difficulties encountered were a demonstration of the disadvantages of the service-by-service as opposed to frequency-by-frequency method of dealing with proposals.

8. Second report from Working Group 5B (continued) (Document No. 187(Rev.))

The Delegate of India, referring to his reservation in paragraph 5.2, proposed a footnote 332A in line with footnote 332, to read as follows: "In India the band 608-614 Mc/s is also allocated to radio astronomy".

Adopted.

9. Proposals for Article 6 from France, India, the United States of America (Documents Nos. 85, 322, 245)

Following the suggestion that Documents Nos. 85 and 322 be considered together, the Delegate of the United States of America said he thought the French proposal in Document No. 85 was to be preferred. Consequential amendments to 951 and 952 might be necessary.

The Delegates of Denmark, Sweden and Norway were in favour of allowing public correspondence from aircraft but were against the Maritime Service bands being used for such a purpose, as possible over-demand and congestion had not been taken into account. The Delegate of Sweden added
that I.A.T.A. and I.C.A.O. had said there was no need to provide the facility and that was one reason why the Special Joint Meeting had not proposed bands, but public correspondence was the responsibility of the telecommunication authorities.

The proposal in Document No. 85 was put to the vote. The result of the vote was 10 for, 9 against and 13 abstentions, and the addition would therefore be included in the Report to the Plenary.

The Chairman then put to the vote notes MOD 951 and MOD 952 in Document No. 322. They were adopted by 14 votes to 8 with 10 abstentions.

The Delegate of the United Kingdom pointed out that the first line of each note should read "Aircraft earth stations ...

Document No. 245

The Delegate of India introduced the proposals MOD 415 and MOD 417.

Adopted.

10. Fourth Report from Working Group 5E and proposal from India (Documents Nos. 316(Rev.), 273(Rev.) and 331)

The Chairman of Working Group 5E regretted having to submit a report which did not contain concrete proposals for all the bands considered.

Paragraph 1 and Annex A

The Chairman indicated that -129 dBW/m² should be inserted in ADD 332A (the detail given in Document No. 344).

The Delegate of the United Kingdom said that after those figures the words "(see Recommendation ...)" should be added and that in the second line the words "frequency modulated television" be inserted before "stations".

Adopted, as amended.

Paragraph 2.1 - noted.

Paragraph 2.2

The Delegate of India referred to the Indian proposal in Document No. 331 which dealt with experimental satellite broadcasting; that proposal would be modified to bring it in line with the -129 dBW/m² previously adopted.
The proposal gave rise to a lengthy debate in which doubts were expressed about the protection afforded to fixed services, the availability of sufficient data and the inclusion in the Radio Regulations of an Allocation for experimental purposes. Several delegations supported the proposal, and the Delegate of India agreed to incorporate in ADD 339B amendments suggested to cover points raised in the discussion.

The principle of a foot-note was adopted in principle by 35 votes to 13, with 5 abstentions, with the understanding that the wording and figures had yet to be approved in Plenary.

The Delegate of Syria reserved the right to refer to the matter in Plenary meeting as did the Delegates of Uganda, Kenya and Tanzania. Paragraphs 4.1, 4.3 - 4.12 were noted.

Paragraphs 4.2, 4.13 - 18, Annex B

Drafting amendments were indicated by the Delegates of the Federal Republic of Germany, the United Kingdom and the Secretary of the Committee.

Annex B - adopted.

MOD 361 - adopted.

ADD 361A - adopted.

ADD 361B

The Delegates of Syria and Pakistan queried the reference to Article 7 when figures were inserted in similar foot-notes elsewhere. The Chairman of Committee 4 explained that in the other bands referred to the figures were only provisional, in fact, the contents of the square bracket might well be removed by the Editorial Committee.

The Delegate of Venezuela raised the point of the ambiguity of "regional" in the third line; the Delegate of Cuba said he would not exercise his right to revert to the question.

Adopted.

MOD 362 - adopted.

ADD 364C - adopted.

ADD 364D
The new text for the note proposed by the Delegate of New Zealand

"In the bands 2500 - 2535 MHz and 2655 - 2690 MHz new tropospheric scatter systems are not permitted. Existing tropospheric scatter systems may continue to operate in these bands"

was put to the vote and adopted by 18 votes to 12, with 5 abstentions.

It was pointed out that the new 364D was in contradiction with the text of 364C just adopted, the Delegate of the U.S.S.R. considering that the vote itself had been based on a misunderstanding. A lengthy discussion ensued in which it was suggested that the note might be applied only to the upper 35 MHz, or on a regional basis. Following an explanation by the Delegate of Brazil which was supported by the Delegates of New Zealand, Canada, the United States of America, the United Kingdom and Japan, it was decided to include in the Committee's report both footnotes as they had been adopted, indicating the discrepancy and leaving it to the Editorial Committee to make the necessary adjustments.

ADD / A / - adopted.
ADD / *** / - adopted.

The Secretary noted that the text should read: "... Fixed and Mobile except Aeronautical Mobile Services only." The Chairman said that Switzerland was to be deleted and Bulgaria added. In reply to the concern expressed by the Delegates of Ethiopia and Uganda, the Delegate of Italy said it was his understanding that the provision did not exempt the countries mentioned from applying the sharing criteria applicable in that band.

Adopted.

11. Statement by the Observer from the International Press Telecommunications Committee (Documents Nos. 115, 201)

The Observer from I.P.T.C. made the statement annexed hereto.

Documents Nos. 115 and 201 were noted.
12. **Completion of the work of Committee 5**

The *Chairman* thanked the Chairmen of Committee 5 Working Groups, all members of the Committee, the Secretariat and the I.F.R.B. who had enabled him to cope with the work of Committee 5 and expressed the hope that good use would be made of the provisions they had adopted.

The Delegate of India in turn thanked Mr. Kieffer for his excellent work.

The meeting rose at 0500 hrs.

Chairman:

H.A. KIEFFER

Annex: 1
ANNEX

1. Documents Nos. 115 and 201 deal with Press radiocommunications and in particular with the Multi-Destination Services provided under Radio Regulation 417.

These services form the principal channel for news to many countries in Asia, Africa, Central America and South America, amounting in all to about one-third of the inhabited area of the earth. Their importance to the spread of information and knowledge cannot be overstated.

2. Space radiocommunications provide a means of improving the reliability of these services by replacing the present short-wave beams by satellite links. The I.P.T.C. is very grateful to the Indian Delegation for proposing, and to the Committee for accepting the proposal, that Radio Regulation 417 be modified to include space communications.

3. The I.P.T.C. would, however, draw the Committee's attention to the similarity between the technical parameters of such a News Distribution Service and the Community Broadcast-Satellite Service. Both would cover about the same regions, both would serve a multiplicity of earth stations, both would require satellites at about the same place in the geostationary orbit and both would produce the same earth power flux-density. (This similarity does not exist in the Terrestrial Services.)

Moreover, the purposes of the two services are identical, to inform, educate and entertain: only the method of treatment of the messages after reception at the earth stations are different, being complementary rather than competitive. Indeed, the two media have already a common link, for broadcasting organizations use the press agency messages in the preparation of newscasts.

Merging of the press and broadcasting radiocommunications, e.g. on a time-sharing basis, would have the following advantages:

i) fewer frequency allocations would be required,
ii) fewer satellites would be required,
iii) fewer earth stations would be required,
iv) costs would be reduced.
4. The I.P.T.C. understands that the objection to sharing between the Press and Broadcasting Services is the administrative advantage of clear-cut distinctions between the various services into which users' requirements have been divided. But this policy has not always been found practicable, and in the present case it clearly conflicts with the Committee's prime responsibility, which is to ensure the economical use of the spectrum. The I.P.T.C., therefore, suggests that the Committee seeks some method of overcoming the administrative objection to the sharing of frequencies in the space element of the transmissions of these complementary mass information media.

5. In conclusion, the I.P.T.C. would point out that the Press itself has little to gain from its proposal, for any extra revenue from the sale of newspapers would be off-set by the higher cost of radiocommunications. The real beneficiaries would be the general public in the countries concerned and this is an additional reason why the Committee should give the proposal careful consideration.
FIFTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

1. On page 4 replace the framed part of the Table for the frequency band 400.05 - 401 MHz by the following:

<table>
<thead>
<tr>
<th>MHz</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>400.05-400.15</td>
<td>STANDARD FREQUENCY SATELLITE</td>
<td>313AB 313 314</td>
</tr>
<tr>
<td>400.15-401</td>
<td>METEOROLOGICAL AIDS</td>
<td>METEOROLOGICAL SATELLITE (Maintenance telemetering)</td>
</tr>
<tr>
<td></td>
<td>SPACE RESEARCH</td>
<td>(Telemetering and tracking)</td>
</tr>
<tr>
<td></td>
<td>313 314</td>
<td></td>
</tr>
</tbody>
</table>

SUP 312A

ADD 312AB In this band the standard frequency is 400.1 MHz. Emissions associated herewith shall be maintained within ± 25 kHz.

2. On page 6 in the framed part of the Table in the box 406 - 408.1 MHz delete foot-note 317.

3. On page 8, in the third line of footnote MOD 322, replace the words "the fixed service" by "the fixed and mobile services".

4. On page 14, in the sixth line of each footnote ADD 352F and 352L, replace the word "these" by "the aeronautical mobile (R) and maritime mobile services".
FIFTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

ARTICLE 5 - TABLE OF FREQUENCY ALLOCATIONS

Frequency bands between 235 Mc/s and 1700 Mc/s

Committee 5 adopted the revised provisions reproduced in the Annex to the present Report which are submitted to the Plenary for first reading.

H.A. KIEFFER
Chairman

**ADD 305A**

In New Zealand the band 235-239.5 Mc/s is also allocated to the aeronautical radionavigation service.
ADD 308A The bands 240-328.6 Mc/s and 335.4-399.9 Mc/s may also be used by the mobile-satellite service. The use and development of this service shall be subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.

MOD 310 Radio astronomy observations in the band 322-328.6 Mc/s are carried out in a number of countries under national arrangements. Administrations should bear in mind the needs of the radio astronomy service in using this band.

ADD 310A In India, the band 322-328.6 Mc/s is also allocated to the radio astronomy service.

**MOD 317**

In making assignments to stations of other services to which this band is allocated, administrations are urged to take all practicable steps to protect radio astronomy observations from harmful interference.

Note to Committee 7: MOD 317 contains the same text as ADD 233A at 37.75-38.25 Mc/s and MOD 286 at 151-155 Mc/s.

Radio altimeters may also be used until 31 December 1974 in the band 420-460 Mc/s. However, after this date, they may be authorized to continue to operate on a secondary basis except in U.S.S.R., where they will continue to operate on a primary basis.

The band 449.75-450.25 Mc/s may be used for space telecommand and space research (Earth-to-Space), subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected.

In France and the French Department of Guinea (Region 2) the frequency 434 Mc/s ± 0.250 Mc/s may be used for Space Operation (Earth-to-Space) subject to agreement among the administrations concerned and those having services, operating in accordance with the Table, which may be affected.

In Denmark, Norway and Sweden, the bands 430-432 Mc/s and 438.440 Mc/s are also allocated to the fixed service.

**ADD 325A**
In Argentina, the band 602-608 Mc/s is allocated to the radio astronomy service.

**ADD 329A**
In India, the band 608-614 Mc/s is also allocated to the radio astronomy service.
Within the frequency band 620.790 Mc/s, assignments may be made to television stations using frequency modulation in the broadcasting-satellite service, subject to agreement among the administrations concerned and affected (see Articles 9 and 9A or Resolution ...). Such stations shall not produce a power flux-density in excess of the value -129 dBW/m² (see Recommendation ...) within the territories of other administrations without the consent of those administrations.

In Region 2, the frequency 915 Mc/s is designated for industrial, scientific and medical purposes. Emissions must be confined within the limits of ± 13 Mc/s of that frequency. Radio-communication services operating within these limits must accept any harmful interference that may be experienced from the operation of industrial, scientific and medical equipment.

**SUP 351**

**NOC 352**
The bands 1,558.5-1,636.5 Mc/s, 1,500-1,525 Mc/s and 15.4-15.7 Gc/s are reserved on a world-wide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based or satellite-borne facilities.

The bands 1,558.5-1,636.5 Mc/s, 5,000-5,250 Mc/s and 15.4-15.7 Gc/s are also allocated to the aeronautical mobile (R) service for the use and development of systems using space radio communication techniques. Such use and development is subject to agreement and co-ordination among administrations concerned and those having services operating in accordance with the Table, which may be affected.

Limited to transmissions from space stations to earth stations in the maritime mobile-satellite service for communication and/or radio-determination purposes. Transmissions from coast stations directly to ship stations, or between ship stations, are also authorized when such transmissions are used to extend or supplement the satellite-to-ship links.
ADD 352F Limited to transmissions from space stations to earth stations in the aeronautical mobile (R) and maritime mobile-satellite services for communication and/or radiodetermination purposes. Transmissions from land stations to mobile stations, or between mobile stations, of these services, are also authorized. The utilization of this band is subject to prior operational co-ordination between the two services.

ADD 352G Limited to transmissions from space stations to earth stations in the aeronautical mobile (R) satellite service for communication and/or radiodetermination purposes. Transmissions from terrestrial aeronautical stations directly to aircraft stations, or between aircraft stations, in the aeronautical mobile (R) service are also authorized when such transmissions are used to extend or supplement the satellite-to-aircraft links.

ADD 352H Limited to transmissions from earth stations in the maritime mobile-satellite service to space stations for communication and/or radiodetermination purposes. Transmissions from ship stations directly to coast stations, or between ship stations, are also authorized when such transmissions are used to extend and supplement the ship-to-satellite links.

ADD 352I Limited to transmissions from earth stations in the aeronautical mobile (R) and maritime mobile-satellite services to space stations for communication and/or radiodetermination purposes. Transmissions from mobile stations to land stations, or between mobile stations, of these services, are also authorized. The utilization of this band is subject to prior operational co-ordination between the two services.
ADD 352J

Limited to transmissions from earth stations in the aeronautical mobile (R)-satellite service to space stations for communication and/or radiodetermination purposes. Transmissions from aircraft stations in the aeronautical mobile (R) service directly to terrestrial aeronautical stations, or between aircraft stations, are also authorized when such transmissions are used to extend or supplement aircraft-to-satellite links.

ADD 352K

Radio astronomy observations on important spectral lines due to the hydroxyl radical OH at frequencies 1 612.231 Mc/s and 1 720.53 Mc/s are carried out in a number of countries under national arrangements; the bands observed being 1 611.5-1 612.5 Mc/s and 1 720-1 721 Mc/s respectively. Administrations should bear in mind the needs of radio astronomy service in their future planning of the bands 1 558.5-1 636.5 Mc/s and 1 710-1 770 Mc/s.

MOD 353A

In view of the successful detection of two hydroxyl spectral lines in the regions of 1 665 Mc/s and 1 667 Mc/s by astronomers, administrations are urged to give all practicable protection in the band 1 660-1 670 Mc/s for future research in radio astronomy particularly by eliminating air-to-ground transmissions in the Meteorological Aids Service in the band 1 664.4-1 668.4 Mc/s as soon as practicable.

MOD 354A

In Algeria, Bulgaria, Cuba, Hungary, Kuwait, Lebanon, Pakistan, Poland, the United Arab Republic, Yugoslavia, Romania, Czechoslovakia and the U.S.S.R., the bands 1 660-1 670 Mc/s and 1 690-1 700 Mc/s are also allocated to the fixed service and the mobile, except aeronautical mobile, service.

SIXTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

1. On page 6, at the bottom insert:

MOD 364A  In Algeria, Bulgaria, Hungary, India, Israel, Kuwait, Lebanon, Morocco, Pakistan, the Philippines, Poland, the United Arab Republic, Yugoslavia, Roumania, Czechoslovakia and the U.S.S.R., the band 2,690-2,700 Mc/s is also allocated to the fixed and mobile services.
Corrigendum to Document No. 375
14 July 1971
Original: English

SIXTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

1. On page 2, replace the text of foot-note MOD 356A by the following:

MOD 356A

In Region 2, in Australia and Japan the band 1 750 - 1 850 Mc/s may also be used for Earth-to-Space transmissions, and in Regions 2 and 3 the band 2 200 - 2 290 Mc/s, may also be used for Space-to-Earth transmissions, in the space research service subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.

2. On page 3, in foot-note ADD 356AB insert after "In Regions 2 and 3 and in Spain, in the band ...";

3. On page 4, in foot-note ADD 356AC delete: "... except in Spain, ..." and add at the end of the footnote:

(see 356AB);

4. On page 5, in the framed part of the Table

- in the box 2 500 - 2 550 MHz for Region 1 delete "364E";
- in the box 2 655 - 2 690 MHz for Region 1 against FIXED 364C add "364D/" and in the same box delete "364E" and "364H";
- in the box 2 655 - 2 690 MHz for Regions 2 and 3 delete "364H".

5. On page 7, delete the foot-note "ADD 364H"

6. On page 13, in the framed part of the Table, in the box 7 450 - 7 550 MHz delete "392F", and delete the foot-note "MOD 392F".
SIXTH REPORT OF COMMITTEE 5 (ALLOCATIONS)

ARTICLE 5 - TABLE OF FREQUENCY ALLOCATIONS

Frequency bands between 1700 Mc/s and 8500 Mc/s

Committee 5 adopted the revised provisions reproduced in the Annex to the present Report which are submitted to the Plenary for first reading.

H.A. KIEFFER
Chairman

</table>
In France and the United Kingdom, the band 2 450-2 500 MHz is allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services.

In France the band 2 500-2 550 MHz is also allocated on a primary basis to the Radiolocation Service and, on a secondary basis, to the Fixed and Mobile Services. In Canada, the band 2 500-2 550 MHz is also allocated on a primary basis to the Radiolocation Service.

The use of the band 2 500-2 690 MHz by the Broadcasting-Satellite Service is limited to domestic and regional systems for community reception and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected (see Articles 9 and 9A or Resolution No. xxx). The power flux-density at the surface of the earth shall not exceed those given in Article 7 Nos. 470NH-470NK.

In the United Kingdom, the band 2 500-2 600 MHz is also allocated, on a secondary basis, to the Radiolocation Service.

When planning new tropospheric scatter radio-relay links in the band 2 500-2 690 MHz, all possible measures shall be taken to avoid directing the antennae of these links towards the geostationary orbit.

In the band 2 655-2 690 MHz new systems using tropospheric scatter are not authorized. Existing systems may continue to operate in this band.
ADD 364E The use of the bands 2 500-2 535 MHz and 2 655-2 690 MHz by the Fixed-Satellite Service is limited to domestic and regional systems and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected. In the direction Space-to-Earth, the power flux-density at the surface of the earth shall not exceed \[ \ldots \ldots \ldots \ldots \]. See Article 7.

ADD 364F In Bulgaria, Iran, Portugal and the U.S.S.R., the band 2 500-2 690 MHz is allocated to the Fixed and Mobile except Aeronautical Mobile Services only.

ADD 364G Radio astronomy observations are being carried out in the band 2 670-2 690 MHz in a number of countries under national arrangements. Administrations should hear in mind the needs of the radio astronomy service in their future planning of this band.

ADD 364H To protect the Radio Astronomy Service, transmissions in the Broadcasting Satellite Service in the band 2 655-2 690 MHz shall not result in spurious emissions in the band 2 690-2 700 MHz with a power flux-density at the earth's surface exceeding \(-277\) dBW/m\(^2\)/Hz.

**ADD 392AA**

In Canada and the United States of America, the band 6 625-7 125 MHz is also allocated, on a secondary basis, to the Fixed-Satellite Service for Space-to-Earth transmissions. The power flux density produced by space stations in this band shall be in accord with Article 7, Section VIII, for Region 2. It shall be at least 6 db lower in Regions 1 and 3.

**MOD 392B**

Receiving Earth stations in this band may not impose restrictions on the locations or technical parameters of existing or future terrestrial stations of other countries.

**MOD 392B**

The band 7 145-7 235 MHz may be used for Earth-to-Space transmissions in the space research service, subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.

</tr>
</tbody>
</table>
As an exception, passive fixed-satellite systems also may be accommodated in the band 7250-7750 MHz subject to:

a) agreement between administrations concerned and those whose services, operating in accordance with the Table, may be affected;

b) the co-ordination procedure laid down in Articles 9 and 9A.

Such systems shall not cause any more interference at active earth station receivers than would be caused by fixed or mobile services. Power-flux density limitations at the earth's surface after reflection from the passive fixed-satellites shall not exceed those prescribed in these Regulations for active fixed-satellite systems.

**SUP 394C**
REPORT OF THE AD HOC GROUP OF COMMITTEE 6

DRAFT NEW RESOLUTION

relating to the technical criteria recommended by the C.C.I.R. for sharing between the space and terrestrial services and within the space service

considering

a) that, in frequency bands shared with equal rights by space and terrestrial services, it is necessary to impose certain technical limitations and co-ordination procedures on each of the sharing services in the interest of controlling mutual interference;

b) that, in frequency bands shared by space stations located on geostationary satellites, it is necessary to impose co-ordination procedures in the interest of controlling mutual interference;

c) that the technical criteria and co-ordination procedures referred to in a) and b) above, and as set forth in the Radio Regulations, are mainly based upon recommendations of the C.C.I.R.;

d) that, in recognition of the successful sharing of frequency bands by space and terrestrial services, and the continuing improvements in space technology, each Plenary Assembly of the C.C.I.R. subsequent to the Xth Plenary Assembly, Geneva, 1963, has improved upon some of the technical criteria recommended by the preceding Plenary Assembly;

e) that Plenary Assemblies of the C.C.I.R. are held triennially whereas Administrative Radio Conferences, which are empowered to modify the Radio Regulations making substantial use of the recommendations of the C.C.I.R. are in practice held less frequently and with much less regularity;

f) that the International Telecommunication Convention of Montreux, 1965, recognizes the right of Members and associated Members to make special agreements on telecommunication matters; however, such agreements shall not be in conflict with the terms of the Convention or of the Regulations annexed thereto, so far as concerns the harmful interference to the radio services of other countries;
that subsequent Plenary Assemblies of the C.C.I.R. are likely to make further changes in the recommended technical criteria; and that administrations should be afforded the opportunity to take advantage of the current C.C.I.R. Recommendations on sharing criteria when planning systems for use in frequency bands, shared with equal rights by space and terrestrial services, or between space systems.

therefore resolves that

1. each Plenary Assembly of the C.C.I.R. should arrange for the Secretary-General to be informed of those Recommendations of the C.C.I.R. affecting the technical criteria relating to sharing between the space and terrestrial services and within the space services;

2. following the distribution to administrations of the relevant C.C.I.R. texts, the Secretary-General shall write to administrations asking them to indicate within 120 days, to which of the C.C.I.R. Recommendations or to which specific technical criteria defined in the Recommendations referred to in 1. above they agree for use in the application of the pertinent Radio Regulations;

3. the administrations which do not respond to the Secretary-General's inquiry within 120 days shall be deemed to wish the application for the time being of the specific technical criteria referred to in the existing Regulations;

4. in those cases where an administration, in its reply to the Secretary-General's inquiry, indicates that a specific C.C.I.R. Recommendation or a specific technical criteria defined in those Recommendations is not acceptable to it, the relevant technical criteria defined in the Radio Regulations shall continue to apply with respect to cases involving that administration;

5. the Secretary-General shall publish, for the information of all administrations, a consolidated list prepared by the I.F.R.B. on the basis of the replies to the inquiry, of the C.C.I.R. Recommendations or of the specific relevant technical criteria defined in those Recommendations, and to which administrations each of those Recommendations or specific relevant technical criteria are acceptable or are not acceptable. This list shall also include those administrations mentioned in paragraph 3. above;

6. the I.F.R.B. be directed to take into account:

a) the applicability of the C.C.I.R. technical criteria consonant with the list referred to in 5. above when making technical examinations with respect to cases involving only administrations to which such criteria are acceptable;
b) the applicability of the technical criteria defined in the Radio Regulations consonant with the list referred to in 5. above when making technical examinations with respect to cases involving an administration which does not accept the relevant C.C.I.R. technical criteria.

7. If, at a later date, questions arise concerning the application of the relevant technical criteria to a case involving administrations described in paragraph 3 above, the I.F.R.B. shall inquire of the administrations concerned whether or not they would agree to the application of the technical criteria defined in the relevant C.C.I.R. Recommendations referred to in paragraph 1 above. If the answer is in the affirmative, the list published pursuant to paragraph 5 above shall be updated.

8. Administrations, when putting into service new stations, or changing the characteristics of existing stations, shall ensure that no harmful interference is caused, or likely to be caused, to the services of stations of those administrations which have not indicated their agreement to the application of the specific technical criteria in the relevant C.C.I.R. Recommendations referred to in paragraph 1 above.
FOURTH REPORT OF COMMITTEE 6

(REGULATIONS)

ARTICLE 9

The modifications and additions to the text of Article 9 appearing in the Annex to the present Report were adopted by Committee 6.

M.K. BASU
Chairman

Annex : 1
ANNEX

MODIFICATIONS TO ARTICLE 9

MOD Notification and recording in the Master International Frequency Register of Frequency Assignments¹ to Terrestrial Radiocommunication Stations.

NOC Section I Notification of Frequency Assignments and Co-ordination Procedure to be Applied in Appropriate Cases

ADD ¹ The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).

(MOD) ² For the notification and recording in the Master International Frequency Register of frequency assignments to radio astronomy and space radiocommunication stations, see Article 9A.
§ 1. (1) Any frequency assignment to a fixed, land, broadcasting, radionavigation land, radiolocation land or standard frequency station, or to a ground-based station in the meteorological aids service, shall be notified to the International Frequency Registration Board.

2 In the case where a frequency is used by numerous stations under the jurisdiction of the same administration, see Appendix 1 (Section E, II, Column 5a, paragraphs 2c and 2d).

3 With respect to assignments to broadcasting stations in the bands allocated exclusively to the broadcasting service between 5 950 kc/s and 26 100 kc/s, see Article 10.
a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration⁴; or

b) if the frequency is to be used for international radiocommunication; or

c) if it is desired to obtain international recognition of the use of the frequency⁴.

4 The attention of administrations is specifically drawn to the application of the provisions of Nos. 486 a) and 486 c) in those cases where they make a frequency assignment to a station in the terrestrial radiocommunications, located within co-ordination area of an earth station (see No. 492A), in a band which terrestrial radiocommunications share with equal rights with space radiocommunications in the frequency spectrum above 1 Gc/s.
NOC 487

(2) Similar notice shall be given for any frequency to be used for the reception of mobile stations by a particular land station in each case where one or more of the conditions specified in No. 486 are applicable.

NOC 488

(3) Specific frequencies prescribed by these Regulations for common use by stations of a given service (for example, international distress frequencies 500 kc/s and 2182 kc/s, frequencies of ship radiotelegraph stations operating in their exclusive high frequency bands, etc.), shall not be notified to the Board.

NOC 489

§ 2.(1) For any notification under Nos. 486 or 487 an individual notice for each frequency assignment shall be drawn up as prescribed in Sections A or B of Appendix 1, which specify the basic characteristics to be furnished, according to the case. It is
recommended that the notifying administration
should also supply the additional data
called for in that Appendix, together with such
further data as it may consider appropriate.

(2) When stations of the same service, such as
the land mobile service, use a band of frequencies
above 28 000 kc/s in a specific area or areas, an
individual notice should be drawn up, as prescribed
in Section C of Appendix 1, which specifies the basic
characteristics to be furnished, for each frequency
on which there are assignments within the band; however,
the particulars should relate only to a typical station.
This does not apply to broadcasting stations or to other
stations in the terrestrial radiocommunications to which the
provisions of Sub-Section IIB of this article apply.
§ 3. (1) Whenever practicable each notice should reach the Board before the date on which the assignment is brought into use. It must reach the Board not earlier than ninety days before the date on which it is to be brought into use, but in any case not later than thirty days after the date it is actually brought into use. However, for a frequency assignment to one of the terrestrial radiocommunication stations mentioned in Sub-Section IIB of this article or in No. 639AQ, the notice must reach the Board not earlier than three years and not later than ninety days before the date on which the assignment is to be brought into use.

(2) Any frequency assignment, the notice of which reaches the Board more than thirty days after the notified date of putting into use, or in the case of a notice concerning an assignment to a terrestrial radiocommunication station mentioned in Sub-Section IIB of this article and which reached the Board less than ninety days before it is taken into use, shall, where it is to be recorded, bear a remark in the Master Register to indicate that it is not in conformity with No. 491.
§ 3A. (1) Before an administration notifies to the Board, or brings into use any frequency assignment to a terrestrial radiocommunication station for transmitting in a band allocated with equal rights to space radio-communications (Space-to-Earth) and terrestrial radio-communications in the frequency spectrum above 1 Gc/s, it shall initiate co-ordination of the proposed assignment with the administration responsible for the receiving earth station concerned if the assignment is for use within the co-ordination area of an existing receiving earth station or of one for which the co-ordination procedure referred to in No. 629AN has been initiated. For the purpose of effecting co-ordination, it shall send to any other such administration, by the fastest possible means, a copy of a diagram drawn to an appropriate scale indicating the location of the terrestrial radiocommunication station and all other pertinent details of the proposed frequency assignment, and the approximate date on which it is planned to begin operations.

1 Appendix 28 contains criteria relating only to co-ordination between stations in the fixed or the mobile service and earth stations. Until the C.C.I.R., in accordance with Recommendation No. Spa I 28 J, provides criteria for other terrestrial radio-communications, the criteria to be used in effecting co-ordination between terrestrial radiocommunication stations other than those of the fixed or the mobile service and earth stations, shall be agreed between the administrations concerned.

2 Calculated, in relation to the fixed or mobile service, in accordance with the procedures described in appendix I 28 J.
MOD 492B (2) An administration with which co-ordination is sought under No. 492A shall immediately by telegram acknowledge receipt of the co-ordination data. If no acknowledgement is received within fifteen days of despatch, the sender may despatch a telegram requesting acknowledgement of receipt of the co-ordination data, to which the receiving administration shall respond. Upon receipt of the co-ordination data an administration shall promptly examine the matter with regard to interference which would be caused to the services rendered by its earth stations operating in accordance with the Convention and these Regulations, or to be so operated within the next three years, with the proviso that in this latter case co-ordination specified in No. 639AN has been effected or that the co-ordination procedure has already been initiated; and shall, within an overall period of sixty days from despatch of the co-ordination data, either notify the administration requesting co-ordination of its agreement to the proposals or, if this is not possible,

ADD 492B.1 1 Criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
indicate the reasons therefor and make such suggestions as it may be able to offer with a view to a satisfactory solution to the problem.

MOD 492C

(5) No co-ordination under No. 492A is required when an administration proposes:

c) to bring into use a terrestrial radiocommunication station which is located, in relation to an earth station, outside co-ordination area; or

d) to change the characteristics of an existing assignment in such a way as not to exceed the permissible level of interference to the earth stations of other administrations.
(4) An administration seeking co-ordination may request the Board to endeavour to effect co-ordination, in those cases where:

a) an administration with which co-ordination is sought under No. 492A fails to acknowledge receipt under No. 492B within a period of thirty days of despatch of the co-ordination data;

b) an administration which has acknowledged receipt under No. 492B fails to give a decision within a period of ninety days of despatch of the co-ordination;

c) there is a disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference, or

d) co-ordination between administrations is not possible for any other reason.
In so doing, it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

(5) Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.

(6) Where the Board receives a request under No. 492D a), it shall forthwith send a telegram to the administration concerned requesting immediate acknowledgement.

(7) Where the Board receives an acknowledgement following its action under No. 492F, or where the Board receives a request under No. 492D b), it shall forthwith send a telegram to the administration concerned requesting an early decision in the matter.
(8) Where the Board receives a request under No. 492J d), it shall endeavour to effect co-ordination in accordance with the provisions of No. 492A. Where the Board receives no acknowledgement to its request for co-ordination within the period specified in No. 492B, it shall act in accordance with the provisions of No. 492F.

(9) Where an administration fails to reply within thirty days of the Board's telegram requesting an acknowledgement sent under No. 492F, or fails to give a decision in the matter within sixty days of the Board's telegram of request sent under No. 492FA, it shall be deemed that the administration with which co-ordination was sought has undertaken that no complaint will be made in respect of any harmful interference which may be caused by terrestrial radiocommunication stations to the services rendered by its earth station.
(10) Where necessary, as part of the procedure under No. 492D, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

(11) In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after sixty days from the date of the request for the assistance of the Board, taking into consideration the provisions of No. 491, send its notice concerning the proposed assignment to the Board.
§ 3 B. Where the Board receives information from an administration in accordance with the provisions of No. 639A in reply to a request for co-ordination for an earth station, it shall consider as notifications under the present Section only that information relating to assignments to existing terrestrial radiocommunication stations or to those to be brought into use within the time limits defined in No. 491. Such notifications shall be examined by the Board with respect to the provisions of Nos. 570AB and 570AD, as appropriate, and shall be treated accordingly.

§ 3 C. (1) Whatever the means of communication, including telegraph, by which a notice is transmitted to the Board, it shall be considered complete if it contains at least those appropriate basic characteristics specified in Appendix 1.

(2) Complete notices shall be considered by the Board in the order of their receipt.
NOC 495 § 4. When a service or regional agreement has been concluded, the Board shall be informed of the details of this agreement.

MOD Sub-section IIA Procedure to be followed in cases not covered by Sub-section IIB of this article

MOD Sub-section IIB Procedure to be followed in cases where stations in the fixed or mobile service are in the same frequency band as, and within the co-ordination area of, an established earth station or one for which co-ordination has been effected or initiated.

NOC 570AA § 23A. The Board shall examine each notice.
NOG 570AB

a) with respect to its conformity with the Convention, the Table of Frequency Allocations and other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and the probability of harmful interference);

NOG 570AC

b) with respect to its conformity with the provisions of No. 492A relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

(MOD) 570AD

c) where appropriate, with respect to the probability of harmful interference to the service rendered by an earth receiving station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639PM, and if the corresponding frequency assignment
to the space transmitting station has not, in fact, caused harmful interference to any frequency assignment in conformity with No. 501 or 570AB, as appropriate, previously recorded in the Master Register.

NOC 570AE

§ 23 B. Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 570AB, 570AC and 570AD, further action shall be as follows:

NOC 570AF

§ 23 C: (1) Finding unfavourable with respect to No. 570AB.

MOD 570AG

(2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be examined immediately with respect to Nos. 570AC and 570AD.
ADD 570AGA  

(3) If the finding is favourable with respect to No. 570AC or 570AD, as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

ADD 570AGB  

(4) If the finding is unfavourable with respect to No. 570AC or 570AD, as appropriate, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.
(5) The period of one hundred and twenty days mentioned in Nos. 570AGB and 570AX shall count from:

- the date when the assignment to the terrestrial radiocommunication station which received an unfavourable finding is brought into use, if the assignment to the earth station is then in use;

- otherwise, from the date when the assignment to the earth station is brought into use.

But if the assignment to the earth station has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance may be made for the additional period mentioned in No. 570BF.
(MOD) 570AH

(6) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

(MOD) 570AI

(7) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 570AH.

MOD 570AJ

(8) If the notifying administration resubmits the notice with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of Nos. 570AG and 570AGA or 570AGB, as appropriate.
(9) If the notifying administration resubmits the notice with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 570AB, the notice shall be treated under the provisions of Nos. 570AL to 570AX. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in Column 2d.

(2) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has been successfully completed with all administrations whose earth stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
(3) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take the appropriate action necessary and shall inform the administrations concerned of the results obtained. If the Board's efforts are successful, the notice shall be treated in accordance with No. 570AM. If the Board's efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of No. 570AD.

(4) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.
(5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedure mentioned in No. 570AC has been successfully completed with all administrations whose earth stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

(6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination, it shall be treated in accordance with the provisions of No. 570AN. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.
(7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, it shall be examined by the Board with respect to the provisions of No. 570AD. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

§ 23E.(1) Finding favourable with respect to Nos. 570AB and 570AD.

(2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

§ 23F.(1) Finding favourable with respect to No. 570AB but unfavourable with respect to No. 570AD.
NOC 570AV

(2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

NOC 570AW

(3) Should the notifying administration resubmit the notice with modifications which result, after re-examination, in a favourable finding by the Board with respect to No. 570AD, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be indicated in the Remarks Column.

MOD 570AX

(4) Should the notifying administration resubmit the notice, either unchanged, or with modifications which decrease the probability of harmful interference, but not sufficiently to permit the provisions of No. 570AW to be applied, and should that administration insist upon reconsideration of the notice, but should
the Board’s finding remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column. The period of one hundred and twenty days shall count from the date indicated in No. 570AGC.

SUP 570AI

NOC 570AZ § 23 G.(l)Change in the Basic Characteristics of Assignments already recorded in the Master Register
(2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix 1 (except those entered in Columns 3 and 4a of the Master Register), shall be examined by the Board according to Nos. 570AB and 570AC and, where appropriate, No. 570AD, and the provisions of Nos. 570AF to 570AX inclusive applied. Where the change should be recorded, the assignment shall be amended according to the notice.

(3) However, in the case of a change in the basic characteristics of an assignment which is in conformity with No. 570AB, should the Board reach a favourable finding with respect to No. 570AC, and, where its provisions are applicable, with respect to No. 570AD, or find that the change does not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. In addition, the date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.
NOC 570BC § 23 H. In applying the provisions of the whole of this Sub-Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

NOC 570BD § 23 I. (1) Recording of Frequency Assignments notified before being brought into use.

NOC 570BE (2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to Nos. 570AB and 570AC and, where appropriate, with respect to No. 570AD, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.
(3) If, within the period of thirty days after the projected date of bringing into use, the Board receives confirmation from the notifying administration of the date of putting into use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

(4) In the circumstances described in No. 570AX, and as long as an assignment which received an unfavourable finding cannot be resubmitted as a consequence of the provisions of No. 570AGC, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 570AX, the information relating to the absence of complaint of harmful interference.
NOC 570BH  (5) If the Board does not receive this confirmation within the period referred to in No. 570BF or at the end of the period referred to in No. 570BG, as appropriate, the entry concerned shall be cancelled.

NOC  
Section VIII - Miscellaneous provisions

ADD 635A  §47A. (1) If it is requested by any administration, particularly by an administration of a country in need of special assistance, and if the circumstances appear to warrant, the Board, using such means at its disposal as are appropriate in the circumstances, shall render the following assistance:

a) preparation of the diagram showing co-ordination area referred to in No. 492A;

b) computation of the interference level, as referred to in No. 492B;

c) any other assistance of a technical nature for completion of the procedures in this article.

ADD 635B  (2) In making a request to the Board under 635A, the administration shall furnish the Board with the necessary information.
The Algerian Delegation has requested that the text of item 4 on page 3 of Document No. 378 be amended to read as follows:

"The delegate of Algeria, speaking on behalf of the African Group and in agreement with Mr. Butler (Liberia) who was not present at the Conference, proposed that Mr. Basu (India) be confirmed as Chairman of Committee 6, and that Mr. Bodede (Nigeria) be elected Vice-Chairman of that Committee."
**MINUTES OF THE THIRD PLENARY MEETING**

Friday, 9 July 1971, at 1500 hrs

_Chairman: Mr. Gunnar PEDERSEN (Denmark)_

Subject discussed (contd.):

11. Decision as to dates for submission of statements for inclusion in the Final Protocol

12. Message from the Minister of Posts and Telecommunications of the Republic of the Ivory Coast
The delegate of Algeria, speaking on behalf of the African Group, proposed the addition to the agenda of a new item: Chairmanship and Vice-Chairmanship of Committee 6.

It was so agreed.

1. Minutes of the first Plenary Meeting (Document No. 129)

Approved.

2. Minutes of the second Plenary Meeting (Document No. 175)

The delegate of Spain made the statement reproduced in Annex 1.

The minutes of the second Plenary Meeting (Document No. 175) were approved.

3. Minutes of the Extraordinary Plenary Meeting held on 30 June, 1971 (Document No. 262)

The minutes of the Extraordinary Plenary Meeting (Document No. 262) were approved.

The delegate of the U.S.S.R. once more expressed his delegation's gratitude to the Chairman and to all delegations who had expressed their sympathy in connection with the great loss recently suffered by his country, and referred to the courage and spirit of self-sacrifice of the astronauts who had lost their lives.

4. Chairmanship and Vice-Chairmanship of Committee 6

The delegate of Algeria, speaking on behalf of Mr. Butler (Liberia), who was unavoidably absent, and of the African Group, proposed that Mr. Basu (India) be confirmed as Chairman of Committee 6, and that Mr. Bode (Nigeria) be elected Vice-Chairman of that Committee.

The delegates of Ethiopia, Morocco, Ghana and Democratic Republic of the Congo supported the proposal.

The Chairman declared those nominations confirmed.

The delegates of India and Nigeria expressed their gratification at the confidence and trust thus displayed in their delegations.
5. Situation of certain countries with respect to the Convention (Addenda 1, 2 and 3 to Document No. 94)

The Chairman drew attention to the fact that Belgium and Cyprus had now ratified the 1965 Montreux Convention and Uruguay had acceded thereto.

The Secretary-General announced that a ratification had just been received from Chile.

The Chairman stated that in accordance with 251 of the Convention the delegations of the following countries represented at the Conference were not entitled to vote but might sign the Final Acts: Colombia, Ghana, Liberia, Panama, Philippines.

The delegate of the Philippines regretted the delay in ratification by his Government, but said that the instrument of ratification would be duly forwarded to the I.T.U. Secretariat.

The delegate of Belgium said that purely domestic reasons had led to delay and he was glad his Government had recently been able to ratify the Convention.

The delegate of Ghana said that his Government's failure to ratify had been due to an administrative oversight, but that had now been corrected and the instrument of ratification should be deposited within a few weeks.

6. Report by the Credentials Committee (Document No. 252)

The Chairman stated that, in Document No. 252, 2) should be deleted from against Uruguay on page 7.

The Chairman of Committee 2 said that since the Committee's last meeting on 25 June, in accordance with the procedure recommended in Document No. 252, paragraph 5, he had duly examined and found in order credentials submitted by the following delegations: Democratic Republic of Congo, Gabon, Ghana, Greece, Niger, Paraguay, Togo and Pakistan, and provisional credentials from the delegation of Panama. Credentials had not yet been received from the delegations of: Upper Volta, Malagasy Republic, Mali and Tunisia.
The Chairman noted with regret that there were still four delegations which under 638 of the Convention were not entitled to vote or to sign the Final Acts.

The delegate of Upper Volta said that a telegram from his Government had arrived the previous day conferring credentials on the head of the delegation, but omitting to state that written confirmation was following.

The delegate of Tunisia apologised for the delay and said his delegation hoped to receive credentials by the beginning of the following week.

The delegate of Rwanda said that paragraph 2(d) of Document No. 252 appeared to be an extension of the provisions of the Convention which in 634, 635 and 636 listed only three criteria for the acceptance of credentials.

The Chairman of Committee 2 said that point had been discussed at length in the Working Group, and it had reached the conclusion that credentials containing no restrictions entitled their holders to vote and to sign the Final Acts. The Committee had based its examination of credentials on the definition of Delegate in 404 of the Convention.

The report by Committee 2 (Document No. 252) was approved.

8. First report by the Budget Control Committee (Document No. 228)

The Chairman said that Document No. 228 had been submitted as an interim report when it had become clear that the Conference budget as approved by the Council would be exhausted in less than six weeks. More accurate figures would be available the following week, in accordance with 676 of the Convention. He proposed that further discussion of the financial position be postponed pending their submission, and that the Plenary should in the meantime merely ratify the Steering Committee's recommendation that the Conference should continue until the end of the following week.

It was so agreed.
9. Draft recommendation relating to the use of satellite communication systems in the event of natural disasters (Document No. 224)

The delegate of the Philippines said that the World Administrative Radio Conference, which had met in Geneva in 1959, recognizing the devastating effects of natural disasters and the needs of Red Cross societies for rapid communication links to enable them to cope with such catastrophes, had adopted Recommendation No. 34. Since that time untold suffering had been caused to humanity by various natural catastrophes and his country, which had been visited by several devastating typhoons in recent years, had decided to take all possible steps to counteract such disasters. It had therefore submitted Resolution 2717 to the 25th Session of the United Nations General Assembly. However, a more specific resolution was required to deal with the disruption of communications which frequently ensued, and to enable governments and relief organizations to assess requirements and to co-ordinate their activities. He therefore introduced draft Recommendation No. K (Document No. 224) which was designed to supplement the provisions of Recommendation No. 34 by providing for the use of satellite communication systems in the event of natural disasters.

The delegates of Japan, Chile, Argentina, Indonesia, China, Venezuela, Malaysia, India, Nigeria, Syria and United Arab Republic supported the draft recommendation. The delegate of Pakistan also endorsed it but requested clarification of its last paragraph.

The delegate of the United Kingdom warmly supported the draft recommendation but pointed out that the location of a transportable earth station would depend on a number of factors and that, in fact, there appeared to be a need for a complete transportable communication system. Furthermore, it would be essential to provide for the waiving of co-ordination procedure requirements when a disaster occurred. He proposed that the last two paragraphs of draft Recommendation No. K be replaced by the following wording:

"requests

the C.C.I.R. to study standard specifications and preferred frequencies for integrated mobile and transportable fixed communication systems including transportable earth stations for use in disaster areas;"
invites administrations concerned
to waive the requirements of co-ordination procedures in
case where they are within co-ordination
distance of disaster areas.

The delegate of Iran supported the draft recommendation and the
United Kingdom amendment, and suggested that epidemics and disease should
be added to the list of natural disasters.

To meet a point made by the Observer from the World Meteorological
Organization, the delegate of the United Kingdom agreed to the addition,
at the end of his proposed amendment, of the words "and to co-operate in
this matter fully with international organizations".

The Secretary-General proposed the addition of a paragraph
inviting the Secretary-General to ensure co-ordination with international
organizations and to transmit the recommendation to the United Nations,
whose Economic and Social Council was actively concerned with the question.

It was agreed that the delegate of the Philippines should convene
a drafting group consisting of the delegates of the United Kingdom, Syria
and Iran, representatives of the Secretary-General and the C.C.I.R., and
the Chairmen of Committee 5 and Committee 6, to re-draft the recommendation.

10. First reading of texts submitted by the Editorial Committee

The Chairman of Committee 7 said that when the Committee had begun
its work of making drafting changes to text submitted to it by Committees 4
and 6, it did not have before it all the new definitions that had been
agreed on. It therefore suggested that the Plenary Meeting should allow
it to insert the new definitions, where necessary, in the texts submitted
for second reading.

It was so agreed.

a) Series B.1 (Document No. 283)
The delegate of Senegal pointed out that the title of MOD 84BC did not refer to an earth satellite, and that it might therefore be more accurate to omit the word "earth's" before "equator".

The Director of the CCIR said that, since the definition essentially represented an abbreviation of the Special Joint Meeting's text concerning an earth satellite, the word should be retained.

The Chairman of Committee 4 suggested that the title of MOD 84BC should end with "(of an Earth Satellite)".

The delegate of Spain considered that the word "between" in that definition should be replaced by "determined by".

The delegate of the United Kingdom said that the word "the" should be inserted before "geostationary satellite orbit" at the end of MOD 84BC.

Approved, as amended.

The Chairman said that the question of the frequencies to be mentioned in the title of Article 5 would be settled in connection with texts appearing in Series B.4.

The delegate of Canada suggested that, since some of the allocations in Article 5 were above 40 Gc/s, the number "40" should be placed in square brackets.

The Chairman of Committee 6 said that MOD 93 had been considered by Committee 4 and had then been passed on to Committee 6 for examination in connection with Articles 9 and 9A. Since Committee 6 had not yet referred its findings to Committee 7, it would be glad if the Plenary Meeting would defer a decision on that point.

On that understanding, Page B.1/03 was approved.

The delegate of Canada said that the square brackets round the word "Recommendations" in (MOD) 470A should be removed.
The delegate of the United Kingdom suggested that the word "so" should be deleted from the penultimate line of the foot-note 470AA.1.

The Director of the C.C.I.R. suggested that the word "latest" in foot-note 470AA.2 should be replaced by "most recent".

Approved, as amended.

The delegate of Argentina suggested that, notwithstanding proposed foot-note ADD 84AB.1 in Series B.3, the word "terrestrial" should be inserted before "station" in ADD 470BA, MOD 470C and ADD 470CA, to clarify matters for users of the Radio Regulations.

The Chairman of Committee 7 said that such an insertion would necessitate similar additions throughout the Radio Regulations and would therefore not be practicable.

The delegate of Canada suggested that the word "maximum" should be inserted before "power" in MOD 470C and ADD 470CA, to bring the English text into line with the French.

The delegate of the United Kingdom pointed out that the notion of "maximum" power was conveyed by the phrase "shall not exceed".

The delegate of Pakistan said that his delegation wished to enter a reservation concerning MOD 470B, which his country would find it very difficult to apply.

Approved.

b) Series B.2 (Document No. 296)

Approved.

The delegate of Denmark suggested that the preamble should make it clear that the Conference was using as a basis, not the 1959 Radio Regulations, but the version amended by the 1963, 1966 and 1967 Administrative Radio Conferences.

It was so agreed.
The Chairman, supported by the delegate of Mexico, suggested that the date of 1 January 1973 should be inserted in the space in the second paragraph.

It was so agreed.

Approved, as amended.

Pages B.2/03 and B.2/04

Approved.

Page B.2/05

The Chairman of Committee 4 suggested that the number "IX" in the title should be placed in square brackets, as the sections might well have to be renumbered.

Approved, as amended.

Page B.2/06

The delegate of Canada suggested that the English text of considering c) should be aligned with the French by replacing the word "investigation" by "research".

The delegate of Spain suggested that the words "the satellite" in the fourth line of the resolves paragraph should be replaced by "these satellites,"

The delegate of the United Kingdom suggested that the opening phrase of the resolves paragraph should be altered to read: "that Administrations may continue to permit the transmission of radio waves from ionospheric research satellites in orbit above the ionosphere in the MF and HF bands provided that ..."

Approved, as amended.

Pages B.2/07 and B.2/08

The delegate of Chile suggested that the word "and" in the last line of page B.2/07 should be replaced by "or", to make it clear that the calculation method in question was not the same for frequencies below 100 MHz and those above 400 MHz.

The Chairman of Committee 4 said he did not think that the use of the word "and" implied that the same method was used for both calculations.
The delegate of Mexico thought that the problem could be solved by using the word "methods" in the plural on page B.2/07, as was done in the last paragraph on page B.2/08.

After a brief discussion, it was decided to leave the final wording to Committee 7.

The delegate of the United States of America said that square brackets should be placed round the number "1a" in considering c), the first sub-paragraph under invites and the first sub-paragraph under recommends, since the Table in question might be renumbered or even deleted.

He also suggested that the second line of considering c) should be altered to read "... values for all the necessary parameters of space radiocommunication ...".

After a brief discussion on a point raised by the delegate of Niger concerning considering a), it was decided, at the suggestion of the Chairman of the I.F.R.B., to amend the third line of the paragraph to read "... equal rights between the terrestrial radiocommunication services and the space radiocommunication services must be ...".

Approved, as amended.

c) Series B.3 (Document No. 313)

Page B.3/01

The delegate of Argentina suggested that the word "object" in MOD 84AE should be replaced by "spacecraft".

The delegate of New Zealand said he could not agree with that suggestion, as the object in question might be the moon, a planet or some other body.

After a brief discussion, it was decided to leave the definition unchanged.

Approved.

Page B.3/02

The delegate of Spain suggested that the French and Spanish texts of the last line of ADD 84APA should be aligned with the English.
The delegate of the United Arab Republic suggested that the words "and in particular those" in ADD 84APA should be deleted.

Approved, as amended.

The delegate of the United Kingdom said that the last alternative under ADD 84APB seemed to preclude the use of the Broadcasting-Satellite Service for such purposes as general educational television programmes to schools, as the definition implied that only a limited number of schools could be covered.

The delegate of Brazil said that the issue had been thoroughly discussed in the ad hoc Group of Committee 5 and in that Committee itself, and that proposals to make the definition more restrictive or broader had been rejected. The concept of community reception was not new and, indeed, had been studied at many C.C.I.R. meetings and the present proposal was based on an S.J.M. text; the key word of the proposal was "intended", which carried the notion that the Broadcasting-Satellite Service was intended to reach the general public directly. The content of messages to groups, on the other hand, was the sole concern of administrations, and could not be incorporated in a definition. In those circumstances, the proposed text seemed to be satisfactory.

The delegate of Israel suggested that the difficulty might be removed by deleting the words "and intended", since the intention was already made clear in the definition of the Broadcasting-Satellite Service in MOD 84AP.

The delegate of India said that the notion of community reception was to make it possible to use signals more beneficially than for individual reception, by distributing them to limited areas such as schools and colleges.

The delegate of the United Kingdom pointed out that the definition of community reception, which was covered by that of the Broadcasting-Satellite Service, was made unduly restrictive by its wording.

The Chairman of Committee 7, supported by the delegate of Italy, suggested that the problem might be solved if the last part of the definition were amended to read:
"... and intended for use by the general public:

- at one location, or
- through a distribution system covering a limited area."

The delegate of the United States of America, supported by the delegates of France, Spain and Mexico, proposed that the definition should remain unchanged.

It was so agreed.

The Chairman of Committee 7 said that the French and Spanish texts of the last phrase of MOD 84AQ should be aligned with the English.

The delegate of Canada pointed out that the last word in the first line of MOD 84AQ should be "radionavigation".

Approved, as amended.

Pages B.3/05 and B.3/06

Approved.

11. Decision as to dates for submission of statements for inclusion in the Final Protocol

The Secretary of the Conference suggested that, on the assumption that the signing ceremony would take place on the evening of Friday, 16 July, statements for inclusion in the Final Protocol should be submitted not later than 1800 hours on Wednesday, 14 July. A conference document containing those statements would be distributed the following morning, and counter-statements should be submitted by 1800 hours on Thursday, 15 July. It should be indicated clearly that the statements were to be included in the Final Protocol, not merely to be issued as conference documents.

Those dates were approved.
12. **Message from the Minister of Posts and Telecommunications of the Republic of the Ivory Coast**

The Chairman announced that H.E. Mr. Souleymane Cissoko, the Minister of Posts and Telecommunications of the Republic of the Ivory Coast, had visited Geneva recently and had intended to address the Conference, but had unfortunately been prevented from doing so. His message would be reproduced in Annex 2 to the minutes of the current meeting.

*The meeting rose at 1840 hrs.*

---

Secretary of the Conference: Clifford STEAD  
Chairman of the Conference: Gunner PEDERSEN

Annexes: 2
Mr. Chairman,

The purpose of my intervention is to provide some details on co-operation in telecommunications between Spain and Equatorial Guinea.

The most important features of this co-operation can be summed up as follows:

- On 20 July 1968, Spain inaugurated and handed over to Equatorial Guinea television installations valued at 200 million pesetas ($2,857,000). In July 1969, the Spanish Government, at the request of the Guinean authorities, began sending out and is now maintaining at its expense a team of seventeen technicians responsible for the technical and economic management of the television services.

- On 12 October 1969, the Governments of Spain and the Republic of Equatorial Guinea signed a Basic Technical Co-operation Agreement which was followed by a Supplementary Technical Assistance Agreement for Telecommunication Services on 4 December 1969, under which a form of financing amounting to 23 million pesetas ($328,571) was decided upon for the period 1970 - 1974 for these services. This technical assistance is being provided via the Compañía Telefónica Nacional de España. The sum provided for includes an amount of 15,780,000 pesetas ($225,428) for television technical assistance costs for the year 1970.

- On 29 May 1971, seven co-operation agreements were initialled in Madrid between the Governments of Spain and Equatorial Guinea; one of these agreements deals with technical co-operation for television. This agreement covers the training of Guinean staff by means of fellowships and theoretical and practical courses at the Spanish School of Broadcasting, the free supply of filmed and recorded material and of Spanish technicians to help operate the facilities installed.
Mr. Chairman, I wish to express my confidence that this co-operation between Spain and Equatorial Guinea, based as it is on the mutual respect of independence and sovereignty, will continue undiminished in the future. I should also like to take advantage of this occasion, Mr. Chairman, to repeat, on behalf of my Delegation, the satisfaction which we have felt at the presence, for the first time at a World Administrative Conference for Telecommunications, of representatives of the Republic of Equatorial Guinea, to which we wish every success in its economic and social development and as a Member of the International Telecommunication Union.

I would ask you, Mr. Chairman, to see that my statement appears in extenso in the Minutes of this Meeting.
MESSAGE FROM HIS EXCELLENCY SOULEYMANE CISSOKO
MINISTER OF POSTS AND TELEGRAPHS OF THE
REPUBLIC OF THE IVORY COAST

It gives me great pleasure to greet this august assembly, met on
the occasion of the World Administrative Radio Conference for Space
Telecommunications. 'Space techniques' : not so long ago, these words
were the stuff of dreams and science fiction - today, they are household
words. In the course of 1970 alone, 114 launchings of all kinds of
satellites were notified to the I.T.U. The developing countries also
entered into the space age, not because they were anxious to engage in a
prestige operation but because they saw a further possibility of making
up some of their leeway.

The antennae of communication-satellite stations can now be seen
rising amid palm and banana trees. Links with the outside world
are extremely important for our countries and satellite telecommunications
offered an economic solution for establishing our international circuits.
These were the motives which impelled us to join INTELSAT, the first world­
wide commercial system. It is also why we are closely following the
progress of certain regional projects which we should be glad to see become
operational in the near future.

The satellite broadcasting and television distribution services
can also be extremely useful to us. The reception of information and
particularly educational programmes by community antennae are a particularly
convenient solution to the problem raised by the scattered nature of our
rural populations and their feeble economic resources.

The African countries are also taking part in space research.
Numerous more advanced states have set up in our territories telecommand
and telemetering stations in which young local technicians are employed
and trained.
The possibilities afforded by satellites for the meteorological aids services are also a considerable asset for our countries, whose major business is agriculture.

Finally, the maritime and aeronautical services established in Africa expect a great deal from space radiocommunications for purposes of navigational safety and control.

For all these various reasons, the African countries owed it to themselves to take an active part in this Conference. Your burden, Gentlemen, is a heavy one, and your agenda is very full, but this is a good time to prepare the ground for the future.

A substantial proportion of your work will be concerned with the sharing of the already congested frequency spectrum. If possible, the frequency bands allocated to space radiocommunications should not be extended at the expense of the other services, particularly radio relays, which also have heavy requirements. The frequencies above 10 GHz offer sufficient scope from this standpoint.

The frequency spectrum belongs to all the Members of the Union. It must not be unfairly monopolized by a certain number who make no real use of it. An assignment procedure must be established on principles of justice and fairness. From this point of view, the International Telecommunication Union is, in my opinion, the appropriate body to ensure effective co-ordination, taking into account the requirements of each. In view of the importance assumed by geostationary satellites, this co-ordination should also extend to positions on the geostationary orbit. Every effort should be made to respect the rights of all and to avoid interference with terrestrial services and with the other space services. In this connection, spacecraft should be equipped with devices to ensure cessation of emissions at any time as required.

I have already made the point that our countries expect a great deal from direct or semi-direct sound and television broadcasting from satellites. However, all steps must be taken to ensure that each State can maintain its sovereignty with regard to the reception of broadcasts in its territory.
As President Houphouët Boigny has repeatedly stated, the Ivory Coast has "adhered without reservation, and even with enthusiasm, to the principles on which the United Nations was founded: freedom of the peoples, peace between men and between peoples, the respect of the individual, and mutual international aid to promote human happiness by universal brotherhood". On this basis, it will consistently endeavour to ensure that outer space is used exclusively for peaceful purposes to bring about better co-operation and a franker exchange of views between men.

I cannot conclude this statement without paying tribute to the International Telecommunication Union and particularly to its Secretary-General, Mr. Mili, for the enormous task which they have accomplished, for the unceasing assistance they have given us and for the spirit of understanding in which they have always attempted to meet our requirements, particularly large with regard to training.

Long live space telecommunications.

Long live the International Telecommunication Union.
MEMORANDUM BY THE CHAIRMAN

The Head of the Delegation of the People's Republic of Poland has sent me the letter reproduced in the Annex.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
PAGE INTENTIONALLY LEFT BLANK

ANNEX

Geneva, 12 July 1971

Mr. Gunnar Pedersen,
Chairman of the World Administrative
Radio Conference for Space
Telecommunications
Geneva

Dear Mr. Chairman,

I am sending you herewith a statement by the Head of the Delegation of the People's Republic of Poland on the participation in the Conference of the People's Republic of China, the German Democratic Republic, the Democratic Republic of Viet-Nam and the Korean People's Democratic Republic.

We request you to publish this statement as an official conference document.

Yours sincerely,

J. RUTKOWSKI
Deputy Head of the Delegation of the People's Republic of Poland

Annex : 1
Annex

Geneva, 12 July 1971

The Delegation of the People's Republic of Poland to the World Administrative Radio Conference for Space Telecommunications wishes to confirm herewith the views it expressed in the Credentials Committee on 17 June 1971 (Document No. 167(Rev.)). It regrets the failure to invite representatives of the People's Republic of China, the Democratic Republic of Viet-Nam and the Korean People's Democratic Republic to take part in the Conference.

The Polish Delegation considers that the absence of the German Democratic Republic, which was not invited to attend the Conference, must also be considered as a serious blow to the principle of universality of the international organizations.

The German Democratic Republic is a sovereign country in Central Europe, possessing a large industrial and economic potential. It also has a substantial radiocommunication infrastructure. The absence of this State from the Conference constitutes a serious obstacle to the satisfactory settlement of problems relating to frequency utilization in Central Europe.
FIFTH REPORT OF COMMITTEE 6

(REGULATIONS)

The texts appearing in the Annexes to the present report, concerning
- the modifications to Appendix 1
- the modifications to Appendix 1A
- the new Appendix 1B

were adopted by Committee 6.

M.K. BASU
Chairman

Annexes : 3
ANNEX 1

MODIFICATIONS TO APPENDIX 1

1. At the end of Section A of Appendix 1, read:

"Supplementary information:

a) Reference frequency, if any, and any co-ordination required by No. 492A.

b) Indicate the name of any administration with which an agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement."

2. At the end of Sections B and C of Appendix 1, read:

"Supplementary information:

a) Any co-ordination required by No. 492A.

b) Indicate the name of any administration with which an agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement."
ANNEX 2

MODIFICATIONS TO APPENDIX 1A

Spa

MOD NOTICES RELATING TO SPACE RADIOCOMMUNICATION AND RADIO ASTRONOMY STATIONS

(see Article 9A)

Section A. General instructions

1. A separate notice shall be sent to the International Frequency Registration Board for notifying:

   - each new frequency assignment,

   - any change in the characteristics of a frequency assignment recorded in the Master International Frequency Register (hereinafter called the Master Register),

   - any total deletion of a frequency assignment recorded in the Master Register.

2. When submitting notices under No. 639BA for earth and space transmitting assignments and under No. 639BB for space and earth receiving assignments, separate notice shall be submitted to the Board for each assignment to an earth or space station. In the case of a passive satellite system, only earth transmitting and receiving assignments shall be notified.

3. In the case of a satellite system employing multiple space stations with the same general characteristics, a separate notice shall be submitted for each space station:

   - when it is aboard a geostationary satellite, or
when it is aboard a non-geostationary satellite except when a number of satellites have the same radio frequency characteristics and orbital characteristics (excluding the ascending node position). In this case one notice covering all such space stations may be submitted.

4. The following basic information shall be shown on the notice:

(a) the serial number of the notice and the date on which the notice is sent to the Board;

(b) the name of the notifying administration;

(c) sufficient data to identify the particular satellite network in which the earth or space station will operate;

(d) whether the notice reflects:

(1) the first use of a frequency by a station,

(2) a change in the characteristics of a frequency assignment recorded in the Master Register (indicate whether the change is a replacement, addition or deletion of existing characteristics), or

(3) a deletion of an assignment in all of its notified characteristics;

(e) reference to the weekly circular providing the advance publication information required in accordance with No. 639AA;

(f) basic characteristics as outlined in section B, C, D, E or F as appropriate;

(g) any other information which the administration considers to be relevant, e.g. any factors taken into account when applying Appendix 28 for the determination of co-ordination area and also an indication that the assignment concerned would be operating in accordance with No. 115, information concerning the use of the notified frequency if such use is restricted, or, in the case of notices pertaining to space stations, if the transmissions of the station are to be permanently switched off after a certain period.
Section B. Basic characteristics to be furnished in notices relating to frequencies used by earth stations for transmitting

Item 1 Assigned frequency

Indicate the assigned frequency as defined in Article 1, in k[c/s] up to 30 000 k[c/s] inclusive, and in M[c/s] above 30 000 k[c/s] (see number 85)

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in k[c/s] (see number 89)

Item 3 Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) of putting the frequency assignment into use.

(b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4(a)), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity and location of the transmitting earth station.

(a) Indicate the name by which the station is known or the name of the locality in which it is situated.

(b) Indicate the country in which the station is located. Symbols from the Preface to the International Frequency List should be used.

(c) Indicate the geographical co-ordinates (in degrees and minutes) of the transmitter site.

Item 5 Station(s) with which communication is to be established

Identify the associated receiving space station(s) by reference to the notification thereof or in any other appropriate manner, or, in the case of a passive satellite, the identity of the satellite and the location of the receiving earth station(s).
Item 6  Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 7  Class of emission, necessary bandwidth and description of transmission

(a) Indicate the class of emission of the assignment

(b)* Indicate the carrier frequency or frequencies of the emission(s)

(c)* Indicate for each carrier the class of emission, necessary bandwidth and description of transmission, in accordance with Article 2 and Appendix 5.

Item 8  Power characteristics of the transmission

(a)* Indicate for each carrier the peak power supplied to the input of the antenna;

(b) Indicate the total peak power and the maximum power density per c/s supplied to the input of the antenna averaged over the worst 1 k/c/s/ band, for carriers below 15 G/c/s/ or averaged over the worst 1 M/c/s/ band, for carriers above 15 G/c/s/.

Item 9  Transmitting antenna characteristics

(a) Indicate the isotropic gain (dB) of the antenna in the direction of maximum radiation (see number 100).

(b) Indicate the beamwidth in degrees between the half power points (describe in detail if not symmetrical).

(c) Either attach the measured radiation diagram of the antenna (taking as a reference the direction of maximum radiation) or indicate the reference radiation diagram to be used for co-ordination.

(d) Indicate graphically the horizon elevation angle for each azimuth around the earth station.

(e) Indicate in degrees from the horizontal plane the planned minimum operating angle of elevation of the antenna in the direction of maximum radiation;

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(f) Indicate in degrees clockwise from true North the planned range of operating azimuthal angles for the direction of maximum radiation.

(g)* Indicate the type of polarization of the transmitted wave in the direction of maximum radiation; also indicate the sense in the case of circular polarization and the plane in the case of linear polarization.

(h) Indicate the altitude (metres) of the antenna above mean sea level.

Item 10* Modulation characteristics

For each carrier, according to the nature of the signal modulating the carrier and the type of modulation, indicate the following characteristics:

(a) Carrier frequency-modulated by a frequency-division multichannel telephony baseband (FDM-FM) or by a signal that can be represented by a multichannel telephony baseband; indicate the lowest and highest frequencies of the baseband and the r.m.s. frequency deviation of the test tone as a function of baseband frequency.

(b) Carrier frequency-modulated by a television signal; indicate the standard of the television signal (including, where appropriate, the standard used for colour), the frequency deviation for the reference frequency of the pre-emphasis characteristic and the pre-emphasis characteristic itself. Also indicate, where applicable, the characteristics of the multiplexing of the video signal with the sound signal(s) or other signals.

(c) Carrier phase-shift-modulated by a pulse code modulation signal (PCM/PSK); indicate the bit rate and the number of phases.

(d) Amplitude-modulated carrier (including single sideband); indicate as precisely as possible the nature of the modulating signal and the kind of amplitude modulation used.

(e) For all other types of modulation, provide such particulars as may be useful for an interference study.

(f) For any type of modulation as applicable indicate the characteristics of energy dispersal.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
Item 11 Maximum hours of operation

Indicate in GMT the maximum hours of operation on the frequency of each carrier.

Item 12 Co-ordination

Indicate the name of any administration with which the use of this frequency has been successfully co-ordinated in accordance with Nos. 639A and 639AN and, if appropriate, the name of any administration with which co-ordination has been sought but not effected.

Item 13 Agreements

Indicate also, if appropriate, the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations, and the contents of such agreement.

Item 14 Operating administration or company

Indicate the name of the operating administration or company and the postal and telegraphic address of the administration to which communications should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of stations (see Article 15).

Section C. Basic characteristics to be furnished in notices relating to frequencies to be received by earth stations

Item 1 Assigned frequency

Indicate the assigned frequency of the emission to be received, as defined in Article 1, in kc/s up to 30,000 kc/s inclusive, and in Mc/s above 30,000 kc/s. (See number 89)

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band (see number 89).

Item 3 Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) when reception of the assigned frequency begins.
(b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4(a)), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity and location of the receiving earth station

(a) Indicate the name by which the receiving earth station is known or the name of the locality in which it is situated.

(b) Indicate the country in which the receiving earth station is located. Symbols from the Preface to the International Frequency List should be used.

(c) Indicate the geographical co-ordinates (in degrees and minutes) of the receiver site.

Item 5 Station(s) with which communication is to be established

Identify the associated transmitting space station(s) by reference to the notification thereof or in any other appropriate manner, or, in the case of a passive satellite, the identity of the satellite(s) and the associated transmitting earth station(s).

Item 6 Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 7 Class of emission, necessary bandwidth and description of the transmission to be received

(a) Indicate the class of emission of the assignment to be received.

(b)* Indicate the carrier frequency or frequencies to be received.

(c)* Indicate, for each carrier to be received, the class of emission, necessary bandwidth and description of the transmission, in accordance with Article 2 and Appendix 5.

Item 8 Earth station receiving antenna characteristics

(a) Indicate the isotropic gain (dB) of the antenna in the direction of maximum radiation (see number 100).

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(b) Indicate the beamwidth in degrees between the half power points (describe in detail if not symmetrical).

(c) Either attach the measured radiation diagram of the antenna (taking as a reference the direction of maximum radiation) or indicate the reference radiation diagram to be used for co-ordination.

(d) Indicate graphically the horizon elevation angle for each azimuth around the earth station.

(e) Indicate in degrees from the horizontal plane the planned minimum operating angle of elevation of the antenna in the direction of maximum radiation.

(f) Indicate in degrees, clockwise from true North, the planned range of operating azimuthal angles for the direction of maximum radiation.

(g) Indicate the altitude (metres) of the antenna above mean sea level.

Item 9 Noise temperature

Indicate the lowest equivalent satellite link noise temperature in degrees Kelvin (see number 103A) under "quiet sky conditions". This value shall be indicated for the nominal value of the angle of elevation when the associated transmitting station is aboard a geostationary satellite and, in other cases, for the minimum value of angle of elevation.

Item 10 Maximum hours of reception

Indicate in GMT the maximum hours of reception of the frequency of each carrier.

Item 11 Co-ordination

Indicate the name of any administration with which the use of this frequency has been successfully co-ordinated in accordance with Nos. 659A and 659A and, if appropriate, the name of any administration with which co-ordination has been sought but not effected.

Item 12 Agreements

Indicate also, if appropriate, the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations, and the contents of such agreement.
Item 13 Operating administration or company

Indicate the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference and questions referring to the technical operation of stations (see Article 15).

Section D. Basic characteristics to be furnished in notices relating to frequencies used by space stations for transmitting

Item 1 Assigned frequency

Indicate the assigned frequency as defined in Article 1, in \( \text{k}[\text{c/s}] \) up to 30 000 \( \text{k}[\text{c/s}] \) inclusive, and in \( \text{M}[\text{c/s}] \) above 30 000 \( \text{k}[\text{c/s}] \) (see number 85). At least one separate assignment notice should be made out for each antenna radiation beam.

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in \( \text{k}[\text{c/s}] \) (see number 89).

Item 3 Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) of putting the frequency assignment into use.

(b) Whenever the assignment is changed in any of its basic characteristics as shown in this Section (except in the case of a change in Item 4), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity of the space station(s)

Indicate the identity of the space station(s).

Item 5 Orbital information

(a) In the case of a space station aboard a geostationary satellite indicate the nominal geographical longitude on the geostationary satellite orbit and the longitudinal and inclination tolerances. Indicate also :
(1) the arc of the geostationary satellite orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth's surface, from its associated earth stations or service areas; and

(2) the arc of the geostationary satellite orbit within which the space station could provide the required service to its associated earth stations or service areas; and

(3) in the event that the arc stated in paragraph (2) above is less than the arc stated in paragraph (1) above, provide the reasons therefor.

Note: The arcs specified in (1) and (2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

(b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period and the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites used.

Item 6 Service area

Indicate the service area or areas on the earth or the name of the locality and country in which the associated receiving station(s) is (are) located.

Item 7 Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 8 Class of emission, necessary bandwidth and description of transmission

(a) Indicate the class of emission of the assignment.

(b)* Indicate the carrier frequency or frequencies.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(c)* Indicate, for each carrier, the class of emission, necessary bandwidth and description of transmission, in accordance with Article 2 and Appendix 5.

Item 9 Power characteristics of the transmission

(a)* Indicate for each carrier the peak power supplied to the input of the antenna,

(b) Indicate the total peak power and the maximum power density per cycle per second input of the antenna averaged over the worst 4 $\frac{1}{2}$ bands for carriers below 15 GHz or averaged over the worst 1 band for carriers above 15 GHz.

Item 10 Space station transmitting antenna characteristics

For each service area:

(a) In the case of a space station aboard geostationary satellite, indicate the gain of the space station transmitting antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

(b) In the case of a space station aboard non-geostationary satellite, indicate the isotropic gain of the space station transmitting antenna in the main direction of radiation and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of radiation as a reference.

(c)* Indicate the type of polarization of the antenna, the sense in the case of circular polarization, and the plane in the case of linear polarization; also indicate the worst case axial ratio in the half power beamwidth.

(d) Indicate for geostationary satellite, the pointing accuracy of the antenna.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
Item 11* Modulation characteristics

For each carrier, according to the nature of the signal modulating carrier and the type of modulation, indicate the following characteristics:

(a) Carrier frequency-modulated by a frequency-division multichannel telephony baseband (FDM-FM) or by a signal that can be represented by a multichannel telephony baseband; indicate the lowest and highest frequencies of the baseband and the r.m.s. frequency deviation of the test tone as a function of baseband frequency.

(b) Carrier frequency-modulated by a television signal; indicate the standard of the television signal (including, where appropriate, the standard used for colour), the frequency deviation for the reference frequency of the pre-emphasis characteristic and the pre-emphasis characteristic itself. Also indicate, where applicable, the characteristics of the multiplexing of the video signal with the sound signal(s) or other signals.

(c) Carrier phase-shift-modulated by a pulse code modulation signal (PCM/PSK); indicate the bit rate and the number of phases.

(d) Amplitude-modulated carrier (including single sideband); indicate as precisely as possible the nature of the modulating signal and the kind of amplitude modulation used.

(e) For all other types of modulation, provide such particulars as may be useful for an interference study.

(f) For any type of modulation as applicable indicate the characteristics of energy dispersal.

Item 12: Maximum hours of operation

Indicate in GMT the maximum hours of operation on the frequency of each carrier.

Item 13: Co-ordination

Indicate the name of any administration or group of administrations with which the use of the space system to which the space station belongs has been successfully co-ordinated in accordance with No. 639AD.

*This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
Item 14  Agreements

Indicate also, if appropriate, the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement.

Item 15  Operating administration or company

Indicate the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of stations (see Article 15).

Section E. Basic characteristics to be furnished in notices relating to frequencies to be received by space stations.

Item 1  Assigned frequency

Indicate the assigned frequency of the emission to be received, as defined in Article 1, in k[\(\text{c/s}\)] up to 30 000 k[\(\text{c/s}\)] inclusive, and in M[\(\text{c/s}\)] above 30 000 k[\(\text{c/s}\)] (see number 85). At least one separate assignment notice should be made out for each antenna radiation beam.

Item 2  Assigned frequency band

Indicate the bandwidth of the assigned frequency band in k[\(\text{c/s}\)] (see number 89).

Item 3  Date of putting into use

(a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) when reception of the assigned frequency begins.

(b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).
Item 4. Identity of the receiving space station(s)

Indicate the identity of the receiving space station(s).

Item 5. Orbital information

(a) In the case of a space station aboard a geostationary satellite, indicate the planned nominal geographical longitude on the geostationary satellite orbit and the planned longitudinal and inclination tolerances. Indicate also:

(1) the arc of the geostationary satellite orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth's surface, from its associated earth stations or service areas; and

(2) the arc of the geostationary satellite orbit within which the space station could provide the required service to its associated earth stations or service areas; and

(3) in the event that the arc stated in paragraph (2) above is less than the arc stated in paragraph (1) above, provide the reasons therefor.

Note: The arcs specified in (1) and (2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

(b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period and the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites used.

Item 6. Associated transmitting earth station(s)

Identify the associated transmitting earth station(s) by reference to the notification thereof or in any other appropriate manner.
Item 7  Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 8  Class of emission, necessary bandwidth and description of the transmission(s) to be received

(a) Indicate the class of emission of the assignment to be received.

(b) Indicate the carrier frequency or frequencies of the transmissions(s) to be received.

(c) Indicate, for each carrier to be received, the class of emission, necessary bandwidth and description of the transmission(s) to be received, in accordance with Article 2 and Appendix 5.

Item 9  Space station receiving antenna characteristics

For each receiving beam:

(a) In the case of a space station aboard geostationary satellite, indicate the gain of the space station receiving antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

(b) In the case of a space station aboard non-geostationary satellite, indicate the isotropic gain of the space station receiving antenna in the main direction of radiation and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of radiation as a reference.

(c) Indicate the type of polarization of the antenna, the sense in the case of circular polarization, and the plane in the case of linear polarization, also indicate the worst case axial ratio in the half power beamwidth.

* This information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration.
(d) Indicate, for geostationary satellite, the pointing accuracy capability of the antenna.

Item 10 Noise temperature

Indicate the total receiving system noise temperature (°K) at the input of the space station receiver.

Item 11 Maximum hours of reception

Indicate in GMT the maximum hours of reception of the frequency of each carrier.

Item 12 Co-ordination

Indicate the name of any administration or group of administrations with which the use of the space system to which the space station belongs has been successfully co-ordinated in accordance with No. 659A/.

Item 13 Agreements

Indicate also if appropriate the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations and the contents of such agreement.

Item 14 Operating administration or company

Indicate the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference and questions referring to the technical operation of stations (see Article 15).

SECOND SATELLITE NETWORK

NOTE: For antenna characteristics (10a(T) or 10b(T) and 9a(R) or 9b(R)) attach the relevant information to this form.
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 3

APPENDIX 1B

ADVANCE PUBLICATION INFORMATION TO BE FURNISHED FOR A SATELLITE NETWORK.

Section A. General instructions

Item 1  Information shall be provided separately for each, satellite network.

Item 2  Information to be furnished for each satellite network shall include general characteristics (Section B), and, as applicable, characteristics in the earth-to-space direction (Section C), characteristics in the space-to-earth direction (Section D), and characteristics for space-to-space relay (Section E).

Section B. General characteristics to be furnished for a satellite network

Item 1  Identity of the satellite network

Provide a separate and clear identity of the satellite network and, if applicable, the identity of the satellite system of which it will form a part.

Item 2  Operational date

Indicate the date by which the satellite network is expected to be brought initially into operation.

Item 3  Administration or group of administrations submitting the advance information

Give the name of the administration or the names of the administrations of the group submitting the advance information on the satellite network and the postal and telegraphic addresses of the administration(s) to which any communication should be sent.
Item 4   Orbital information relating to the space station(s)

(a) In the case of a space station aboard a geostationary satellite, give the planned nominal geographical longitude on the geostationary satellite orbit and the planned longitudinal and inclination tolerances. Indicate also

(1) the arc of the geostationary orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth's surface, from its associated earth stations or service areas; and

(2) the arc of the geostationary orbit within which the space station could provide the required service to its associated earth stations or service areas; and

(3) in the event that the arc stated in paragraph (2) above is less than the arc stated in paragraph (1) above, provide the reasons therefor.

Note: The arcs specified in (1) and (2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

(b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period and the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites having the same characteristics used.

Section C. Characteristics of the satellite network in the "Earth-Space" direction

Item 1  "Earth-Space" service area(s)

Indicate the service area(s) on the earth associated with each receiving antenna of the space station.
Item 2  Class of stations and nature of service

For each "Earth-Space" service area, indicate the class of the stations in the satellite network and the nature of the service to be performed, using the symbols shown in Appendix 10.

Item 3  Frequency range

For each "Earth-Space" service area, indicate the frequency range within which the carriers will be located.

Item 4  Power characteristics of the transmitted wave

(a) For each "Earth-Space" service area indicate the maximum spectral power density (W/Hz) to be delivered to the antenna of the transmitting earth stations (the bandwidth over which this is averaged depends on the nature of the service concerned).

(b) If available, indicate, for each "Earth-Space" service area, the actual radiation pattern (relative to isotropic) of the transmitting earth station antenna having the highest off-beam equivalent isotropically radiated spectral power density.

Item 5  Characteristics of space station receiving antennae

For each "Earth-Space" service area,

(a) in the case of a space station aboard a geostationary satellite, indicate the estimated gain of the space station receiving antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 db and 10 db intervals thereafter as necessary, below the maximum gain, shall be indicated.

(b) in the case of a space station aboard a non-geostationary satellite, indicate the estimated isotropic gain of the space station receiving antenna in the main direction of reception and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of reception as a reference.
For each "Earth-Space" service area, indicate, when other than simple frequency changing transponder is used aboard the space station, the lowest total receiving system noise temperature.

Section D. Characteristics of the satellite network in the "Space-Earth" direction

Item 1 "Space-Earth" service area(s)

Indicate the service area(s) on the earth associated with each transmitting antenna of the space station.

Item 2 Class of stations and nature of service

For each "Space-Earth" service area, indicate the class of the stations in the satellite network and the nature of the service to be performed, using the symbols shown in Appendix 10.

Item 3 Frequency range

For each "Space-Earth" service area, indicate the frequency range within which the carriers will be located.

Item 4 Power characteristics of the transmission

For each "Space-Earth" service area, indicate the maximum spectral power density (W/Hz) to be delivered to the transmitting antenna of the space station (the bandwidth over which this is averaged depends on the nature of the service concerned).

Item 5 Characteristics of space station transmitting antennae

For each "Space-Earth" service area

(a) in the case of a space station aboard a geostationary satellite, indicate the estimated gain of the space station transmitting antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to gain of 2, 4, 6, 10, 20 db and 10 db intervals thereafter as necessary, below the maximum gain, shall be indicated.
(b) in the case of a space station aboard a non-geostationary satellite, indicate the estimated isotropic gain of the space station transmitting antenna in the main direction of transmission and the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of transmission as a reference.

Item 6  Characteristics of receiving earth stations

(a) For each "Space-Earth" service area, indicate, when other than simple frequency changing transponder is used aboard the space station, the lowest total receiving system noise temperature of the earth stations.

For each "Space-Earth" service area and for each projected usage, indicate, when simple frequency changing transponders are used on the space station, the lowest equivalent satellite link noise temperature and the associated value of transmission gain evaluated from the output of the receiving antenna of the space station to the output of the receiving antenna of the earth station. For each projected usage, indicate also the receiving antenna(e) of the space station to which each simple frequency changing transponder will be connected.

(b) If available, indicate for each "Space-Earth" service area the actual radiation pattern (relative to isotropic) of the receiving earth station antenna having the highest off-beam level. When a simple frequency changing transponder is used on the space station, indicate also, if available, the pattern associated with each equivalent satellite link noise temperature indicated above.

* A different usage will be considered to take place when different types of carriers are employed (different by virtue of maximum power spectral density), or when different types of receiving earth stations are employed (different by virtue of receiving antenna gain).
Section II. Characteristics to be furnished for space-to-space relay

Where the satellite network is connected to another satellite network by means of space-to-space relay, indicate the following:

(a) name(s) of the satellite network(s) to which the satellite network is connected

(b) transmit and receive frequency bands

(c) class of emission

(d) nominal e.i.r.p. on the beam axis.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

ARTICLE 9

Notification and Recording in the Master International Frequency Register of Frequency Assignments 1 to Terrestrial Radiocommunication Stations 2

Section I. Notification of Frequency Assignments and Co-ordination Procedure to be Applied in Appropriate Cases

§ 1. (1) Any frequency assignment 3 to a fixed, land, broadcasting 4, radionavigation land, radiolocation land or standard frequency station, or to a ground-based station in the meteorological aids service, shall be notified to the International Frequency Registration Board,

a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration 5; or

1 The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).

2 For the notification and recording in the Master International Frequency Register of frequency assignments to radio astronomy and space radiocommunication stations, see Article 9A.

3 In the case where a frequency is used by numerous stations under the jurisdiction of the same administration, see Appendix 1 (Section E, II, Column 5a, paragraphs 2c and 2d).

4 With respect to assignments to broadcasting stations in the bands allocated exclusively to the broadcasting service between 5 950 kHz and 26 100 kHz, see Article 10.

5 The attention of administrations is specifically drawn to the application of the provisions of Nos. 486 a) and 486 c) in those cases where they make a frequency assignment to a terrestrial station, located within co-ordination area of an earth station (see No. 492A), in a band which terrestrial radiocommunication services share with equal rights with space radiocommunication services in the frequency spectrum above 1 GHz.

B11—01
b) if the frequency is to be used for international radio-communication; or

c) if it is desired to obtain international recognition of the use of the frequency.¹

NOC 487 (2) Similar notice shall be given for any frequency to be used for the reception of mobile stations by a particular land station in each case where one or more of the conditions specified in No. 486 are applicable.

NOC 488 (3) Specific frequencies prescribed by these Regulations for common use by stations of a given service (for example, international distress frequencies 500 kHz and 2 182 kHz, frequencies of ship radiotelegraph stations operating in their exclusive high frequency bands, etc.), shall not be notified to the Board.

NOC 489 § 2. (1) For any notification under No. 486 or No. 487 an individual notice for each frequency assignment shall be drawn up as prescribed in Sections A or B of Appendix 1, which specify the basic characteristics to be furnished, according to the case. It is recommended that the notifying administration should also supply the additional data called for in that Appendix, together with such further data as it may consider appropriate.

MOD 490 (2) When stations of the same service, such as the land mobile service, use a band of frequencies above 28 000 kHz in a specific area or areas, an individual notice should be drawn up, as prescribed in Section C of Appendix 1, which specifies the basic characteristics

¹ The attention of administrations is specifically drawn to the application of the provisions of Nos. 486 a) and 486 c) in those cases where they make a frequency assignment to a terrestrial station, located within co-ordination area of an earth station (see No. 492A), in a band which terrestrial radiocommunication services share with equal rights with space radiocommunication services in the frequency spectrum above 1 GHz.
to be furnished, for each frequency on which there are assignments within the band; however, the particulars should relate only to a typical station. This does not apply to broadcasting stations or to other terrestrial stations to which the provisions of Sub-Section IIB of this article apply.

MOD 491 § 3. (1) Whenever practicable, each notice should reach the Board before the date on which the assignment is brought into use. It must reach the Board not earlier than ninety days before the date on which it is to be brought into use, but in any case not later than thirty days after the date it is actually brought into use. However, for a frequency assignment to one of the terrestrial stations mentioned in Sub-Section IIB of this article or in No. 639A, the notice must reach the Board not earlier than three years and not later than ninety days before the date on which the assignment is to be brought into use.

MOD 492 (2) Any frequency assignment, the notice of which reaches the Board more than thirty days after the notified date of bringing into use, or in the case of a terrestrial station mentioned in Sub-Section IIB of this article, any frequency assignment, the notice of which reached the Board less than ninety days before it is brought into use, shall, where it is to be recorded, bear a remark in the Master Register to indicate that it is not in conformity with No. 491.

MOD 492A § 3A. (1) Before an administration notifies to the Board, or brings into use any frequency assignment to a terrestrial station for transmitting in a band allocated with equal rights to terrestrial radiocommunication services, the criteria to be used in effecting co-ordination between earth stations and stations in the fixed or the mobile service shall be agreed between the administrations concerned.

SUP 492A.1

ADD 492A.2 1 Appendix 28 contains criteria relating only to co-ordination between earth stations and stations in the fixed or the mobile service. Until the C.C.I.R., in accordance with Recommendation No. Spa[3], provides criteria for other terrestrial radiocommunication services, the criteria to be used in effecting co-ordination between earth stations and terrestrial stations other than those of the fixed or the mobile service, shall be agreed between the administrations concerned.
communication services and space radiocommunication services (space-to-Earth) and in the frequency spectrum above 1 GHz, it shall initiate co-ordination of the proposed assignment with the administration responsible for the receiving earth station concerned if the assignment is for use within the co-ordination area ¹ of an existing receiving earth station or of one for which the co-ordination procedure referred to in No. 639AN has been initiated. For the purpose of effecting co-ordination, it shall send to any other such administration, by the fastest possible means, a copy of a diagram drawn to an appropriate scale indicating the location of the terrestrial station and all other pertinent details of the proposed frequency assignment, and the approximate date on which it is planned to bring the station into use.

MOD 492B (2) An administration with which co-ordination is sought under No. 492A shall acknowledge receipt of the co-ordination data immediately by telegram. If no acknowledgement is received within fifteen days of despatch, the administration seeking co-ordination may despatch a telegram requesting acknowledgement of receipt of the co-ordination data, to which the receiving administration shall reply. Upon receipt of the co-ordination data an administration shall promptly examine the matter with regard to interference ² which would be caused to the services rendered by its earth stations operating in accordance with the Convention and these Regulations, or to be so operated within the next three years, with the proviso that in this latter case co-ordination specified in No. 639AN has been effected.

MOD 492A.3 ¹ Calculated, in the case of the fixed or mobile service, in accordance with the procedures described in Appendix 28.

ADD 492B.1 ² Criteria to be employed in evaluating interference levels shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
or that the co-ordination procedure has already been initiated; and shall, within an overall period of sixty days from despatch of the co-ordination data, either notify the administration requesting co-ordination of its agreement to the proposals or, if this is not possible, indicate the reasons therefor and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

MOD 492C (3) No co-ordination under No. 492A is required when an administration proposes:

a) to bring into use a terrestrial station which is located, in relation to an earth station, outside the co-ordination area; or

b) to change the characteristics of an existing assignment in such a way as not to exceed the acceptable level of interference to the earth stations of other administrations.

MOD 492D (4) An administration seeking co-ordination may request the Board to endeavour to effect co-ordination, in those cases where:

a) an administration with which co-ordination is sought under No. 492A fails to acknowledge receipt under No. 492B within thirty days of dispatch of the co-ordination data;

b) an administration which has acknowledged receipt under No. 492B but fails to give a decision within ninety days of dispatch of the co-ordination;

c) there is disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference; or

d) co-ordination between administrations is not possible for any other reason.

In so doing, it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

MOD 492E (5) Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.

MOD 492F (6) Where the Board receives a request under No. 492D a), it shall forthwith send a telegram to the administration concerned requesting immediate acknowledgement.

ADD 492FA (7) Where the Board receives an acknowledgement following its action under No. 492F, or where the Board receives a request under No. 492D b), it shall forthwith send a telegram to the administration concerned requesting an early decision in the matter.

ADD 492FB (8) Where the Board receives a request under No. 492D d), it shall endeavour to effect co-ordination in accordance with the provisions of No. 492A. Where the Board receives no acknowledgement of its request for co-ordination within the period specified in No. 492B, it shall act in accordance with No. 492F.

ADD 492FC (9) Where an administration fails to reply within thirty days of dispatch of the Board's telegram sent under No. 492F requesting an acknowledgement, or fails to give a decision in the matter within sixty days of dispatch of the Board's telegram of request sent under No. 492FA, it shall be deemed that the administration with which co-ordination was sought has undertaken that no complaint will be

B11—06
made in respect of any harmful interference which may be caused by terrestrial stations to the services rendered by its earth station.

MOD 492G (10) Where necessary, as part of the procedure under No. 492D, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

ADD 492GA (11) In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after sixty days from the date of the request for the assistance of the Board, taking into consideration the provisions of No. 491, send its notice concerning the proposed assignment to the Board.

ADD 492GB § 3 B. Where the Board receives information from an administration in accordance with the provisions of No. 639AQ in reply to a request for co-ordination for an earth station, it shall consider as notifications under the present Section, only that information relating to assignments to existing terrestrial stations or to those to be brought into use within the time limits defined in No. 491. Such notifications shall be examined by the Board with respect to the provisions of Nos. 570AB and 570AD, as appropriate, and shall be treated accordingly.

(MOD) 493 § 3 C. (1) Whatever the means of communication, including telegraph, by which a notice is transmitted to the Board, it shall be considered complete if it contains at least those appropriate basic characteristics specified in Appendix 1.

NOC 494 (2) Complete notices shall be considered by the Board in the order of their receipt.

NOC 495 § 4. When a service or regional agreement has been concluded, the Board shall be informed of the details of this agreement.
Sub-Section IIA. Procedure to be followed in cases not covered by Sub-Section IIB of this Article

Sub-Section IIB. Procedure to be followed in cases where terrestrial stations [in the fixed or mobile service] are in the same frequency band as, and within the co-ordination area of, an existing earth station or one for which co-ordination has been effected or initiated.

NOC 570AA §23A. The Board shall examine each notice,

NOC 570AB a) with respect to its conformity with the Convention, the Table of Frequency Allocations and other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedure and the probability of harmful interference);

NOC 570AC b) with respect to its conformity with the provisions of No. 492A relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

(MOD) 570AD c) where appropriate, with respect to the probability of harmful interference to the service rendered by an earth receiving station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639BM, and if the corresponding frequency assignment to the space transmitting station has not, in fact, caused harmful inter-
ference to any frequency assignment in conformity with No. 501 or 570AB, as appropriate, previously recorded in the Master Register.

**NOC 570AE** § 23 B. Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 570AB, 570AC and 570AD, further action shall be as follows:

**NOC 570AF** § 23 C. (1) *Finding unfavourable with respect to No. 570AB.*

**MOD 570AG** (2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be examined immediately with respect to Nos. 570AC and 570AD.

**ADD 570AGA** (3) If the finding is favourable with respect to No. 570AC or 570AD, as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

**ADD 570AGB** (4) If the finding is unfavourable with respect to No. 570AC or 570AD, as appropriate, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.

**ADD 570AGC** (5) The period of one hundred and twenty days mentioned in Nos. 570AGB and 570AX shall count:
— from the date when the assignment to the terrestrial station which received an unfavourable finding is brought into use, if the assignment to the earth station is then in use;

— otherwise, from the date when the assignment to the earth station is brought into use.

But if the assignment to the earth station has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance, if necessary, may be made for the additional period mentioned in No. 570BF.

(MOD) 570AH  (6) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

(MOD) 570AI  (7) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 570AH.

MOD 570AJ  (8) If the notifying administration resubmits the notice with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of No. 570AG and No. 570AGA or No. 570AGB, as appropriate.

(MOD) 570AK  (9) If the notifying administration resubmits the notice with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 570AB, the notice shall be treated under the provisions of Nos. 570AL to 570AX. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in Column 2d.
NOC 570AL § 23D. (1) Finding favourable with respect to No. 570AB.

NOC 570AM (2) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has been successfully completed with all administrations whose earth stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

NOC 570AN (3) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take appropriate action and shall inform the administrations concerned of the results obtained. If the Board’s efforts are successful, the notice shall be treated in accordance with No. 570AM. If the Board’s efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of No. 570AD.

NOC 570AO (4) Where the Board finds that the co-ordination procedure mentioned in No. 570AC has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

NOC 570AP (5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedure mentioned in No. 570AC has been successfully completed with all administrations whose earth stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt
by the Board of the resubmitted notice shall be entered in the Remarks Column.

NOC 570AQ (6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination, it shall be treated in accordance with the provisions of No. 570AN. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

NOC 570AR (7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, it shall be examined by the Board with respect to the provisions of No. 570AD. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

NOC 570AS § 23E. (1) Finding favourable with respect to Nos. 570AB and 570AD.

NOC 570AT (2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

NOC 570AU § 23F. (1) Finding favourable with respect to No. 570AB but unfavourable with respect to No. 570AD.

NOC 570AV (2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

NOC 570AW (3) Should the notifying administration resubmit the notice with modifications which result, after re-examination, in a favourable finding by the Board with respect to No. 570AD, the assignment
shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be indicated in the Remarks Column.

**MOD 570AX** (4) Should the notifying administration resubmit the notice, either unchanged, or with modifications which decrease the probability of harmful interference, but not sufficiently to permit the provisions of No. 570AW to be applied, and should that administration insist upon reconsideration of the notice, but should the Board’s finding remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column. The period of one hundred and twenty days shall count from the date indicated in No. 570AGC.

**SUP 570AY**

**NOC 570AZ** § 23 G. (1) *Change in the Basic Characteristics of Assignments already recorded in the Master Register.*

**MOD 570BA** (2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix 1 (except those entered in Columns 3 and 4a of the Master Register), shall be examined by the Board according to Nos. 570AB and 570AC and, where appropriate, No. 570AD, and the provisions of Nos. 570AF to 570AX inclusive applied. Where the change should be recorded, the assignment shall be amended according to the notice.
NOC 570BB (3) However, in the case of a change in the basic characteristics of an assignment which is in conformity with No. 570AB, should the Board reach a favourable finding with respect to No. 570AC, and, where its provisions are applicable, with respect to No. 570AD, or find that the change does not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. In addition, the date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.

(MOD) 570BC § 23H. In applying the provisions of this Sub-Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

NOC 570BD § 23 I. (1) Recording of Frequency Assignments notified before being brought into use.

NOC 570BE (2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to Nos. 570AB and 570AC and, where appropriate, with respect to No. 570AD, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.

(MOD) 570BF (3) If, within the period of thirty days after the projected date of bringing into use, the Board receives confirmation from the notifying administration of the date of bringing into use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

MOD 570BG (4) In the circumstances described in No. 570AX, and as long as an assignment which received an unfavourable finding cannot be re-
submitted as a consequence of the provisions of No. 570AGC, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 570AX, the information relating to the absence of complaint of harmful interference.

NOC 570BH (5) If the Board does not receive this confirmation within the period referred to in No. 570BF or at the end of the period referred to in No. 570BG, as appropriate, the entry concerned shall be cancelled.

NOC

Section VIII. Miscellaneous provisions

ADD 635A § 47 A. (1) If it is requested by any administration, particularly by an administration of a country in need of special assistance, and if the circumstances appear to warrant, the Board using such means at its disposal as are appropriate in the circumstances, shall render the following assistance:

a) preparation of the diagram showing the co-ordination area referred to in No. 492A;

b) computation of the interference level, as referred to in No. 492B;

c) any other assistance of a technical nature for completion of the procedures in this article.

ADD 635B (2) In making a request to the Board under 635A, the administration shall furnish the Board with the necessary information.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

APPENDIX 1A

MOD

Spa

Notices Relating to Space Radiocommunication and Radioastronomy Stations

(See Article 9A)

Section A. General Instructions

1. A separate notice shall be sent to the International Frequency Registration Board for notifying:

   — each new frequency assignment,

   — any change in the characteristics of a frequency assignment recorded in the Master International Frequency Register (hereinafter called the \textit{Master Register}),

   — any total deletion of a frequency assignment recorded in the Master Register.

2. When submitting notices under No. 639BA for earth and space transmitting assignments and under No. 639BB for space and earth receiving assignments, separate notice shall be submitted to the Board for each assignment to an earth or space station. In the case of a passive satellite system, only earth transmitting and receiving assignments shall be notified.

3. In the case of a satellite system employing multiple space stations with the same general characteristics, a separate notice shall be submitted for each space station:

   — when it is aboard a geostationary satellite, or

   — when it is aboard a non-geostationary satellite except when a number of satellites have the same radio frequency characteristics and orbital characteristics (excluding the ascending node...
position). In the latter case, one notice covering all such space stations may be submitted.

4. The following basic information shall be shown on the notice:

a) the serial number of the notice and the date on which the notice is sent to the Board;

b) the name of the notifying administration;

c) sufficient data to identify the particular satellite network in which the earth or space station will operate;

d) whether the notice reflects:

(1) the first use of a frequency by a station,

(2) a change in the characteristics of a frequency assignment recorded in the Master Register (indicate whether the change is a replacement, addition or deletion of existing characteristics), or

(3) a deletion of an assignment in all of its notified characteristics;

e) reference to the weekly circular providing the advance publication information required in accordance with No. 639AA;

f) basic characteristics as outlined in Section B, C, D, E, or F as appropriate;

g) any other information which the administration considers to be relevant, e.g. any factors taken into account when applying Appendix 28 for determination of the co-ordination area and also an indication that the assignment concerned would be operating in accordance with No. 115, information concerning the use of the notified frequency if such use is restricted, or, in the case of notices pertaining to space stations, if the transmissions of the station are to be permanently switched off after a certain period.
Section B. Basic Characteristics to be Furnished in Notices relating to Frequencies used by Earth Stations for Transmitting

Item 1 Assigned frequency

Indicate the assigned frequency as defined in Article 1, in kHz up to 30000 kHz inclusive, and in MHz above 30000 kHz (see No. 85)

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in kHz (see No. 89)

Item 3 Date of bringing into use

a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) of bringing the frequency assignment into use.

b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4 a)), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity and location of the transmitting earth station

a) Indicate the name by which the station is known or the name of the locality in which it is situated.

b) Indicate the country in which the station is located. Symbols from the Preface to the International Frequency List should be used.

c) Indicate the geographical co-ordinates (in degrees and minutes) of the transmitter site.

Item 5 Station(s) with which communication is to be established

Identify the associated receiving space station(s) by reference to the notification thereof or in any other appropriate manner, or,

B12—04
in the case of a passive satellite, the identity of the satellite and the location of the receiving earth station(s).

Item 6  
Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 7  
Class of emission, necessary bandwidth and description of transmission

a) Indicate the class of emission of the assignment.

b) Indicate the carrier frequency or frequencies of the emission(s).

c) Indicate for each carrier, the class of emission, necessary bandwidth and description of transmission, in accordance with Article 2 and Appendix 5.

Item 8  
Power characteristics of the transmission

a) Indicate for each carrier, the peak power supplied to the input of the antenna.

b) Indicate the total peak power and the maximum power density per Hz supplied to the input of the antenna averaged over the worst 4 kHz band for carriers below 15 GHz, or averaged over the worst 1 MHz band for carriers above 15 GHz.

Item 9  
Transmitting antenna characteristics

a) Indicate the isotropic gain (dB) of the antenna in the direction of maximum radiation (see No. 100).

b) Indicate the beamwidth in degrees between the half power points (describe in detail if not symmetrical).

---

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
c) Either attach the measured radiation diagram of the antenna (taking as a reference the direction of maximum radiation) or indicate the reference radiation diagram to be used for co-ordination.

d) Indicate graphically the horizon elevation angle for each azimuth around the earth station.

e) Indicate in degrees from the horizontal plane the planned minimum operating angle of elevation of the antenna in the direction of maximum radiation.

f) Indicate in degrees, clockwise from True North, the planned range of operating azimuthal angles for the direction of maximum radiation.

g) Indicate the type of polarization of the transmitted wave in the direction of maximum radiation; also indicate the sense in the case of circular polarization and the plane in the case of linear polarization.

h) Indicate the altitude (metres) of the antenna above mean sea level

Item 10

Modulation characteristics

For each carrier, according to the nature of the signal modulating the carrier and the type of modulation, indicate the following characteristics:

a) Carrier frequency modulated by a frequency-division multi-channel telephony baseband (FDM-FM) or by a signal that can be represented by a multichannel telephony baseband: indicate the lowest and highest frequencies of the baseband and the r.m.s.

---

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
frequency deviation of the test tone as a function of baseband frequency.

b) Carrier frequency modulated by a television signal; indicate the standard of the television signal (including, where appropriate, the standard used for colour), the frequency deviation for the reference frequency of the pre-emphasis characteristic and the pre-emphasis characteristic itself. Also indicate, where applicable, the characteristics of the multiplexing of the video signal with the sound signal(s) or other signals.

c) Carrier phase-shift modulated by a pulse code modulation signal (PCM/PSK); indicate the bit rate and the number of phases.

d) Amplitude modulated carrier (including single sideband): indicate as precisely as possible the nature of the modulating signal and the kind of amplitude modulation used.

e) For all other types of modulation, provide such particulars as may be useful for an interference study.

f) For any type of modulation as applicable indicate the characteristics of energy dispersal.

Item 11 Maximum hours of operation

Indicate in G.M.T. the maximum hours of operation on the frequency of each carrier.

Item 12 Co-ordination

Give the name of any administration with which the use of this frequency has been successfully co-ordinated in accordance with Nos. 639AJ and 639AN and, if appropriate, the name of any administration with which co-ordination has been sought but not effected.
Item 13 Agreements

Give also, if appropriate, the name of any administration with which agreement has been effected to exceed the limits prescribed in these Regulations, and the contents of such agreement.

Item 14 Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic address of the administration to which communications should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of stations (see Article 15).

Section C. Basic Characteristics to be furnished in Notices relating to Frequencies to be received by Earth Stations

Item 1 Assigned frequency

Indicate the assigned frequency of the emission to be received, as defined in Article 1, in kHz up to 30,000 kHz inclusive, and in MHz above 30,000 kHz. (See No. 85).

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in kHz (see No. 89).

Item 3 Date of bringing into use

a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) when reception of the assigned frequency begins.

b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a
change in Item 4a), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity and location of the receiving earth station

a) Indicate the name by which the receiving earth station is known or the name of the locality in which it is situated.

b) Indicate the country in which the receiving earth station is located. Symbols from the Preface to the International Frequency List should be used.

c) Indicate the geographical co-ordinates (in degrees and minutes) of the receiver site.

Item 5 Station(s) with which communication is to be established

Identify the associated transmitting space station(s) by reference to the notification thereof or in any other appropriate manner, or, in the case of a passive satellite, the identity of the satellite(s) and the associated transmitting earth station(s).

Item 6 Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 7 Class of emission, necessary bandwidth and description of the transmission to be received

a) Indicate the class of emission of the assignment to be received.

b) ¹ Indicate the carrier frequency or frequencies to be received.

¹ This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
c) Indicate, for each carrier to be received, the class of emission, necessary bandwidth and description of the transmission, in accordance with Article 2 and Appendix 5.

Item 8 Earth station receiving antenna characteristics

a) Indicate the isotropic gain (dB) of the antenna in the direction of maximum radiation (see No. 100).

b) Indicate the beamwidth in degrees between the half power points (describe in detail if not symmetrical).

c) Either attach the measured radiation diagram of the antenna (taking as a reference the direction of maximum radiation) or indicate the reference radiation diagram to be used for co-ordination.

d) Indicate graphically the horizon elevation angle for each azimuth around the earth station.

e) Indicate in degrees from the horizontal plane the planned minimum operating angle of elevation of the antenna in the direction of maximum radiation.

f) Indicate in degrees, clockwise, from True North, the planned range of operating azimuthal angles for the direction of maximum radiation.

g) Indicate the altitude (metres) of the antenna above mean sea level.

Item 9 Noise temperature

Indicate the lowest equivalent satellite link noise temperature in degrees Kelvin (see No. 103A) under “quiet sky conditions”. This value shall be indicated for the nominal value of the angle of

---

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
elevation when the associated transmitting station is aboard a geostationary satellite and, in other cases, for the minimum value of angle of elevation.

**Item 10  Maximum hours of reception**

Indicate in G.M.T. the maximum hours of reception of the frequency of each carrier.

**Item 11  Co-ordination**

Give the name of any administration with which the use of this frequency has been successfully co-ordinated in accordance with Nos. 639AJ and 639AN and, if appropriate, the name of any administration with which co-ordination has been sought but not effected.

**Item 12  Agreements**

Give also, if appropriate, the name of any administration with which agreement has been concluded to exceed the limits prescribed in these Regulations, and the contents of such agreement.

**Item 13  Operating administration or company**

Give the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference and questions referring to the technical operation of stations (see Article 15).

**Section D. Basic Characteristics to be furnished in Notices relating to Frequencies used by Space Stations for transmitting**

**Item 1  Assigned frequency**

Indicate the assigned frequency as defined in Article 1, in kHz up to 30 000 kHz inclusive, and in MHz above 30 000 kHz (see
No. 85). At least one separate assignment notice should be made out for each antenna radiation beam.

Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in kHz (see No. 89).

Item 3 Date of bringing into use

a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) of bringing the frequency assignment into use.

b) Whenever the assignment is changed in any of its basic characteristics as shown in this Section (except in the case of a change in Item 4), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity of the space station(s)

Indicate the identity of the space station(s).

Item 5 Orbital information

a) In the case of a space station aboard a geostationary satellite indicate the nominal geographical longitude on the geostationary satellite orbit and the longitudinal and inclination tolerances. Indicate also:

(1) the arc of the geostationary satellite orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth’s surface, from its associated earth stations or service areas; and

(2) the arc of the geostationary satellite orbit within which the space station could provide the required service to its associated earth stations or service areas; and
(3) in the event that the arc defined in paragraph (2) above is less than the arc defined in paragraph (1) above, provide the reasons therefor.

*Note*: The arcs specified in (1) and (2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period, the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites used.

**Item 6** Service area

Indicate the service area or areas on the Earth or the name of the locality and country in which the associated receiving station(s) is (are) located.

**Item 7** Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

**Item 8** Class of emission, necessary bandwidth and description of transmission

a) Indicate the class of emission of the assignment.

b) Indicate the carrier frequency or frequencies.

c) Indicate, for each carrier, the class of emission, necessary bandwidth and description of transmission, in accordance with Article 2 and Appendix 5.

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
Item 9  Power characteristics of the transmission

   a) Indicate for each carrier the peak power supplied to the input of the antenna.

   b) Indicate the total peak power and the maximum power density per cycle per second input of the antenna averaged over the worst 4 kHz band for carriers below 15 GHz or averaged over the worst 1 MHz band for carriers above 15 GHz.

Item 10  Space station transmitting antenna characteristics

   For each service area:

   a) In the case of a space station aboard a geostationary satellite, indicate the gain of the space station transmitting antenna by means of gain contours plotted on a map of the earth’s surface. The isotropic gain at each contour which corresponds to a gain of 2, 4, 6, 10 and 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

   b) In the case of a space station aboard a non-geostationary satellite, indicate the isotropic gain of the space station transmitting antenna in the main direction of radiation and indicate the antenna radiation pattern in those directions which can intersect with the earth’s surface, taking the gain in the main direction of radiation as a reference.

   c) Indicate the type of polarization of the antenna, the sense in the case of circular polarization, and the plane in the case of linear polarization; also indicate the worst case axial ratio in the half power beamwidth.

   d) Indicate for a geostationary satellite, the pointing accuracy of the antenna.

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.

B12—14
Item II: Modulation characteristics

For each carrier, according to the nature of the signal modulating carrier and the type of modulation, indicate the following characteristics:

a) Carrier frequency modulated by a frequency-division multichannel telephony baseband (FDM-FM) or by a signal that can be represented by a multichannel telephony baseband: indicate the lowest and highest frequencies of the baseband and the r.m.s. frequency deviation of the test tone as a function of baseband frequency.

b) Carrier frequency modulated by a television signal: indicate the standard of the television signal (including, where appropriate, the standard used for colour), the frequency deviation for the reference frequency of the pre-emphasis characteristics and the pre-emphasis characteristic itself. Also indicate, where applicable, the characteristics of the multiplexing of the video signal with the sound signal(s) or other signals.

c) Carrier phase-shift-modulated by a pulse code modulation signal (PCM/PSK): indicate the bit rate and the number of phases.

d) Amplitude modulated carrier (including single sideband): indicate as precisely as possible the nature of the modulating signal and the kind of amplitude modulation used.

e) For all other types of modulation, provide such particulars as may be useful for an interference study.

f) For any type of modulation as applicable, indicate the characteristics of energy dispersal.

---

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
**Item 12** Maximum hours of operation

Indicate in G.M.T. the maximum hours of operation on the frequency of each carrier.

**Item 13** Co-ordination

Give the name of any administration or group of administrations with which the use of the space system to which the space station belongs has been successfully co-ordinated in accordance with No. 639AJ.

**Item 14** Agreements

Give also, if appropriate, the name of any administration with which agreement has been concluded to exceed the limits prescribed in these Regulations and the contents of such agreement.

**Item 15** Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of stations (see Article 15).

---

**Section E. Basic Characteristics to be furnished in Notices relating to Frequencies to be received by Space Stations**

**Item 1** Assigned frequency

Indicate the assigned frequency of the emission to be received, as defined in Article 1, in kHz up to 30 000 kHz inclusive, and in MHz above 30 000 kHz (see No. 85). At least one separate assignment notice should be made out for each antenna radiation beam.
Item 2 Assigned frequency band

Indicate the bandwidth of the assigned frequency band in kHz (see No. 89).

Item 3 Date of bringing into use

a) In the case of a new assignment, indicate the date (actual or foreseen, as appropriate) when reception of the assigned frequency begins.

b) Whenever the assignment is changed in any of its basic characteristics, as shown in this Section (except in the case of a change in Item 4), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).

Item 4 Identity of the receiving space station(s)

Indicate the identity of the receiving space station(s).

Item 5 Orbital information

a) In the case of a space station aboard a geostationary satellite, indicate the planned nominal geographical longitude on the geostationary satellite orbit and the planned longitudinal and inclination tolerances. Indicate also:

(1) the arc of the geostationary satellite orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth’s surface, from its associated earth stations or service areas; and

(2) the arc of the geostationary satellite orbit within which the space station could provide the required service to its associated earth stations or service areas; and

(3) in the event that the arc defined in paragraph (2) above is less than the arc defined in paragraph (1) above, provide the reasons therefor.
Note: The arcs specified in (1) and (2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

b) In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period and the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites used.

Item 6 Associated transmitting earth station(s)

Identify the associated transmitting earth station(s) by reference to the notification thereof or in any other appropriate manner.

Item 7 Class of station and nature of service

Indicate the class of station and nature of service performed, using the symbols shown in Appendix 10.

Item 8 Class of emission, necessary bandwidth and description of the transmission(s) to be received

a) Indicate the class of emission of the assignment to be received.

b) \(^1\) Indicate the carrier frequency or frequencies of the transmission(s) to be received.

c) \(^1\) Indicate, for each carrier to be received, the class of emission, necessary bandwidth and description of the transmission(s) to be received, in accordance with Article 2 and Appendix 5.

\(^1\) This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
Item 9  Space station receiving antenna characteristics

For each receiving beam:

a) In the case of a space station aboard a geostationary satellite, indicate the gain of the space station receiving antenna by means of gain contours plotted on a map of the earth’s surface. The isotropic gain at each contour which corresponds to a gain of 2, 4, 6, 10 and 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

b) In the case of a space station aboard a non-geostationary satellite, indicate the isotropic gain of the space station receiving antenna in the main direction of radiation and indicate the antenna radiation pattern in those directions which can intersect with the earth’s surface, taking the gain in the main direction of radiation as a reference.

c) 1 Indicate the type of polarization of the antenna, the sense in the case of circular polarization, and the plane in the case of linear polarization, also indicate the worst case axial ratio in the half power beamwidth.

d) Indicate, for a geostationary satellite, the pointing accuracy capability of the antenna.

Item 10  Noise temperature

Indicate the total receiving system noise temperature (°K) at the input of the space station receiver.

Item 11  Maximum hours of reception

Indicate in G.M.T. the maximum hours of reception of the frequency of each carrier.

1 This information need only be furnished when such information has been used as a basis to effect co-ordination with another administration.
Item 12 Co-ordination

Give the name of any administration or group of administrations with which the use of the space system to which the space station belongs has been successfully co-ordinated in accordance with No. 639AJ.

Item 13 Agreements

Give also, if appropriate, the name of any administration with which agreement has been conducted to exceed the limits prescribed in these Regulations and the contents of such agreement.

Item 14 Operating administration or company

Give the name of the operating administration or company and the postal and telegraphic addresses of the administration to which communications should be sent on urgent matters regarding interference and questions referring to the technical operation of stations (see Article 15).

Section F. Basic Characteristics to be furnished in Notices relating to Frequencies to be received by Radio Astronomy Stations

Item 1 Observed frequency

Indicate the centre of the frequency band observed, in kHz up to 30 000 kHz inclusive, and in MHz above 30 000 kHz.

Item 2 Date of bringing into use

a) Indicate the date (actual or foreseen, as appropriate) when reception of the frequency band begins.

b) Whenever there is a change in any of the basic characteristics, as shown in this Section (except in the case of a change in Item 3b)), the date to be given shall be that of the latest change (actual or foreseen, as appropriate).
Item 3 Name and location of the station

   a) Indicate the letters "RA".

   b) Indicate the name by which the station is known or the name of the locality in which it is situated or both.

   c) Indicate the country in which the station is located. Symbols from the Preface to the International Frequency List should be used.

   d) Indicate the geographical co-ordinates (in degrees and minutes) of the station site.

Item 4 Bandwidth

   Indicate the width of the frequency band observed by the station.

Item 5 Antenna characteristics

   Indicate the antenna type and dimensions, effective area and angular coverage in azimuth and elevation.

Item 6 Maximum hours of reception

   Indicate in G.M.T. the maximum hours of reception of the frequency band shown in Item 1.

Item 7 Noise temperature

   Indicate the over-all receiving system noise temperature (°K).

Item 8 Class of observations

   Indicate the class of observations to be taken on the frequency band shown in Item 1. Class A observations are those in which the sensitivity of the equipment is not a primary factor. Class B

BII—21
observations are those of such a nature that they can be made only with advanced low-noise receivers using the best techniques.

**Item 9 Operating administration or company**

Indicate the identity of the operating administration or company and the postal and telegraphic addresses of the administration to which communication should be sent on urgent matters regarding interference and question referring to the technical operation of stations (see Article 15).

13(R), 14(T) Agreement/

Other information (g)

NOTE: For antenna characteristics (10a(T) or 10b(T) and 9a(R) or 9b(R)) attach the relevant information to this form.

Information on visible arc, service arc and reasons if service arc is less than visible are to be attached (5a.1, 5a.2, 5a.3).
Advance Publication Information to be furnished for a Satellite Network

Section A. General Instructions

Item 1 Information shall be provided separately for each satellite network.

Item 2 Information to be furnished for each satellite network shall include general characteristics (Section B), and, as applicable, characteristics in the Earth-to-space direction (Section C), characteristics in the space-to-earth direction (Section D), and characteristics for space-to-space relay (Section E).

Section B. General characteristics to be furnished for a satellite network.

Item 1 Identity of the satellite network

Clearly identify, of the satellite network and, if applicable, identify the satellite system of which it will form a part.

Item 2 Date of bringing into use

Indicate the date by which the satellite network is expected to be brought initially into use.

Item 3 Administration or group of administrations submitting the advance information
Give the name of the administration or the names of the administrations in the group submitting the advance information on the satellite network and the postal and telegraphic addresses of the administration(s) to which any communication should be sent.

**Item 4** Orbital information relating to the space station(s)

*a)* In the case of a space station aboard a geostationary satellite, give the planned nominal geographical longitude on the geostationary satellite orbit and the planned longitudinal and inclination tolerances. Indicate also:

1) the arc of the geostationary satellite orbit over which the space station is visible, at a minimum angle of elevation of 10° at the earth's surface, from its associated earth stations or service areas;

2) the arc of the geostationary satellite orbit within which the space station could provide the required service to its associated earth stations or service areas; and

3) in the event that the arc defined in paragraph 2) above is less than the arc defined in paragraph 1) above, provide the reasons therefor;

*Note:* The arcs specified in 1) and 2) will be indicated by the geographical longitude of the projection of the extremes of these arcs on the surface of the earth.

*b)* In the case of space station(s) aboard non-geostationary satellite(s), indicate the angle of inclination of the orbit, the period, the altitudes in kilometres of the apogee and perigee of the space station(s) and the number of satellites used having the same characteristics.
Section C. Characteristics of the Satellite Network in the Earth-to-Space direction

Item 1  Earth-to-space service area(s)

Indicate the service area(s) on the Earth associated with each receiving antenna of the space station.

Item 2  Class of stations and nature of service

For each Earth-to-space service area, indicate the class of the stations in the satellite network and the nature of the service to be performed, using the symbols shown in Appendix 10.

Item 3  Frequency range

For each Earth-to-space service area, indicate the frequency range which the carriers will be located.

Item 4  Power characteristics of the transmitted wave

a) For each Earth-to-space service area indicate the maximum spectral power density (W/Hz) to be delivered to the antenna of the transmitting earth stations (the bandwidth over which is averaged depends on the nature of the service concerned).

b) If available, indicate, for each Earth-to-space service area, the actual radiation pattern (relative to isotropic) of the transmitting earth station antenna having the highest off-beam equivalent isotropically radiated spectral power density.

Item 5  Characteristics of space station receiving antennae

For each Earth-to-space service area:

a) in the case of a space station aboard a geostationary satellite, indicate the estimated gain of the space station receiving...
antenna by means of gain contours plotted on a map of the earth’s surface. The isotropic gain at each contour which corresponds to a gain of 2, 4, 6, 10 and 20 dB and at 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated:

b) in the case of a space station aboard a non-geostationary satellite, indicate the estimated isotropic gain of the space station receiving antenna in the main direction of reception and indicate the antenna radiation pattern in those directions which can intersect with the earth’s surface, taking the gain in the main direction of reception as a reference.

Item 6 Noise temperature of the receiving space station

For each Earth-to-space service area, when other than a simple frequency changing transponder is used aboard the space station indicate the lowest total receiving system noise temperature.

Section D. Characteristics of the Satellite Network in the Space-to-Earth Direction

Item 1 Space-to-Earth service area(s)

Indicate the service area(s) on the Earth associated with each transmitting antenna of the space station.

Item 2 Class of stations and nature of service

For each space-to-Earth service area, indicate the class of the stations in the satellite network and the nature of the service to be performed, using the symbols shown in Appendix 10.

Item 3 Frequency range

For each space-to-Earth service area, indicate the frequency range within which the carriers will be located.
Item 4  Power characteristics of the transmission

For each space-to-Earth service area, indicate the maximum spectral power density (W/Hz) to be delivered to the transmitting antenna of the space station (the bandwidth over which this is averaged depends on the nature of the service concerned).

Item 5  Characteristics of space station transmitting antennae

For each space-to-Earth service area:

a) in the case of a space station aboard a geostationary satellite, indicate the estimated gain of the space station transmitting antenna by means of gain contours plotted on a map of the earth's surface. The isotropic gain at each contour which corresponds to a gain of 2, 4, 6, 10 and 20 dB and 10 dB intervals thereafter as necessary, below the maximum gain, shall be indicated.

b) in the case of space station aboard a non-geostationary satellite, indicate the estimated isotropic gain of the space station transmitting antenna in the main direction of transmission and indicate the antenna radiation pattern in those directions which can intersect with the earth's surface, taking the gain in the main direction of transmission as a reference.

Item 6  Characteristics of receiving earth stations

a) For each space-to-Earth service area, when other than a simple frequency changing transponder is used aboard the space station, indicate the lowest total receiving system noise temperature of the earth stations.

1 A different usage will be considered to take place when different types of carriers are employed (different by virtue of maximum power spectral density), or when different types of receiving earth stations are employed (different by virtue of receiving antenna gain).
are used on the space station, indicate the lowest equivalent satellite link noise temperature and the associated value of transmission gain evaluated from the output of the receiving antenna of the space station to the output of the receiving antenna of the earth station. For each projected usage, indicate also the receiving antenna(e) of the space station to which each simple frequency changing transponder will be connected.

b) If available, indicate for each space-to-Earth service area the actual radiation pattern (relative to isotropic) of the receiving earth station antenna having the highest off beam level. When simple frequency changing transponders are used on the space station, indicate also, if available, the pattern associated with each equivalent satellite link noise temperature indicated above.

Section E. Characteristics to be furnished for Space-to-Space Relay

Where the satellite network is connected to one or more satellite networks by means of space-to-space relay, indicate the following:

a) identity or identities of the other satellite network(s) to which the satellite network is connected;

b) transmit and receive frequency bands;

c) classes of emission;

d) nominal equivalent isotropically radiated power(s) on the beam axis.
MEMORANDUM BY THE SECRETARIAT

As agreed at the Eighth Plenary Meeting, the following foot-note relative to the band 435-438 MHz should be included in the draft revision of Article 5:

"320A In the band 435-438 MHz, the Amateur Satellite Service may be authorized, on condition that harmful interference shall not be caused to other services operating in accordance with the Table of Frequency Allocations. Administrations authorizing such use shall ensure that any harmful interference caused by emissions from amateur satellites is immediately eliminated in accordance with the provisions of No. 1567 bis."
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

**ADD 201A**  

Frequencies 2 182 kHz, 3 023.5 kHz, 5 680 kHz, 8 364 kHz, 121.5 MHz, 156.8 MHz, and 243 MHz may also be used, in accordance with the procedures in force, for search and rescue operations concerning manned space vehicles.

The same applies to frequencies 10 003 kHz, 14 993 kHz and 19 993 kHz, but in these cases emissions must be confined in a band of + 3 kHz about the frequency.

**MOD 274**

In Bulgaria, Japan, Poland, Portugal, Portuguese Oversea Provinces in Region 1 south of the equator, Roumania, Sweden, Czechoslovakia and the U.S.S.R., existing stations in the aeronautical mobile (OR) service will continue to operate for an unspecified period, on a primary basis.

**ADD 274A**

In Regions 2 and 3, stations of the fixed and mobile services may continue to use this band until 1 January 1976.

Until that date, frequency assignments to the aeronautical mobile (R) service shall be co-ordinated between the administrations concerned and shall be protected from harmful interference.

**ADD 274B**

In Cuba and Mexico, the band 132-136 MHz is also allocated to the fixed and mobile services.

**MOD 275**

In Burundi, Ethiopia, Gambia, Malawi, Nigeria, Portuguese Oversea Provinces in Region 1 south of the equator, Rhodesia, Rep. of South Africa, Rwanda, and Sierra Leone, the band 138-138 MHz is allocated to the fixed and mobile services. In these countries, existing stations in the fixed and mobile services may continue to operate in the band 132-136 MHz until 1 January 1976.

**SUP 276**

**SUP 277**
In New Zealand the band 138-144 MHz is allocated to the aeronautical mobile (OR) service.

In Bulgaria, China, Cyprus, Korea, Cuba, Spain, Ethiopia, Ghana, Hungary, India, Indonesia, Iran, Iraq, Kuwait, Pakistan, Philippines, Poland, Portugal, the United Arab Republic, Roumania, Senegal, Syria, Czechoslovakia and the U.S.S.R., the band 136-137 MHz is also allocated to the fixed and mobile services.

In making assignments to stations of other services to which this band is allocated, administrations are urged to take all practicable steps to protect radio astronomy observations from harmful interference.

In the frequency bands designated for the maritime mobile service in accordance with Appendix 18 of the Radio Regulations, the use of satellite systems for safety and distress may be authorized on certain channels on an exclusive basis in the band 157.3125–157.4125 MHz for transmissions from ships to satellites and in the band 161.9125–162.0125 MHz for transmissions from satellites to ships. The date on which satellite systems may be brought into use shall not be earlier than 1 January 1976 (see Resolution No. Spa B).

ADD 305A

In New Zealand the band 235-239.5 MHz is also allocated to the aeronautical radionavigation service.
ADD 308A  The bands 240-328.6MHz and 335.4-399.9MHz may also be used by the mobile-satellite service. The use and development of this service shall be subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.

MOD 310  Radio astronomy observations in the band 322-328.6MHz are carried out in a number of countries under national arrangements. Administrations should bear in mind the needs of the radio astronomy service in using this band.

ADD 310A  In India, the band 322-328.6MHz is also allocated to the radio astronomy service.

**ADD 325A**  
In Argentina, the band 602-608 MHz is allocated to the radio astronomy service.

**SUP 326**

**ADD 329A**  
In India, the band 608-614 MHz is also allocated to the radio astronomy service.
ADD 332A

Within the frequency band 620-790 MHz, assignments may be made to television stations using frequency modulation in the broadcasting-satellite service, subject to agreement among the administrations concerned and those having services which may be affected (see Articles 9 and 9A or Resolution ...). Such stations shall not produce a power flux-density in excess of the value \(-129\, \text{dBW/m}^2\) (see Recommendation No. Spa DD) within the territories of other administrations without the consent of those administrations.

ADD 339B

In India, the band 845-935 MHz is also allocated for use in the experimentation of satellite broadcasting of television with frequency modulation including energy dispersal, subject to agreement with the administrations having services operating in accordance with the Table which may be affected.

For the protection of terrestrial television services, the power flux-density limit given in foot-note 332A will apply; and for the protection of fixed and mobile services operating in this band, the power flux-density limits as per Article 7, 470NI and 470MEB will apply.

MOD 340

In Region 2, the frequency 915 MHz is designated for industrial, scientific and medical purposes. Emissions must be confined within the limits of \(\pm 13\, \text{MHz}\) of that frequency. Radio-communication services operating within these limits must accept any harmful interference that may be experienced from the operation of industrial, scientific and medical equipment.

</table>
In France and the United Kingdom, the band 2 450-2 500 MHz is allocated on a primary basis to the radiolocation service and, on a secondary basis, to the fixed and mobile services.

In France the band 2 500-2 550 MHz is also allocated on a primary basis to the radiolocation service and, on a secondary basis, to the fixed and mobile services. In Canada, the band 2 500-2 550 MHz is also allocated on a primary basis to the radiolocation service.

The use of the band 2 500-2 690 MHz by the broadcasting-satellite service is limited to domestic and regional systems for community reception and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected (see Articles 9 and 9A or Resolution No. ).

The power flux-density at the surface of the earth shall not exceed those given in Article Nos. 470NH-470NK.

In the United Kingdom, the band 2 500-2 600 MHz is also allocated, on a secondary basis, to the radiolocation service.

In Algeria, Bulgaria, Hungary, India, Israel, Kuwait, Lebanon, Morocco, Pakistan, the Philippines, Poland, the United Arab Republic, Roumania, Czechoslovakia, the U.S.R., and Yugoslavia, the band 2 690-2 700 MHz is also allocated to the fixed and mobile services.

When planning new tropospheric scatter radio-relay links in the band 2 500-2 690 MHz, all possible measures shall be taken to avoid directing the antennae of these links towards the geostationary satellite orbit.

In the band 2 655-2 690 MHz new systems using tropospheric scatter are not authorized. Existing systems may continue to operate in this band.
The use of the bands 2 500–2 535 MHz and 2 655–2 690 MHz by the fixed-satellite service is limited to domestic and regional systems and such use is subject to agreement among administrations concerned and those having services operating in accordance with the Table, which may be affected. In the direction space-to-Earth, the power flux-density at the surface of the Earth shall not exceed \[ \text{see Article 7}. \]

In Bulgaria, Iran, Portugal and the U.S.S.R., the band 2 500–2 690 MHz is allocated to the fixed and mobile services with the exception of the aeronautical mobile service.

Radio astronomy observations are being carried out in the band 2 670–2 690 MHz in a number of countries under national arrangements. Administrations should bear in mind the needs of the radio astronomy service in their future planning of this band.

In making assignments to stations of other services to which this band is allocated, administrations are urged to take all practicable steps to protect radio astronomy observations from harmful interference.

**ADD 392AA**

In Canada and the United States of America, the band 6 625-7 125 MHz is also allocated on a secondary basis to the fixed-satellite service for space-to-earth transmissions. In Region 2, the power flux-density produced by space stations in this band shall be in accordance with Article 7, Section VIII (No. 470NM). In the Regions 1 and 3, it shall be at least 6 dB lower. Receiving earth stations in this band may not impose restrictions on the locations or technical parameters of existing or future terrestrial stations of other countries.

**MOD 392B**

The band 7 145-7 235 MHz may be used for Earth-to-space transmissions in the space research service, subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.

**SUP 392C**
As an exception, passive fixed-satellite systems also may be accommodated in the band 7250-7750 MHz subject to:

a) agreement between administrations concerned and those whose services, operating in accordance with the Table, may be affected;

b) the co-ordination procedure laid down in Articles 9 and 9A.

Such systems shall not cause any more interference at active earth station receivers than would be caused by fixed or mobile services. Power flux-density limitations at the earth's surface after reflection from the passive fixed-satellites shall not exceed those prescribed in these Regulations for active fixed-satellite systems.

Radio astronomy observations on the carbon monoxide line at 115.271 GHz are carried out in a number of countries under national arrangements. In making assignments to other services in the Table, administrations should bear in mind the need to protect radio astronomy observations from harmful interference in the band 115.16-115.38 GHz.

**FLOW DIAGRAM 3**

**PLOTTING MODE (a)**

- To be calculated for all azimuths, for angles of elevation \( \phi \), \( \epsilon < \phi < 90° \)

\[
L_{\text{a}} = L_{\text{a}}(f) + 10 \log T_x + 20 \log T_y + C_3
\]

- Use Figure No. 4

**PLOTTING MODE (b)**

- To be calculated for angles of elevation exactly \( \epsilon \) when the angle of elevation \( \epsilon = 90° \)

\[
L_{\text{b}} = L_{\text{b}}(f) + 10 \log T_y + C_4
\]

- Use Figure No. 5

**PLOTTING MODE (c)**

- To be calculated for angles of elevation \( \phi \) when \( \epsilon < \phi < 90° \)

\[
L_{\text{c}} = (f) + 10 \log T_y + C_5
\]

- Use Figure No. 6

**Co-ordination distance**

If the terrain path is non-straight, use formula (3.7) for each azimuth and then use procedure 3.8 for the two applicable azimuths and apply the larger of \( d_p \) or \( d_f \).

\[
L_{\text{c}} = \min \left( L_{\text{a}}, L_{\text{b}}, L_{\text{c}} \right)
\]

The value of co-ordination distance \( L_{\text{c}} \) plotted for each azimuth is whichever is the larger of \( d_p \) or \( d_f \).
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

Francois Job
Chairman of the Editorial Committee

Annex: Pages B14/01-47
Procedure for Determination of the Co-ordination Area around an Earth Station in Frequency Bands between 1 and 40 GHz shared between Space and Terrestrial Radiocommunication Services

1. Objectives

The co-ordination area (see No. 103D) is determined by calculating, in all directions from the earth station, the co-ordination distances (see No. 103B), and drawing to scale on an appropriate map the co-ordination contour (see No. 103C).

It must be Emphasized that the Presence or Installation of a Terrestrial Station within the Co-ordination Area of an Earth Station would not Necessarily Preclude the Successful Operation of Either the Earth Station or that Terrestrial Station, Since the Procedure is Based on the most unfavourable Case Assumptions as Regards Interference.

For the determination of the co-ordination area two cases may have to be considered:

1) for the earth station when it is receiving (and hence capable of being interfered with by terrestrial stations);
2) for the earth station when it is transmitting (and hence capable of interfering with terrestrial stations).

Where an earth station is intended to operate with a variety of classes of emissions, the earth station parameters to be used in the determination of the co-ordination contour shall be those which lead to the greatest co-ordination distances, for each earth station antenna beam and in each allocated frequency band which the earth station proposes to share with the terrestrial services.

The procedure given in this Appendix for calculating co-ordination distance is fairly complex. For this reason it is considered useful to present in Annex A a simplified version of this procedure which will assist a user in following the necessary steps to produce co-ordination contours.
The simplified presentation is given for certain allocated frequency bands.

It is suggested to draw, together with the co-ordination contour, auxiliary contours based on less unfavourable assumptions than those chosen for determination of the co-ordination contour. These auxiliary contours may be used during subsequent negotiations between the administrations concerned with a view to eliminating from the discussions (without the need for more precise calculations) the case of certain existing or planned stations located within the co-ordination area. The procedure for obtaining these auxiliary contours is explained in Annex B to this Appendix.

2. **Permissible values of interference**

The permissible interference power (in dBW) in the reference bandwidth to be exceeded for no more than \( p \) percent of the time at the receiver input of a station suffering interference, from each source of interference, is given by the general formula below:

\[
P_r(p) = 10 \log_{10} (kT_rB) + J + M(p) - W
\]  (1)

where

\[
M(p) = M(p_0/n) = M_0(p_0)
\]  (1a)

with

- \( k \) = Boltzmann's constant (1.38 \times 10^{-23} \text{ joule per } °\text{K});
- \( T_r \) = thermal noise temperature of the receiving system (°K);
- \( B \) = reference bandwidth (in Hz) (bandwidth, of concern to the interfered with system, over which the interference power can be averaged);
- \( J \) = ratio (in dB) of the permissible long term (20% of the time) interfering power to the thermal noise power in the receiving system;\(^1\)
- \( p_0 \) = percentage of the time during which the interference from all sources may exceed the permissible value;
- \( n \) = number of expected entries of interference, assumed to be uncorrelated;

\(^1, 2, 3\) see notes below.
\[ p = \text{percentage of the time during which the interference from one source may exceed the permissible value; since the entries are not likely to occur simultaneously: } \]
\[ p = \frac{p_0}{n}; \]

\[ M_0(p_0) = \text{ratio (in dB) between the permissible interference powers during } p_0 \% \text{ and } 20\% \text{ of the time respectively, for all entries of interference;}^2 \]

\[ M(p) = \text{ratio (in dB) between the permissible interference powers during } p \% \text{ of the time for one entry of interference, and during } 20\% \text{ of the time for all entries of interference, respectively;} \]

\[ W = \text{equivalence factor (in dB) relating the effect of interference to that of thermal noise of equal power in the reference bandwidth.}^3 \]

Tables I and II list values for the above parameters.

**Notes**

1) The factor \( J \) (in dB) is defined as the ratio of total permissible long term (20\% of the time) interference power in the system, to the long term thermal noise power in a single receiver. For example, in a 50-hop terrestrial hypothetical reference circuit, the total allowable additive interference power is 1 000 pWOp (C.C.I.R. Recommendation 357-1) and the mean thermal noise power in a single hop may be assumed to be 25 pWOp. Therefore, since in a FDM/FM system the ratio of the interference noise power to the thermal noise power in a 4 kHz band is the same before and after demodulation, \( J = 16 \text{ dB}. \) In a fixed-service satellite system, the total allowable interference power is also 1 000 pWOp (C.C.I.R. Recommendation 356-2), but the thermal noise contribution of the down path is not likely to exceed 7 000 pWOp, hence \( J \leq -8.5 \text{ dB}. \) In digital systems it may be necessary to protect each communication path individually, and in that case, long term interference power may be of the same order of magnitude as long-term thermal noise, hence \( J = 0 \text{ dB}. \)

2) \( M_0(p_0) \) (in dB) is the “interference margin” between the long-term (20\%) and the short term (\( p_0 \% \)) allowable interference powers. For analogue radio-relay and fixed-satellite systems in bands between 1 and 15 GHz, this is the ratio (in dB) between 50 000 and 1 000 pWOp (17 dB). In the case of digital systems, \( M_0(p_0) \) may tentatively be set equal to the fading margin which depends, inter alia, on the local rain climate.
3) The factor \( W \) (in dB) is the ratio of thermal noise power to interference power, in the refer-
ence bandwidth, producing the same interference effect after demodulation (e.g. in a FDM/FM system it would be expressed for equal voice channel performance; in a digital system it would be expressed for equal bit error probabilities). For FM signals, it is defined as follows:

\[
W = 10 \log_{10} \frac{\text{Interfering power in the receiving system after demodulation}}{\text{Thermal noise power in the receiving system after demodulation}} \times \frac{\text{Thermal noise power at the receiver input in the reference bandwidth}}{\text{Interfering power at the radio frequency in the reference bandwidth}}
\]

Also, when the wanted signal uses FM modulation with r.m.s. modulation indices which are greater than unity, \( W \) is approximately 4 dB, regardless of the characteristics of the interfering signal. For low-index FDM/FM systems a very small reference bandwidth (4 kHz) has been used in order to avoid the necessity of dealing with a large range of characteristics of both wanted and unwanted signals upon which, for greater reference bandwidths, the value of \( W \) would depend.

When the wanted signal is digital, \( W \) is usually equal to or less than 0 dB, regardless of the characteristics of the interfering signal.

3. **Determination of co-ordination distance for near great circle propagation mechanisms**

When determining the co-ordination distance for an earth station, a number of mechanisms of radio-wave propagation need to be considered. This section deals with the determination of co-ordination distance in conditions associated with super-refraction, ducting, scattering and reflection due to irregularities in the refractive index of the lower atmosphere in the absence of precipitation. The determination of the co-ordination distance associated with propagation due to scattering from hydrometeors is discussed in Section 4.

3.1 **Normalized basic transmission loss \( L_0 \) (0.01)**

To facilitate the graphical determination of the co-ordination distance, it is convenient to normalize the percentage of time to 0.01% and the frequency to 4 GHz.
The first step in the determination of the co-ordination distance is the calculation of a normalized basic transmission loss $L_0(0.01)$ given by:

$$L_0(0.01) = P_t' + G_t' + G_r - P_r(p) - F(p) - 20 \log_{10}(f/4) \quad (2)$$

where

- $P_t'$ = maximum available transmitting power (in dBW) in bandwidth $B$ at the input to the antenna of an interfering station *;
- $G_t'$ = gain (in dB relative to isotropic) of the transmitting antenna of the interfering station. If the interfering station is an earth station, this is the isotropic gain in the pertinent direction. If it is a terrestrial station, $P_t'$ and $G_t'$ are combined in the main beam equivalent isotropically radiated power $E$, for which the values given in Table II shall be used. When $G_t'$ is the gain in the main direction of radiation it is denoted $G_t'_{\text{max}}$.
- $G_r$ = gain (in dB relative to isotropic) of the receiving antenna of the station suffering interference. If that station is an earth station, this is the isotropic gain in the pertinent direction; in the case of a terrestrial station, the maximum antenna gain is to be used. When $G_r$ is the main beam gain, it is denoted $G_r_{\text{max}}$. (In the case of terrestrial stations, see Table I);
- $F(p)$ = correction factor in dB to relate the effective percentage of the time $p$ to 0.01% (see Figure 1);
- $f$ = operating frequency in GHz.

The "pertinent direction" referred to in the definitions of $G_t'$ and $G_r$ is usually the direction toward the physical horizon on the azimuth considered (see Section 3.2) except when an earth station points its main beam at elevation angles below $12^\circ$. In the latter case, the path of minimum

---

* Primes refer to the parameters associated with the interfering station.
transmission loss may not be the horizon path but rather the main beam path (see Section 3.6).

When considering moving satellites, $G_e$ or $G_r$ (whichever pertains to the earth station antenna) is variable with time. In such cases, it is suggested that an equivalent time-invariant earth station antenna gain should be used.* This equivalent gain is either 10 dB less than the maximum horizon antenna gain or is that value of horizon antenna gain exceeded for no more than 10% of the time, whichever is the greater.

3.2 Antenna gain at the earth station horizon for geostationary satellites

The gain component of the earth station antenna in the direction of the physical horizon around an earth station is a function of the angular separation $\varphi$ between the antenna main beam direction and the horizon direction under consideration. Therefore, knowledge of the angle $\varphi$ is required for each azimuth.

The elevation $\epsilon$ and azimuth $\alpha$ of geostationary satellites as seen from an earth station at a latitude $\lambda$ are uniquely related. Figure 2 shows the permissible location arcs of geosynchronous equatorial satellites in a rectangular elevation/azimuth plot, each arc corresponding to an earth station latitude.

Specific relative satellite longitudes may not be known beforehand, but even when they are, the possibility of the addition of a new satellite, or the repositioning of an existing one suggests that all or a portion of the applicable arc be considered to hold satellites.

With the correct arc or segment of arc chosen and suitably marked, the horizon profile $\theta (\alpha)$ is superimposed on the plot of Figure 3, which shows

* This equivalent antenna gain should not be used when the earth station antenna points in the same direction for appreciable periods of time (e.g., when working to space probes or to satellites which are almost geostationary).
an example for an earth station located at 45°N latitude for a satellite expected to be located somewhere between relative longitudes of 10°E and 45°W, with the site horizon profile drawn as shown.

For each point on the local horizon $\theta$ (\(\alpha\)), the smallest distance to the arc is determined and measured on the elevation scale. The example of Figure 3 shows the determination of the off-beam angle \(\varphi\) at an azimuth \(\alpha_0 = 210°\) with a horizon elevation \(\theta = 4°\).

If this is done for all azimuths (in suitable increments, e.g., 5°), a relationship \(\varphi (\alpha)\) results. The relationship \(\varphi (\alpha)\) may be used to derive a function for the horizon antenna gain, \(G (\alpha)\), by using the actual earth station antenna pattern, or a formula giving a good approximation; for example, in cases where the ratio between the antenna diameter and the wavelength exceeds 100, the following equation should be used:

\[
G(\varphi) = 32 - 25 \log_{10} \varphi (\text{dB}) \quad (1° \leq \varphi \leq 48°)
\]

\[
= -10 \text{ dB} \quad (48° < \varphi \leq 180°)
\]

The application of this gain equation to the \(\varphi (\alpha)\) plot yields the desired horizon antenna gain as a function of azimuth.

The parameters used above are defined as follows:

\(\alpha\) = azimuthal angle under consideration, east of True North.

\(\varphi\) = the smaller angle between the main beam direction of the earth station antenna and the straight line connecting the earth station to the physical horizon on azimuth \(\alpha\).

\(\varepsilon\) = earth station main beam elevation angle above horizontal plane.

\(\lambda\) = latitude of earth station.

\(\theta\) = elevation angle of the physical horizon above the horizontal plane on azimuth \(\alpha\).
3.3 Climatic Zones

The world has been divided into three basic radio-climatic regions termed Zones A, B and C, respectively.

These Zones are defined as follows:

— Zone A: land, with the exception of a coastal strip the width of which is either 100 km or that distance from the actual coast at which the terrain begins to exceed an altitude of 1000 m, whichever is the lesser distance.

— Zone B: sea, at latitudes greater than 23.5° (North or South), excluding the Mediterranean and Black Seas, but including the coastal strip defined above wherever land borders on sea at latitudes greater than 23.5°.

— Zone C: sea, at latitudes smaller than 23.5° (North or South), including the Mediterranean and Black Seas, and the coastal strip defined above wherever land borders on sea at latitudes smaller than 23.5°.

3.4 Procedure for the determination of the co-ordination distance for propagation mode (a)

To obtain the co-ordination distance for Zone A, it is necessary to subtract from \( L_0(0-01) \) a correction \( \Delta L \) which accounts for the difference in basic transmission loss over paths that have different horizon elevation angles at the earth station. \( \Delta L \) is computed in two steps. First a correction \( \Delta L_0 \) for unit/elevation angle (i.e. for a 1° elevation angle) is obtained from Figure 4 as a function of the normalized basic transmission loss and the frequency. Linear interpolation should be used between the curves of Figure 4 for frequencies not shown.

For any other horizon elevation angle \( \theta \), the horizon angle correction \( \Delta L \) (in dB) is obtained from Figure 5 using the value of \( \Delta L_0 \) previously obtained from Figure 4. If values are required at elevation angles other than those indicated, linear interpolation should again be used.

B14—08
In cases where the elevation angle is less than 0.2°, $\Delta L$ is always 0 dB.

The horizon angle correction $\Delta L$ as obtained should be subtracted from the normalized basic transmission loss to result in a "co-ordination loss" $L_c$:

$$L_c = L_0(0.01) - \Delta L \quad (3)$$

This co-ordination loss, used with the appropriate frequency in Figure 6, yields the co-ordination distance.

In a similar manner, the Zone B and Zone C co-ordination distance can be determined using Figures 7, 8 and 9 for Zone B and Figures 10, 11 and 12 for Zone C.

Distances so obtained are, for reference purposes, to be labelled $d_{aA}$, $d_{ab}$ and $d_{ac}$ for Zones A, B and C, respectively.

3.5 Co-ordination distance for mixed paths

3.5.1 Two Zones

The procedure to be followed in the case of a mixed path involving two zones is illustrated by the example shown in Figure 13(b). The earth station is situated in Zone A at a distance of 75 km from Zone B. The graphical presentation described below is particularly useful where more than one boundary between zones may be involved, as in this example.

It is assumed that, at a frequency of 4 GHz, the normalized basic transmission loss $L_0(0.01)$ is 200 dB, and that the horizon elevation angle is zero degrees. This results in identical values of 200 dB for $L_c$ in any zone (which would, of course, not be the case if the horizon elevation angle were greater than 0.2°). The procedure is as follows:

i) Determine the distance entirely in Zone A that would give the co-ordination loss. Mark this distance (in this case it is 350 km) from the origin along the abscissa axis of linear graph paper as indicated by the point A (Figure 13 a));
ii) determine the distance entirely in Zone B that would give the same co-ordination loss. Mark this distance (in this case it is 530 km) from the origin along the ordinate axis of the chart as indicated by the point B;

iii) draw a straight line between points A and B representing these distances from the origin;

iv) starting from the origin, the distance of 75 km from the earth station to Zone B is set off along the abscissa axis of the chart as indicated by the point A;

v) starting from point A, the Zone B path length of 375 km is then set off parallel to the ordinate axis of the chart as indicated by the point B;

vi) the further distance in the next Zone A region is then measured parallel to the abscissa axis from the point B to the point of intersection of the mixed path curve as indicated by X. On Figure 13a), this distance is 30 km;

vii) the co-ordination distance is the sum of the distances OA, A1B1 and B1X and is equal to 75 + 375 + 30 = 480 km.

The distance, B1X can also, more precisely, be found numerically from the total distance in Zones A, OA1 + B1X given by

\[ OA_1 + B_1X = OA \left(1 - \frac{A_1B_1}{OB}\right) \]

whence:

\[ B_1X = OA \left(1 - \frac{A_1B_1}{OB}\right) - OA_1. \]

Hence,

\[ B_1X = 350 \left(1 - \frac{375}{530}\right) - 75 = 27 \text{ km} \]
3.5.2 *Three Zones*

In some special cases, the mixed path involves all three radio-climatic Zones A, B and C. A solution to this problem can be found in adding a third dimension to the procedure to be followed for mixed paths involving only two Zones. Theoretically, it means that the third coordinate has to be determined for a point having coordinates corresponding to the known distances in the first two Zones and lying in a plane defined by three points on the axes X, Y and Z, corresponding to distances in Zones A, B and C, respectively, that would give the required basic transmission loss.

In practice, the procedure can be reduced to a simple graphical method shown in Figure 14, assuming for example a co-ordination loss ($L_c$) of 200 dB, at a frequency of 4 GHz. It is required to find the co-ordination distance from the earth station in the direction given in Figure 14a). Here an earth station is situated in Zone A at a distance of 75 km in a given azimuthal direction from Zone B. In the same azimuthal direction Zone B is 375 km long and followed by an unknown portion in Zone C (Figure 14a)).

In this case, the procedure to be applied should be as follows (Figure 14 b)):

i) Repeat the same procedure as for mixed paths involving only two Zones, given in steps (i) to (v) above, and continue as follows:

ii) From the point $B_1$ draw a line parallel to the line $AB$ to intersect the abscissa axis as indicated by the point $D$.

iii) Determine the distance entirely in Zone C that would give the co-ordination loss. Mark this distance (in this case it is 930 km) from the origin along the ordinate axis of the chart as indicated by the point $C$. Draw a straight line between the points $C$ and $A$.

iv) At the point $D$, draw a line parallel to the ordinate axis to intersect the line $CA$ as indicated by $X$.

v) The distance between the points $D$ and $X$, which is the unknown distance in Zone C, is found to be 75 km.
vi) The co-ordination distance is then the sum of the distances $OA_1 + A_1B_1 + DX$ and in this example is equal to $75 + 375 + 75 = 525$ km.

The distance $DX$ can also, more precisely, be found numerically from the formula:

$$DX = OC \left(1 - \frac{OA_1}{OA} - \frac{A_1B_1}{OB}\right)$$

Hence,

$$DX = 930 \left(1 - \frac{75}{350} - \frac{375}{530}\right) = 73 \text{ km}$$

The distance obtained from either the single zone case (Section 3.4), or the multi-zone case (Section 3.5), whichever is applicable, is to be labelled $d_a$.

### 3.6 Determination of the co-ordination distance for propagation mode (b)

If the main beam of the earth station antenna is elevated less than $12^\circ$ for long periods of time, as may be the case in operation with geostationary satellites, the co-ordination distance in the azimuthal direction of the main beam is determined in the same manner as above but the antenna elevation angle $\epsilon$ is used instead of the horizon angle $\theta$, and the antenna main beam gain is used instead of the gain towards the horizon. In all such cases, the Zone A curves should be used irrespective of the actual Zone involved.

This procedure yields a distance for propagation mode (b), to be labelled $d_b$.

When considering non-geostationary satellites, interference via the main beam path should only be considered when the earth station antenna points in the same direction for appreciable periods of time (e.g. when working to space probes or to satellites which are almost geostationary).
3.7 Evaluation of results from propagation modes (a) and (b)

If propagation mode (b) is applicable, then the distance obtained for propagation mode (b) is compared with that of propagation mode (a) and where the co-ordination distance resulting from the main beam calculation exceeds that from the horizon path calculation, the procedure illustrated in Figure 15 should be used as follows to obtain the co-ordination contour for great circle propagation mechanisms:

i) Draw two straight lines from the earth station at azimuthal angles of $\pm 5^\circ$ relative to the azimuth of the main beam till they intersect the co-ordination contour obtained according to propagation mode (a);

ii) from the point corresponding to the co-ordination distance derived according to propagation mode (b) in the azimuthal direction of the main beam, draw two straight lines to join these two intersections;

iii) these two lines so drawn constitute the part of the co-ordination contour to be used in the sector $\pm 5^\circ$ relative to the azimuthal direction of the main beam;

iv) outside the preceding sector $\pm 5^\circ$ the co-ordination contour for the great circle propagation mechanisms is the one obtained for propagation mode (a).

For reference purposes, the distances obtained after application of procedures set forth in Sections 3.4 to 3.7 are to be labelled $d_{ab}$.

4. Determination of co-ordination distance for propagation mode (c) (scattering from hydrometeors)

The determination of co-ordination distance for scattering from hydrometeors (rain scatter) is predicated on a path geometry which is substantially different from that of the great circle propagation mechanisms.
4.1 Normalized transmission loss $L_1 (0.01)$

To determine the co-ordination distance associated with rain scatter, it is necessary to calculate a normalized transmission loss, given by:

$$L_1 (0.01) = P_T + \Delta G - P_r(p) - F_{f1}(p,f)$$  \hspace{1cm} (4)

where:

$\Delta G$ = difference (in dB) between the maximum gain of terrestrial station antennae in the frequency band under investigation and the value of 42 dB. When the earth station in a transmitting station, the values shown in Table I should be used; when it is a receiving station, the values shown in Table II should be used.

$F_{f1}(p,f)$ = correction factor (in dB) to relate the effective percentage of the time $p$ to 0.01%, in the frequency band under consideration (see Figure 16).

All other parameters have been defined in Section 2. For terrestrial stations, values of $P_T$ are listed in Table II.

4.2 Rain-climatic zones

The world has been divided into five basic rain-climatic zones numbered 1 to 5 as shown in Figure 17.

4.3 Procedure for the determination of rain scatter co-ordination distance

To obtain the rain scatter co-ordination distance for rain-climatic zone 1, the normalized transmission loss (obtained by solving equation (4)), is used together with the appropriate frequency in Figure 18 to yield the rain scatter distance $d_{sr}$.
Figures 19 to 21 show corresponding curves for rain-climatic zones 2 to 5. In all cases that rain climate is to be chosen which corresponds to the location of the earth station. Due to the peculiar geometry associated with rain scatter propagation, the centre of the rain scatter co-ordination contour does not coincide with the location of the earth station by a distance $\Delta d$.

The rain scatter distance $d_{cr}$, together with the elevation angle $e$ of the main beam of the earth station antenna are used in Figure 22 to obtain the distance denoted $\Delta d$. The distance $\Delta d$ is measured from the earth station location along the azimuth of the main beam of the earth station antenna, a circle of radius $d_{cr}$ is drawn around the point so reached. The circle is the rain scatter contour.

The rain scatter co-ordination distance, to be labelled $d_{c}$, is the distance from the earth station site to the rain scatter co-ordination contour on the azimuth under consideration.

5. **Minimum value of co-ordination distance**

In the process of determining the co-ordination distance for propagation mode $a)$ or $b)$, if values result which would require the co-ordination distance curves to be extended to distances of less than 100 km, the co-ordination distance ($d_a$ or $d_b$) for the propagation mode under consideration shall be 100 km.

In the process of determining the co-ordination distance for propagation mode $c)$, if values result which would require the rain scatter distance curves to be extended to distances of less than 100 km, the rain scatter distance ($d_{cr}$) shall be 100 km, used with the appropriate value of $\Delta d$.

6. **The co-ordination distance**

On any azimuth, the greatest of the co-ordination distances $d_a$, $d_b$, or $d_c$, for any of the three propagation modes, represents the co-ordination
distance and is to be used for the co-ordination procedure. An example of a co-ordination contour is shown in Figure 23.

7. **Parameters for calculation**

The values of parameters necessary for the determination of the co-ordination contour are given in Table I in the case of a transmitting earth station, and in Table II in the case of a receiving earth station.

In certain cases, an administration may have reason to believe that, for its specific earth station, a departure from the values associated with the earth station, as listed in Table II, may be justified. Attention is drawn to the fact that for specific systems the bandwidths $B$ or, as e.g. in the case of demand assignment systems, the percentages of the time $p$ and $p_0$ may have to be changed from the values given in Table II.

To aid in subsequent negotiations between administrations (as discussed in Annex B), it has been found useful to isolate from equation (2) two composite parameters associated only with terrestrial stations, an interference sensitivity factor $S = G_r - P_r(p)$ for the case of transmitting earth stations, and the e.i.r.p. $E = P_t + G_t$ for the case of receiving earth stations. Values for $S$ and $E$ are given in Tables I and II, respectively.

If it becomes necessary to calculate the co-ordination distance in a band not shown in Table I or II, the values associated with the nearest allocated frequency band for the same service should be used.

1) Parameters associated with these services may vary over a rather wide range. Further study is required before representative values become available.
2) A = analogue modulation; N = digital modulation.
3) See note (2) in Section (2). \(M_0\) (\(p_0\)) may assume values between 5 and 40 dB, depending on frequency, rain climate and system design.
4) These values are estimates for 1 Hz bandwidth and are 30 dB below the total power assumed for emission.
5) These values assume an r.f. bandwidth of no less than 100 MHz, and are 20 dB below total power assumed per emission.
6) In these bands, the parameters for the terrestrial stations associated with transhorizon systems have been used.

If by using the auxiliary contours it is seen that a terrestrial station can be eliminated with respect to the great circle propagation mechanism then:

1) if that terrestrial station is outside of the shaded area (rain-scatter mode), it may be eliminated from any further consideration;

2) if that terrestrial station is within the shaded area (rain-scatter mode), it must still be considered, but simply for the rain-scatter propagation mode only.

Figure 23 - Example of contours for a transmitting earth station
ANNEX A TO APPENDIX 28

Determination of Co-ordination Distance in allocated Frequency Bands

1. Article 9A requires co-ordination distances to be determined only in the particular frequency bands given in Article 5 and listed in Tables III and IV of this Annex. For each of these frequency bands it is convenient to combine those parameters which depend only upon the frequency and types of system using the band. The resulting value of the combined parameters is then a given constant for a particular allocated frequency band and type of earth station.

Earth station transmission

2. In the bands allocated for earth station transmission (Table III), use is made of constants $C_1$ and $C_2$ derived in the following manner:

   For propagation by modes (a) and (b):
   
   \[ C_1 = G_r - P_r(p) - 20 \log f/4 - F(p) \]
   
   \[ = S - 20 \log (f/4) - F(p) \]

   For propagation by mode (c):
   
   \[ C_2 = - P_s(p) - F_1(p,f) + A \Delta G \]

The normalized basic transmission loss $L_0(0-01)$ and the normalized transmission loss $L_1(0-01)$ are given by:

\[ L_0(0-01) = P_r' + G_r' + C_1 \]

\[ L_1(0-01) = P_r' + C_2 \]

The values of $C_1$ and $C_2$ for bands allocated for earth station transmission are given in Table III, together with the reference bandwidth (B) which is used in calculating $P_r'$. B14—42
Earth station reception

3. In the bands used for earth station reception (see Table IV) use is made of constants $C_3$ and $C_4$ which are derived in the following manner:

For propagation by modes (a) and (b):

$$C_3 = E - (10 \log kB + J - W) - F(p) - 20 \log (f/4)$$

For propagation by mode (c):

$$C_4 = P_t' - (10 \log kB + J - W) - F_x(p, f) + \Delta G$$

The normalized basic transmission loss $L_0(0-01)$ and the normalized transmission loss $L_t(0-01)$ are given by:

$$L_0(0-01) = G_r + C_3 - 10 \log T_r - M(p)$$
$$L_t(0-01) = C_4 - 10 \log T_r - M(p)$$

The values of $C_3$ and $C_4$ for bands allocated for earth station reception are given in Table IV.

Flow diagrams

4. The procedure for determining co-ordination distance is illustrated by Flow Diagrams 1 and 2 in this Annex. The steps required to determine co-ordination distances for a transmitting earth station are shown in Flow Diagram 1, and those for a receiving earth station are shown in Flow Diagram 2. The symbols used in these diagrams are defined in the main text of Appendix 28.

ANNEX B TO APPENDIX 28

Determination and use of Auxiliary Contours

1. Introduction

For great circle propagation mechanisms, modes (a) and (b), auxiliary contours are of great value in eliminating certain existing or planned terrestrial stations falling within the co-ordination area without recourse to precise and arduous calculations. The work of both the earth station administration and the affected administrations is therefore eased during subsequent negotiations if these auxiliary contours are supplied.

2. Determination of the auxiliary contours

Two types of contours can be determined, depending on whether the earth station is used for transmission or reception.

2.1 Transmitting earth station

The contours are determined in the same way as the corresponding co-ordination contour for propagation modes (a) and (b), but using terrestrial station interference sensitivity factor $S$ values (in dBW) which are 5, 10, 15, 20 dB etc. lower than the value (given in Table I of Appendix 28) corresponding to the co-ordination contour.

2.2 Receiving earth station

The contours are determined in the same way as the corresponding co-ordination contour, for propagation modes (a) and (b), but using terrestrial station e.i.r.p. values (in dBW) 5, 10, 15, 20 dB, etc. lower than the value (given in Table II of Appendix 28) corresponding is the co-ordination contour.

3. Use of auxiliary contours

The auxiliary contours, the co-ordination contour for great circle propagation (modes (a) and (b)) and the co-ordination contour for
rain scatter (mode (c)) are all plotted on the same diagram for a given shared band. An illustrated example is given in Figure 25 for a transmitting earth station.

For each terrestrial station situated within the co-ordination area, a two-stage procedure may be applied, one for the great circle propagation mechanism and the other for rain scatter.

3.1 Great circle propagation mechanism (modes (a) and (b))

If a transmitting terrestrial station is outside the co-ordination area corresponding to modes (a) and (b), it need not be considered further with respect to modes (a) and (b).

For each transmitting terrestrial station situated within the co-ordination area corresponding to modes (a) and (b), the e.i.r.p. value in the direction of the earth station is determined. If this value is less than the value associated with the nearest contour defining an area outside of which the station is situated, the station may be considered not to cause more than a permissible level of interference and therefore may be eliminated from further considerations with respect to modes (a) and (b).

For each receiving terrestrial station, the analogous procedure may be applied, using the interference sensitivity factor instead of the e.i.r.p. value.

3.2 Elimination of a terrestrial station and rain scatter mechanism (mode (c))

Terrestrial stations eliminated by the above procedure from further consideration with regard to propagation modes (a) and (b) need, nevertheless, be further considered with regard to propagation mode (c) when they lie within the rain scatter co-ordination area.
On page 7, replace in the framed part of the Table the frequency band 22-23 GHz by the following:

<table>

**ADD**

In the band 11.7-12.2 GHz in Region 3 and in the band 11.7-12.5 GHz in Region 1, existing and future fixed, mobile and broadcasting services shall not cause harmful interference to broadcasting-satellite stations operating in accordance with the provisions of the appropriate broadcasting frequency assignment planning conference (see Recommendation No. § and this requirement shall be taken into account in the decisions of that conference.

**ADD**

Terrestrial services in these bands shall be introduced only after the elaboration of agreed and approved plans for the space services, so as to ensure compatibility between the uses that each country decides for this band.

**ADD**

The use of the band 11.7-12.2 GHz by the broadcasting-satellite and the fixed-satellite services is limited to domestic systems and is subject to previous agreement among administrations concerned and those having services, operating in accordance with the Table, which may be affected.

The band 13.25-14.2 GHz may also be used, on a secondary basis, for Earth-to-Space transmissions in the space research service, subject to agreement among the administrations concerned and those having services operating in accordance with the Table, which may be affected.

ADD 405BD

The band 14.4-15.35 GHz may also be used, on a secondary basis, for Space-to-Earth transmissions in the space research service, subject to agreement among the administrations concerned and those having services, operating in accordance with the Table, which may be affected.

ADD 405BE

Radio astronomy observations on the Formaldehyde line (rest frequency 14.489 GHz) are being carried out in a number of countries under national arrangements. In making assignments to stations in the fixed and mobile services, administrations are urged to take all practicable steps to protect radio astronomy observations from harmful interference in the band 14.485-14.515 GHz.

N.B. This revised edition corrects and completes the original version dated 14 July 1971.
1. **Resolution No. Spa 2 relating to Space Vehicles in Distress and Emergency**

   Committee 5 decided that Resolution No. Spa 2 should be abrogated.

2. **Frequency band 10 000-10 500 MHz**

   Foot-note ADD 402A presented by Working Group 5D for adoption in Document No. 240 was found to be outside the competence of the Conference. On the invitation of the Chairman, the delegations of France and Greece did not press their proposal. The proposed foot-note read:

   "In France and Greece the band 10 000-10 500 MHz is also allocated to the aeronautical radionavigation service."

3. **Frequency band 25 600-26 100 kHz**

   3.1 The Committee adopted the agreement reached in Working Group 5E (Document No. 281, para. 1), that there would be no allocation in this band to the Broadcasting-Satellite-Service and, consequently, adopted the status quo between 25 600 kHz and 26 100 kHz.

   3.2 The Delegation of the United Kingdom withdrew its proposal in deference to the views of a majority of delegations, stressing that they do not withdraw on technical grounds since the technical arguments advanced against making allocations to the Broadcasting-Satellite Service in this band, were not accepted.

   3.3 The Delegations of New Zealand and Sweden concurred with the majority view reluctantly.

4. **Frequency band 148.25 MHz ± 15 kHz**

   In view of the decision to amend foot-note 285A, the Delegation of the F.R. of Germany reserved the right to revert, if necessary, to this question in Plenary.

5. **Frequency band 420-450 MHz**

   5.1 With respect to the use of space techniques by the Amateur Service, by 31 against, 26 for with 9 abstentions, the Committee was against such use. The proposal to add a new foot-note ADD 320A, which is reproduced hereunder, therefore was not retained.

   "ADD 320A In the band 435-438 MHz the amateur-satellite-service may be authorized on condition that harmful interference shall not be caused to other services operating in accordance with the Table of Frequency Allocations. Administrations authorizing such use shall ensure that any harmful interference caused by emissions from amateur satellites is immediately eliminated."
In view of this decision, Document No. 315, containing fuller justification for the proposal, was left for consideration in Plenary should the Delegation of the United Kingdom so request.

5.2 The Delegation of the U.S.A. reserved the right to revert to this question if necessary in Plenary.

6. **Frequency band 460-470 MHz**

In view of the decision to add a foot-note ADD 3240 in favour of the Earth Exploration-Satellite Service (Space-to-Earth) the following delegations were unable to accept this foot-note and reserved the right to revert to the question if necessary in Plenary: Cuba, Chile, Malaysia, Kenya, Pakistan, Syria, Tanzania and Uganda.

7. **Frequency bands 453-455 MHz and 611-613 MHz**

Proposal G-S-N/293(Rev.) seeking allocations in the bands 453-455 MHz (Space-to-Earth) and 611-613 MHz (Earth-to-Space), on a secondary basis, to the Maritime Mobile-Satellite Service to be inserted in the framed part of the Table for the three Regions, together with a foot-note ADD 322A, were examined and rejected by 17 for, 40 against, with 3 abstentions.

8. **Frequency band 790-960 MHz**

8.1 After detailed examination of proposals seeking allocations to the Broadcasting-Satellite Service in this band, the Committee decided that there would be no allocation to the Broadcasting-Satellite Service on a world-wide basis.

8.2 The Delegations of Syria, Uganda, Kenya and Tanzania reserved the right to revert to this question if necessary in Plenary.

9. **Frequency band 845-890 MHz**

The Brazilian Delegation proposed the inclusion of a foot-note as follows:

"In Brazil the band 845-890 MHz is also allocated to the fixed service. Time did not permit of its examination and the Chairman suggested that the text be passed to Plenary for consideration."
10. **Frequency bands**: 1 215-1 500 MHz, 2 300-2 450 MHz, 3 500-3 500 MHz, 5 650-5 925 MHz, 10 000-10 500 MHz

10.1 The Committee adopted the conclusions of Working Group 5C against the use of space techniques by the Amateur Service in these frequency bands.

10.2 The Delegations of New Zealand, the U.S.A., Israel and Italy reserved the right to revert to this subject in Plenary if they still so desired.

11. **Frequency band**: 1 535-1 660 MHz

The Delegation of the U.S.S.R. was strongly in favour of the status quo for the band 1 535-1 550 MHz and reserved the right to reopen this question in Plenary if it still so desires.

12. **Frequency band**: 1 540-1 660 MHz

The Committee decided to make no change to foot-note 352D.

13. **Frequency bands**: 1 660-1 670 MHz and 1 690-1 700 MHz - Foot-note 354A

The Delegation of Austria requested to be inserted in foot-note 354A. The Committee considered that it would appear that the question of competence of the Conference was involved. The Delegation reserved the right to revert to this question in Plenary if still so desired.

14. **Frequency bands**: 1 690-1 700 MHz, 1 690-1 690 MHz

The Delegation of India reserved the right to revert to this question in Plenary if it still so desired.

15. **Frequency band**: 1 690-1 700 MHz

The foot-note proposed by the Delegation of the United Kingdom in Document No. 291 was presented. In view of the lack of support for its proposal the Delegation of the United Kingdom reserved its right to revert to the matter if necessary in the Plenary.

16. **Frequency bands**: 1 670-1 690 MHz, 1 690-1 700 MHz

Upon adoption by the Committee of foot-notes 356AB, 356ABA and 356AC, the Delegation of India reserved its right to revert to the matter if necessary in the Plenary.
17. Frequency band 2 655-2 690 MHz

With respect to the allocation adopted for the Fixed-Satellite Service in this band for Region 3 for use in the upward direction, the Delegation of India reserved its right to revert to the matter if necessary in the Plenary in connection with the direction of the transmission.

18. Frequency band 3 500-3 700 MHz

Regarding the revision of foot-note 377 with respect to changing the category of the service from alternative allocations to additional services (Nos. 185 and 142 of the Radio Regulations refers), the Committee had no difficulty in adopting this change by changing the term "allocated" to "also allocated" for the two countries appearing in the foot-note, e.g. China and Japan; however, the Committee was unable to adopt the recommendation of Working Group 5A with respect to adding the name of Korea to the foot-note. The Delegation of Korea recognized the difficulty and reluctantly decided not to press his request.

19. Frequencies 4 202 MHz and 6 727 MHz

Foot-note ADD 379A was adopted by 22 in favour 9 against and 3 abstentions. The Delegations of the United Kingdom and the United States reserved the right to revert to this question in the Plenary if still so desired.

20. Frequency band 6 625-7 125 MHz

Foot-note 392AA was adopted. The Delegation of Cuba reserved the right to revert to the matter if necessary in the Plenary.

21. Frequency band 8 025-8 400 MHz

The Delegation of Australia advised that it wished to have its name removed from foot-note 394 and invited attention to the consequential change in the framed part of the Table.

22. Frequency band 8 025-8 400 MHz

Upon the adoption of the allocation to the Earth Exploration-Satellite Service in Region 3 as a primary service, the Delegation of New Zealand reserved the right to revert to the matter if necessary in the Plenary. In connection with the Region 2 allocation to this service, the Delegation of Cuba reserved the right to revert to the matter if necessary in the Plenary.
25. **Frequency band 11.7-12.5 GHz**

Foot-notes A, D and E were provisionally adopted subject to the conclusions of Committee 6 with respect to the related procedures. The Committee decided that further time was necessary before these foot-notes could be finalized and accordingly requested that they be shown in square brackets.

H.A. KIEFFER  
Chairman
ARTICLE 5 - TABLE OF FREQUENCY ALLOCATIONS

| Frequency bands | 10 000-10 500 MHz |
|                | 25 600-26 100 kHz |
|                | 148.25 MHz + 15 kHz |
|                | 420-450 MHz |
|                | 460-470 MHz |
|                | 611-613 MHz |
|                | 790-960 MHz |
|                | 845-890 MHz |
|                | 1 215-1 300 MHz |
|                | 2 305-2 450 MHz |
|                | 3 305-3 500 MHz |
|                | 5 650-5 925 MHz |
|                | 10 000-10 500 MHz |
|                | 1 535-1 660 MHz |
|                | 1 540-1 660 MHz |
|                | 1 660-1 670 MHz |
|                | 1 690-1 700 MHz |
|                | 1 690-1 700 MHz |
|                | 1 670-1 690 MHz |
|                | 1 670-1 690 MHz |
|                | 1 690-1 700 MHz |
|                | 2 655-2 690 MHz |
|                | 3 500-3 700 MHz |

| Frequencies    | 4 202 MHz |
|                | 6 727 MHz |

| Frequency bands | 6 625-7 125 MHz |
|                | 8 025-8 400 MHz |
|                | 8 025-8 400 MHz |
1. **Resolution No. Spa 2 relating to Space Vehicles in Distress and Emergency**

   Committee 5 decided that Resolution No. Spa 2 should be abrogated.

2. **Frequency band 10 000-10 500 MHz**

   Foot-note ADD 402A presented by Working Group 5D for adoption in Document No. 240 was found to be outside the competence of the Conference. The delegations of France and Greece did not press their proposal. The proposed foot-note read:

   "In France and Greece the band 10 000-10 500 MHz is also allocated to the aeronautical radionavigation service."

3. **Frequency band 25 600-26 100 kHz**

   3.1 The Committee adopted the agreement reached in Working Group 5E (Document No. 281, para. 1), that there would be no allocation in this band to the Broadcasting-Satellite Service and, consequently, adopted the status quo between 25 600 kHz and 26 100 kHz.

   3.2 The Delegation of the United Kingdom withdrew its proposal in deference to the views of a majority of delegations, stressing that they do not withdraw on technical grounds since the technical arguments advanced against making allocations to the Broadcasting-Satellite Service in this band, were not accepted.

   3.3 The Delegations of New Zealand and Sweden concurred with the majority view reluctantly.

4. **Frequency band 148.25 MHz + 15 kHz**

   In view of the decision to amend foot-note 285A, the Delegation of the F.R. of Germany reserved the right to revert, if necessary, to this question in Plenary.

5. **Frequency band 420-450 MHz**

   5.1 With respect to the use of space techniques by the Amateur Service, by 31 against, 26 for with 9 abstentions, the Committee was against such use. The proposal to add a new foot-note ADD 320A, which is reproduced hereunder, therefore was not retained.

   "ADD 320A In the band 435-438 MHz the amateur-satellite-service may be authorized on condition that harmful interference shall not be caused to other services operating in accordance with the Table of Frequency Allocations. Administrations authorizing such use shall ensure that any harmful interference caused by emissions from amateur satellites is immediately eliminated."
In view of this decision, Document No. 315, containing fuller justification for the proposal, was left for consideration in Plenary should the Delegation of the United Kingdom so request.

5.2 The Delegation of the U.S.A. reserved the right to revert to this question if necessary in Plenary.

6. Frequency band 460-470 MHz

In view of the decision to add a foot-note ADD 324C in favour of the Earth Exploration-Satellite Service (Space-to-Earth) the following delegations were unable to accept this foot-note and reserved the right to revert to the question if necessary in Plenary: Cuba, Chile, Malaysia, Kenya, Pakistan, Syria, Tanzania and Uganda.

7. Frequency band 611-613 MHz

Proposals G-S/293/2 and 3 seeking an allocation in the band 611-613 MHz on a secondary basis to the Maritime Mobile-Satellite Service (Earth-to-Space) to be inserted in the framed part of the table for the three regions, together with a foot-note ADD 322A were examined and rejected by 17 for 40 against with 3 abstentions.

8. Frequency band 790-960 MHz

8.1 After detailed examination of proposals seeking allocations to the Broadcasting-Satellite Service in this band, the Committee decided that there would be no allocation to the Broadcasting-Satellite Service on a world-wide basis.

8.2 The Delegations of Syria, Uganda, Kenya and Tanzania reserved the right to revert to this question if necessary in Plenary.

9. Frequency band 845-890 MHz

The Brazilian Delegation proposed the inclusion of a foot-note as follows:

"In Brazil the band 845-890 MHz is also allocated to the fixed service. Time did not permit of its examination and the Chairman suggested that the text be passed to Plenary for consideration."
10. **Frequency bands 1 215-1 300 MHz, 2 300-2 450 MHz, 3 300-3 500 MHz, 5 650-5 925 MHz, 10 000-10 500 MHz**

10.1. The Committee adopted the conclusions of Working Group 5C against the use of space techniques by the Amateur Service in these frequency bands.

10.2. The Delegations of New Zealand, the U.S.A., Israel and Italy reserved the right to revert to this subject in Plenary if they still so desired.

11. **Frequency band 1 535-1 660 MHz**

   The Delegation of the U.S.S.R. was strongly in favour of the status quo for this band and reserved the right to reopen this question in Plenary if it still so desires.

12. **Frequency band 1 540-1 660 MHz**

   The Committee decided to make no change to foot-note 532D.

13. **Frequency bands 1 660-1 670 MHz and 1 690-1 700 MHz - Foot-note 554A**

   The Delegation of Austria requested to be inserted in foot-note 554A. The Committee considered that it would appear that the question of competence of the Conference was involved. The Delegation reserved the right to revert to this question in Plenary if still so desired.

14. **Frequency bands 1 690-1 700 MHz, 1 670-1 690 MHz**

   The Delegation of India reserved the right to revert to this question in Plenary if it still so desired.

15. **Frequency band 1 690-1 700 MHz**

   Upon adoption by the Delegation of the United Kingdom in Document No. 291 was presented. In view of the lack of support for its proposal the Delegation of the United Kingdom reserved its right to revert to the matter if necessary in the Plenary.

16. **Frequency bands 1 670-1 690 MHz, 1 690-1 700 MHz**

   Upon adoption by the Committee of foot-notes 356AB, 356ABA and 356AC; the Delegation of India reserved its right to revert to the matter if necessary in the Plenary.
17. **Frequency band 2 655-2 690 MHz**

   With respect to the allocation adopted for the Fixed-Satellite Service in this band for Region 3 for use in the upward direction, the Delegation of India reserved its right to revert to the matter if necessary in the Plenary in connection with the direction of the transmission.

18. **Frequency band 3 500-3 700 MHz**

   Regarding the revision of foot-note 377 with respect to changing the category of the service from alternative allocations to additional services (Nos. 145 and 142 of the Radio Regulations refers), the Committee had no difficulty in adopting this change by changing the term "allocated" to "also allocated" for the two countries appearing in the foot-note, e.g. China and Japan; however, the Committee was unable to adopt the recommendation of Working Group 5A with respect to adding the name of Korea to the foot-note. The Delegation of Korea recognized the difficulty and reluctantly decided not to press his request.

19. **Frequencies 4 202 MHz and 6 727 MHz**

   Foot-note ADD 379A was adopted by 22 in favour 9 against and 3 abstentions. The Delegations of the United Kingdom and the United States reserved the right to revert to this question in the Plenary if still so desired.

20. **Frequency band 6 625-7 125 MHz**

   Foot-note 392AA was adopted. The Delegation of Cuba reserved the right to revert to the matter if necessary in the Plenary.

21. **Frequency band 8 025-8 400 MHz**

   The Delegation of Australia advised that it wished to have its name removed from foot-note 394 and invited attention to the consequential change in the framed part of the Table.

22. **Frequency band 8 025-8 400 MHz**

   Upon the adoption of the allocation to the Earth Exploration-Satellite Service in Region 3 as a primary service, the Delegation of New Zealand reserved the right to revert to the matter if necessary in the Plenary. In connection with the Region 2 allocation to this service, the Delegation of Cuba reserved the right to revert to the matter if necessary in the Plenary.

   (To be continued)

PARTIAL REVISION
OF THE RADIO REGULATIONS

In its Recommendation No. Spa 9, the Extraordinary Administrative Radio Conference to allocate frequency bands for space radiocommunication purposes, held in Geneva in 1963, recommended that the Administrative Council of the Union should review annually the progress in space radiocommunications made by Administrations and the available reports and recommendations of the permanent organs of the Union with respect thereto. The Conference also recommended that the Administrative Council should, in the light of its annual review and at a date which it would determine, recommend to Administrations the convening of an administrative conference to work out further agreements for the international regulation of the use of radio frequency bands allocated for space radiocommunications by the 1963 Conference.

At its 23rd Session in 1968, the Administrative Council, in its Resolution No. 632, recommended that a World Administrative Radio Conference should be convened during the latter part of 1970 or early 1971 and invited Administrations to send to the Secretary-General their proposals for the agenda thereof.

In accordance with Nos. 56 and 64 of the International Telecommunication Convention (Montreux, 1965), the Administrative Council, at its 1969 Session, with the concurrence of a majority of the Members of the Union, determined in its Resolution No. 653 the agenda of the World

Administrative Radio Conference for Space Telecommunications and decided that it would meet in Geneva on 7 June 1971 for a duration of six weeks, provision being made for one additional week if necessary.

However, in 1970, the Administrative Council, taking into account the provisions of Resolution No. 40 of the XIIth Plenary Assembly of the C.C.I.R. relative to the convening, prior to the Conference, of a Special Joint Meeting of C.C.I.R. Study Groups, decided in its Resolution No. 665 that the duration of the Conference would be six weeks.

* * *

The World Administrative Radio Conference for Space Telecommunications, accordingly convened on the appointed date, considered and revised, in conformity with its agenda, the relevant parts of the Radio Regulations. Particulars of the revisions of the Radio Regulations are given in Annexes 1 to hereto.

The revised provisions of the Radio Regulations shall form an integral part of the Radio Regulations which are annexed to the International Telecommunication Convention. They shall come into force on 1 January 1973, on which date the provisions of the Radio Regulations which are cancelled or modified by these revisions shall be abrogated.

* * *

The delegates signing this revision of the Radio Regulations hereby declare that, should an Administration make reservations concerning the application of one or more of the revised provisions of the Radio Regulations no other Administration shall be obliged to observe that provision or those provisions in its relations with that particular Administration.

* * *

Members and Associate Members of the Union shall inform the Secretary-General of their approval of the revision of the Radio Regulations by the World Administrative Radio Conference for Space Telecommuni-

R1—02
cations, Geneva, 1971. The Secretary-General will inform Members and Associate Members of the Union regarding receipt of such notifications of approval as they are received.

In witness whereof the delegates of the Members of the Union represented at the World Administrative Radio Conference for Space Telecommunications, Geneva, 1971, have signed in the names of their respective countries this revision of the Radio Regulations in a single copy which will remain in the archives of the International Telecommunication Union and of which a certified copy will be delivered to each Member and Associate Member of the Union.

ANNEX II

Revision of Article 9A of the Radio Regulations

The entire Article 9A is replaced by the following new text:

ARTICLE 9A

Co-ordination, Notification and Recording in the Master International Frequency Register of Frequency Assignments to Radio Astronomy and Space Radiocommunication Stations [except Stations in the Broadcasting Satellite Service]

Section I. Procedure for the Advance Publication of Information on Planned Satellite Systems

639AA §1. (1) An administration (or one acting on behalf of a group of named administrations) which intends to establish a satellite system shall, prior to the co-ordination procedure in accordance with No. 639AJ where applicable, send to the International Frequency Registration Board not earlier than five years before the date of bringing into service each satellite network of the planned system, the information listed in Appendix [IB].

639AB (2) Any amendments to the information sent concerning a planned satellite system in accordance with No. 639AA shall also be sent to the Board as soon as they become available.

1 The expression frequency assignment, wherever it appears in this Article, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).
639AC  (3) The Board shall publish the information sent under Nos. 639AA and 639AB in a special section of its weekly circular and shall also, when the weekly circular contains such information, so advise all administrations by circular telegram.

639AD  (4) If, after studying the information published under No. 639AC, any administration is of the opinion that interference, which may be unacceptable, may be caused to its existing or planned space radiocommunication services, it shall within ninety days after the date of the weekly circular publishing the information listed in Appendix [IB], send its comments to the administration concerned. A copy of these comments shall also be sent to the Board. If no such comments are received from an administration within the period mentioned above, it may be assumed that that administration has no basic objections to the planned satellite network(s) of that system on which details have been published.

639AE  (5) An administration receiving comments sent in accordance with No. 639AD shall endeavour to resolve any difficulties that may arise.

639AF  (6) In case of difficulties arising when any planned satellite network of a system is intended to use the geostationary orbit:

\[a\)] The administration responsible for the planned system shall first explore all possible means of meeting its requirements, taking into account the characteristics of the geostationary satellite networks of other systems, and without considering the possibility of adjustment to systems of other administrations. If no such means can be found, the administration concerned is then free
to apply to other administrations concerned to solve these difficulties;

b) An administration receiving a request under a) above shall, in consultation with the requesting administration, explore all possible means of meeting the requirements of the requesting administration, for example, by relocating one or more of its own geostationary space stations involved, or by changing the emissions, frequency usage (including changes in frequency bands) or other technical or operational characteristics;

c) If after following the procedure outlined in a) and b) above there are unresolved difficulties, the administrations concerned shall together make every possible effort to resolve these difficulties by means of mutually acceptable adjustments, for example, to geostationary space station locations and to other characteristics of the systems involved in order to provide for the normal operation of both the planned and existing systems.

639AG (7) In their attempts to resolve the difficulties mentioned above administrations may seek the assistance of the Board.

639AH (8) In complying with the provisions of Nos. 639AE to 639AG, an administration responsible for a planned satellite system shall if necessary defer its commencement of the co-ordination procedure, or where this is not applicable, the sending of its notices to the Board, until one hundred and fifty days after the date of the weekly circular containing the information listed in Appendix [IB] on the relevant satellite network. However, in respect of those administrations with whom difficulties have been resolved or who have responded favourably, the co-ordination procedure, where applicable, may be commenced prior to the expiry of the one hundred and fifty days mentioned above.
639AI  (9) An administration on behalf of which details of planned satellite networks in its system have been published, in accordance with the provisions of Nos. 639AA to 639AC, shall periodically inform the Board whether or not comments have been received and of the progress made, with other administrations, in resolving any difficulties. The Board shall publish this information in a special section of its weekly circular and shall also, when the weekly circular contains such information, so inform all administrations by circular telegram.

Section II. Co-ordination Procedures to be Applied in Appropriate Cases

639AJ § 2. (1) Before an administration notifies to the Board or brings into use any frequency assignment to a space station on a geostationary satellite or to an earth station that is to communicate with a space station on a geostationary satellite, it shall effect co-ordination of the assignment with any other administration whose assignment in the same band for a space station on a geostationary satellite or for an earth station that communicates with a space station on a geostationary satellite is recorded in the Master Register, or has been co-ordinated or is being co-ordinated under the provisions of this paragraph. For this purpose, the administration requesting co-ordination shall send to any other such administration the information listed in Appendix [IA].

639AK  (2) No coordination under No. 639AJ is required:

a) when the use of a new frequency assignment will cause, to any service of another administration, an increase in the noise temperature of any space station receiver or earth station receiver, or an increase in the equivalent satellite link noise temperature, as appropriate, not exceeding the predetermined increase of noise

639AK.1  If only the up path is involved, the increase in the equivalent noise temperature is determined at the space station receiver.
temperature calculated in accordance with the method
given in Appendix [29] or;

b) when an administration proposes to change the charac­
teristics of an existing assignment in such a way as
will, in respect of any service of another administration,
meet the requirements of sub-paragraph a) above, or,
where this assignment has previously been coordinated,
will cause an increase in noise temperature not exceed­
ing the value agreed during coordination.

639AL (3) An administration initiating the co-ordination procedure
referred to in No. 639AJ shall at the same time send to the Board
a copy of the request for co-ordination, with the information listed
in Appendix [I.A] and the name(s) of the administration(s) with
which co-ordination is sought. The Board shall publish this infor­
mation in a special section of its weekly circular, together with a
reference to the weekly circular in which details of the satellite
system were published in accordance with Section I of this Article.
When the weekly circular contains such information, the Board
shall so inform all administrations by circular telegram.

639AM (4) An administration believing that it should have been
included in the co-ordination procedure under No. 639AJ shall
have the right to request that it be brought into the co-ordination
procedure.

639AN § 3. (1) Before an administration notifies to the Board or brings
into use any frequency assignment to an earth station, whether for
transmitting or receiving, in a particular band allocated with equal

639AK.2 [1 For a broadcasting satellite space station, the technical data used to effect
co-ordination should be [based upon the most recent, Recommendations of the
C.C.I.R., as accepted by the administrations concerned under Resolution No.
Spa...]. In the absence of relevant C.C.I.R. Recommendations, the technical
data to be used to effect co-ordination shall be agreed between the administra­
tions concerned.]
rights to space and terrestrial \(^1\) radiocommunication services in the frequency spectrum above one Ge/s, it shall effect co-ordination of the assignment with any other administration whose territory lies wholly or partly within the co-ordination area \(^2\) of the planned earth station. For this purpose it shall send to any other such administration a copy of a diagram drawn to an appropriate scale indicating the location of the earth station and showing the co-ordination areas \(^2\) of the earth station for the cases of transmission and reception by the earth station and the data on which they are based, including all pertinent details of the proposed frequency assignment, as listed in Appendix [IA], and an indication of the approximate date on which it is planned to begin operations.

639AO (2) An administration with which co-ordination is sought under No. 639AJ shall acknowledge receipt of the co-ordination data immediately by telegram. If no acknowledgement is received within thirty days after the date of the weekly circular publishing the information under No. 639AL, the administration seeking co-ordination shall dispatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of thirty days. Upon receipt of the co-ordination data, an administration shall, having regard to the proposed date of bringing into use of the assignment for which co-ordination was requested,

639AN.1 \(^1\) Appendix [28] contains criteria relating only to co-ordination between earth stations and stations in the fixed or mobile service. Until the C.C.I.R., in accordance with Recommendation \(^*\), provides criteria relating to other terrestrial radiocommunications, the criteria to be employed in effecting co-ordination between earth stations and terrestrial radiocommunication stations, other than those of the fixed or mobile service, shall be agreed between the administrations concerned.

639AN.2 \(^2\) Calculated, in relation to the fixed or mobile service, in accordance with the procedures described in Appendix [28].
promptly examine the matter with regard to interference\(^1\) which would be caused to the service rendered by its stations in respect of which co-ordination is sought under No. 639AJ; and shall, within ninety days from the date of the relevant weekly circular, notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree, it shall, within the same period, send to the administration seeking co-ordination the technical details upon which its disagreement is based, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem. A copy of these comments shall also be sent to the Board.

639AP

(3) An administration with which co-ordination is sought under No. 639AN shall acknowledge receipt of the co-ordination data immediately by telegram. If no acknowledgement is received within fifteen days of dispatch of the co-ordination data the administration seeking co-ordination shall dispatch a telegram requesting acknowledgement, to which the receiving administration shall reply within a further period of fifteen days. Upon receipt of the co-ordination data an administration shall, having regard to the proposed date of bringing into use the assignment for which co-ordination was requested, promptly examine the matter both with regard to:

\( a \) interference\(^2\) which would be caused to the service rendered by its terrestrial radiocommunication stations operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer, and

639AO.1
\(^1\) The criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.

639AP.1
\(^2\) The criteria to be employed in evaluating interference level shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.
b) interference which would be caused to reception at the earth station by the service rendered by its terrestrial radiocommunication stations operating in accordance with the Convention and these Regulations, or to be so operated prior to the planned date of bringing the earth station assignment into service, or within the next three years, whichever is the longer.

The administration with which co-ordination is sought shall then, within sixty days from despatch of the co-ordination data, notify the administration requesting co-ordination of its agreement. If the administration with which co-ordination is sought does not agree it shall, within the same period, send to the administration seeking co-ordination a copy of a diagram drawn to an appropriate scale showing the location of its terrestrial radiocommunication stations which are or will be within the co-ordination area of the earth transmitting or receiving station, as appropriate, together with all other relevant basic characteristics, and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

639AQ (4) When the administration with which co-ordination is sought sends to the administration seeking co-ordination the information mentioned in No. 639AP, a copy thereof shall also be sent to the Board. The Board shall consider as notifications in accordance with Section I of Article 9, only that information relating to existing terrestrial radiocommunication stations or to those to be brought into use within the next three years.

639AR (5) No co-ordination under No. 639AN is required when an administration proposes:

639AP 1 The criteria to be employed in evaluating interference levels shall be based upon relevant C.C.I.R. Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.

R1—11
a) to bring into use an earth station, the co-ordination area of which does not include any of the territory of any other country;

b) to change the characteristics of an existing assignment in such a way as not to exceed the permissible level of interference to or from the terrestrial radiocommunication stations of other administrations;

c) to operate a mobile earth station. However, if the co-ordination area associated with the operation of such a mobile earth station, in a frequency band referred to in No. 639AN, includes any of the territory of another country, it shall be subject to prior agreement between the administrations concerned in order to avoid harmful interference to existing terrestrial radiocommunication stations of that country. This agreement shall apply to the characteristics of the mobile earth station(s), or to the characteristics of a typical mobile earth station, and shall apply to a specified service area; unless otherwise stipulated in the agreement, it shall apply to any mobile earth stations in the specified service area provided that the probability of harmful interference caused by them shall not be greater than that caused by the typical earth station.

639AS § 4. (1) An administration seeking co-ordination may request the Board to endeavour to effect co-ordination in those cases where:

a) an administration with which co-ordination is sought under No. 639AJ fails to acknowledge receipt, under
No. 639AO, within sixty days after the date of the weekly circular publishing the information relating to the request for co-ordination;

b) an administration with which co-ordination is sought under No. 639AN fails to acknowledge receipt, under No. 639AP, within thirty days of dispatch of the co-ordination data;

c) an administration has acknowledged receipt under No. 639AO, but fails to give a decision within ninety days from the date of the relevant weekly circular;

d) an administration has acknowledged receipt under No. 639AP, but fails to give a decision within sixty days from dispatch of the co-ordination data;

e) there is disagreement between the administration seeking co-ordination and an administration with which co-ordination is sought as to the acceptable level of interference;

f) co-ordination between administrations is not possible for any other reason.

In so doing, it shall furnish the Board with the necessary information to enable it to endeavour to effect such co-ordination.

639AT (2) Either the administration seeking co-ordination or an administration with which co-ordination is sought, or the Board, may request additional information which they may require to assess the level of interference to the services concerned.
639AU (3) Where the Board receives a request under 639AS a) or b), it shall forthwith send a telegram to the administration concerned requesting immediate acknowledgement.

639AV (4) Where the Board receives an acknowledgement following its action under No. 639AU, or where the Board receives a request under No. 639AS c) or d), it shall forthwith send a telegram to the administration concerned requesting an early decision in the matter.

639AW (5) Where the Board receives a request under No. 639AS f), it shall endeavour to effect co-ordination in accordance with the provisions of Nos. 639AJ and 639AN, as appropriate. The Board shall also, where appropriate, act in accordance with No. 639AL. Where the Board receives no acknowledgement to its request for co-ordination within the periods specified in No. 639AO or 639AP, as appropriate, it shall act in accordance with No. 639AU.

639AX (6) Where an administration fails to reply within thirty days of dispatch of the Board’s telegram requesting an acknowledgement sent under No. 639AU, or fails to give a decision in the matter within thirty days of dispatch of the Board’s telegram of request under No. 639AV, it shall be deemed that the administration with which co-ordination was sought has undertaken:

a) that no complaint will be made in respect of any harmful interference which may be caused to the services rendered by its space or terrestrial radiocommunication stations by the use of the assignment for which co-ordination was requested;

b) that its space or terrestrial radiocommunication stations will not cause harmful interference to the use
of the assignment for which co-ordination was requested.

639AY (7) Where necessary, as part of the procedure under No. 639AS, the Board shall assess the level of interference. In any case, the Board shall inform the administrations concerned of the results obtained.

639AZ § 5. In the event of continuing disagreement between one administration seeking to effect co-ordination and one with which co-ordination has been sought, provided that the assistance of the Board has been requested, the administration seeking co-ordination may, after one hundred and fifty days from the date of the request for co-ordination, taking into consideration the provisions of No. 639BF, send its notice concerning the proposed assignment to the Board.

Section III. Notification of Frequency Assignments

639BA § 6. (1) Any frequency assignment to an earth or space station shall be notified to the Board:

   a) if the use of the frequency concerned is capable of causing harmful interference to any service of another administration; or

   b) if the frequency is to be used for international radio-communications; or

   c) if it is desired to obtain international recognition of the use of the frequency.

639BB (2) Similar notice shall be given for any frequency to be used for the reception of transmissions from earth or space stations by a particular space or earth station in each case where one or more of the conditions specified in No. 639BA are applicable.
639BC  (3) Similar notice may be given for any frequency or frequency band to be used for reception by a particular radio astronomy station, if it is desired that such data should be included in the Master Register.

639BD  (4) A notice submitted in accordance with No. 639BA or 639BB and relating to a frequency assignment to mobile earth stations in a satellite system shall include the technical characteristics either of each mobile earth station, or of a typical mobile earth station, and an indication of the service area within which these stations are to be operated.

639BE  § 7. For any notification under No. 639BA, 639BB, 639BC, or 639BD, an individual notice for each frequency assignment shall be drawn up as prescribed in Appendix [IA], the various Sections of which specify the basic characteristics to be furnished according to the case. It is recommended that the notifying administration should also supply the additional data called for in Section A of that Appendix, together with such further data as it may consider appropriate.

639BF  § 8. (1) For a frequency assignment to an earth or space station, each notice must reach the Board not earlier than three years before the date on which the assignment is to be brought into use. The notice must reach the Board in any case not later than ninety days before this date, except in the case of assignments in the space research service in bands allocated exclusively to this service or in shared bands in which this service is the sole primary service. In the case of such an assignment in the space research service the notice should, whenever practicable, reach the Board before the date on which the assignment is brought into use, but it must in any case reach the Board not later than thirty days after the date it is actually brought into use.

639BF.1  § 1. The notifying administration shall take this limit into account when deciding, where appropriate, to initiate the co-ordination procedure(s).

R1—16
(2) Any frequency assignment to an earth or space station, the notice of which reaches the Board after the applicable period specified in No. 639BF, shall, where it is to be recorded, bear a mark in the Master Register to indicate that it is not in conformity with No. 639BF.

Section IV. Procedure for the Examination of Notices and the Recording of Frequency Assignments in the Master Register

639BH § 9. Any notice which does not contain at least those basic characteristics specified in Appendix [IA] shall be returned by the Board immediately, by airmail, to the notifying administration with the reasons therefor.

639BI § 10. Upon receipt of a complete notice, the Board shall include the particulars thereof, with the date of receipt, in the weekly circular referred to in No. 497, which shall contain the particulars of all such notices received since the publication of the previous circular.

639BJ § 11. The circular shall constitute the acknowledgement to the notifying administration of the receipt of a complete notice.

639BK § 12. Complete notices shall be considered by the Board in the order of their receipt. The Board shall not postpone the formulation of a finding unless it lacks sufficient data to render a decision in connection therewith; moreover, the Board shall not act upon any notice which has a technical bearing on an earlier notice still under consideration by the Board, until it has reached a finding with respect to such earlier notice.

639BL § 13. The Board shall examine each notice:

639BM  a) with respect to its conformity with the Convention, the Table of Frequency Allocations and the other pro-
visions of the Radio Regulations (with the exception of those relating to the co-ordination procedures and the probability of harmful interference);

639BN  
b) where appropriate, with respect to its conformity with the provisions of No. 639AJ, relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis space radiocommunication stations;

639BO  
c) where appropriate, with respect to its conformity with the provisions of No. 639AN relating to the co-ordination of the use of the frequency assignment with the other administrations concerned vis-a-vis terrestrial radiocommunication stations;

639BP  
d) where appropriate, with respect to the probability of harmful interference to the service rendered by a space radiocommunication station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 639BM if this frequency assignment has not in fact caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

639BQ  
e) where appropriate, with respect to the probability of harmful interference to the service rendered by a terrestrial radiocommunication station for which a frequency assignment already recorded in the Master Register is in conformity with the provisions of No. 501 or [570AB], as appropriate, if this frequency assignment has not, in fact, caused harmful interference to any frequency assignment in conformity with No. 639BM previously recorded in the Master Register;

R1—18
where appropriate, with respect to the probability of harmful interference caused to the receiving earth station by a terrestrial radiocommunication station for which a frequency assignment already recorded in the Master Register is in conformity with No. 501 or [570AB], as appropriate.

When, following an examination of a notice with respect to No. 639BP, the Board reaches an unfavourable finding based upon the probability of harmful interference to a recorded assignment for a space station which the Board has reason to believe may not be in regular use, the Board shall forthwith consult the administration responsible for the registered assignment. If it is established, after such consultation and on the basis of the information available, that the recorded assignment has not been in use for two years, it shall not be taken into account for the purposes of the examination in progress or any other further examination under No. 639BP conducted before the date on which the assignment is brought back into use. Before the assignment is brought back into use, it shall be subject to further co-ordination in accordance with the provisions of No. 639AJ or further examination by the Board with respect to No. 639BP as appropriate. The date on which the assignment is brought back into use shall then be entered in the Master Register.

Depending upon the findings of the Board subsequent to the examination prescribed in Nos. 639BM, 639BN, 639BO, 639BP, 639BQ and 639BR, as appropriate, further action shall be as follows:

Finding favourable with respect to No. 639BM in cases where the provisions of Nos. 639BN and 639BO are not applicable.

The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.
639BW § 16. (1) Finding unfavourable with respect to No. 639BM;

639BX (2) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, and the finding is favourable with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR as appropriate, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

639BY (3) Where the notice includes a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115 and the finding is unfavourable with respect to Nos. 639BN, 639BO, 639BP, 639BQ or 639BR, as appropriate, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding. Should the administration insist upon reconsideration of the notice, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the advice that no complaint of harmful interference has been received shall be indicated in the Remarks Column.

639BZ (4) The period of one hundred and twenty days mentioned in Nos. 639BY and 639CP shall count:

— from the date when the assignment to the space radio-communication station which received an unfavourable finding is brought into use, if the assignment to the station which was the basis for the unfavourable finding is then in use;

— otherwise, from the date when the assignment to the station which was the basis for the unfavourable finding is brought into use.
But if the assignment to the station which was the basis for the unfavourable finding has not been brought into use by the notified date, the period of one hundred and twenty days shall be counted from this date. Allowance shall, if necessary, be made for the additional period mentioned in No. 639CY.

639CA (5) Where the notice does not include a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

639CB (6) If the notifying administration resubmits the notice unchanged, it shall be treated in accordance with the provisions of No. 639CA. If it is resubmitted with a specific reference to the fact that the station will be operated in accordance with the provisions of No. 115, it shall be treated in accordance with the provisions of No. 639BX or 639BY, as appropriate. If it is resubmitted with modifications which, after re-examination, result in a favourable finding by the Board with respect to No. 639BM, it shall be treated as a new notice.

639CC § 17. (1) Finding favourable with respect to No. 639BM in cases where the provisions of No. 639BN or 639BO are applicable.

639CD (2) Where the Board finds that the co-ordination procedures mentioned in Nos. 639BN or 639BO have been successfully completed with all administrations whose space or terrestrial radio-communication stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

R1—21
(3) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration requests the Board to effect the required co-ordination, the Board shall take appropriate action and shall inform the administrations concerned of the results obtained. If the Board’s efforts are successful, the notice shall be treated in accordance with No. 639CD. If the Board’s efforts are unsuccessful, the notice shall be examined by the Board with respect to the provisions of Nos. 639BP, 639BQ and 639BR, as appropriate.

(4) Where the Board finds that either of the co-ordination procedures mentioned in Nos. 639BN and 639BO has not been applied, and the notifying administration does not request the Board to effect the required co-ordination, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this action and with such suggestions as the Board may be able to offer with a view to the satisfactory solution of the problem.

(5) Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures mentioned in Nos. 639BN and 639BO have been successfully completed with all administrations whose space or terrestrial radiocommunication stations may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the original notice shall be entered in Column 2d. The date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

(6) Where the notifying administration resubmits the notice with a request that the Board effect the required co-ordination under No. 639AJ or 639AN, it shall be treated in accordance with the provisions of No. 639CE. However, in any subsequent recording
of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

639CI (7) Where the notifying administration resubmits the notice and states it has been unsuccessful in effecting the co-ordination, the Board shall inform the administrations concerned thereof. The notice shall be examined by the Board with respect to the provisions of Nos. 639BP, 639BQ and 639BR, as appropriate. However, in any subsequent recording of the assignment, the date of receipt by the Board of the resubmitted notice shall be entered in the Remarks Column.

639CJ § 18. (1) Finding favourable with respect to Nos. 639BM, 639BP, 639BQ and 639BR, as appropriate.

639CK (2) The assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in Column 2d.

639CL (3) However, should the examination show that the level of the interference noise and the percentage of time during which it is likely to occur have values slightly greater than those used for assessing the probability of harmful interference (extreme propagation conditions, abnormal atmospheric humidity, etc.), a remark shall be included in the Master Register to show that there may be a slight risk of harmful interference and hence additional precautions must be taken in the use of the assignment to avoid harmful interference to assignments already recorded in the Master Register.

639CM § 19. (1) Finding favourable with respect to No. 639BM but unfavourable with respect to Nos. 639BP, 639BQ or 639BR, as appropriate

639CN (2) The notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this
finding and with such suggestions as the Board may be able to offer
with a view to the satisfactory solution of the problem.

639CO (3) Should the notifying administration resubmit the notice
with modifications which result, after re-examination, in a favourable
finding by the the Board with respect to Nos. 639BP, 639BQ and
639BR, as appropriate, the assignment shall be recorded in the
Master Register. The date of receipt by the Board of the original
notice shall be entered in Column 2d. The date of receipt by the
Board of the resubmitted notice shall be indicated in the Remarks
Column.

639CP (4) Should the notifying administration resubmit the notice,
either unchanged, or with modifications which decrease the proba­
bility of harmful interference, but not sufficiently to permit the pro­
visions of No. 639CO to be applied, and should that administration
insist upon reconsideration of the notice, but should the Board’s
finding remain unchanged, the assignment shall be recorded in the
Master Register. However, this entry shall be made only if the
notifying administration informs the Board that the assignment has
been in use for at least one hundred and twenty days without any
complaint of harmful interference having been received. The date
of receipt by the Board of the original notice shall be entered in
Column 2d. The date of receipt by the Board of the advice that
no complaint of harmful interference has been received shall be
indicated in the Remarks Column. The period of one hundred
and twenty days shall count from the date indicated in No. 639BZ.

639CQ § 20. (1) Notices relating to radio astronomy stations.

639CR (2) A notice relating to a radio astronomy station shall not
be examined by the Board with respect to Nos. 639BN, 639BO,
639BP, 639BQ and 639BR. Whatever the finding, the assignment

R1—24
shall be recorded in the Master Register with a date in Column 2c. The date of receipt by the Board of the notice shall be recorded in the Remarks Column.

639CS § 21. (1) **Change in the basic characteristics of assignments already recorded in the Master Register.**

639CT (2) A notice of a change in the basic characteristics of an assignment already recorded, as specified in Appendix [IA] (except the name of the station or the name of the locality in which it is situated) shall be examined by the Board according to No. 639BM, and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, and the provisions of Nos. 639BU to 639CR inclusive shall apply. Where the change should be recorded, the assignment shall be amended according to the notice.

639CU (3) However, in the case of a change in the characteristics of an assignment which is in conformity with No. 639BM, should the Board reach a favourable finding with respect to Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, where appropriate, or find that the changes do not increase the probability of harmful interference to assignments already recorded, the amended assignment shall retain the original date in Column 2d. The date of receipt by the Board of the notice relating to the change shall be entered in the Remarks Column.

639CV § 22. In applying the provisions of the whole of this Section, any resubmitted notice which is received by the Board more than two years after the date of its return by the Board, shall be considered as a new notice.

639CW § 23. (1) **Recording of Frequency Assignments notified before being brought into use.**

R1—25
639CX (2) If a frequency assignment notified in advance of bringing into use has received a favourable finding by the Board with respect to No. 639BM and, where appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR, it shall be entered provisionally in the Master Register with a special symbol in the Remarks Column indicating the provisional nature of that entry.

639CY (3) If, within thirty days after the projected date of bringing into use, the Board receives confirmation from the notifying administration of the date of putting unto use, the special symbol shall be deleted from the Remarks Column. In the case where the Board, in the light of a request from the notifying administration received before the end of the thirty-day period, finds that exceptional circumstances warrant an extension of this period, the extension shall in no case exceed one hundred and fifty days.

639CZ (4) In the circumstances described in Nos. 639BY and 639CP, and as long as an assignment which received an unfavourable finding cannot be resubmitted as a consequence of the provisions of No. 639BZ, the notifying administration may ask the Board to enter the assignment provisionally in the Master Register, in which event a special symbol to denote the provisional nature of the entry shall be entered in the Remarks Column. The Board shall delete this symbol when it receives from the notifying administration, at the end of the period specified in No. 639BY or 639CP, as appropriate, the information relating to the absence of complaint of harmful interference.

639DA (5) If the Board does not receive this confirmation within the period referred to in No. 639CY or at the end of the period referred to in Nos. 639BY or 639CP, as appropriate, the entry concerned shall be cancelled. The Board shall advise the administration concerned before taking such action.

Section V. Recording of Findings in the Master Register

639DB § 24. In any case where a frequency assignment is recorded in the Master Register, the finding reached by the Board shall be indicated
by a symbol in Column 13a. In addition, a remark indicating the reasons for any unfavourable finding shall be inserted in the Remarks Column.

Section VI. Categories of Frequency Assignments

639DC § 25. (1) The date in Column 2c shall be the date of putting into use notified by the administration concerned. It is given for information only.

639DD (2) If harmful interference is actually caused to the reception of any space radiocommunication station whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to Nos. 639BM, 639BN, 639BO, 639BP, 639BQ and 639BR, as appropriate, by the use of a frequency assignment to a space radiocommunication station subsequently recorded in the Master Register in accordance with the provisions of No. 639CP, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

639DE (3) If harmful interference to the reception of any station whose assignment is in accordance with No. 501, [570AB] or 639BM, as appropriate, is actually caused by the use of a frequency assignment which is not in conformity with No. 639BM, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

Section VII. Review of Findings

639DF § 26. (1) The review of a finding by the Board may be undertaken:

— at the request of the notifying administration,
— at the request of any other administration interested in
the question, but only on the grounds of actual harmful
interference,

— on the initiative of the Board itself when it considers
this is justified.

639DG (2) The Board, in the light of all the data at its disposal shall
review the matter, taking into account No. 639BM and, where
appropriate, Nos. 639BN, 639BO, 639BP, 639BQ and 639BR and
shall render an appropriate finding, informing the notifying admin­
istration prior either to the promulgation of its finding or to any
recording action.

639DH § 27. (1) After actual use for a reasonable period of an assignment
which has been entered in the Master Register on the insistence of
the notifying administration, following an unfavourable finding with
respect to Nos. 639BP, 639BQ or 639BR, this administration may
request the Board to review the finding. Thereupon the Board shall
review the matter, having first consulted the administrations con­
cerned.

639DI (2) If the finding of the Board is then favourable it shall enter
in the Master Register the changes that are required so that the entry
shall appear in the future as if the original finding had been favour­
able.

639DJ (3) If the finding with regard to the probability of harmful
interference remains unfavourable, no change shall be made in the
original entry.

Section VIII. Modification, Cancellation and Review of Entries
in the Master Register

639DK § 28. (1) Where the use of a recorded assignment to a space station
is suspended for a period of eighteen months, the notifying admin­
istration shall, within this eighteen-month period, inform the Board

R1—28
of the date on which such use was suspended and of the date on which the assignment is to be brought back into regular use.

639DL (2) Whenever it appears to the Board, whether or not as a result of action under No. 639DK, that a recorded assignment to a space station has not been in regular use for more than eighteen months, the Board shall inquire of the notifying administration as to when the assignment is to be brought back into regular use.

639DM (3) If no reply is received within six months of action by the Board under No. 639DL, or if the reply does not confirm that the assignment to a space station is to be brought back into regular use within this six month limit, a mark shall be applied against the entry in the Master Register. Thereafter, the assignment shall be treated in accordance with No. 639BS as one which has been established as having been out of regular use for two years.

639DN § 29. In case of permanent discontinuance of the use of any recorded frequency assignment, the notifying administration shall inform the Board within ninety days of such discontinuance, whereupon the entry shall be removed from the Master Register.

639DO § 30. Whenever it appears to the Board from the information available that a recorded assignment has not been brought into regular operation in accordance with the notified basic characteristics, or is not being used in accordance with those basic characteristics the Board shall consult the notifying administration and, subject to its agreement, shall either cancel or suitably modify the entry.

639DP § 31. If, in connection with an enquiry by the Board under No. 639DO, the notifying administration has failed to supply the
Board within forty-five days with the necessary or pertinent informa-
tion, the Board shall make suitable entries in the Remarks Column of
the Master Register to indicate the situation.

Section IX. Studies and Recommendations

639DQ § 32. (1) If it is requested by any administration, and if the circum-
stances appear to warrant, the Board, using such means at its disposal
as are appropriate in the circumstances, shall conduct a study of
cases of alleged contravention or non-observance of these Regulations,
or of harmful interference.

639DR (2) The Board shall thereupon prepare and forward to the
administration concerned a report containing its finding and re-
commendations for the solution of the problem.

639DS § 33. In a case where, as a result of a study, the Board submits to
one or more administrations suggestions or recommendations for the
solution of a problem, and where no answer has been received from
one or more of these administrations within a period of ninety days,
the Board shall consider that the suggestions or recommendations
concerned are unacceptable to the administrations which did not
answer. If it was the requesting administration which failed to answer
within this period, the Board shall close the study.

Section X. Miscellaneous Provisions

639DT § 34. (1) If it is requested by any administration, particularly by an
administration of a country in need of special assistance, and if the
circumstances appear to warrant, the Board, using such means at its
disposal as are appropriate in the circumstances, shall render the
following assistance:

a) computation of the increases in noise temperatures in
accordance with No. 639AK;

R1—30
b) preparation of diagrams showing the co-ordination areas in No. 639AN;
c) any other assistance of a technical nature for completion of the procedures in this Article.

639DU (2) In making a request to the Board under No. 639DT, the administration shall furnish the Board with the necessary information.

639DV § 35. The technical standards of the Board shall be based upon the relevant provisions of these Regulations and the Appendices thereto, the decisions of Administrative Conferences of the Union as appropriate, the Recommendations of the C.C.I.R., the state of the radio art and the development of new transmission techniques.

639DW § 36. The Board shall promulgate to administrations its findings and reasons therefor, together with all changes made to the Master Register, through the weekly circular referred to in No. 497.

639DX § 37. In case a Member or Associate Member of the Union avails itself of the provisions of Article 28 of the Convention, the Board shall, upon request, make its records available for such proceedings as are prescribed in the Convention for the settlement of international disputes.
FINAL PROTOCOL

At the time of signing the Final Acts of the World Administrative Radio Conference for Space Telecommunications, Geneva, 1971, the undersigned delegates take note of the following statements made by signatory delegations:
RESOLUTION No. Spa A

Relating to the Experimental Use of Radio Waves by Ionospheric Research Satellites

considering

a) that research into the earth's ionosphere is very important in the study of the relationship between the Sun and the Earth and also for the effective use of radio-wave transmission via the ionosphere;

b) that successful research has been conducted with satellites such as Alouette 1 and 2 and ISIS 1 and 2 in which top-side sounding equipment is installed;

c) that similar ionospheric research satellites will be used for further research into the ionosphere and beyond;

d) that top-side sounding equipment is operated mostly in a frequency-sweeping pulse mode;

e) that this type of satellite is usually operated intermittently during a limited period each day according to the orbital characteristics;

f) that operation of the sounder can be accurately commanded at will by the earth station concerned;

resolves

that administrations may continue to permit the transmission of radio waves from ionospheric research satellites in orbit above the ionosphere in the MF and HF bands provided that suitable means are available for controlling the transmission from these satellites as required by No. 470V of the Radio Regulations to prevent harmful interference to other services.
RECOMMENDATION No. Spa AA

Relating to the Co-ordination of Earth Stations

considering

a) that under the terms of Article 9A of the Radio Regulations, frequency assignments to earth stations in certain bands shared with equal rights between terrestrial radiocommunication services and space radiocommunication services must be co-ordinated with a view to preventing mutual harmful interference;

b) that the calculation method described in Appendix 28 applies solely to frequencies in the 1-40 G[c/s] range;

c) that Tables I, [Ia] and II of Appendix 28 do not show numerical values for all the necessary parameters of certain space radiocommunication services and terrestrial radiocommunication services sharing frequency bands with equal rights;

invites the C.C.I.R.

to continue as a matter of urgency its study:
— of data not included in Tables I, [Ia] and II of Appendix 28, relating to the space radiocommunication services and terrestrial radiocommunication services sharing frequency bands with equal rights,
— of the formulation of calculation methods for determining the co-ordination area of earth stations at frequencies below 1 G[c/s] and above 40 G[c/s];

RI—34
recommends to administrations

that until the next competent Administrative Conference they should use:

— any C.C.I.R. Recommendation, if applicable, for the values missing from Tables I, [Ia] and II of Appendix 28;

— the methods of determining the co-ordination area for frequencies below 1 G[c/s] and above 40 G[c/s], which may be the subject of a C.C.I.R. Recommendation.
RECOMMENDATION No. Spa BB

Relating to Carrier Energy Dispersal in Systems in the Fixed Satellite Service

considering

a) that use of carrier energy dispersal techniques in systems in the fixed satellite service can result in a substantial reduction of interference to stations of a terrestrial service operating in the same frequency bands;

b) that the use of such techniques can result in a substantial reduction in the level of interference between systems in the fixed satellite service operating in the same frequency bands;

c) that such techniques are being regularly and successfully employed in systems in the fixed satellite service without noticeable deterioration of the quality of operation;

recommends

1. that systems in the fixed satellite service employing angle modulation by analogue signals should use carrier energy dispersal techniques as far as is practicable with a view to spreading energy at all times and in a manner consistent with the satisfactory operation of the systems;

2. that systems in the fixed satellite service employing digital modulation should use carrier energy dispersal techniques when this becomes technically feasible and is practical.

R1—36
R. 2

The Editorial Committee, having examined the following texts, submits them to the Plenary Meeting for a second reading.

François Job
Chairman of the Editorial Committee

Annex: Pages R.2/01-32
RECOMMENDATION No. Spa CC

Relating to the Use of Space Radiocommunication Systems in the Event of Natural Disasters, Epidemics, Famines and Similar Emergencies

considering

a) that in the case of natural disasters, epidemics, famines and similar emergencies lives can be saved by prompt and effective relief;

b) that rapid and reliable telecommunications are essential for relief operations;

c) that, through damage or from other causes, the normal telecommunications facilities in disaster areas are often inadequate for relief operations and cannot be restored or supplemented quickly through local resources;

d) that use of space radiocommunication systems is one of the means by which rapid and reliable telecommunications could be provided for relief operations;

noting

a) that known planning of space radiocommunication systems makes no provision for specific frequencies or channels for emergency communications;

b) that in the absence of such planning it is not feasible to proceed with specifications for rapidly transportable, universally operable earth stations;

recommends

1. that administrations, individually or in collaboration, provide for the needs of eventual relief operations in planning their space radiocommunication systems and identify for this purpose preferred radio-frequency

R2—01
channels and facilities which could quickly be made available for relief operations;

2. that administrations concerned waive the coordination procedures provided for in the Radio Regulations in the case of transportable earth stations used for relief operations;

requests

the Secretary-General to bring this Recommendation to the attention of the United Nations, the specialized agencies, and other international organizations concerned, in order to ensure full cooperation in the implementation of this Recommendation;

invites

the C.C.I.R. to study standard specifications and preferred frequencies for transportable earth stations and for compatible mobile and transportable fixed radiocommunications equipment for relief operations.
Method of calculation to evaluate the degree of interference between geostationary satellite networks sharing the same frequency bands

1. **Introduction**

   The method of calculating interference is based on the concept that the noise temperature of the system receiving interference increases as the level of the interference increases. It can, therefore, be applied irrespective of the modulation characteristics of these satellite networks, and of the precise frequencies used.

   In this method, the apparent increase in the equivalent satellite-link noise temperature\(^1\) [of an earth station receiver] resulting from interference caused by a given system is calculated and this value is compared with a predetermined increase in the noise temperature (see section 3 below).

2. **Calculation of the Increase in Noise Temperature of the Satellite Link receiving Interference.**

   Let \(A\) and \(A'\) be the satellite links of the two satellite networks considered. Primes indicate the parameters of satellite link \(A'\); the notation without primes is used for the parameters of satellite link \(A\).

   The parameters are defined as follows (for satellite link \(A\)):

   \(\Delta T_S\) : increase in the receiving noise temperature of the satellite \(S\) caused by interference in the receiver of this satellite (K);

   \(\Delta T_e\) : increase in the receiving noise temperature of the earth station \(e_R\) caused by interference in the receiver of this station (K);

---

\(^1\) See No. 103A.
\(^2\) See No. 84ALB.
maximum power density per Hz delivered to the antenna of satellite S (averaged over the worst 4 kHz band for a carrier frequency below 15 GHz or over the worst 1 MHz band above 15 GHz) (W/kHz);

transmitting antenna gain of satellite S in the direction of the receiving earth station e'_R of satellite link A' (numerical power ratio);

Note: the product $p_s g_3(e'_R)$ is the maximum equivalent isotropic radiated power per Hz of satellite S in the direction of the receiving earth station e'_R of satellite link A'.

maximum power density per Hz delivered to the antenna of the transmitting earth station e'_T (averaged over the worst 4 kHz band) (W/Hz);

receiving antenna gain of satellite S in the direction of the transmitting earth station e'_T of satellite link A' (numerical power ratio);

transmitting antenna gain of the earth station e'_T in the direction of satellite S' (numerical power ratio);

receiving antenna gain of the earth station e_R in the direction of satellite S' (numerical power ratio);

Boltzmann's constant (J/K);

free-space transmission loss on the down-path (numerical power ratio);

free-space transmission loss on the up-path (numerical power ratio);

*) To simplify the calculation it was assumed that:

— basic transmission loss on the down-path is the same regardless of the satellite and earth station considered;

— basic transmission loss on the up-path is the same regardless of the earth station and satellite considered;

— the topocentric angular separation between the two satellites as seen from any earth station is identical to the geocentric angular separation between the two satellites.
γ : transmission gain of the satellite link evaluated from the output of the receiving antenna of the space station S to the output of the receiving antenna of the earth station eR (numerical power ratio, usually less than 1);

θ*) : geocentric angular separation between two satellites (degrees).

The parameter ΔT_s and ΔT_e are given by the following equations:

\[ ΔT_s = \frac{P'_s g'_1(θ) g_8(θ)}{k\lambda} \]  

(1)

\[ ΔT_e = \frac{P'_s g'_3(θ) g_4(θ)}{k\lambda} \]  

(2)

The symbol ΔT will be used to denote the apparent increase in the equivalent noise temperature for the entire satellite link at the receiver input of the receiving station eR due to interference from link A'.

This increase is the result of interference entering at both the satellite and earth station receiver of link A and can accordingly be expressed as:

\[ ΔT = γΔT_s + ΔT_e \]  

(3)

Hence,

\[ ΔT = \frac{γ P'_s g'_1(θ) g_8(θ)}{k\lambda} + \frac{P'_s g'_3(θ) g_4(θ)}{k\lambda} \]  

(4)

Equation (4) combines both the up-path and the down-path interference. If there is a change of modulation in the satellite or if the translation frequencies of the wanted and interfering satellites are different then it may be necessary to treat up and down paths separately using equations (1) and (2).

In the foregoing equations, the gains g'_1(θ) and g_4(θ) are those of the earth stations concerned. Unless more precise actual data are available, an appropriate reference radiation pattern may be used to express the gain g'_1(θ) and g_4(θ) in a direction forming an angle θ with the direction of maximum radiation. In the event that precise numerical data are not avail-
able, the reference radiation pattern $32 - 25 \log_{10} (\theta)$ shall be used for earth station antennae for which the ratio of effective diameter to wavelength exceeds 100.

In the same way, the increase $\Delta T'$ in the equivalent noise temperature for the entire satellite link at the receiver input of the receiving earth station $e' r$ under the effect of the interference caused by satellite link A is given by the following equations:

$$\Delta T'_{\phi'} = \frac{p_s g_s (\theta)}{k l_a} g' (\theta)$$

$$\Delta T'_{v'} = \frac{p_s g_s (\nu e') g' (\theta)}{k l_a}$$

$$\Delta T' = \gamma' \frac{p_s g_s (\theta)}{k l_a} g' (\theta) + p_s g_s (\nu e') g' (\theta)$$

For two multiple-access satellites, this calculation must be made for each of the satellite links established via one satellite in relation to each of the satellite links established via the other satellite.

3. **Comparison between Calculated and Predetermined Percentage Increase in Equivalent Satellite Link Noise Temperature**

The calculated values of $\Delta T$ and $\Delta T'$ shall be compared with the corresponding predetermined values. These predetermined values are taken as 2% of the appropriate equivalent satellite link noise temperatures:

- if the calculated value of $\Delta T$ is less than the predetermined one, the interference level from satellite link $A'$ to satellite link A is acceptably small irrespective of the modulation characteristics of the two satellite links and of the precise frequencies used;

- if the calculated value of $\Delta T$ is more than the predetermined one, a detailed calculation shall be carried out following the methods and techniques set out in the relevant C.C.I.R. Reports and Recommendations.
The comparison of $\Delta T'$ with the predetermined value shall be carried out in a similar manner.

As an example, it can be seen that in the case of a satellite link operating in accordance with current C.C.I.R. Recommendations, using FM telephony and having a total noise in a telephone channel of 10 000 pW0p including 1 000 pW0p interference noise from terrestrial radio-relay systems and 1 000 pW0p interference noise from other satellite links, a 2% increase in equivalent noise temperature would correspond to 160 pW0p of interference noise.

The list of basic characteristics to be furnished for each network is given in Appendix 1B. A detailed illustration of the interference calculation in the case of two geostationary satellite links is given in the Annex to this Appendix.

4. Determination of the Satellite Links to be Considered in Calculating the Increase in Equivalent Satellite Link Noise Temperature from the Data Furnished for the Advance Publication of a Satellite Network

The greatest increase in equivalent satellite link noise temperature caused to any link of another satellite network, existing or planned, by interference produced by the proposed satellite network must be determined.

The most unfavourably sited transmitting earth station of the interfering satellite network should be determined for each satellite receiving antenna of the network suffering interference by superimposing the Earth-to-space service areas of the interfering network on the space station receiving antenna gain contours plotted on a map of the earth's surface. The most unfavourably sited transmitting earth station is the one in the direction of which the satellite receiving antenna gain of the network interfered with is the greatest.

The most unfavourably sited receiving earth station of the network suffering interference should be determined in an analogous manner for each space-to-Earth service area of that network. The most unfavourably sited receiving earth station is the one in the direction of which the satellite transmitting antenna gain of the interfering network is the greatest.
When the satellite of the network suffering interference is equipped with simple frequency- translating transponders the above determinations are made in pairs, one for the receiving antenna of a specific transponder and one for the space-to-Earth service area associated with the transmitting antenna of this transponder.

The calculation procedure described above may be used to determine the greatest increase in equivalent noise temperature caused to any satellite link in a proposed satellite network by interference produced by any other satellite network.
ANNEX

Example of an Interference Calculation Between Two Geostationary Satellite Links Sharing the Same Frequency Band

A. General

In this example, for simplicity, two identical satellite networks are assumed with $\theta = 6^\circ$ geocentric angular spacing between the satellites. For this angular separation the reference radiation pattern of the earth station antenna $(32 - 25 \log_0 \theta)$ gives a gain of 12.5 dB in the direction of the satellite of the other network.

The calculations have been performed in dB, which means that numerical multiplications thus become dB additions and numerical divisions become dB subtractions. In each step, the contributing factors have been introduced in a sequence corresponding to the propagation direction. The first three steps define the system parameters for each link. Steps 4, 5 and 6 perform the actual interference calculations.

To determine the equivalent link noise temperature it is necessary to know the ratio between the total internal link noise and the thermal noise of the down-path. The noise budget for this example is assumed as follows:

Noise budget

<table>
<thead>
<tr>
<th>Internal noise</th>
<th>Thermal noise (down path)</th>
<th>5 000 pW0p</th>

</tr>
</tbody>
</table>

R2—09
It may be noted that since both satellites use global beams, essentially no antenna discrimination between wanted and unwanted signals is obtained at the satellite and that this constitutes a worst case.

<td>2.24</td>
<td>K</td>
</tr>
</tbody>
</table>

Increase in satellite noise temperature (from Step 4)
Numerical value for $\gamma$ (from Step 3)
Increase in earth station noise temperature (from Step 5)
Increase in equivalent link noise temperature
$\gamma \Delta T_s + \Delta T_e = (0.01 \times 91) + 2.24$.

### D. Conclusions

In the example shown, the increase in equivalent satellite link noise temperature is 3.29%. Since it exceeds the predetermined value of 2%, the amount of noise introduced can no longer be considered negligible and therefore co-ordination between the two networks is required. More precise calculations should now be made using, in particular, the actual antenna patterns of the earth stations, the topocentric angular separation of the satellites, and the precise basic transmission losses. There may be addi-

---

R2—12
tional factors such as polarization discrimination, frequency interleaving, spectral distribution of the interference which all reduce the calculated interference.

It can be shown that for this example a larger satellite spacing of 7.5° would have caused only 2% increase in equivalent link noise temperature and thus obviated the need for any co-ordination.
RESOLUTION No. Spa B

Relating to the Use of the Band 156-174 MHz by the Maritime Mobile Satellite Service

considering

a) that there is a need to develop the use of space radiocommunication techniques to meet the future requirements of the maritime mobile service;

b) that, of the bands used at present by the maritime mobile service, there may be advantages in using for the maritime mobile satellite service narrow channels between 156-174 MHz for safety and distress;

recognizing

a) that the maritime mobile bands between 156-174 MHz are also used for other services;

b) that the power flux densities laid down by maritime satellites in this band may cause harmful interference to terrestrial receivers and that the satellite receiver may suffer harmful interference from terrestrial radiocommunication transmissions;

c) that the terrestrial maritime mobile service makes extensive use of the channels given in Appendix 18 of the Radio Regulations;

is of the opinion

that it is important for the maritime mobile satellite service to be able to use some narrow channels, on an exclusive basis, for safety and distress as soon as practicable;

R2—14
having provided for

the possible use of narrow channels for safety and distress by the maritime mobile satellite service in bands 157.3125-157.4125 MHz and 161.9125-162.0125 MHz not earlier than 1 January 1976 (see No. 287A of the Radio Regulations);

resolves

that the World Administrative Maritime Radio Conference to be held in 1974 be invited to consider this matter further and to decide if and to what extent the maritime mobile satellite service should be introduced in the above bands on an exclusive basis and to make any consequential changes in the Radio Regulations and in the provisions governing the use of the channels in Appendix 18;

requests the Secretary-General

to transmit this Resolution to Members and Associate Members and to the Administrative Council for inclusion in the draft agenda for the 1974 Maritime Conference.
RECOMMENDATION No. Spa. EE

Relating to a Revised Presentation of the Sections of Article 1
of the Radio Regulations

considering

a) that, as a result of the amendments made to the Article 1 of the Radio Regulations, the terms specified in that Article are no longer arranged in logical order;

b) that it would therefore be desirable to rearrange Article 1 of the Radio Regulations in a more appropriate form;

recognizing

that this Conference was unable to perform this task;

recommends

that the next world administrative conference which is competent to revise Article 1 of the Radio Regulations should consider the rearrangement of Article 1 in a more logical manner, for example, on the lines of the Annex to this Recommendation, and further amendments to this Article, as necessary.

ANNEX TO RECOMMENDATION No. Spa EE

R2—16
Section III. Radio Services and Stations

Sub-Section IIIA. Terrestrial Radiocommunication
Sub-Section IIIB. Space Radiocommunication
Sub-Section IIIC. Radio Astronomy

Section IV. Technical Characteristics
RECOMMENDATION No. Spa FF

Relating to the Future Use of Bands Allocated to the Inter-Satellite Service

considering

a) that the bands 54-25-58-2 GHz, 59-64 GHz, 105-130 GHz, 170-182 GHz and 185-190 GHz have been allocated to the inter-satellite service;

b) that all the foregoing bands are located in parts of the radio-frequency spectrum close to peaks of atmospheric absorption;

and recognizing

that the inter-satellite and terrestrial radiocommunication services are protected from mutual interference by the attenuation due to atmospheric absorption;

recommends

that a future world administrative radio conference should consider allocating these bands also to terrestrial radiocommunication (except the aeronautical mobile) services.
Relevant to the Future Use of Certain Frequency Bands between 40 and 275 GHz

considering

that the 43-48 GHz, 66-71 GHz, 95-101 GHz, 142-150 GHz, 190-200 GHz and 250-265 GHz bands have been allocated to the following services:

— Aeronautical mobile satellite
— Maritime mobile satellite
— Aeronautical radionavigation-satellite
— Maritime radionavigation-satellite;

recognizing

that it is not desirable for compatibility considerations that at a later date these bands should be shared with terrestrial radiocommunication services other than those of interest to the aeronautical and maritime mobile services and/or the aeronautical and maritime radionavigation services;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 43-48 GHz, 66-71 GHz, 95-101 GHz, 142-150 GHz, 190-200 GHz and 250-265 GHz bands to the following services:

— Aeronautical mobile
— Maritime mobile
— Aeronautical radionavigation
— Maritime radionavigation

in an appropriate manner.

R2—19
RECOMMENDATION No. Spa HH

Relating to the Future Use of the 41-43 GHz Band by the Fixed and Mobile Services

considering

that the 41-43 GHz band has been allocated to the broadcasting-satellite service;

recognizing

that it is possible, by appropriate co-ordination, for a frequency band to be shared by the broadcasting-satellite service, on the one hand, and the fixed and mobile services, on the other;

recommends

that a future competent world administrative conference should consider allocating, in addition, the 41-43 GHz band to the fixed and mobile services.
RECOMMENDATION No. Spa II

Relating to Future Frequency Allocation Requirements for the
Maritime Mobile Satellite Service

having noted

that the Inter-Governmental Maritime Consultative Organization (I.M.C.O.) has stated a requirement for frequencies of the order of 400 MHz, believing that small vessels in particular may be unable to use satellite radiocommunications if such frequencies are not made available;

further noting

that the C.C.I.R. Special Joint Meeting, Geneva, 1971, concluded that the present Conference should be invited to examine the possibility of providing exclusive channels for the maritime mobile satellite service at about 400 MHz and that provision of such channels is desirable;

considering

a) that ship stations and survival craft stations are completely dependent upon the use of radio for communication;

b) that the use of space techniques will provide the maritime mobile service with a reliable and more efficient method of communication;

c) that reliable maritime mobile satellite service communications will greatly assist in the saving of lives and property;

d) that although the Conference has made certain provisions for the maritime mobile satellite service, there is some uncertainty with respect to the adequacy and usefulness of these provisions, particularly insofar as small ships and survival craft are concerned;
e) that general participation of small ships in a service using space techniques would not only benefit the efficient and safe operation of these ships but would also improve the safety service for larger ships and survival craft;

f) that future conferences might find it necessary to make additional allocations for such uses nearer to the optimum portions of the spectrum;

g) that for some communications functions, such as certain broadcasting and fixed applications, other means than radio could be used, thereby making portions of the spectrum available for services which are dependent on radio;

recommends

1. that administrations and appropriate international organizations continue to review the requirements for the maritime mobile satellite service and the suitability of current frequency allocations in meeting those requirements;

2. that the C.C.I.R. should continue its studies to determine the optimum portions of the frequency spectrum and related sharing conditions to accommodate maritime mobile satellite service requirements, taking into consideration advances in space radiocommunication technology;

3. that a competent administrative radio conference should review the requirements of the maritime mobile satellite and safety services, and if necessary, provide the frequency allocation to satisfy these requirements.
RECOMMENDATION No. Spa JJ

Relating to the Protection of Radio Astronomy Observations on the Shielded Area of the Moon

considering

a) that radio astronomy observations at frequencies below the ionospheric critical frequencies and above 100 GHz are hampered or prevented by absorption in the Earth's atmosphere;

b) that successful radio astronomy observations require complete freedom from harmful interference;

c) that the shielded area of the Moon offers unique opportunities for observations which are not affected by such absorption;

d) that the shielded area of the Moon appears to be the potentially most useful area accessible to man which is completely free from interference from terrestrial transmissions;

e) that the shielded area of the Moon refers to the area of the Moon which is more than 23.5° beyond the mean limb of the Moon as seen from the centre of the Earth;

f) that the transmissions by radio of data from observation stations to collection points will be in the bands allocated for this purpose;

noting

the desirability of maintaining the shielded area of the Moon as an area of maximum value for observations by the radio astronomy service and by passive space research and consequently as free as possible from transmissions;

R2—23
It recommends

1. that the C.C.I.R. study the frequency bands most suitable for radio astronomy observations on the shielded area of the Moon and work out recommendations concerning these bands as well as criteria for their application and protection;

2. that in the meantime, administrations, in accordance with the intent of this Recommendation, take all practicable steps to ensure that there will be no interference to radio astronomy observations on the shielded area of the Moon; and

3. that administrations apply such Recommendations as may be provided on this matter by the C.C.I.R. pending the convening of the next World Administrative Radio Conference.
RECOMMENDATION No. Spa KK

Relating to the Future Provision of a Band near 10 MHz for the Radio Astronomy Service

considering

a) the requirements of the radio astronomy service, as expressed by the Inter-Union Commission on Frequency Allocations for Radio Astronomy and Space Science (IUCAF), for a frequency allocation near 10 MHz;

b) that the use of the standard frequency guard bands has not satisfied the needs of the radio astronomy service at a frequency near 10 MHz;

c) that propagation conditions at a frequency near 10 MHz are such that a transmitter operating anywhere on the Earth might cause interference to the radio astronomy service and as a consequence an exclusive world-wide allocation is necessary for long term observations;

d) that successful radio astronomical measurements have, at times, been made at frequencies near 10 MHz;

e) that IUCAF is co-ordinating the needs of radio astronomers for frequency allocations;

recommends

1. that administrations keep under review the possibility of releasing a band of frequencies 50 kHz wide for the use of the radio astronomy service between 10 MHz and 15 MHz;

2. that administrations give close attention to any future recommendation of the IUCAF concerning the specific frequency band between 10 MHz and 15 MHz required by the radio astronomy service;

3. that a future world administrative radio conference consider granting to the radio astronomy service an exclusive allocation in this region of the spectrum.

R2—25
MOD  

RECOMMENDATION No. Spa 3

To the C.C.I.R. and to Administrations Relating to Frequency Bands
Shared between Space Radiocommunications Services and between
Space and Terrestrial Radiocommunications Services

recognizing

a) the value to the Conference of the material contained in Document No. 64 (results of C.C.I.R. studies relating to space telecommunications concluded at its Special Joint Meeting, Geneva, 1971);

b) that further studies on a wide range of problems dealing with space radiocommunications form the subject of C.C.I.R. Questions and Study Programmes approved by the XIIth Plenary Assembly;

considering however

a) that certain C.C.I.R. Recommendations, listed below, call for further work and study:

Recommendation 355-1  "FREQUENCY SHARING BETWEEN ACTIVE COMMUNICATION-SATELLITE SYSTEMS AND TERRESTRIAL RADIO SERVICES IN THE SAME FREQUENCY BANDS"

Recommendation 465  "GENERALIZED EARTH-STATION ANTENNA RADIATION PATTERN FOR USE IN INTERFERENCE CALCULATIONS, INCLUDING COORDINATION PROCEDURES, IN THE FREQUENCY RANGE 2-10 GHz"

Recommendation 466  "COMMUNICATION-SATELLITE SYSTEMS FOR TELEPHONY USING FREQUENCY-DIVISION MULTIPLEX —Maximum allowable values of interference in R2—26
a telephone channel of a geostationary communication-satellite system employing frequency modulation, caused by other geostationary communication-satellite systems”

b) that as a result of the deliberations of this Conference, particularly in relation to the provisions of Article 7, Sections VII, VIII and IX, and to other relevant Articles of the Radio Regulations, further information is required to reply to the following current Questions and Study Programmes of the C.C.I.R.:

**Question 1-1/4**  
under Decides 2  
“**Antennae for space systems**”  
the state of development in antenna design and fabrication;

under Decides 3  
the state of development of antennae with improved side- and back-lobe characteristics;

under Decides 4  
the polarization characteristics of antennae, particularly in the side-lobe regions and in planes other than the principal planes;

**Question 2-1/4**  
under Decides 3  
“**Technical characteristics of communication-satellite systems for fixed and mobile, excluding aeronautical and maritime mobile, services**”

under Decides 4  
under what conditions and to what extent would it be feasible for communication-satellites, operating in the same system or operating in different systems, to share preferred frequency bands;

under Decides 4  
under what conditions and to what extent would it be feasible for communication-satellite systems to share preferred frequency bands with terrestrial services;
Study Programme 2-1A-1/4  "Feasibility of frequency sharing between communication-satellite systems and terrestrial services"

under Decides 2  the determination of the preferred technical characteristics of transmitting and receiving antennae for earth stations at fixed locations, from the standpoint of spectrum sharing with other radio services;

Study Programme 2-1C/4  "Communication-satellite systems—Feasibility of frequency sharing among communication-satellite systems"

under Decides 1  the criteria which affect interference among communication-satellites in a given system and between communication-satellite systems, taking into account the two directions of transmission;

under Decides 2  the preferred technical characteristics of transmitting and receiving antennae for earth stations, from the standpoint of frequency sharing within the same system and with other communication-satellite systems;

Study Programme 2-1H/4  "Communication-satellite systems—Technical factors influencing the efficiency of use of the geostationary satellite orbit by communication-satellites sharing the same frequency bands"

under Decides 1  the technical characteristics of communication-satellite systems which affect the utilization of the geostationary satellite orbit, and the interrelationships between them;

under Decides 3  the extent to which it may be feasible and desirable to adopt preferred technical char-
acteristics for different geostationary communication-satellites and earth stations;

under note 1: Some of the factors which should be taken into account in carrying out these studies:

— the tolerable levels of interference noise in different communication-satellite systems;

— the radiation patterns of the earth station and satellite antennae;

— factors affecting the multiple use of the same frequencies within a single communication satellite;

— polarization discrimination;

c) that the method of determining the co-ordination area of an earth station as described in Appendix 28 is probably open to improvement and simplification;

d) that frequency bands have been allocated to the broadcasting satellite service and that the use of satellite transmissions for reception by the general public of sound and television broadcasts may be possible in the future;

e) that the C.C.I.R. is studying the conditions under which sharing between the broadcasting satellite service and other services may be possible;

f) that it would be useful to have a clear definition of the term “system noise temperature”;

g) that it would be useful to have clear definitions of the terms “acceptable (or unacceptable) interference” and “harmful interference” for the space radiocommunication, radio astronomy, and terrestrial radiocommunication services;

h) that it would be useful to have specific numerical values of power flux density from space stations of the broadcasting-satellite service which
would permit differentiation between "individual reception" and "community reception" in the broadcasting-satellite service;

i) that frequency sharing between the radionavigation service and the fixed-satellite service (Earth-to-space) has been adopted in the frequency band 14-0 to 14-3 GHz, and between the radionavigation-satellite service and the fixed-satellite service (Earth-to-space) in the frequency band 14-3 to 14-4 GHz;

recommends

1. that administrations, recognized private operating agencies, and other participants in the work of the C.C.I.R., consider as a matter of priority, the submission of contributions on these subjects, so that draft Recommendations on them can be prepared at the Meetings of the relevant Study Groups for consideration by the Plenary Assembly of the C.C.I.R.;

2. that the C.C.I.R. should study or, as appropriate, continue to study:

2.1 the reference antenna patterns for earth station antennae, which may be appropriate for setting minimum standards of performance with a view to recommending specific patterns for this purpose, in order to improve utilization of the bands shared between the fixed-satellite service and terrestrial radiocommunication services, and of the bands shared by space radiocommunication services, and to improve the utilization of the geostationary satellite orbit;

2.2 the reference antenna patterns for satellite antennae, which may be appropriate for setting minimum standards of performance, particularly outside the main beam, in order to improve the utilization of the geostationary satellite orbit and to increase the possibilities for frequency re-use;

2.3 the reference cross-polarization antenna patterns which may be appropriate for setting minimum standards of performance and, in this connection, further study:
2.3.1 the portions of the spectrum within which linear-orthogonal or circular-orthogonal polarizations might be most appropriate;

2.3.2 the relative desirability, taking into account technical and orbit utilization factors, of using orthogonal polarizations within a single satellite as against with two satellites;

2.4 the necessary limitation of spurious emissions and the frequency tolerances to be observed in both the terrestrial and space radiocommunication services insofar as they may affect sharing of frequency bands;

2.5 the criteria of acceptable interference for the various space radiocommunication services and terrestrial radiocommunication services sharing the frequency bands allocated by the present Conference, in order to permit the determination of;

2.5.1 the co-ordination distance and the probability of interference between stations within that distance;

2.5.2 the necessary limits of power flux density set up at the Earth's surface by space stations;

2.6 the maximum acceptable level of interference into a geostationary satellite link from any other single interfering geostationary satellite network and from the aggregate of all other geostationary satellite networks, particularly in the case of:

2.6.1 frequency-modulated telephony signals;

2.6.2 frequency-modulated television signals;

2.6.3 digitally-modulated signals;

and the most appropriate manner in which acceptable interference should be specified in these and other cases;
2.7 the interference criteria applicable to frequency sharing between non-geostationary satellite networks and geostationary satellite networks;

2.8 the possibility of establishing a technical criterion for expressing the efficiency of use of the geostationary satellite orbit;

2.9 the possibility of improving and simplifying the method of determining the co-ordination area as described in Appendix 28.;

2.10 the conditions for frequency sharing in those bands allocated to the broadcasting-satellite service by the present Conference with a view to making appropriate recommendations as soon as possible so that administrations and the International Frequency Registration Board shall have the necessary technical data required to carry out examination procedures, in particular regarding Articles 9 and 9A of the Radio Regulations;

2.11 the term "system noise temperature" with a view to formulating a clear definition of this term applicable to space radiocommunication systems;

2.12 the terms "acceptable (or unacceptable) interference" and "harmful interference" with a view to formulating clear definitions appropriate to the radio astronomy service and to the various space radiocommunication and terrestrial radiocommunication services;

2.13 the power flux densities required for individual and community reception in the broadcasting-satellite service, with a view to specifying numerical values which will differentiate between these types of reception;

2.14 the criteria for frequency sharing between the radionavigation service and the fixed-satellite service (Earth-to-space) in the frequency band 14-0 to 14-3 GHz and between the radionavigation-satellite service and the fixed-satellite service (Earth-to-space) in the frequency band 14-3 to 14-4 GHz.
New Appendix 28 relating to the procedure for the determination of the co-ordination area around an earth station in frequency bands between 1 and 40 GHz shared between services of space and terrestrial radiocommunication has been approved by Committee 4 and forwarded to the Drafting Committee.

In view of the limited time and the size of the document, Appendix 28 will be reproduced only as a Blue Document.

B.F. SANDBACH
Chairman
Committee 4
TWELFTH AND FINAL REPORT OF
COMMITTEE 4

The Committee 4 (Technical) held eight meetings at which it considered the various proposals and items arising out of its terms of reference. The Committee's deliberations have been submitted in Reports for consideration of Plenary Meeting as well as to Committee 7 (Drafting Committee).

The last remaining items which have to be referred for deliberation of the Plenary Meeting are:

- With reference to Proposal No. USA/28/266, Committee 4 agreed to recommend to Plenary Meeting to suppress Resolution No. Spa 3.

- In view of the new text to replace existing Recommendation No. Spa 3 broadly covering the outstanding problems related to frequency sharing between space services and terrestrial services, I would like to invite the Plenary Meeting to consider the suppression of Recommendation No. Spa 2.

E. SANDBACH
Chairman
Committee 4
SUMMARY RECORD

OF THE

FOURTH MEETING OF COMMITTEE 6

Monday, 12 July 1971, at 0955 hrs

Chairman: Mr. M.K. BASU (India)

1. Summary record of the third meeting (Document No. 353)

Approved.

2. Article 9 (Document No. 346)

The Chairman of Working Group 6A said that the Group at its last meeting had succeeded in solving the problems left pending by Sub-Group 6A-3 and had unanimously adopted the text of Article 9 which was before the Committee.

The Chairman observed that a few terms had been left in square brackets throughout the text because certain definitions had not been forthcoming from Committees 4 and 5, and proposed that the small drafting group appointed to remove the square brackets from the document on Article 9A would be requested to perform the same function in respect of Article 9.

In view of the unanimity that had been reached on the Article in Working Group 6A, the Committee might agree to approve Document No. 346 as a whole.

The Delegate of France pointed out that not all the terms in square brackets related only to definitions. In particular, the question of the terrestrial services which should be co-ordinated with space radiocommunication services had not yet been settled. He asked whether that question should be left to the Plenary Meeting.

The Chairman considered that the problem should be solved in Committee 6 and said that the document should be considered page by page.

Pages 3 and 4

Approved.

Page 5

The Delegate of Nigeria said that the foot-note reference after sub-paragraph c) should be 3, not 4.

The Delegate of New Zealand said that the last part of the penultimate line of foot-note MOD 486.4 should read "... with space radio communications in ...".
He proposed that the words "fixed or mobile" in square brackets in that foot-note should be replaced by "terrestrial".

The Delegate of the United States of America pointed out that co-ordination distance was calculated on the basis of Appendix 28, which showed that calculation methods were not applicable to all terrestrial services except the fixed or mobile service.

The Delegate of the United Kingdom said that the Article in fact referred to the fixed or mobile service.

The Delegate of India considered that at that stage the Committee had no other choice but to remove the square brackets round the words "fixed or mobile service" throughout the document.

The Delegate of France thought it would be unwise to take a hasty decision on such an important subject. Surely a decision could be arrived at after examination of the texts of Articles 9 and 9A, Appendix 28 and the draft Recommendation inviting the C.C.I.R. to conduct further studies of co-ordination distance calculations.

The Chairman said that a decision on the matter would be deferred until a solution could be found, if possible during the current meeting.

On that understanding, page 5, as amended, was approved.

Pages 6 to 9
Approved.

Page 10

The Delegate of Pakistan, supported by the Delegate of Cuba, said that the period of sixty days mentioned in the sixteenth line of MOD 492B was too short to allow small countries to carry out the necessary technical examination and co-ordination procedures, and proposed that the period should be increased to ninety days, in accordance with sub-paragraph b) of MOD 492D on page 12.

The Chairman of the I.F.R.B. pointed out that the sixty-day period was not a time-limit for effecting the co-ordination procedure, but merely served to enable the administration seeking co-ordination to find out whether or not the other administration wished to enter into the discussion. Under MOD 492D, however, the latter administration was given ninety days in which to indicate that it did not wish to reply. Accordingly, the two periods could not be the same, and there was no question of aligning MOD 492B with MOD 492D.
The Delegate of the United States of America observed that the existing No. 492B also provided for a sixty-day period, which should give ample time to decide whether or not a co-ordination problem existed.

The Delegate of Mexico pointed out that the period had originally been the same for the two clauses, but had been changed to ninety days in the case of MOD 492D. He could, however, agree that the sixty-day period should be retained in MOD 492B.

The Delegates of Pakistan and Cuba agreed not to press their proposal, although they still considered that a wider margin should be allowed.

Page 10 was approved.

Pages 11 to 17 Approved.

Page 18

The Delegate of Canada said that "NOC 570AD" should be changed to "MOD 570AD", as the original reference in the penultimate line had been to No. 639AS, not to No. 639BM.

Approved as amended.

Pages 19 to 32 Approved.

The Chairman of Working Group 6A reminded the Committee that during the discussion of Article 9A, the Netherlands Delegation had proposed that the term "fixed or mobile service" should be replaced by "terrestrial radiocommunications", but that that proposal had been rejected on the grounds that Appendix 28 related only to co-ordination criteria for sharing between earth stations and stations in the fixed or mobile service. An excellent solution had now been found on the basis of the Netherlands proposal, by adding a foot-note stating that the provisions would apply only to the fixed or mobile service, until such time as the C.C.I.R. had established criteria for other terrestrial radiocommunications.
The Delegate of the United Kingdom said that the proposed change would be inserted on page 9, where the third line would be altered to read "terrestrial radiocommunication stations") for" and the new foot-note") would read:

"Appendix 28 contains criteria relating only to co-ordination between stations in the fixed or mobile service and earth stations. Until the C.C.I.R.; in accordance with Recommendation No. X, provides criteria relating to other terrestrial radiocommunications, the criteria to be employed in effecting co-ordination between terrestrial radiocommunication stations other than those of the fixed or mobile service, and earth stations, shall be agreed between the administrations concerned."

The existing foot-note MOD 492A.1 would be renumbered MOD 492A.2 and would be altered to read "2) Calculated, in relation to the fixed or mobile service, in accordance with the procedures described in Appendix [28]."

If that amendment was acceptable, the small drafting group could be authorized to go through the remainder of the text, removing the square brackets and making appropriate changes. Corresponding changes would also be required in Article 9A, where the order in which the services were mentioned would of course be reversed.

The Delegate of India said he was not sure of the effects that the amendment would have on the co-ordination procedure as a whole, and reserved the right to return to the question in the Plenary Meeting.

The Chairman suggested that the drafting group should be entrusted with the task outlined by the United Kingdom Delegate and that he, as Chairman of the Committee, should introduce the proposed changes in Article 9A in the Plenary Meeting.

It was so decided.

3. Appendix 1B (Document No. 329, Document No. 325)

The Chairman of Working Group 6A introduced Document No. 329 containing a draft of Appendix 1B, incorporating amendments proposed by Working Group 4E in Document No. 311, which was to be considered in conjunction with the proposed French amendments in Document No. 325. The square brackets enclosing the words "Indicate also ..." on page 4 to "of the earth" on page 5 were a typographical error, and should be removed.
The Delegate of France pointed out that the words "in accordance with Resolution No. Space C on page 4 should be deleted because that Resolution had been withdrawn by its sponsor. The words "satellite network" and "satellite system" had been incorporated in the text after a decision on those terms had been taken; they were therefore correct wherever they appeared and the Drafting Group had only to remove the square brackets from them.

After some discussion of the desirability of deleting the phrase "[and the number of satellites having the same characteristics used in the satellite network]" on page 5 (sub-paragraph (b)), it was agreed that the square brackets should be removed, the words "in the satellite network" deleted, and the remainder of the phrase referred to the Drafting Group so that its wording might be improved.

Pages 3, 4 and 5 of Document No. 329 were approved as amended.

The Delegate of France introduced the proposed modifications in Document No. 325.

Pages 6, 7, 8 and 9 of Document No. 329 were approved with the relevant modifications from Document No. 325.

The proposed modification to page 10 of Document No. 329 (Document No. 325, Annex, paragraph 2) was approved with the following minor modifications to the English text:

1) Replace "foreseen" by "projected" in the 1st and 7th lines.

2) Replace "smaller" by "lowest" in the 3rd line, and delete "highest" in the 4th line.

3) Replace "link gain" by "transmission gain" (English text only) in the 5th line.

Pages 10 and 11 of Document No. 329 as thus amended were approved.

4. Appendices 1 and 1A (Document No. 355)

The Chairman of Working Group 6A introduced Document No. 355 containing the provisionally approved texts of Appendices 1 and 1A, and pointed out that on page 18, Item 5, sub-paragraph (a)(1) and (2) should read "the arc of the geostationary satellite orbit ...", and on page 21, in the Note at the bottom of the right-hand corner of the page "profile" should be replaced by "elevation angle diagram". The square brackets on page 5 would be removed by the Drafting Group.
In reply to a request for clarification by the Delegate of Pakistan, it was agreed that the footnote reading "This Information need only be supplied in the notice when such information has been used as a basis to effect co-ordination with another administration" should be inserted on pages 21 and 22 as footnote **).

The Delegate of India queried whether that implied that some notices would not give information regarding the carrier frequency involved, because he believed Working Group 6A had decided that co-ordination would not be carried out for the whole frequency band but only for carrier frequencies. There was some discussion of the subject, in which it was explained that notification was to be made on the basis of assigned frequencies and assigned frequency bands in kc/s, and that because of material difficulties with certain new transmission and modulation techniques, it had been decided that it was only necessary to give the carrier frequency when it had been used for co-ordination purposes. The assigned frequency band was not the same thing as the allocated frequency band, and within the assigned frequency band administrations were quite free to co-ordinate carrier frequency by frequency if they so desired.

Document No. 355 was approved as amended.

5. Final Report from Working Group 6A (Document No. 359)

The Chairman of Working Group 6A introduced Document No. 359.

The Representative of the I.F.R.B. drew attention to a typographical error whereby "noise temperature", which was dealt with in IIB, also appeared in IIA.

The Delegate of the U.S.S.R. pointed out that certain terms listed in IIA as considered unnecessary to be included in the Radio Regulations, in fact appeared in the draft resolution and recommendations annexed to Document No. 359.

After some discussion of the point, it was agreed to state that in some cases terms had not been defined, either because they were not used in Appendices I, IA and IB, or because they were quite clear in themselves and needed no explanation.
It was agreed that IDE and MOD 89 should remain pending until the following meeting, so as to give the Delegate of India an opportunity to revert to the point he had raised in connection with Document No. 325.

Annexes 1, 2 and 3 of Document No. 359 were approved.

The meeting rose at 1330 hrs.

The Secretary:  
W. GARCIA-RIOS

The Chairman:  
M.K. BASU
SUMMARY RECORD
OF THE
FIFTH MEETING OF COMMITTEE 6
Monday, 12 July 1971, at 2115 hrs
Chairman: Mr. M.K. BASU (India)

Subjects discussed
1. Draft Resolution No. J
2. Draft new Resolution A
3. Appendix 10

Document No.
188 (Rev.)
286
356
358
The Delegate of France introduced the document, pointing out that it had been prepared by his delegation in pursuance of discussions on co-ordination distances in Working Group 4C and of certain comments in Document No. 61 submitted by the I.F.R.B. The Draft Resolution had been studied by Committee 4, which had approved it with the two small changes given in Document No. 269. The purpose of the text was to provide for a case not covered in the Radio Regulations; co-ordination distances were determined on the basis of arbitrarily fixed values of the e.i.r.p. of transmitting terrestrial stations, as those values were not limited anywhere in the Regulations. The French Delegation had thought that, rather than imposing such limits in the Regulations themselves, it would be more convenient to ask administrations to indicate the characteristics of the stations which exceeded those values; as there were very few such stations, they could easily be enumerated in a list which administrations could consult. He stressed that the question was not one of protecting space stations vis-à-vis terrestrial stations or vice versa, since that point was covered in Article 7, but one of preventing interference between earth and terrestrial stations in cases where the values determining the co-ordination area were exceeded. If it was deemed necessary for purposes of clarification, he would be prepared to add a note to the effect that the Resolution related only to the frequency bands where the co-ordination distance was applicable, i.e. between 1 and 40 Gc/s.

The Delegate of the U.S.S.R., supported by the Delegates of the United Kingdom, the United States of America, the Netherlands and Japan, said that, although his delegation had studied the document carefully, it could see no need for the new provision. The co-ordination procedure in question was fully covered by No. 492A, and it was quite unnecessary to impose further work on administrations and to lengthen the Radio Regulations. Moreover, the French Delegate had admitted that further clarification might be required. In the interests of advancing the work of the Conference, he appealed to the French Delegation to withdraw its proposal.

In reply to a question by the Delegate of Pakistan, the Chairman of the I.F.R.B. said that the Draft Resolution was intended to elicit information additional to that already required under No. 490. Interference could indeed be caused by terrestrial or earth stations with a very high e.i.r.p. beyond the co-ordination area, and the new information could be very useful to administrations. The role of the I.F.R.B. would be merely that of publishing the information.
The Delegate of France pointed out that the problem had been very clearly stated in paragraph 3.6.4 on page 26 of Document No. 61 submitted by the I.F.R.B. An earth station obviously might not be protected against interference from certain terrestrial stations which nevertheless operated in accordance with the Radio Regulations. As the number of such stations was small, the best solution was to enumerate them in a list which could be consulted with a view to choosing sites for earth stations. Similarly, interference might be caused by an earth station to a terrestrial station with a sensitivity higher than the e.i.r.p. value from which the co-ordination distance was calculated, although that station also operated in accordance with the Regulations. Accordingly, the situation in question was not covered by No. 492A, and was permitted by the existing Regulations.

In view of the favourable reception of the Draft Resolution in Committee 4, he wished to know the technical grounds for the opposition that had been expressed in Committee 6.

In reply to the Delegate of Austria, the Representative of the I.F.R.B. said that the Board believed the Draft Resolution to be well justified. There seemed to be some misunderstanding about the scope of that text. It should be borne in mind that, in the bands allocated to earth receiving stations sharing frequencies with fixed services, the co-ordination distance was calculated with respect to the hypothetical e.i.r.p. of the fixed service. The Master Register contained entries for over 300 fixed stations where that e.i.r.p. was exceeded. Since Article 7 set no limit for e.i.r.p. in those bands, receiving stations of a country operating within the hypothetical e.i.r.p. of 55 dBW were open to interference from sending stations of a neighbouring country operating in excess of that value. The co-ordination distance of sending earth stations was calculated on hypothetical e.i.r.p. values of terrestrial stations, and the same situation was liable to arise. Thus, the purpose of the Draft Resolution was to compile a list of the few cases in which those hypothetical values were exceeded, so that they could be taken into account in choosing sites for receiving and sending earth stations.

The Delegates of Argentina, Spain, Mexico, Brazil and Mauritania said that they had been convinced by those arguments and could support the Draft Resolution.

In reply to the Delegate of Syria, the Chairman of the I.F.R.B. said that the problem was whether No. 490 indeed sufficed to enable an administration to determine whether or not a station in another country
was liable to cause it harmful interference under No. 486. The statements of the French Delegate and the Representative of the I.F.R.B. showed that No. 490 was inadequate for that purpose in the cases at issue. Adoption of the Draft Resolution would allow for the technical examination of the terrestrial stations concerned, and that in turn might lead to unfavourable findings by the Board.

The Delegate of the United States of America said he doubted whether the problem would be solved by listing high-sensitivity receiving stations in the Master Register. Moreover, No. 486, sub-paragraph a) covered the case of terrestrial stations with a high e.i.r.p., and it should also be borne in mind that, if administrations wanted to obtain international recognition of the use of the frequency, in accordance with sub-paragraph c) of that provision, it would not be in their interests to use a very high e.i.r.p.

The Delegate of the U.S.S.R. agreed that the situation was not entirely covered by the Radio Regulations, but pointed out that the provisions of the Regulations were fundamental and were not intended to cover all the activities of individual administrations. When choosing sites for earth stations, administrations made searching investigations and took very careful precautions. The French Delegation and the I.F.R.B. might be complicating an issue which was not really so difficult to settle in practice: there were certainly other means of avoiding the dangers feared by some delegations.

The Delegate of the United Kingdom, supported by the Delegate of Australia, considered that the Draft Resolution was redundant, for if an administration complied with No. 490 and the Board made the necessary entry in the Master Register, the essential provisions of the Draft Resolution would in fact be implemented.

The Delegate of France pointed out that the U.S.S.R. Delegate had not explained what other means there were of protecting earth and terrestrial stations. Nor could he agree with the United Kingdom Delegate that the necessary provisions were contained in No. 490; for instance the azimuths in which the e.i.r.p. was exceeded were unknown. In any case, Committee 4 had found considerable technical value in the document, and he appealed to Committee 6 to ponder its decision.

The Chairman observed that opinion on the question was divided and invited the Committee to vote on the Draft Resolution.
The Draft Resolution was rejected by 15 votes to 7, with 5 abstentions.

The Delegate of France reserved the right to raise the matter again in the Plenary Meeting.

2. Draft new Resolution /A (Document No. 286)

The Chairman pointed out that the Draft Resolution had been examined by Committee 4, which had considered that it was not competent to deal with the administrative and legal aspects of the text.

The Delegate of New Zealand said that considerable amendments to the draft were in the course of preparation.

The Delegate of Syria drew attention to paragraphs 4 and 5 of the document and pointed out that the competence of the Space Conference to revise Regulations affecting services other than space services had been questioned. Perhaps the Committee should settle that issue before proceeding with the debate.

The Delegate of India, supported by the Delegates of the United States of America, the United Kingdom and Brazil, proposed that a small group should be set up to prepare a unified draft of the document, bearing in mind the point raised by the Syrian Delegate.

It was decided that the group would be convened by the Delegate of New Zealand and would consist of the Delegates of the United Kingdom, the United States, India, Syria and Brazil, assisted by the Representative of the I.F.R.B.

3. Appendix 10 (Document No. 356)

The Chairman of Working Group 6A said that the amendments to Appendix 10 which appeared in the document were based on the Argentine proposal in Document No. 185 and drew attention to No. 831 of the Radio Regulations, which authorized the Secretary-General to select additional symbols where necessary.
In reply to the Delegate of Venezuela, the Delegate of Argentina explained that the designation "space" was used to describe space-to-earth and earth-to-space links, whereas the word "satellite" was used for services, in accordance with definitions approved during the Conference.

In reply to the Delegate of Syria, the Representative of the I.F.R.B. said that the symbols in Appendix 10 were intended for use in service documents, not in connection with the Frequency Allocation Table. In the existing Appendix 10, there were different symbols for television, sound channel, and for television, vision channel, so that it had been considered advisable also to distinguish between sound broadcasting and television for space stations in the Broadcasting-Satellite Service.

Document No. 356 was approved.

The Convenor of Sub-Working Group 6A-2 said that the draft provision to be added to Article 7, contained in Annex 1 to the document, could be considered separately from the Draft Resolutions and Recommendation in Annexes 2, 3 and 4.

At the proposal of the Delegate of Brazil, it was agreed to replace the word "neighbouring" in the fourth line of Annex 1 by "other".

The Delegate of Argentina proposed that the word "possible" in the third line should be replaced by "necessary" and that the phrase "so as to avoid affecting their existing or planned services" should be inserted after "other countries" in the fourth line.

The Delegates of Syria, Brazil, Pakistan, the United States of America and Mexico supported that proposal.

The Delegate of Italy, supported by the Delegates of Sweden, India, Japan and the Netherlands, proposed that the existing text, as amended by Brazil, should be retained.

The Delegate of Spain pointed out that the text might in any case have to be aligned with the draft Resolution in Annex 2.

The meeting rose at 2320 hours.
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of the Republic of Viet-Nam, the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
Geneva, 9 July 1971

Mr. Gunnar Pedersen
Chairman of the
World Administrative Radio Conference
for Space Telecommunications

Geneva

Dear Sir,

I am sending you herewith the text of a statement made by the Delegation of the Republic of Viet-Nam regarding Document No. 290 and should be grateful if you would issue it as a Conference document.

Yours faithfully,

For the Head of the Delegation

Vuong Quang Nghia

Annex: 1
Geneva, 9 July 1971

Statement by the Delegation of the Republic of Viet-Nam

The Delegation of the Republic of Viet-Nam strongly protests against the allegations made by the representative of the Castro régime in Document No. 290 and declares them null and void.

Our Delegation would again stress that any polemics in this Assembly directed towards political ends and using insulting language are out of place and quite unacceptable at an international conference.

Our Delegation would recall that the terms of reference of the Credentials Committee are to verify the credentials of delegates in conformity with Chapter 5 of the General Regulations and not to serve as a forum for discussing invitations to certain countries to participate in the Conference.
The Editorial Committee, having examined the following documents, submits the attached texts to the Plenary Meeting for a first reading.

Francis JOB  
Chairman of the Editorial Committee

Annex: Pages B.15/01-24
ADD Section IA Broadcasting-Satellite Service

ADD 428A § 2A. In devising the characteristics of a broadcasting space station, all technical means available shall be used to reduce to the maximum extent the radiation over the territory of other countries unless an agreement has been previously reached with such countries.
B.15/02

RESOLUTION No. Spa F

relating to the Establishment of Agreements and Associated Plans for the Broadcasting-Satellite Service

considering

a) that it is important to make the best possible use of the geostationary-satellite orbit and of the frequency bands allocated to the Broadcasting-Satellite Service;

b) that the great number of receiving installations using such directional antennae as could be set up for a Broadcasting-Satellite Service may be an obstacle to changing the location of broadcasting space stations on the geostationary-satellite orbit, from the date of their bringing into use;

c) that satellite broadcasts may create harmful interference over a large area of the earth's surface;

d) that the other services with allocations in the same band need to use the band before the Broadcasting-Satellite Service is set up;

resolves

1. that stations in the Broadcasting-Satellite Service shall be established and operated in accordance with agreements and associated plans adopted by world or regional administrative conferences, as the case may be, in which all the administrations concerned and the administrations whose services are liable to be affected may participate;

2. that the Administrative Council be requested to examine as soon as possible the question of a world administrative conference, and/or regional administrative conferences as required, with a view to fixing suitable dates, places and agenda;

3. that during the period before the entry into force of such agreements and associated plans the administrations and the I.F.R.B. shall apply the procedure contained in Resolution No. Spa G.
DRAFT RESOLUTION No. Spa G

relating to the Bringing into use of Broadcasting Space Stations, prior to the entry into force of Agreements and Associated Plans for the Broadcasting-Satellite Service

considering

a) that while Resolution No. Spa F has been adopted by this Conference, envisaging plans for the Broadcasting-Satellite Service, some administrations might nevertheless feel the need to bring broadcasting space stations into service prior to such plans being established;

b) that administrations should, as far as possible, avoid proliferation of broadcasting space stations before such plans have been established;

c) that a broadcasting space station may cause harmful interference to terrestrial stations operating in the same frequency band, even if the latter are outside the service area of the space station;

d) that the procedure specified in Article 9A of the Radio Regulations contains no provisions for co-ordination between broadcasting space stations and terrestrial stations and between broadcasting space stations and space systems of other administrations;

resolves

1. that the following procedure shall be applied until agreements and associated plans pursuant to Resolution No. Spa F enter into force:

Section A: Co-ordination procedure between broadcasting space stations and terrestrial stations;

2.1 Before an administration notifies to the Board or brings into use any frequency assignment to a broadcasting space station in a frequency band where this frequency band is allocated, with equal rights,
to the Broadcasting-Satellite Service and to a Terrestrial Radiocommunication Service, either in the same Region or sub-Region or in different Regions or sub-Regions, it shall co-ordinate the use of this assignment with any other administration whose Terrestrial Radiocommunication Services may be affected. For this purpose, it shall inform the Board of all the technical characteristics of the station, as listed in the relevant sections of Appendix IA, which are necessary to assess the risk of interference to a Terrestrial Radiocommunication Service;

2.2 The Board shall publish this information in a special section of its weekly circular and shall also, when the weekly circular contains such information, so advise all administrations by circular telegram;

2.3 Any administration which considers that its Terrestrial Radiocommunication Services may be affected shall forward its comments to the administration seeking co-ordination and, in any case, to the Board. These comments must be forwarded within one hundred and twenty days from the date of the relevant I.F.R.B. weekly circular. It shall be deemed that any administration which has not forwarded comments within that period considers that its Terrestrial Radiocommunication Services are unlikely to be affected;

2.4 Any administration which has forwarded comments on the projected station shall either give its agreement or, if this is not possible, send to the administration seeking co-ordination all the data on which its comments are based as well as any such suggestions as it may be able to offer with a view to a satisfactory solution of the problem;

2.5 The administration which plans to bring into use a broadcasting space station as well as any other administration which believes that its Terrestrial Radiocommunication Services are likely to be affected by the station in question may request the assistance of the Board at any time during the co-ordination procedure;

2.6 If the assistance of the Board has been sought and there is a continuing disagreement between the administration seeking co-ordination and the administration which has forwarded its comments, the administration seeking co-ordination may, after a total period of one hundred and eighty days, send to the Board its notice concerning the frequency assignment in question.

1 The technical data to be used in effecting co-ordination should be based on the most recent C.C.I.R. Recommendations as accepted by the administrations concerned under the terms of Resolution No. Spa E. In the absence of relevant C.C.I.R. Recommendations, the technical data to be used in effecting co-ordination shall be determined by agreement among the administrations concerned.
Section B : Co-ordination procedure between broadcasting space stations and space systems of other administrations

3. An administration intending to bring into use a broadcasting space station shall, for the purpose of co-ordination with space systems of other administrations, apply the following provisions of Article 9A of the Radio Regulations:

3.1 Nos. 639AA to 639AI inclusive.

3.2.1 No. 639AJ.

3.2.2 No co-ordination under paragraph 3.2.1 is required when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase the probability of harmful interference to stations in the Space Radiocommunication Service of other administrations.

3.2.3 Nos. 639AI, 639AM, 639AO, 639AS(a), (c), (e), (f), 639AT, 639AU, 639AV, 639AW, 639AY, 639AZ.

Section C : Notification, examination and recording in the Master Register of assignments to broadcasting space stations, dealt with under this Resolution.

4.1 Any frequency assignment to a broadcasting space station shall be notified to the Board. The notifying administration shall apply for this purpose the provisions of Nos. 639BE, 639BF and 639BG of the Radio Regulations.

4.2 Notices made under paragraph 4.1 shall initially be treated in accordance with No. 639BH of the Radio Regulations.

1 The technical data to be used in effecting co-ordination should be based on the most recent C.C.I.R. Recommendations as accepted by the administrations concerned under the terms of Resolution No. Spa E. In the absence of relevant C.C.I.R. Recommendations, the technical data to be used in effecting co-ordination shall be determined by agreement among the administrations concerned.

2 The expression frequency assignment, wherever it appears, in this Resolution shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).
5.1 The Board shall examine each notice with respect to:

5.2 a) its conformity with the Convention, the Table of Frequency Allocations and the other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedures and to the probability of harmful interference);

5.3 b) its conformity, where applicable, with the provisions of paragraph 2.1 and Section A above, relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

5.4 c) its conformity, where applicable, with the provisions of paragraph 3.2.1 of Section B above, relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

5.5 d) where appropriate, the probability of harmful interference to the service rendered by a station in a Space or Terrestrial Radiocommunication Service for which a frequency assignment has already been recorded in the Master Register in conformity with the provisions of No. 501 or 639BM as appropriate, if that assignment has not, in fact, caused harmful interference to the service rendered by a station for which an assignment has been previously recorded in the Master Register and which itself is in conformity with No. 501 or 639BM as appropriate.

5.6 Depending upon the findings of the Board subsequent to the examination prescribed in paragraphs 5.2, 5.3, 5.4 and 5.5, further action shall be as follows:

5.7 Where the Board reaches an unfavourable finding with respect to paragraph 5.2 the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.8 Where the Board reaches a favourable finding with respect to paragraph 5.2, or where it reaches the same finding after resubmission of the notice, it shall examine the notice with respect to the provisions of paragraphs 5.3 and 5.4.

5.9 Where the Board finds that the co-ordination procedures mentioned in paragraphs 5.3 and 5.4 have been successfully completed with all administrations whose services may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in the column 2d of the Master Register with entry in the Remarks Column indicating that such recording does not prejudge in any way the decisions to be included in the agreements and associated plans referred to in Resolution No. Spa F.
5.10 Where the Board finds that the co-ordination procedures mentioned in paragraph 5.3 or 5.4 have not, as appropriate, been applied or have been unsuccessfully applied, the notice shall be returned immediately by airmail to the notifying administration with the reason for its return and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.11 Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures have been successfully completed with all administrations whose services may be affected, the assignment shall be treated as indicated in paragraph 5.9.

5.12 Where the notifying administration resubmits the notice and states that it has been unsuccessful in endeavouring to effect the co-ordination, the notice shall be examined by the Board with respect to paragraph 5.9.

5.13 Where the Board reaches a favourable finding with respect to paragraph 5.5, the assignment shall be recorded in the Master Register. The appropriate symbol indicating the finding by the Board shall indicate that the co-ordination procedures, as appropriate, referred to in paragraph 2.1 were not successfully completed. The date of receipt by the Board of the notice shall be entered in the column 2d of the Master Register, with the remark mentioned in paragraph 5.9.

5.14 Where the Board reaches an unfavourable finding with respect to paragraph 5.5, the notice shall be returned immediately by airmail to the notifying administration with the reasons for the Board's finding and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.15 If the administration resubmits the notice unchanged with the insistence that it be reconsidered, but should the Board's unfavourable finding under paragraph 5.5 remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in column 2d of the Master Register, with the remark mentioned in paragraph 5.9. An appropriate remark shall be placed in column 13 to indicate that the assignment is not in conformity with the provisions of paragraphs 5.2, 5.3, 5.4 or 5.5, as appropriate. In the event that the administration concerned receives no complaint of harmful interference concerning the operation of the station in question for a period of one year from the commencement of operation, the Board shall review its finding.
5.16 If harmful interference is actually caused to the reception of any station in the Broadcasting-Satellite Service whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to paragraphs 5.2, 5.3, 5.4 and 5.5 of this Resolution, as appropriate, by the use of a frequency assignment to a station of the Broadcasting-Satellite Service which has been subsequently recorded in the Master Register in accordance with the provisions of paragraph 5.15 of this Resolution or of No. 639CP of the Radio Regulations, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

5.17 If harmful interference to the reception of any station whose assignment is in accordance with paragraph 5.2 of this Resolution, is actually caused by the use of a frequency assignment which is not in conformity with paragraph 5.2 of this Resolution, or with Nos. 501, 570AB or 639BM of the Radio Regulations, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.
RESOLUTION No. Spa E

Relating to the Technical Criteria recommended by the C.C.I.R. for sharing frequency bands between Space Radiocommunication and Terrestrial Radiocommunication Services or between Space Radiocommunication Services

considering

a) that, in frequency bands shared with equal rights by Space Radiocommunication and Terrestrial Radiocommunication Services, it is necessary to impose certain technical limitations and co-ordination procedures on each of the sharing services in the interest of controlling mutual interference;

b) that, in frequency bands shared by space stations located on geostationary satellites, it is necessary to impose co-ordination procedures in the interest of controlling mutual interference;

c) that the technical criteria and co-ordination procedures referred to in a) and b) above, and as set out in the Radio Regulations, are mainly based upon Recommendations of the C.C.I.R.;

d) that, in recognition of the successful sharing of frequency bands by Space Radiocommunication and Terrestrial Radiocommunication Services, and the continuing improvements in space technology, each Plenary Assembly of the C.C.I.R. subsequent to the Xth Plenary Assembly, Geneva, 1963, has improved upon some of the technical criteria recommended by the preceding Plenary Assembly;

e) that Plenary Assemblies of the C.C.I.R. are held triennally whereas Administrative Radio Conferences, which are empowered to modify the Radio Regulations making substantial use of the Recommendations of the C.C.I.R., are in practice held less frequently and with much less regularity;

f) that the International Telecommunication Convention of Montreux, 1965, recognizes the right of Members and associated Members of the Union to make special agreements on telecommunication matters; however, such agreements shall not be in conflict with the terms of the Convention or of the Regulations annexed thereto, so far as concerns the harmful interference to the radio services of other countries;
is of the opinion

that subsequent Plenary Assemblies of the C.C.I.R. are likely to make further changes in the recommended technical criteria; and

that administrations should be afforded the opportunity to take advantage of the current C.C.I.R. Recommendations on sharing criteria when planning systems for use in frequency bands shared with equal rights by Space Radiocommunication and Terrestrial Radiocommunication Services, or between space systems,

therefore resolves that

1. each Plenary Assembly of the C.C.I.R. should arrange for the Secretary-General of the I.T.U. to be informed of those Recommendations of the C.C.I.R. affecting the technical criteria relating to sharing between Space Radiocommunication and Terrestrial Radiocommunication Services or between Space Radiocommunication Services;

2. following the distribution to administrations of the relevant C.C.I.R. texts, the Secretary-General shall write to administrations asking them to indicate within one hundred and twenty days, to which of the C.C.I.R. Recommendations or to which specific technical criteria defined in the Recommendations referred to in 1. above they agree for use in the application of the pertinent provisions of the Radio Regulations;

3. the administrations which do not respond to the Secretary-General's enquiry within one hundred and twenty days shall be deemed to wish the specific technical criteria referred to in the existing Regulations to be applied for the time being;

4. in those cases where an administration, in its reply to the Secretary-General's enquiry, indicates that a specific C.C.I.R. Recommendation or a specific technical criterion defined in those Recommendations is not acceptable to it, or where an administration has not replied to the Secretary-General's enquiry as in paragraph 3. above, the relevant technical criteria defined in the Radio Regulations shall continue to apply with respect to cases involving that administration;

5. the Secretary-General shall publish, for the information of all administrations, a consolidated list prepared by the I.F.R.B. on the basis of the replies to the enquiry, of the C.C.I.R. Recommendations or of the specific relevant technical criteria defined in those Recommendations, and to which administrations each of those Recommendations or specific relevant technical criteria are acceptable or are not acceptable. This list shall also include those administrations mentioned in paragraph 3. above;

6. the I.F.R.B. be directed to take into account:

a) the applicability of the C.C.I.R. technical criteria in accordance with the list referred to in 5. above, when making technical examinations with respect to cases involving only administrations to which such criteria are acceptable;
b) the applicability of the technical criteria defined in the Radio Regulations in accordance with the list referred to in 5. above, when making technical examinations with respect to cases involving an administration which does not accept the relevant C.C.I.R. technical criteria.

7. If, at a later date, questions arise concerning the application of the relevant technical criterion or criteria to a case involving administrations described in paragraph 3. above, the I.F.R.B. shall enquire of the administrations concerned whether or not they would agree to the application of the technical criterion or criteria defined in the relevant C.C.I.R. Recommendations referred to in paragraph 1. above. The list published pursuant to paragraph 5. above shall be updated on the basis of the reply of the administration or of the absence of reply.
RESOLUTION No. Spa D

Relating to the Use by All Countries, with Equal Rights, of Frequency Bands for Space Radiocommunication Services

considering

that all countries have equal rights in the use of both the radio frequencies allocated to various space radiocommunication services and the geostationary satellite orbit for these services,

taking into account

that the radio frequency spectrum and the geostationary satellite orbit are limited natural resources and should be most effectively and economically used,

having in mind

that the use of the allocated frequency bands and fixed positions in the geostationary satellite orbit by individual countries or groups of countries can start at various dates depending on requirements and readiness of technical facilities of countries,

resolves

1) that the registration with the I.T.U. of frequency assignments for space radiocommunication services and their use should not provide any permanent priority for any individual country or groups of countries and should not create an obstacle to the establishment of space systems by other countries,
that, accordingly, a country or a group of countries having registered with the I.T.U. frequencies for their space radiocommunication services, should take all practicable measures to realize the possibility of the use of new space systems by other countries or groups of countries so desiring, and

3) that the provisions contained in operative paragraphs 1 and 2 of this Resolution should be taken into account by the Administrations and the permanent organs of the Union.
RECOMMENDATION No. Spa LL

Relating to the Examination by Administrative Radio Conferences of the Situation with regard to Occupation of the Frequency Spectrum in Space Radiocommunications

considering

a) that the frequency bands available for space applications are limited in number and size;

b) that the possible positions for satellites whose main purpose is to establish telecommunication links are limited in number and that certain positions are more favourable than others for certain links;

c) that all administrations should be enabled to establish the space links which they deem necessary;

d) that the scale and cost of space networks or systems are such that their operation and development must be hindered as little as possible;

e) that technology is steadily and rapidly evolving and that the best possible use should be made of resources in space radiocommunications;

f) that administrations should ensure that frequency assignments for space applications are utilized in the most efficient manner possible consistent with developing technology and that such assignments are relinquished when no longer in use;

g) that despite the provisions of Article 9A and the principles adopted by this Conference, which provide for full consultation and coordination between administrations with a view to the optimum accommodation of all space systems, it is possible that as the use of frequencies and orbital
positions increases, administrations may encounter undue difficulty in one or more frequency bands in meeting their requirements for space radiocommunication;

recommends

that the next appropriate Administrative Radio Conference be empowered to deal with this situation, if it arises;

invites

the Administrative Council, in the event of such a situation arising, to include in the agenda for the next appropriate Administrative Radio Conference specific provisions enabling it to examine all aspects of the use of the frequency band(s) concerned including, inter alia, the relevant frequency assignments recorded in the Master International Frequency Register and to find a solution to the problem.
RECOMMENDATION Spa MM

Relating to Technical Standards for the Assessment
of Harmful Interference in the Frequency Bands above 28 MHz

The World Administrative Radio Conference for Space
Telecommunications, Geneva, 1971,

considering

a) that the definition of harmful interference (No. 93 of the
Radio Regulations), being of a qualitative nature, leads to a purely
subjective estimation of the nuisance;

b) that, for the accomplishment of its regulatory tasks, the I.F.R.B.
has adopted in its technical standards, for the frequency bands below 28 MHz,
values for the ratio between the wanted signal and the interfering signal,
below which harmful interference may be expected;

c) that "harmful interference" implies a considerable degree, or
probability, of interference;

d) that, as a consequence, it is desirable to determine the
level of interference by which any emission, radiation or induction
affects a radiocommunication service beyond specific limits established
to ensure the quality and reliability of performance required by the
nature of the service;

e) that the assessment of interference levels is related to
various factors such as the nature of the services concerned, number of
interference sources, percentages of time during which the interfering
signal affects the wanted signal;
and noting

a) that the I.F.R.B. has been considering the maximum allowable values of interference given in the pertinent C.C.I.R. Recommendations to be values which ensure a satisfactory service;

b) that, however, the I.F.R.B. does not possess data on the extent to which these recommended values and the associated percentages of time may be exceeded without affecting a service beyond the specific limits established to ensure the quality and reliability of performance required by the nature of the service;

invites the C.C.I.R.

to study this subject and to recommend the technical performance criteria for the frequency bands above 28 MHz, allocated to space radiocommunication, radio astronomy, and the terrestrial radiocommunication services concerned, in order to enable the I.F.R.B. and administrations to apply such criteria for these bands;

and invites the I.F.R.B.

to publish, for the information of administrations, its technical standards based upon the relevant provisions of the Radio Regulations and Appendices thereto, decisions of Administrative Conferences of the Union as appropriate and the Recommendations of the C.C.I.R., the state of the radio art and the development of transmission techniques.
Assigned Frequency Band: The frequency band (the centre of which coincides with the frequency assigned to the station and) the width of which equals the necessary bandwidth plus twice the absolute value of the frequency tolerance.
Modifications to Appendix 9 to the Radio Regulations

RESOLUTION No. Spa C

Relating to the inclusion of additional Section
in List VIIIA (Article 20, Appendix 9)

The World Administrative Radio Conference for Space
Telecommunications, Geneva, 1971,

considering

a) that it has modified the definitions which appeared in the
Radio Regulations and has adopted a series of new definitions for the
services and the various categories of earth and space stations;

b) that, within the framework of these modifications, it has
changed, in Appendix 9 to Radio Regulations, the headings and the
contents of the existing nine Sections of List VIIIA (List of Space
Radiocommunication Stations and Radio Astronomy Stations);

c) that however, in List VIIIA so modified, it is not possible
to include all the categories of earth and space stations notified to
the I.F.R.B. for inclusion in the Master International Frequency Register;

d) that the Conference has not had the time to make the required
modifications;

decides

to invite the Secretary-General, in collaboration with the
I.F.R.B., to take the necessary steps, on the basis of the existing
Sections of List VIIIA, to have additional Sections added to this List,
so that the particulars of all the earth and space stations notified to
the I.F.R.B. under Article 9A of the Radio Regulations, for recording
in the Master International Frequency Register, be included.
The Editorial Committee, having examined the following texts, submits them to the Plenary Meeting for a second reading.

ANNEX 1

Revision of Article 1 of the Radio Regulations

Article 1 of the Radio Regulations shall be amended as follows:

Section II is amended as follows:

Section II. Radio Systems, Services and Stations

NOC 21

ADD 21A Space Station

(MOD 84AE) A station located on an object which is beyond, is intended to go beyond, or has been beyond, the major portion of the earth’s atmosphere.

ADD 21B Earth Station

(MOD 84AD) A station located either on the earth’s surface or within the major portion of the earth’s atmosphere intended for communication:

— with one or more space stations; or
— with one or more stations of the same kind by means of one or more passive satellites or other objects in space.

ADD 21C Space Radiocommunication

(MOD 84AC) Any radiocommunication involving the use of one or more space stations or the use of one or more passive satellites or other objects in space.

ADD 21D Terrestrial Radiocommunication

(MOD 84AA) Any radiocommunication other than space radiocommunication or radio astronomy.

ADD 21D.1 In these Regulations, unless otherwise stated, any radiocommunication service relates to terrestrial radiocommunication.

R3—01
ADD 21E  Terrestrial Station
(MOD 84AB) A station effecting terrestrial radiocommunication.

NOC 22-68

MOD 69  Safety Service
A radiocommunication service used permanently or temporarily for the safeguarding of human life and property on the earth’s surface, in the air or in space.

(MOD 70-73 SUP (Spa 1)

SUP 84AA Replaced by ADD 21D
SUP 84AB Replaced by ADD 21E

Section IIA is replaced by the following new text:

NOC  Section IIA. Space Systems, Services and Stations
SUP 84AC (See 84ATE and 84ATF)
SUP 84AD Replaced by ADD 21B
SUP 84AE Replaced by ADD 21A
MOD 84AF Space System
Any group of co-operating earth and/or space stations employing space radiocommunication for specific purposes.

ADD 84AFA Satellite System
(MOD 84AL) A space system using one or more artificial earth satellites.

ADD 21E.1 1 In these Regulations, unless otherwise stated, any station is a terrestrial station.

R3—02
**ADD 84AFB**  *Satellite Network*

A satellite system or a part of a satellite system, consisting of only one satellite and the co-operating earth stations.

**ADD 84AFC**  *Satellite Link*

A radio link between a transmitting earth station and a receiving earth station through one satellite.

A satellite link comprises one up path and one down path.

**ADD 84AFD**  *Multi-Satellite Link*

A radio link between a transmitting earth station and a receiving earth station through two or more satellites, without any intermediate earth station.

A multi-satellite link comprises one up path, one or more satellite-to-satellite paths and one down path.

**MOD 84AG**  *Fixed-Satellite Service*

A radiocommunication service:

— between earth stations at specified fixed points when one or more satellites are used; in some cases this service includes satellite to satellite links, which may also be effected in the inter-satellite service;

— for connection between one or more earth stations at specified fixed points and satellites used for a service other than the fixed-satellite service (for example, the mobile-satellite service, broadcasting-satellite service, etc.).

**ADD 84AGA**  *Mobile-Satellite Service*

A radiocommunication service:

R3–03
— between mobile earth stations and one or more space stations; or between space stations used by this service;

— or between mobile earth stations by means of one or more space stations;

— and if the system so requires, for connection between these space stations and one or more earth stations at specified fixed points.

ADD 84AGB  *Aeronautical Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on board aircraft. Survival craft stations and emergency position indicating radiobeacon stations may also participate in this service.

ADD 84AGC  *Maritime Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on board ships. Survival craft stations and emergency position indicating radiobeacon stations may also participate in this service.

ADD 84AGD  *Land Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on land.

SUP 84AM  *Replaced by ADD 84ATD*

SUP 84AN

SUP 84AO
MOD 84AP  

*Broadcasting-Satellite Service*

A radiocommunication service in which signals transmitted or retransmitted by space stations are intended for direct reception¹ by the general public.

ADD 84APA  

*Individual reception* (in the broadcasting-satellite service)

The reception of emissions from a broadcasting-satellite space station by simple domestic installations and in particular those possessing small antennae.

ADD 84APB  

*Community reception* (in the broadcasting-satellite service)

The reception of emissions from a broadcasting-satellite space station by receiving equipment, which in some cases may be complex and have antennae larger than those used for individual reception, and intended for use:

— by a group of the general public at one location, or

— through a distribution system covering a limited area.

ADD 84APC  

*Radiodetermination-Satellite Service*

A radiocommunication service involving the use of radiodetermination and the use of one or more space stations.

MOD 84AQ  

*Radionavigation-Satellite Service*

A radiodetermination-satellite service used for the same purposes as the radionavigation service; in certain cases this service

ADD 84AP.1 ¹ In the broadcasting-satellite service, the term “direct reception” shall encompass both individual reception and community reception.
includes transmission or retransmission of supplementary information necessary for the operation of the radionavigation systems.

ADD 84AQA  *Aeronautical Radionavigation-Satellite Service*

A radionavigation-satellite service in which mobile earth stations are located on board aircraft.

ADD 84AQB  *Maritime Radionavigation-Satellite Service*

A radionavigation-satellite service in which mobile earth stations are located on board ships.

SUP 84AR

SUP 84AS

ADD 84ASA  *Earth Exploration-Satellite Service*

A radiocommunication service between earth stations and one or more space stations in which:

- information relating to the characteristics of the Earth and its natural phenomena is obtained from instruments on earth satellites;
- similar information is collected from air-borne or earth-based platforms;
- such information may be distributed to earth stations within the system concerned;
- platform interrogation may be included.

MOD 84AT  *Meteorological-Satellite Service*

An earth exploration-satellite service for meteorological purposes.
ADD 84ATA  Amateur-Satellite Service

A radiocommunication service using space stations on earth satellites for the same purposes as those of the amateur service.

ADD 84ATB  Standard Frequency-Satellite Service

A radiocommunication service using space stations on earth satellites for the same purposes as those of the standard frequency service.

ADD 84ATC  Time Signal-Satellite Service

A radiocommunication service using space stations on earth satellites for the same purposes as those of the time signal service.

ADD 84ATD  Space Research Service

(MOD 84AM) A radiocommunication service in which spacecraft or other objects in space are used for scientific or technological research purposes.

ADD 84ATE.  Space Operation Service

A radiocommunication service concerned exclusively with the operation of spacecraft, in particular tracking, telemetry and telecommand.

These functions will normally be provided within the service in which the space station is operating.

ADD 84ATF  Inter-Satellite Service

A radiocommunication service providing links between artificial earth satellites.

SUP 84AU
SUP 84AV

R3—07
Section IIB is replaced by the following new text:

NOC Section IIB. Space, Orbits and Types of Objects in Space

MOD 84BA  Deep Space

Space at distances from the Earth approximately equal to, or greater than, the distance between the Earth and the Moon.

ADD 84BAA  Spacecraft

(MOD 84BH) A man-made vehicle which is intended to go beyond the major portion of the earth’s atmosphere.

ADD 84BAB  Satellite

A body\footnote{A body so defined which revolves around the Sun is called a planet or planetoid.} which revolves around another body of preponderant mass and which has a motion primarily and permanently determined by the force of attraction of that other body.

ADD 84BAC  Active Satellite

(formerly 84AJ) An earth satellite carrying a station intended to transmit or retransmit radiocommunication signals.

ADD 84BAD  Passive Satellite

(formerly 84AK) An earth satellite intended to transmit radiocommunication signals by reflection.

ADD 84BAB.1
MOD 84BB  

Orbit

1. The path, relative to a specified frame of reference, described by the centre of mass of a satellite or other object in space, subjected solely to natural forces, mainly the force of gravity.

2. By extension, the path described by the centre of mass of an object in space subjected to natural forces and occasional low-energy corrective forces exerted by a propulsive device in order to achieve and maintain a desired path.

MOD 84BC  

Inclination of an Orbit (of an Earth Satellite)

The angle determined by the plane containing an orbit and the plane of the earth’s equator.

MOD 84BD  

Period (of a Satellite)

The time elapsing between two consecutive passages of a satellite or planet through a characteristic point on its orbit.

MOD 84BE  

Altitude of the Apogee (Perigee)

The altitude of the apogee (perigee) above a specified reference surface serving to represent the surface of the Earth.

SUP 84BF

ADD 84BFA  

Geosynchronous Satellite

An earth satellite whose period of revolution is equal to the period of rotation of the Earth about its axis.

MOD 84BG  

Geostationary Satellite

A satellite, the circular orbit of which lies in the plane of the earth’s equator and which turns about the polar axis of the
Earth in the same direction and with the same period as those of the Earth’s rotation.

The orbit on which a satellite should be placed to be a geostationary satellite is called the “geostationary satellite orbit”.

SUP  84BH  Replaced by ADD 84BAA

Section III is amended as follows:

NOC  85-98

ADD  98A  Equivalent Isotropically Radiated Power (e.i.r.p.)

The product of the power of an emission as supplied to an antenna and the antenna gain in a given direction relative to an isotropic antenna.
NOC  99-103

**Equivalent Satellite-Link Noise Temperature**

The noise temperature at the input of the earth station receiver corresponding to the radio-frequency noise power which produces the total observed noise at the output of the satellite link excluding noise due to interference coming from satellite links using other satellites and from terrestrial systems.

**Co-ordination Distance**

Distance from an earth station in a given azimuth within which a terrestrial station sharing the same frequency band may cause or be subject to more than a permissible level of interference.

**Co-ordination Contour**

The line joining the points which are on all azimuths around this earth station at a distance from this station equal to the co-ordination distance corresponding to each azimuth.

**Co-ordination Area**

Area around an earth station enclosed by the co-ordination contour.
ANNEX 2

Revision of Article 2 of the Radio Regulations

Article 2 of the Radio Regulations shall be amended as follows:

Replace Section III by the following new text:

MOD Section III. Nomenclature of the Frequency and Wavelength Bands Used in Radiocommunication

MOD 112 § 7. The radio spectrum shall be subdivided into nine frequency bands, which shall be designated by progressive whole numbers in accordance with the following Table. Frequencies shall be expressed:

— in kilohertz (kHz) up to and including 3000 kHz
— in megahertz (MHz) thereafter up to and including 3000 MHz
— in gigahertz (GHz) thereafter up to and including 3000 GHz.

However, where adherence to these provisions would introduce serious difficulties, for example in connection with the notification and registration of frequencies, the lists of frequencies and related matters, reasonable departures may be made.

- Band 11 = EHF

R3—13
ANNEX 3

Revision of Article 5 of the Radio Regulations

Article 5 of the Radio Regulations shall be amended as follows:

Frequency Allocations
10 kHz to 275 GHz

Section I. Regions and Areas

(MOD) § 1. For the allocation of frequencies the world has been subdivided into three Regions (see Appendix 24).

ADD 1 See Resolution No. 6.
(MOD) 125.1 2 It should be noted that where the words “regions” or “regional” are without a capital “R” in these Regulations, they do not relate to the three Regions here defined for purposes of frequency allocation.
ANNEX 4

Revision of Article 6 of the Radio Regulations

Article 6 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 415 by the following new text:

MOD 415 § 2. (1) When special circumstances make it indispensable to do so, an administration may, as an exception to the normal methods of working authorized by these Regulations, have recourse to the special methods of working enumerated below, on the sole condition that the characteristics of the stations still conform to those inserted in the Master International Frequency Register:

a) a fixed station in the terrestrial radiocommunication service or an earth station in the fixed satellite service may, on a secondary basis, transmit to mobile stations on its normal frequencies;

b) a land station may communicate, on a secondary basis, with fixed stations in the terrestrial radiocommunication service or earth stations in the fixed satellite service or other land stations of the same category.

Replace Regulation No. 417 by the following new text:

MOD 417 § 3. Any administration may assign a frequency in a band allocated to the fixed service or allocated to the fixed satellite service to a station authorized to transmit, unilaterally, from one specified fixed point to one or more specified fixed points provided that such transmissions are not intended to be received directly by the general public.

R3—15
Add the following new text after Regulation No. 419:

ADD 419A § 5A. Earth stations on board aircraft are authorized to use frequencies in the bands allocated to the maritime mobile-satellite service for the purpose of communicating, via the stations of that service, with the public telegraph and telephone networks.
ANNEX 5

Revision of Article 7 of the Radio Regulations

Article 7 of the Radio Regulations shall be amended as follows:

Add the following new text after Regulation Section I:

ADD

Section IA. Broadcasting-Satellite Service

ADD 428A § 2A. In devising the characteristics of a broadcasting space station, all technical means available shall be used to reduce, to the maximum extent practicable, the radiation over the territory of other countries unless an agreement has been previously reached with such countries.

Replace Section VII by the following new text:

MOD Section VII. Terrestrial Radiocommunication Services sharing frequency bands with Space Radiocommunication Services above 1 GHz

Choice of Sites and Frequencies

(MOD) 470A § 18. Sites and frequencies for terrestrial stations, operating in frequency bands shared with equal rights between terrestrial radiocommunication and space radiocommunication services shall be selected having regard to the relevant Recommendations of the C.C.I.R. with respect to geographical separation from earth stations.

ADD 470AA § 18bis. (1) As far as practicable, sites for transmitting stations, in the fixed or mobile service, employing maximum values of equi-

ADD 470AA.1 ¹ For their own protection receiving stations in the fixed or mobile services operating in bands shared with space radiocommunication services (space-to-Earth) should also avoid directing their antennae towards the geostationary satellite orbit if their sensitivity is sufficiently high that interference from space station transmissions may be significant.

R3—17
valent isotropically radiated power exceeding 35 dBW in the frequency bands between 1 and 10 GHz, should be selected so that the direction of maximum radiation of any antenna will be at least 2° away from the geostationary satellite orbit, taking into account the effect of atmospheric refraction.¹

ADD 470AB (2) As far as practicable, sites for transmitting stations, in the fixed or mobile service, employing maximum values of equivalent isotropically radiated power exceeding 45 dBW in the frequency bands between 10 and 15 GHz, should be selected so that the direction of maximum radiation of any antenna will be at least 1.5° away from the geostationary satellite orbit, taking into account the effect of atmospheric refraction.²

ADD 470AC (3) In the frequency bands above 15 GHz there shall be no restriction as to the direction of maximum radiation for stations in the fixed or mobile service.

Power Limits

MOD 470B §19. (1) The maximum equivalent isotropically radiated power of a station in the fixed or mobile service shall not exceed +55 dBW.

ADD 470BA (Ibis) Where compliance with No. 470AA is impracticable the maximum equivalent isotropically radiated power of a station in the fixed or mobile service shall not exceed:

+47 dBW in any direction within 0.5° of the geostationary satellite orbit; or

ADD 470AA.1 ¹ See No. 470AA.1.
ADD 470AB.1 ² See No. 470AB.1.
+47 dBW to +55 dBW, on a linear decibel scale (8 dB per degree), in any direction between 0.5° and 1.5° of the geostationary satellite orbit, taking into account the effect of atmospheric refraction.1

MOD 470C (2) The power delivered by a transmitter to the antenna of a station in the fixed or mobile service in frequency bands between 1 and 10 GHz, shall not exceed +13 dBW.

ADD 470CA (2bis) The power delivered by a transmitter to the antenna of a station in the fixed or mobile service in frequency bands above 10 GHz shall not exceed +10 dBW.

MOD 470D (3) The limits given in Nos. 470AA, 470B, 470BA and 470C apply in the following frequency bands allocated to the fixed satellite service and the meteorological satellite service for reception by space stations, where these bands are shared with equal rights with the fixed or mobile service:

2 655 - 2 690 MHz for Regions 2 and 3.
5 800 - 5 850 MHz (for the countries mentioned in No. 390).
5 850 - 5 925 MHz for Regions 1 and 3.
5 925 - 6 425 MHz
7 900 - 7 975 MHz
7 975 - 8 025 MHz (for the countries mentioned in No. 392H).
8 025 - 8 400 MHz

ADD 470BA.1 See No. 470AA.2.
ADD 470DA  (4) The limits given in Nos. 470AB, 470B and 470CA apply in the following frequency bands allocated to the fixed-satellite service for reception by space stations, where these bands are shared with equal rights with the fixed or mobile service:

10.95 - 11.2 GHz (Region 1)
12.5 - 12.75 GHz (Regions 1 and 2)
14.175 - 14.3 GHz (for the countries mentioned in No. 407)
14.4 - 14.5 GHz

ADD 470DB  (5) The limits given in Nos. 470B and 470CA apply in the following frequency bands allocated to the fixed-satellite service for reception by space stations, where these bands are shared with equal rights with the fixed or mobile service:

27.5 - 29.5 GHz
29.5 - 31 GHz (for the countries mentioned in No. 409E).

Replace Section VIII by the following new text:

MOD Section VIII. Space Radiocommunication Services sharing Frequency Band with Terrestrial Radiocommunication Services above 1 GHz

Choice of Sites and Frequencies

(MOD) 470E § 20. Sites and frequencies for earth stations, operating in frequency bands shared with equal rights between terrestrial and space radiocommunication services, shall be selected having regard to the relevant Recommendations of the C.C.I.R. with respect to geographical separation from terrestrial stations.

Power Limits

MOD 470G (2) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands between 1 and 15 GHz, shall not exceed the following limits except as provided in Nos. 470H or 470GC:

\[ +40 \text{ dBW in any } 4 \text{ kHz band for } \delta \leq 0^\circ \]

\[ +40 + 3\delta \text{ dBW in any } 4 \text{ kHz band for } 0^\circ < \delta \leq 5^\circ \]

where \( \delta \) is the angle of elevation of the horizon viewed from the centre of radiation of the antenna of the earth station and measured as positive above the horizontal plane and negative below it.

ADD 470GA (2A) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands above 15 GHz shall not exceed the following limits except as provided in Nos. 470H or 470GD:

\[ +64 \text{ dBW in any } 1 \text{ MHz band for } \delta \leq 0^\circ \]

\[ +64 + 3\delta \text{ dBW in any } 1 \text{ MHz band for } 0^\circ < \delta \leq 5^\circ \]

where \( \delta \) is as defined in No. 470G.

ADD 470GB (2B) For angles of elevation of the horizon greater than 5° there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

ADD 470GC (2C) As an exception to the limits given in No. 470G, the equivalent isotropically radiated power towards the horizon for an earth station in the space research (deep-space) shall not exceed +55 dBW in any 4 kHz band.

ADD 470GD (2D) As an exception to the limits given in No. 470GA, the equivalent isotropically radiated power towards the horizon for space research earth station (deep-space) shall not exceed +79 dBW in any 1 MHz band.
MOD 470H  (3) The limits given in No. 470G, No. 470GA, No. 470GC and No. 470GD, as applicable, may be exceeded by not more than 10 dB. However, when the resulting co-ordination area extends into the territory of another administration, such increase shall be subject to agreement by that administration.

SUP 470I

MOD 470J  (3B) The limits given in No. 470G apply in the following frequency bands allocated to the fixed-satellite service and earth exploration-satellite service, including the meteorological-satellite service for transmission by earth stations where these bands are shared with equal rights with the fixed or mobile service:

- 2 655 - 2 690 MHz (Regions 2 and 3)
- 4 400 - 4 700 MHz
- 5 800 - 5 850 MHz (for the countries mentioned in No. 390)
- 5 850 - 5 925 MHz (Regions 1 and 3)
- 5 925 - 6 425 MHz
- 7 900 - 7 975 MHz
- 7 975 - 8 025 MHz (for the countries mentioned in No. 392H)
- 8 025 - 8 400 MHz
- 10.95 - 11.2 GHz (Region 1)
- 12.50 - 12.75 GHz (Regions 2 and for the countries mentioned in No. 405BA)
- 14.175 - 14.300 GHz (for the countries mentioned in No. 407)
- 14.4 - 14.5 GHz

ADD 470JA  Spa (3B) The limits given in No. 470GA apply in the following frequency band allocated to transmission by earth stations in the fixed satellite service, where this is shared with equal rights with the fixed
or mobile service:

\[ 27.5 \text{ - } 29.5 \text{ GHz} \]

*Minimum Angle of Elevation*

**MOD 470K** § 22. (1) Earth stations.

MOD **470L** (2) Earth station antennae shall not be employed for transmission at elevation angles of less than 3 degrees measured from the horizontal plane to the direction of maximum radiation, except when agreed to by administrations concerned or those whose services may be affected. In case of reception by an earth station, the above value shall be used for co-ordination purposes if the operating angle of elevation is less than that value.

**ADD 470LA** (2A) As an exception to No. 470L, earth station antennae in the space research service (near-earth) shall not be employed for transmission at elevation angles of less than 5 degrees, and earth station antennae in the space research service (deep-space) shall not be employed for transmission at elevation angles of less than 10 degrees, both angles being those measured from the horizontal plane to the direction of maximum radiation. In case of reception by an earth station, the above values shall be used for co-ordination purposes if the operating angle of elevation is less than those values.

**SUP 470M**

R3—23
Power Flux Density Limits

Limits of Power Flux Density from Space Stations

MOD 470N § 23. (1) Power flux density limits between 1 690 MHz and 1 700 MHz.

ADD 470NA a) The power flux density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed —133 dBW/m² in any 1-5-MHz band. This limit relates to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NB b) The limit given in No. 470NA applies in frequency band listed in No. 470NC which is allocated to transmission by space stations in the earth exploration-satellite service and in particular the meteorological-satellite service where this band is shared with equal rights with the meteorological aids service.

ADD 470NC 1 690 - 1 700 MHz.
ADD 470ND (2) Power flux density limits between 1 670 MHz and 2 535 MHz.

ADD 470NE a) The power flux density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 154 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- \(154 + \frac{8 - 5}{2}\) dBW/m² in any 4 kHz band for angles of arrival (\(\theta\)) between 5 and 25 degrees above the horizontal plane;

- 144 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NF b) The limits given in No. 470NE apply in the frequency bands listed in No. 470NG which are allocated to transmission by space stations in the following space radiocommunication services:

- Earth exploration-satellite service and in particular meteorological-satellite service (space-to-Earth)

- Space research service (space-to-Earth)

- Fixed-satellite service (space-to-Earth)

where these bands are shared with equal rights with the fixed or mobile services.
ADD 470NG

1 670 - 1 690 MHz
1 690 - 1 700 MHz (for the countries mentioned in No. 354A)
1 700 - 1 710 MHz
1 770 - 1 790 MHz (for the countries mentioned in No. 356AA)
2 200 - 2 290 MHz
2 290 - 2 300 MHz
2 500 - 2 535 MHz

ADD 470NGA

c) The power flux density values given in No. 470NE are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the bands listed in No. 470NG and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed —168 dBW in any 4 kHz band.

ADD 470NH

(3) Power flux density limits between 2 500 - 2 690 MHz.

ADD 470NI

a) The power flux density at the earth’s surface produced by emissions from a space station in the broadcasting-satellite service for all conditions and for all methods of modulation shall not exceed the following values:

—152 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;
- $152 + \frac{3(8 - 5)}{4}$ dBW/m² in any 4-kHz band for angles of arrival ($\theta$) between 5 and 25 degrees above the horizontal plane;

- 137 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NJ

b) The limits given in No. 470NI apply in the frequency band:

2 500 - 2 690 MHz

which is shared by the broadcasting-satellite service with the fixed or mobile service.

ADD 470NK
c) The power flux density values given in No. 470NI are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the band mentioned in No. 470NJ and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed $-168$ dBW in any 4 kHz band.

ADD 470NL (4) Power flux density limits between 3 400 MHz and 7 750 MHz.

ADD 470NM

a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a
passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 152 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

\[-152 + \frac{(8 - 5)}{2}\] dBW/m² in any 4 kHz band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

- 142 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NN b) The limits given in No. 470NM apply in the frequency bands listed in No. 470NO which are allocated to transmission by space stations in the following space radiocommunication services:

- fixed-satellite service (space to Earth)
- meteorological-satellite service (space to Earth)

where these bands are shared with equal rights with the fixed or mobile services:

ADD 470NO
3 400 - 4 200 MHz
7 250 - 7 300 MHz (for the countries mentioned in No. 392G)
7 300 - 7 750 MHz
ADD 470NP  (5) Power flux density limits between 8 025 MHz and 11-7 GHz.

ADD 470NQ  a) The power flux density at the earth's surface, produced by emissions from a space station, or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 150 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $150 + \frac{(8 - 5)}{2}$ dBW/m² in any 4 kHz band for angles of arrival $(\theta)$ between 5 and 25 degrees above the horizontal plane;

- 140 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NR  b) The limits given in No. 470NQ apply in the frequency bands listed in No. 470NS which are allocated to transmission by space stations in the following space radiocommunication services:

- Earth exploration satellite service (space to Earth)
- space research service (space to Earth)
- fixed-satellite service (space to Earth)

where these bands are shared with equal rights with the fixed or mobile services.
ADD 470NS

8 025 - 8 400 MHz
8 400 - 8 500 MHz
10-95 - 11-2 GHz
11-45 - 11-7 GHz

ADD 470NT

(6) Power flux density limits between 11-7 and 12-75 GHz.

ADD 470NU

a) The power flux density at the earth's surface, produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 148 dBW/m² in any 4 kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $148 + \frac{(8-5)}{2}$ dBW/m² in any 4 kHz band for angles of arrival (θ) between 5 and 25 degrees above the horizontal plane;

- 138 dBW/m² in any 4 kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NV

b) The limits given in No. 470NU apply in the frequency band indicated in No. 470NW which is allocated to the fixed-satellite service for transmission by space stations where this band is shared with equal rights with the fixed or mobile service.

R3—30
ADD 470NW
12.5 - 12.75 GHz (Region 3 and for countries mentioned in No. 405BA)

ADD 470NX
(7) Power flux density limits between 17.7 GHz and 22 GHz.

ADD 470NY
a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 115 dBW/m² in any 1 MHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $115 + \frac{(\theta - 5)}{2}$ dBW/m² in any 1 MHz band for angles of arrival ($\theta$) between 5 and 25 degrees above the horizontal plane;

- 105 dBW/m² in any 1 MHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NZ
b) The limits given in No. 470NY apply in the frequency bands listed in No. 470NZA which are allocated to transmission by space stations in the following space radiocommunication services:

- fixed-satellite service (space to Earth)

- Earth exploration satellite service (space to Earth)

where these bands are shared with equal rights with the fixed or mobile services:

R3—31
ADD 470NZA

17.7 - 19.7 GHz
21.2 - 22 GHz

ADD 470NZB

(8) The limits given in 470NA, 470NE, 470NI, 470NM, 470NQ, 470NU and 470NY may be exceeded on the territory of any administration which has so agreed.

SUP 470O to 470U

Replace Section IX by the following new text:

MOD Section IX. Space Radiocommunication Services
**Cessation of Emissions**

**MOD 470V § 24.** Space stations shall be fitted with devices to ensure immediate cessation of their radio emissions by telecommand, whenever such cessation is required under the provisions of these Regulations.

**SUP Note 1**

**ADD Control of Interference between Geostationary-Satellite Systems and Non-Synchronous Inclined Orbit-Satellite Systems**

**ADD 470VA § 25.** Non-geostationary space stations in the fixed satellite services shall cease or reduce to a negligible level radio emissions, and their associated earth stations shall not transmit to them whenever there is insufficient angular separation between the non-geostationary satellite and geostationary satellites and unacceptable interference to geostationary satellite space systems operating in accordance with these Regulations.

**ADD Station Keeping of Space Stations 2**

**ADD 470VB § 26.** Space stations on geostationary satellites:

**ADD 470VC** — shall have the capability of maintaining their positions within $\pm$ 1 degree of the longitude of their nominal positions, but efforts should be made to achieve a capability of maintaining their positions at least within $\pm$ 0.5 degrees of the longitude of their nominal positions,

**ADD 470VA.1** 1 The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

2 In the case of space stations on geosynchronous satellites with orbits having an angle of inclination greater than 5 degrees the positional tolerance shall relate to the nodal point.

R3—33
ADD  470VD — shall maintain their positions within ±1 degree of longitude of their nominal positions irrespective of the cause of variation, but

ADD  470VE — need not comply with No. 470VD as long as the satellite network to which the space station belongs does not produce an unacceptable level interference ¹ into any other satellite network whose space station complies with the limits given in No. 470VD.

ADD  

Pointing Accuracy of Antennae on Geostationary Satellites

ADD  470VF § 27. The pointing direction of maximum radiation of any earthward beam of antennae on geostationary satellites shall be capable of being maintained within:

10% of the half power beamwidth relative to the nominal pointing direction; or

0.5 degrees relative to the nominal pointing direction.

whichever is greater. This provision applies only when these beams are intended for less than global coverage.

In the event that the beam is not rotationally symmetrical about the axis of maximum radiation, the tolerance in any plane containing this axis shall be related to the half power beamwidth in that plane.

This accuracy shall be maintained only if it is required to avoid unacceptable interference ² to other systems.

ADD  470VE.1 ¹ The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

ADD  470VF.1 ² The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

R3—34
In the frequency band 8 025 to 8 400 MHz, which the Earth exploration-satellite service using non-geostationary satellites shares with the fixed-satellite service (Earth-to-space or the meteorological satellite service (Earth-to-space), the maximum power flux density produced at the geostationary satellite orbit by any Earth exploration-satellite service space station shall not exceed $-174 \text{ dBW/m}^2$ in any 4 kHz band.
ANNEX 6

Revision of Article 8 of the Radio Regulations

Article 8 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 477 by the following new text:

MOD 477

e) the study, on a long-term basis, of the usage of the radio spectrum, with a view to making recommendations for its more effective use;
ANNEX 9

Revision of Article 14 of the Radio Regulations

Article 14 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 695 by the following new text:

MOD 695 § 3. In order to avoid interference:

— locations of transmitting stations and, where the nature of the service permits, locations of receiving stations shall be selected with particular care;

— radiation in and reception from unnecessary directions shall be minimized, where the nature of the service permits, by taking the maximum practical advantage of the properties of directional antennae;

— the choice and use of transmitters and receivers shall be in accordance with the provisions of Article 12;

— the conditions specified under No. 470V shall be fulfilled.
ANNEX 10

Revision of Article 15 of the Radio Regulations

Article 15 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 717 by the following new text:

MOD 717 (2) In such a case, the administration concerned may also request the Board to act in accordance with the provisions of Sections VII and VIII of Article 9 and Sections IX and X of Article 9A; but it shall then supply the Board with the full facts of the case, including all the technical and operational details and copies of the correspondence.
ANNEX 11

Revision of Article 27 of the Radio Regulations

Article 27 of the Radio Regulations shall be amended as follows:

Replace Nos. 951 and 952 by the following new texts:

MOD 951 § 3. (1) Stations on board aircraft may communicate with stations of the maritime mobile or maritime mobile satellite services. They shall conform to those provisions of these Regulations which relate to these service.

MOD 952 (2) For this purpose stations on board aircraft should use the frequencies allocated to the maritime mobile or maritime mobile satellite services. However, having regard to interference which may be caused by aircraft stations at high altitudes, maritime mobile frequencies in the bands above 30 MHz shall not be used by aircraft stations in any specific area without the prior agreement of all the administrations of the area in which interference is likely to be caused. In particular, aircraft stations operating in Region I should not use frequencies in the bands above 30 MHz allocated to the maritime mobile service by virtue of any agreement between administrations in that Region.

R3—39
RECOMMENDATION No. Spa DD

Relating to the Criteria to be Applied for Sharing between the Broadcasting-Satellite Service and the Terrestrial Broadcasting Service in the Band 620-790 MHz

considering

a) that, within, the band 620-790 MHz, assignments may be made to television stations using frequency modulation in the broadcasting-satellite service;

b) that it is necessary to have a power flux density limit which will provide adequate protection to the terrestrial broadcasting service:

taking into account

a) that the conclusions of the Special Joint Meeting of the C.C.I.R. Geneva, 1971, indicated that the following power flux density limits are necessary to protect the terrestrial broadcasting service:

\[
\begin{align*}
-121 \text{ dBW/m}^2 & \quad \delta < 20^\circ \\
-121 + 0.4 (\delta - 20) \text{ dBW/m}^2 & \quad 20^\circ < \delta < 60^\circ \\
-105 \text{ dBW/m}^2 & \quad 60^\circ < \delta < 90^\circ 
\end{align*}
\]

where \( \delta \) is the angle of arrival above the horizontal plane;

b) that additional tests carried out by one administration after the Special Joint Meeting of the C.C.I.R., indicated that the following more conservative power flux density limits may be necessary:

\[
\begin{align*}
-130 \text{ dBW/m}^2 & \quad \delta < 20^\circ \\
-130 + 0.4 (\delta - 20) \text{ dBW/m}^2 & \quad 20^\circ < \delta < 60^\circ \\
-114 \text{ dBW/m}^2 & \quad 60^\circ < \delta < 90^\circ 
\end{align*}
\]

where \( \delta \) is the angle of arrival above the horizontal plane;
c) that additional information is required on the protection ratio for interference from an FM television signal into a VSB television signal for both the 625- and 525-line systems;

d) that with terrestrial television receiving systems using current technology, the minimum field strength to be protected may in some cases be less than the values included in C.C.I.R. Recommendation 417-2;

e) that account may have to be taken of ground reflections;

f) that energy dispersal techniques may reduce the required protection ratio and should be used if shown to be effective;

recommends

1. that in view of the absence of sufficient information on tests under operational conditions and in order to provide sharing criteria, on a provisional basis, the maximum power flux density produced at the surface of the earth within the service area of a terrestrial broadcasting station (see C.C.I.R. Recommendation 417-2), by a space station in the broadcasting-satellite service in the band 620-790 MHz should not exceed:

   \[ -129 \text{ dBW/m}^2 \quad \text{if } \theta < 20^\circ \]
   \[ -129 + 0.4 (\theta - 20) \text{ dBW/m}^2 \quad 20^\circ < \theta < 60^\circ \]
   \[ -113 \text{ dBW/m}^2 \quad 60^\circ < \theta < 90^\circ \]

where \( \theta \) is the angle of arrival above the horizontal plane;

2. that these limits be not exceeded on the territory of an administration except with the latter's agreement;

3. that the transmission of unmodulated carriers should be avoided.

4. that the C.C.I.R. urgently study the sharing criteria to be applied to frequency sharing between the broadcasting-satellite service and the terrestrial broadcasting service in the band 620-790 MHz and prepare a Recommendation on power flux densities to be used in lieu of the above provisional limits;

R3—41
5. that in its studies the C.C.I.R. consider in particular the following aspects:

5.1 the required protection ratio for both 525- and 625-line systems for interference from an FM television signal into a VSB television signal;

5.2 the minimum field strength to be protected for the terrestrial television service taking into account the current state of the art;

5.3 the effect of ground reflections;

5.4 the number of broadcasting satellites that may be visible from a terrestrial broadcasting receiver;

5.5 the effect of polarization discrimination;

5.6 the effect of antenna directivity;

6. that in its studies the C.C.I.R. should consider the advantages of energy dispersal techniques in the broadcasting-satellite service (television).
The Editorial Committee, having examined the following texts, submits them to the Plenary Meeting for a second reading.

ANNEX

Revision of Article 1 of the Radio Regulations

Article 1 of the Radio Regulations shall be amended as follows:

Section II is replaced by the following new text:

NOC Section II. Radio Systems, Services and Stations

ADD 21A Space Station
(MOD 84AE) A station located on an object which is beyond, is intended to go beyond, or has been beyond, the major portion of the earth’s atmosphere.

ADD 21B Earth Station
(MOD 84AD) A station located either on the earth’s surface or within the major portion of the earth’s atmosphere intended for communication:
— with one or more space stations; or
— with one or more stations of the same kind by means of one or more passive satellites or other objects in space.

ADD 21C Space Radiocommunication
(MOD 84AC) Any radiocommunication involving the use of one or more space stations or the use of one or more passive satellites or other objects in space.

ADD 21D Terrestrial Radiocommunication
(MOD 84AA) Any radiocommunication other than space radiocommunication or radio astronomy.

ADD 21D.1 In these Regulations, unless otherwise stated, any radiocommunication service relates to terrestrial radiocommunication.

R3—01
ADD 21E  Terrestrial Station
(MOD 84AB) A station effecting terrestrial radiocommunication.

NOC 22-68

MOD 69  Safety Service
A radiocommunication service used permanently or temporarily for the safeguarding of human life and property on the earth's surface, in the air or in space.

(MOD 70-73) SUP (Spa 1)

NOC 74-84

SUP 84AA Replaced by ADD 21D

SUP 84AB Replaced by ADD 21E

Section II.A is replaced by the following new text:

NOC  Section II.A. Space Systems, Services and Stations

SUP 84AC (See 84ATE and 84ATF)

SUP 84AD Replaced by ADD 21B

SUP 84AE Replaced by ADD 21A

MOD 84AF Space System
Any group of co-operating earth and/or space stations employing space radiocommunication for specific purposes.

ADD 84AFA Satellite System
(MOD 84AL) A space system using one or more artificial earth satellites.

ADD 21E.1 1 In these Regulations, unless otherwise stated, any station is a terrestrial station.

R3—02
Satellite Network

A satellite system or a part of a satellite system, consisting of only one satellite and the co-operating earth stations.

Satellite Link

A radio-link between a transmitting earth station and a receiving earth station through one satellite.

A satellite link comprises one up path and one down path.

Multi-Satellite Link

A radio-link between a transmitting earth station and a receiving earth station through two or more satellites, without any intermediate earth station.

A multi-satellite link comprises one up path, one or more satellite-to-satellite paths and one down path.

Fixed-Satellite Service

A radiocommunication service:

— between earth stations at specified fixed points when one or more satellites are used; in some cases this service includes satellite to satellite links, which may also be effected in the inter-satellite service;

— for connection between one or more earth stations at specified fixed points and satellites used for a service other than the fixed-satellite service (for example, the mobile-satellite service, broadcasting-satellite service, etc.).

Mobile-Satellite Service

A radiocommunication service:
— between mobile earth stations and one or more space stations; or between space stations used by this service;
— or between mobile earth stations by means of one or more space stations;
— and if the system so requires, for connection between these space stations and one or more specified fixed points on the earth.

ADD 84AGB  *Aeronautical Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on board aircraft. Survival craft stations and emergency position indicating radiobeacon stations may also participate in this service.

ADD 84AGC  *Maritime Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on board ships. Survival craft stations and emergency position indicating radiobeacon stations may also participate in this service.

ADD 84AGD  *Land Mobile-Satellite Service*

A mobile-satellite service in which mobile earth stations are located on land.

SUP 84AH
SUP 84AI
SUP 84AJ  *Replaced by ADD 84BAC*
SUP 84AK  *Replaced by ADD 84BAD*
SUP 84AL  *Replaced by ADD 84AFA*
SUP 84AM  *Replaced by ADD 84ATD*
SUP 84AN
SUP 84AO

R3—04
MOD 84AP  \textit{Broadcasting-Satellite Service}

A radiocommunication service in which signals transmitted or retransmitted by space stations are intended for direct reception\(^1\) by the general public.

ADD 84APA  \textit{Individual reception} (in the broadcasting-satellite service)

The reception of emissions from a broadcasting-satellite space station by simple domestic installations and in particular those possessing small antennae.

ADD 84APB  \textit{Community reception} (in the broadcasting-satellite service)

The reception of emissions from a broadcasting-satellite space station by receiving equipment, which in some cases may be complex and have antennae larger than those used for individual reception, and intended for use:

- by a group of the general public at one location, or
- through a distribution system covering a limited area.

ADD 84APC  \textit{Radiodetermination-Satellite Service}

A radiocommunication service involving the use of radiodetermination and the use of one or more space stations.

MOD 84AQ  \textit{Radionavigation-Satellite Service}

A radiodetermination-satellite service used for the same purposes as the radionavigation service; in certain cases this service

ADD 84AP.1  \footnote{In the broadcasting-satellite service, the term “direct reception” shall encompass both individual reception and community reception.}

R3—05
includes transmission or retransmission of supplementary information necessary for the operation of the radionavigation systems.

ADD 84AQA  *Aeronautical Radionavigation-Satellite Service*

A radionavigation-satellite service in which mobile earth stations are located on board aircraft.

ADD 84AQB  *Maritime Radionavigation-Satellite Service*

A radionavigation-satellite service in which mobile earth stations are located on board ships.

SUP 84AR

SUP 84AS

ADD 84ASA  *Earth Exploration-Satellite Service*

A radiocommunication service between earth stations and one or more space stations in which:

- information relating to the characteristics of the Earth and its natural phenomena is obtained from instruments on earth satellites;
- similar information is collected from air-borne or earth-based platforms;
- such information may be distributed to earth stations within the system concerned;
- platform interrogation may be included.

MOD 84AT  *Meteorological-Satellite Service*

An earth exploration-satellite service for meteorological purposes.

R3—06
ADD 84ATA  Amateur-Satellite Service
A radiocommunication service using space stations on earth satellites for the same purposes as those of the amateur service.

ADD 84ATB  Standard Frequency-Satellite Service
A radiocommunication service using space stations on earth satellites for the same purposes as those of the standard frequency service.

ADD 84ATC  Time Signal-Satellite Service
A radiocommunication service using space stations on earth satellites for the same purposes as those of the time signal service.

ADD 84ATD  Space Research Service
A radiocommunication service in which spacecraft or other objects in space are used for scientific or technological research purposes.

ADD 84ATE  Space Operation Service
A radiocommunication service concerned exclusively with the operation of spacecraft, in particular tracking, telemetry and telecommand.

These functions will normally be provided within the service in which the space station is operating.

ADD 84ATF  Inter-Satellite Service
A radiocommunication service providing links between artificial earth satellites.

SUP 84AU
SUP 84AV

R3—07
Section IIB is replaced by the following new text:

NOC 84AW
NOC 84AX
NOC 84AY
NOC 84AZ

Section IIB. Space, Orbits and Types of Objects in Space

MOD 84BA Deep Space

Space at distances from the Earth approximately equal to, or greater than, the distance between the Earth and the Moon.

ADD 84BAA Spacecraft
(MOD 84BH) A man-made vehicle which is intended to go beyond the major portion of the earth’s atmosphere.

ADD 84BAB Satellite

A body\(^1\) which revolves around another body of preponderant mass and which has a motion primarily and permanently determined by the force of attraction of that other body.

ADD 84BAC Active Satellite
(formerly 84AJ) An earth satellite carrying a station intended to transmit or retransmit radiocommunication signals.

ADD 84BAD Passive Satellite
(formerly 84AK) An earth satellite intended to transmit radiocommunication signals by reflection.

ADD 84BAB.1 \(^1\) A body so defined which revolves around the Sun is called a planet or planetoid.

R3—08
 Orbit

1. The path, relative to a specified frame of reference, described by the centre of mass of a satellite or other object in space, subjected solely to natural forces, mainly the force of gravity.

2. By extension, the path described by the centre of mass of an object in space subjected to natural forces and occasional low-energy corrective forces exerted by a propulsive device in order to achieve and maintain a desired path.

Inclination of an Orbit (of an Earth Satellite)

The angle determined by the plane containing an orbit and the plane of the earth’s equator.

Period (of a Satellite)

The time elapsing between two consecutive passages of a satellite or planet through a characteristic point on its orbit.

Altitude of the Apogee (Perigee)

The altitude of the apogee (perigee) above a specified reference surface serving to represent the surface of the Earth.

Geosynchronous Satellite

An earth satellite whose period of revolution is equal to the period of rotation of the Earth about its axis.

Geostationary Satellite

A satellite, the circular orbit of which lies in the plane of the earth’s equator and which turns about the polar axis of the
The orbit on which a satellite should be placed to be a geostationary satellite is called the “geostationary satellite orbit”.

Section III is amended as follows:

Section III. Technical Characteristics

Equivalent Isotropically Radiated Power (e.i.r.p.)

The product of the power of an emission as supplied to an antenna and the antenna gain in a given direction relative to an isotropic antenna.
NOC  99-103

ADD  103A  *Equivalent Satellite-Link Noise Temperature*

The noise temperature at the input of the earth station receiver corresponding to the radio-frequency noise power which produces the total observed noise at the output of the satellite link excluding noise due to interference coming from satellite links using other satellites and from terrestrial systems.

ADD  103B  *Co-ordination Distance*

Distance from an earth station in a given azimuth within which a terrestrial station sharing the same frequency band may cause or be subject to more than a permissible level of interference.

ADD  103C  *Co-ordination Contour*

The line joining the points which are on all azimuths around this earth station at a distance from this station equal to the co-ordination distance corresponding to each azimuth.

ADD  103D  *Co-ordination Area*

Area around an earth station enclosed by the co-ordination contour.
ANNEX

Revision of Article 2 of the Radio Regulations

Article 2 of the Radio Regulations shall be amended as follows:

Replace Section III by the following new text:

MOD Section III. Nomenclature of the Frequency and Wavelength Bands Used in Radiocommunication

MOD 112 § 7. The radio spectrum shall be subdivided into nine frequency bands, which shall be designated by progressive whole numbers in accordance with the following Table. Frequencies shall be expressed:

— in kilohertz (kHz) up to and including 3000 kHz
— in megahertz (MHz) thereafter up to and including 3000 MHz
— in gigahertz (GHz) thereafter up to and including 3000 GHz.

However, where adherence to these provisions would introduce serious difficulties, for example in connection with the notification and registration of frequencies, the lists of frequencies and related matters, reasonable departures may be made.

R3—13
ANNEX 3

Revision of Article 5 of the Radio Regulations

Article 5 of the Radio Regulations shall be amended as follows:

Frequency Allocations\(^1\)
10 kHz to 275 GHz

Section I. Regions and Areas

(MOD) 125 § 1. For the allocation of frequencies the world has been subdivided into three Regions\(^2\) (see Appendix 24).

---

ADD (MOD) 125.1 1 See Resolution No. 6.
2 It should be noted that where the words “regions” or “regional” are without a capital “R” in these Regulations, they do not relate to the three Regions here defined for purposes of frequency allocation.
ANNEX 4

Revision of Article 6 of the Radio Regulations

Article 6 of the Radio Regulations shall be amended as follows:

*Replace Regulation No. 415 by the following new text:*

MOD 415 § 2. (1) When special circumstances make it indispensable to do so, an administration may, as an exception to the normal methods of working authorized by these Regulations, have recourse to the special methods of working enumerated below, on the sole condition that the characteristics of the stations still conform to those inserted in the Master International Frequency Register:

a) a fixed station in the terrestrial radiocommunication service or an earth station in the fixed satellite service may, on a secondary basis, transmit to mobile stations on its normal frequencies;

b) a land station may communicate, on a secondary basis, with fixed stations in the terrestrial radiocommunication service or earth stations in the fixed satellite service or other land stations of the same category.

*Replace Regulation No. 417 by the following new text:*

MOD 417 § 3. Any administration may assign a frequency in a band allocated to the fixed service or allocated to the fixed satellite service to a station authorized to transmit, unilaterally, from one specified fixed point to one or more specified fixed points provided that such transmissions are not intended to be received directly by the general public.

R3—15
Add the following new text after Regulation No. 419:

ADD 419A § 5A. Earth stations on board aircraft are authorized to use frequencies in the bands allocated to the maritime mobile-satellite service for the purpose of communicating, via the stations of that service, with the public telegraph and telephone networks.
ANNEX

Revision of Article 7 of the Radio Regulations

Article 7 of the Radio Regulations shall be amended as follows:

Add the following new text after Regulation Section I:

ADD

Section 1A. Broadcasting-Satellite Service

ADD 428A § 2A. In devising the characteristics of a broadcasting space station, all technical means available shall be used to reduce, to the maximum extent, the radiation over the territory of other countries unless an agreement has been previously reached with such countries.

Replace Section VII by the following new text:

MOD

Section VII. Terrestrial Radiocommunication Services sharing frequency bands with Space Radiocommunication Services above 1 GHz

Choice of Sites and Frequencies

(MOD) 470A § 18. Sites and frequencies for terrestrial stations, operating in frequency bands shared with equal rights between terrestrial radiocommunication and space radiocommunication services shall be selected having regard to the relevant Recommendations of the C.C.I.R. with respect to geographical separation from earth stations.

ADD 470AA § 18bis. (1) As far as practicable, sites for transmitting 1 stations, in the fixed or mobile service, employing maximum values of equi-

ADD 470AA.1 1 For their own protection receiving stations in the fixed or mobile services operating in bands shared with space radiocommunication services (satellite-to-earth) should also avoid directing their antennas towards the geostationary satellite orbit if their sensitivity is sufficiently high that interference from space station transmissions may be significant.
valent isotropically radiated power exceeding 35 dBW in the frequency bands between 1 and 10 GHz, should be selected so that the direction of maximum radiation of any antenna will be at least 2° away from the geostationary satellite orbit, taking into account the effect of atmospheric refraction.1

ADD 470AB  (2) As far as practicable, sites for transmitting 2 stations, in the fixed or mobile service, employing maximum values of equivalent isotropically radiated power exceeding 45 dBW in the frequency bands between 10 and 15 GHz, should be selected so that the direction of maximum radiation of any antenna will be at least 1-5° away from the geostationary satellite orbit, taking into account the effect of atmospheric refraction.2

ADD 470AC  (3) In the frequency bands above 15 GHz there shall be no restriction as to the direction of maximum radiation for stations in the fixed or mobile service.

**Power Limits**

MOD 470B § 19. (1) The maximum equivalent isotropically radiated power of a station in the fixed or mobile service shall not exceed +55 dBW.

ADD 470BA (1bis) Where compliance with No. 470AA is impracticable the maximum equivalent isotropically radiated power of a station in the fixed or mobile service shall not exceed:

+47 dBW in any direction within 0-5° of the geostationary satellite orbit; or

ADD 470AA.2 1 Information on this subject is given in the most recent version of C.C.I.R. Report No. 393.

ADD 470AB.1 2 See No. 470AA.1.

ADD 470AB.2 3 See No. 470AA.2.
+47 dBW to +55 dBW, on a linear decibel scale (8 dB per degree), in any direction between 0-5° and 1-5° of the geostationary satellite orbit, taking into account the effect of atmospheric refraction.  

MOD 470C  (2) The power delivered by a transmitter to the antenna of a station in the fixed or mobile service in frequency bands between 1 and 10 GHz, shall not exceed +13 dBW.

ADD 470CA  (2bis) The power delivered by a transmitter to the antenna of a station in the fixed or mobile service in frequency bands above 10 GHz shall not exceed +10 dBW.

MOD 470D  (3) The limits given in Nos. 470AA, 470B, 470BA and 470C apply in the following frequency bands allocated to the fixed satellite service and the meteorological satellite service for reception by space stations, where these bands are shared with equal rights with the fixed or mobile service:

- 2 655 - 2 690 MHz for Regions 2 and 3.
- 5 800 - 5 850 MHz (for the countries mentioned in No. 390).
- 5 850 - 5 925 MHz for Regions 1 and 3.
- 5 925 - 6 425 MHz
- 7 900 - 7 975 MHz
- 7 975 - 8 025 MHz (for the countries mentioned in No. 392H).
- 8 025 - 8 400 MHz

ADD 470BA.1  ' See No. 470AA.2.
ADD 470DA (4) The limits given in Nos. 470AB, 470B and 470CA apply in the following frequency bands allocated to the fixed-satellite service for reception by space stations, where these bands are shared with equal rights with the fixed or mobile service:

- 10.95 - 11.2 GHz (Region 1)
- 12.5 - 12.75 GHz (Regions 1 and 2)
- 14.175 - 14.3 GHz (for the countries mentioned in No. 407)
- 14.4 - 14.5 GHz

ADD 470DB (5) The limits given in Nos. 470AC, 470B and 470CA apply in the following frequency bands allocated to the fixed-satellite service for reception by space stations, where these bands are shared with equal rights with the fixed or mobile service:

- 27.5 - 29.5 GHz
- 29.5 - 31 GHz (for the countries mentioned in No. 409E).

Replace Section VIII by the following new text:

MOD Section VIII. Space Radiocommunication Services sharing Frequency Band with Terrestrial Radiocommunication Services above 1 GHz

Choice of Sites and Frequencies

(MOD) 470E § 20. Sites and frequencies for earth stations, operating in frequency bands shared with equal rights between terrestrial and space radiocommunication services, shall be selected having regard to the relevant Recommendations of the C.C.I.R. with respect to geographical separation from terrestrial stations.

Power Limits

MOD 470G  (2) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands between 1 and 15 GHz, shall not exceed the following limits except as provided in Nos. 470H or 470HA:

\[ +40 \text{ dBW in any 4-kHz band for } \delta \leq 0^\circ \]
\[ +40 \pm 3 \delta \text{ dBW in any 4-kHz band for } 0^\circ < \delta \leq 5^\circ \]

where \( \delta \) is the angle of elevation of the horizon viewed from the centre of radiation of the antenna of the earth station and measured as positive above the horizontal plane and negative below it.

ADD 470GA  (2A) The equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands above 15 GHz shall not exceed the following limits except as provided in Nos. 470H or 470HB:

\[ +64 \text{ dBW in any 1-MHz band for } \delta \leq 0^\circ \]
\[ +64 + 3 \delta \text{ dBW in any 1-MHz band for } 0^\circ < \delta \leq 5^\circ \]

where \( \delta \) is as defined in No. 470G.

ADD 470GB  (2B) For angles of elevation of the horizon greater than 5° there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

MOD 470H  (3). The limits given in No. 470G, No. 470GA, No. 470HA and No. 470HB, as applicable, may be exceeded by not more than 10 dB. However, when the resulting co-ordination area extends into the territory of another administration, such increase shall be subject to agreement by that administration.
ADD 470HA (3A) As an exception to the limits given in No. 470G, the equivalent isotropically radiated power towards the horizon for an earth station in the space research (deep-space) shall not exceed +55 dBW in any 4-kHz band.

ADD 470HB (3B) As an exception to the limits given in No. 470GA, the equivalent isotropically radiated power towards the horizon for space research earth station (deep-space) shall not exceed +79 dBW in any 1-MHz band.

SUP 470I

MOD 470J (3C) The limits given in No. 470G apply in the following frequency bands allocated to the fixed-satellite service and meteorological-satellite service for transmission by earth stations where these bands are shared with equal rights with the fixed or mobile service:

- 2.655 - 2.690 MHz
- 4.400 - 4.700 MHz
- 5.800 - 5.850 MHz (for the countries mentioned in No. 390)
- 5.850 - 5.925 MHz (Regions 1 and 3)
- 5.925 - 6.425 MHz
- 7.900 - 7.975 MHz
- 7.975 - 8.025 MHz (for the countries mentioned in No. 392H)
- 8.025 - 8.400 MHz
- 10.95 - 11.2 GHz (Region 1)
- 12.50 - 12.75 GHz (Regions 2 and 3)
- 14.175 - 14.300 GHz (for the countries mentioned in No. 407)
- 14.4 - 14.5 GHz

ADD 470JA (3D) The limits given in No. 470GA apply in the following frequency band allocated to transmission by earth stations in the fixed satellite service, where this is shared with equal rights with the fixed
or mobile service:

27.5 - 29.5 GHz

*Minimum Angle of Elevation*

**MOD 470K** § 22. (1) Earth stations.

**MOD 470L** (2) Earth station antennae shall not be employed for transmission at elevation angles of less than 3° measured from the horizontal plane to the direction of maximum radiation, except when agreed to by administrations concerned or those whose services may be affected. In case of reception by an earth station, the above value shall be used for co-ordination purposes if the operating angle of elevation is less than that value.

**ADD 470LA** (2A) As an exception to No. 470L, earth station antennae in the space research service (near-earth) shall not be employed for transmission at elevation angles of less than 5°, and earth station antennae in the space research service (deep-space) shall not be employed for transmission at elevation angles of less than 10°, both angles being those measured from the horizontal plane to the direction of maximum radiation. In case of reception by an earth station, the above values shall be used for coordination purposes if the operating angle of elevation is less than those values.

**MOD 470M** (2B) The limit given in No. 470L applies in the following frequency bands allocated to the fixed-satellite service and to the meteorological-satellite service for transmission by earth stations where these bands are shared with equal rights with the fixed or mobile services:

- 2 655 - 2 690 MHz
- 4 400 - 4 700 MHz
- 5 800 - 5 850 MHz (for the countries mentioned in No. 390)

R3—23
SUP

Power Flux Density Limits

ADD

Limits of Power Flux Density from Space Stations

MOD 470N § 23. (1) Power flux density limits between 1 690 MHz and 1 700 MHz.

ADD 470NA

a) The power flux density at the earth's surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed $-133$ dBW/m$^2$ in any 1.5-MHz band. This limit relates to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NB

b) The limit given in No. 470NA applies in frequency band listed in No. 470NC which is allocated to transmission by space stations in the earth exploration-satellite service and in particular the meteorological-satellite service where this band is shared with equal rights with the meteorological aids service.

ADD 470NC

c) 1 690 - 1 700 MHz.
ADD 470ND  (2) Power flux density limits between 1 670 MHz and 2 535 MHz.

ADD 470NE  a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 154 dBW/m² in any 4-kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $154 + \frac{8 - 5}{2}$ dBW/m² in any 4-kHz band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

- 144 dBW/m² in any 4-kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane. These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NF  b) The limits given in No. 470NE apply in the frequency bands listed in No. 470NG which are allocated to transmission by space stations in the following space radiocommunication services:

- Earth exploration-satellite service and in particular meteorological-satellite service (space to Earth)

- Space research service (space to Earth)

- Fixed-satellite service (space to Earth) where these bands are shared with equal rights with the fixed or mobile services:

R3—25
ADD 470NG
1 670 - 1 690 MHz
1 690 - 1 700 MHz (for the countries mentioned in No. 354A)
1 700 - 1 710 MHz
1 770 - 1 790 MHz (for the countries mentioned in No. 356AA)
2 290 - 2 300 MHz
2 500 - 2 535 MHz

ADD 470NGA

The power flux density values given in No. 470NE are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the bands listed in No. 470NG and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed —168 dBW in any 4-kHz band.

ADD 470NH
(3) Power flux density limits between 2 500 - 2 690 MHz.

ADD 470NI

The power flux density at the earth’s surface produced by emissions from a space station in the broadcasting-satellite service for all conditions and for all methods of modulation shall not exceed the following values:

—152 dBW/m² in any 4-kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;
— 152 + \frac{3(8-5)}{4} \text{dBW/m}^2 \text{ in any 4-kHz band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;}

— 137 \text{dBW/m}^2 \text{ in any 4-kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.}

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NJ  

b) The limits given in No. 470NI apply in the frequency band:

2 500 - 2 690 MHz

which is shared by the broadcasting-satellite service with the fixed or mobile service.

ADD 470NK  

c) The power flux density values given in No. 470NI are derived on the basis of protecting the fixed service using line-of-sight techniques. Where a fixed service using tropospheric scatter operates in the band mentioned in No. 470NJ and where there is insufficient frequency separation, there must be sufficient angular separation between the direction to the space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed —168 dBW in any 4-kHz band.

ADD 470NL  

(4) Power flux density limits between 3 400 MHz and 7 750 MHz.

ADD 470NM  

a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a
passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 152 dBW/m² in any 4-kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- \( 152 + \frac{(8 - 5)}{2} \) dBW/m² in any 4-kHz band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

- 142 dBW/m² in any 4-kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NN

b) The limits given in No. 470NM apply in the frequency bands listed in No. 470NO which are allocated to transmission by space stations in the following space radiocommunication services:

- fixed-satellite service (space to Earth)
- meteorological-satellite service (space to Earth)

where these bands are shared with equal rights with the fixed or mobile services:

ADD 470NO

3 400 - 4 200 MHz
6 625 - 7 125 MHz for Region 2 (see No. 392AA for Regions 1 and 3)
7 250 - 7 300 MHz (for the countries mentioned in No. 392G)
7 300 - 7 750 MHz
ADD 470NP  (5) Power flux density limits between 8 025 MHz and 11.7 GHz.

ADD 470NQ  a) The power flux density at the earth's surface, produced by emissions from a space station, or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 150 dBW/m² in any 4-kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- 150 + (\frac{8-5}{2}) dBW/m² in any 4-kHz band for angles of arrival (\theta) between 5 and 25 degrees above the horizontal plane;

- 140 dBW/m² in any 4-kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NR  b) The limits given in No. 470NQ apply in the frequency bands listed in No. 470NS which are allocated to transmission by space stations in the following space radiocommunication services:

- Earth exploration satellite service (space to Earth)
- space research service (space to Earth)
- fixed-satellite service (space to Earth)

where these bands are shared with equal rights with the fixed or mobile services:

R3—29
ADD 470NS

8 025 - 8 400 MHz
8 400 - 8 500 MHz
10·95 - 11·2 MHz
11·45 - 11·7 GHz

ADD 470NT (6) Power flux density limits between 11·7 and 12·75 GHz.

ADD 470NU a) The power flux density at the earth’s surface, produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 148 dBW/m² in any 4-kHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $148 + \frac{\theta - 5}{2}$ dBW/m² in any 4-kHz band for angles of arrival (θ) between 5 and 25 degrees above the horizontal plane;

- 138 dBW/m² in any 4-kHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NV b) The limits given in No. 470NU apply in the frequency bands listed in No. 470NW which are allocated to transmission by space stations in the following space radiocommunication services:

- fixed-satellite service

where these bands are shared with equal rights with the fixed or mobile services:

R3—30
ADD 470NW
11.7 - 12.2 GHz (Region 2 only)
12.5 - 12.75 GHz (Regions 2 and 3 only)

ADD 470NX
(7) Power flux density limits between 17.7 GHz and 23 GHz.

ADD 470NY
a) The power flux density at the earth’s surface produced by emissions from a space station or reflected from a passive satellite for all conditions and for all methods of modulation shall not exceed the following values:

- 115 dBW/m² in any 1-MHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;

- $115 + \frac{(8 - 5)}{2}$ dBW/m² in any 1-MHz band for angles of arrival (8) between 5 and 25 degrees above the horizontal plane;

- 105 dBW/m² in any 1-MHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

These limits relate to the power flux density which would be obtained under assumed free-space propagation conditions.

ADD 470NZ
b) The limits given in No. 470NY apply in the frequency bands listed in No. 470NZA which are allocated to transmission by space stations in the following space radiocommunication services:

- fixed-satellite service (space to Earth)
- Earth exploration satellite service (space to Earth)

where these bands are shared with equal rights with the fixed or mobile services:
ADD 470NZA
17.7 - 19.7 GHz
21.2 - 22 GHz

ADD 470NZB
(8) The limits given in 470NA, 470NE, 470NI, 470NM, 470NQ, 470NU and 470NY may be exceeded on the territory of any administration which has so agreed.

SUP 470O to 470U

Add the following new text at the end of Section VIII

ADD Section VIII. Space Radiocommunication Services sharing Frequency Band with Terrestrial Radiocommunication Services below 1 GHz

ADD 470MA § 23. (1) Power flux density limits below 1 GHz.

ADD 470MB In the portions of the band 620-790 MHz shared with equal rights by the broadcasting-satellite service and the fixed service using tropospheric scatter, where there is insufficient frequency separation there must be sufficient angular separation between the direction to the broadcasting-satellite space station and the direction of maximum radiation of the antenna of the receiving station of the fixed service using tropospheric scatter to ensure that the interference power at the receiver input of the station of the fixed service does not exceed -168 dBW in any 4-kHz band.

Replace Section IX by the following new text:

MOD Section IX. Space Radiocommunication Services

R3—32
Cessation of Emissions

MOD 470V § 24. Space stations shall be fitted with devices to ensure immediate cessation of their radio emissions by telecommand, whenever such cessation is required under the provisions of these Regulations.

SUP Note 1

ADD Control of Interference between Geostationary-Satellite Systems and Non-Synchronous Inclined Orbit-Satellite Systems

ADD 470VA § 25. Non-geostationary space stations in the fixed satellite services shall cease or reduce to a negligible level radio emissions, and their associated earth stations shall not transmit to them whenever there is insufficient angular separation between the non-geostationary satellite and geostationary satellites and unacceptable interference 1 to geostationary satellite space systems operating in accordance with these Regulations.

ADD Station Keeping of Space Stations 2

ADD 470VB § 26. Space stations on geostationary satellites:

ADD 470VC — shall have the capability of maintaining their positions within ± 1° of the longitude of their nominal positions, but efforts should be made to achieve a capability of maintaining their positions at least within ± 0.5° of the longitude of their nominal positions,

ADD 470VA.1 1 The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

2 In the case of space stations on geosynchronous satellites with orbits having an angle of inclination greater than 5° the positional tolerance shall relate to the nodal point.
ADD 470VD  — shall maintain their positions within ± 1° of longitude of their nominal positions irrespective of the cause of variation, but

ADD 470VE  — need not comply with [b] as long as the satellite network to which the space station belongs does not produce an unacceptable level of interference into any other satellite network whose space station complies with the limits given in [b].

ADD  

Pointing Accuracy of Antennae on Geostationary Satellites

ADD 470VF § 27. The pointing direction of maximum radiation of any earthward beam of antennae on geostationary satellites shall be capable of being maintained within:

- 10% of the half power beamwidth relative to the nominal pointing direction; or
- 0.5° relative to the nominal pointing direction,

whichever is greater. This provision applies only when these beams are intended for less than global coverage.

In the event that the beam is not rotationally symmetrical about the axis of maximum radiation, the tolerance in any plane containing this axis shall be related to the half power beamwidth in that plane.

This accuracy shall be maintained only if it is required to avoid unacceptable interference into other systems.

ADD 470VE.1 ¹ The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

ADD 470VF.1 ² The level of unacceptable interference shall be fixed by agreement between the administrations concerned, using the relevant C.C.I.R. Recommendations as a guide.

R3—34
Power Flux Density at the geostationary Satellite Orbit

ADD 470VG In the frequency band 8 025 to 8 400 MHz which the Earth Exploration-Satellite Service using non-geostationary satellites shares with the Fixed-Satellite Service (Earth-to-space) the maximum power flux density produced at the geostationary satellite orbit by any Earth Exploration-Satellite Service space station shall not exceed -174 dBW/m² in any 4-kHz band.
ANNEX Q

Revision of Article 8 of the Radio Regulations

Article 8 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 477 by the following new text:

e) the study, on a long-term basis, of the usage of the radio spectrum, with a view to making recommendations for its more effective use;
ANNEX G

Revision of Article 14 of the Radio Regulations

Article 14 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 695 by the following new text:

MOD 695 §3. In order to avoid interference:

— locations of transmitting stations and, where the nature of the service permits, locations of receiving stations shall be selected with particular care;

— radiation in and reception from unnecessary directions shall be minimized, where the nature of the service permits, by taking the maximum practical advantage of the properties of directional antennae;

— the choice and use of transmitters and receivers shall be in accordance with the provisions of Article 12;

— the conditions specified under No. 470V shall be fulfilled.
ANNEX

Revision of Article 15 of the Radio Regulations

Article 15 of the Radio Regulations shall be amended as follows:

Replace Regulation No. 717 by the following new text:

MOD 717 (2) In such a case, the administration concerned may also request the Board to act in accordance with the provisions of Section VII of Article 9 and Section VII of Article 9A; but it shall then supply the Board with the full facts of the case, including all the technical and operational details and copies of the correspondence.
ANNEX

Revision of Article 27 of the Radio Regulations

Article 27 of the Radio Regulations shall be amended as follows:

Replace Nos. 951 and 952 by the following new texts:

MOD 951 § 3. (1) Aircraft stations may communicate with stations of the maritime mobile or maritime mobile satellite services. They shall then conform to those provisions of these Regulations which relate to these services.

MOD 952 (2) For this purpose aircraft stations should use the frequencies allocated to the maritime mobile or maritime mobile satellite services. However, having regard to interference which may be caused by aircraft stations at high altitudes, maritime mobile frequencies in the bands above 30 MHz shall not be used by aircraft stations in any specific area without the prior agreement of all the administrations of the area in which interference is likely to be caused. In particular, aircraft stations operating in Region 1 should not use frequencies in the bands above 30 MHz allocated to the maritime mobile service by virtue of any agreement between administrations in that Region.
RECOMMENDATION No. Spa DD

Relating to the Criteria to be Applied for Sharing
between the Broadcasting-Satellite Service and the Terrestrial
Broadcasting Service in the Band 620-790 MHz

considering

a) that the band 620-790 MHz has been allocated to the broadcasting-satellite service;

b) that it is necessary to have a power flux-density limit which will provide adequate protection to the terrestrial broadcasting service;

taking into account

a) that the conclusions of the Special Joint Meeting of the C.C.I.R. Geneva, 1971, indicated that the following power flux-density limits are necessary to protect the terrestrial broadcasting service:

\[
\begin{align*}
&-121 \text{ dBW/m}^2 & \quad \theta < 20^\circ \\
&-121 + 0.4 (\theta - 20) \text{ dBW/m}^2 & \quad 20^\circ < \theta < 60^\circ \\
&-105 \text{ dBW/m}^2 & \quad 60^\circ < \theta < 90^\circ 
\end{align*}
\]

where \( \theta \) is the angle of arrival above the horizontal plane;

b) that additional tests carried out by one administration after the Special Joint Meeting of the C.C.I.R., indicated that the following more conservative power flux-density limits may be necessary:

\[
\begin{align*}
&-130 \text{ dBW/m}^2 & \quad \theta < 20^\circ \\
&-130 + 0.4 (\theta - 20) \text{ dBW/m}^2 & \quad 20^\circ < \theta < 60^\circ \\
&-114 \text{ dBW/m}^2 & \quad 60^\circ < \theta \leq 90^\circ 
\end{align*}
\]

where \( \theta \) is the angle of arrival above the horizontal plane;

R3—40
c) that additional information is required on the protection ratio for interference from an FM television signal into a VSB television signal for both the 625- and 525-line systems;

d) that with terrestrial television receiving systems using current technology, the minimum field strength to be protected may in some cases be less than the values included in C.C.I.R. Recommendation 417-2;

e) that account may have to be taken of ground reflections;

f) that energy dispersal techniques may reduce the required protection ratio and should be used if shown to be effective;

**recommends**

1. that in view of the absence of sufficient information on tests under operational conditions and in order to provide sharing criteria, on a provisional basis, the maximum power flux-density produced at the surface of the earth within the service area of a terrestrial broadcasting station (see C.C.I.R. Recommendation 417-2), by a space station in the broadcasting-satellite service in the band 620-790 MHz should not exceed:

\[
\begin{align*}
-129 \text{ dBW/m}^2 & \quad \theta < 20^\circ \\
-129 + 0.4(\theta - 20) \text{ dBW/m}^2 & \quad 20^\circ < \theta < 60^\circ \\
-113 \text{ dBW/m}^2 & \quad 60^\circ < \theta < 90^\circ
\end{align*}
\]

where $\theta$ is the angle of arrival above the horizontal plane;

2. that these limits be not exceeded on the territory of an administration except with the latter’s agreement;

3. that the transmission of unmodulated carriers should be avoided.

4. that the C.C.I.R. urgently study the sharing criteria to be applied to frequency sharing between the broadcasting-satellite service and the terrestrial broadcasting service in the band 620-790 MHz and prepare a Recommendation on power flux densities to be used in lieu of the above provisional limits;

R3—41
5. that in its studies the C.C.I.R. consider in particular the following aspects:

5.1 the required protection ratio for both 525- and 625-line systems for interference from an FM television signal into a VSB television signal;

5.2 the minimum field strength to be protected for the terrestrial television service taking into account the current state of the art;

5.3 the effect of ground reflections;

5.4 the number of broadcasting satellites that may be visible from a terrestrial broadcasting receiver;

5.5 the effect of polarization discrimination;

5.6 the effect of antenna directivity;

6. that in its studies the C.C.I.R. should consider the advantages of energy dispersal techniques in the broadcasting-satellite service (television).
SUMMARY RECORD
OF THE
THIRD AND LAST MEETING OF COMMITTEE 3
(BUDGET CONTROL)
Monday, 12 July 1971, at 0930 hrs
Chairman: Mr. L. CONSTANTINESCU
(Socialist Republic of Roumania)

Subjects discussed

1. Approval of the Summary Record of the Second Meeting of Committee 3

2. Draft Final Report of the Budget Control Committee to the Plenary Assembly

3. Completion of the work of the Committee
1. Approval of the Summary Record of the Second Meeting of Committee 3 (Document No. 261)

The Summary Record was approved, subject to the replacement of the words "the delegate of the United States" by "the delegate of the Territories of the United States of America" throughout the text. The amendment applied also to the Summary Record of the First Meeting of Committee 3 (Document No. 212).

During the discussion the delegate of Italy urged the Budget Control Committee to present the Plenary Meeting with the precise facts reflecting the true situation, i.e. that the preparations for the Conference had been carried out by the Special Joint Meeting of the C.C.I.R. Study Groups, without whose work the duration of the Conference itself would have been longer.

That point of view was confirmed by the Director of the C.C.I.R.

The delegate of the U.S.S.R. was not opposed to the idea as far as the substance was concerned; nevertheless he thought that, properly speaking, the Administrative Council should have considered the matter at its last Session. If that procedure had been followed, it could have made the necessary budgetary arrangements to meet the situation. It was not customary to sanction additional expenditure at such a late stage merely by including it in the expenses of the Conference.

The delegate of the Territories of the United States of America thought that the Committee might recommend the Administrative Council to post the excess expenditure, accepted as inevitable, to the 1971 account for additional credits.

At the end of a discussion in which the delegates of Canada, the U.S.S.R., Italy, Federal Republic of Germany, the United Kingdom, Territories of the United States of America, the Chairman, the Vice-Chairman and the Secretary of the Conference took part, it was decided to replace the last two paragraphs on page 3 and the first paragraph on page 4 by the following text:

"After a lengthy study of this situation, the Budget Control Committee concluded that Conference expenditure should be kept within the limits of the budget approved by the Administrative Council.

Under No. 675 of the Convention, the Budget Control Committee therefore drew the Plenary Meeting's attention to the situation."
The Budget Control Committee nevertheless recognizes that the excess expenditure mentioned above could not be cut without jeopardizing the smooth running of the Conference and was therefore justified.

Under these conditions the Committee recommends the approval of this report for transmission to the Secretary-General for submission to the Administrative Council at its next annual session, in accordance with No. 677 of the Convention."

Page 10

The Secretary of the Committee said that the following operating agencies and international organizations attending the Conference had chosen the half-unit class of contribution.

- Marconi International Marine Co. Ltd.
- Radio-Austria AG
- International Chamber of Shipping (I.C.S.)
- International Press Telecommunications Committee (I.P.T.C.)
- International Transport Federation (I.T.F.)

The Secretary of the Conference pointed out that, since some of the organizations which had asked to take part in the Conference had not sent representatives, they would not have to make a contribution.

Replying to a question by the delegate of Italy, he said the established rule was that organizations which had not sent representatives to a conference did not receive any of the conference documents.

There being no further comments, the Chairman said that the draft Report of the Committee (Document No. DT/101) which had just been approved would be published as amended and submitted to the Plenary Meeting of the Conference, where he hoped it would be well received.

3. Completion of the work of Committee 3

The delegate of the U.S.S.R. congratulated the Chairman for the excellent way in which he had guided the work of the Committee. His work was all the more praiseworthy in that it was the first time that he had been asked to preside over the discussions of a committee.

The Chairman then thanked the members of the Committee for the spirit of co-operation they had shown during the meetings and declared that the work of Committee 3 was finished.

The meeting rose at 1145 hrs.

The Secretary: 
R. PRELAZ

The Chairman: 
L. CONSTANTINESCU
SEVENTH REPORT OF COMMITTEE 6

(REGULATIONS)

SATELLITE-BROADCASTING

The following texts appearing in the annexes to the present Report, concerning:

- the addition of a provision to Article 7 (Annex 1);
- Resolution No. 47E (Annex 2)

were adopted by Committee 6.

Resolution No. 47D also appearing in the Annex to the present Report (Annex 3) was adopted by Committee 6. With respect to paragraph 2 of the said Resolution, 24 delegations were in favour of its retention, 14 against, and 5 abstained. Some delegations of countries in Region 1 stated that they reserved the right to come back to this question when discussing the matter at the Plenary Meeting.

M.K. BASU
Chairman

Annexes: 3
ARTICLE 7

Satellite Broadcasting

§ 2A. In devising the characteristics of a broadcasting space station, all technical means available shall be used to reduce to the maximum extent the radiation over the territory of other countries unless an agreement has been previously reached with such countries.
RESOLUTION / D. 7

on the establishment of agreements and associated plans for satellite broadcasting

The World Administrative Radio Conference for Space Telecommunications, Geneva 1971,

considering

a) that it is important to make the best possible use of the geostationary satellite orbit and of the frequency bands allocated to the Broadcasting-Satellite Service;

b) that the great number of receiving installations using such directional antennae as could be set up for a Broadcasting-Satellite Service may be an obstacle to changing the location of broadcasting space stations on the geostationary satellite orbit, from the date of their bringing into use;

c) that satellite broadcasts may create harmful interference over a large area of the earth's surface;

d) that the other services with allocations in the same band need to use the band before the Broadcasting-Satellite Service is set up;

resolves

1. that satellite broadcasting stations shall be established and operated in accordance with agreements and associated plans adopted by World or Regional Administrative Conferences, as the case may be, in which all the administrations concerned and the administrations whose services are liable to be affected may participate;

2. that the Administrative Council be requested to examine as soon as possible the question of a World Administrative Conference, and/or Regional Administrative Conferences as required, with a view to fixing suitable dates, places and their agenda.

3. that during the period before the entry into force of such agreements and associated plans the administrations and the I.F.R.B. shall apply the procedure contained in Resolution / E. 4.
on the bringing into service of broadcasting space stations, prior to the entry into force of agreements and associated plans for satellite broadcasting.

considering

a) that while Resolution No. 7 has been adopted by this Conference envisaging plans for satellite broadcasting, some administrations might nevertheless feel the need to bring such stations into service prior to such plans being established;

b) that administrations should, as far as possible, avoid proliferation of broadcasting space stations before such plans have been established;

c) that a broadcasting space station may cause harmful interference to terrestrial stations operating in the same frequency band, even if the latter are outside the service area of the space station;

d) that the procedure specified in Article 9A of the Radio Regulations contains no provisions for the co-ordination between broadcasting space stations and terrestrial stations and between broadcasting space stations and space systems of other administrations.

resolves

1. that the following procedure shall be applied until agreements and associated plans pursuant to Resolution No. D enter into force:

   Section A: Co-ordination procedure between broadcasting space stations and terrestrial stations

   2.1 Before an administration notifies to the Board or brings into service any frequency assignment to a broadcasting space station in a frequency band where this frequency band is allocated, with equal rights,
to the Broadcasting-Satellite Service and to a Terrestrial Radio-communication Service, either in the same Region or sub-Region or in different Regions or sub-Regions, it shall co-ordinate the use of this assignment with any other administration whose Terrestrial Radio-communication Services may be affected. For this purpose, it shall inform the Board of all the technical characteristics of the station, as listed in the relevant section of Appendix 1A, which are necessary to assess the risk of interference to a Terrestrial Radio-communication Service.

2.2 The Board shall publish this information in a special section of its weekly circular and shall also, when the weekly circular contains such information, so advise all administrations by circular telegram.

2.3 Any administration which considers that its Terrestrial Radio-communication Services may be affected shall forward its comments to the administration seeking co-ordination and, in any case, to the Board. These comments must be forwarded within one hundred and twenty days from the date of the relevant I.F.R.B. weekly circular. It shall be deemed that any administration which has not forwarded comments within that period does not consider that its Terrestrial Radio-communication Services are likely to be affected.

2.4 Any administration which has forwarded comments on the projected station shall either give its agreement to the co-ordination, or, if this is not possible, send to the administration seeking co-ordination all the data on which its comments are based as well as any such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

2.5 The administration which plans to bring into use a space station as well as any other administration which believes that its Terrestrial Radio-communication Services are likely to be affected by the station in question may request the assistance of the Board at any time during the co-ordination procedure.

2.6 If the assistance of the Board has been sought and there is a continuing disagreement between the administration seeking co-ordination and the administration which has forwarded its comments, the administration seeking co-ordination may, after a total period of one hundred and eighty days, send to the Board its notice concerning the frequency assignment in question.

1) The technical data to be used in effecting co-ordination should be based on the most recent C.C.I.R. Recommendations as accepted by the administrations concerned under the terms of Resolution No. ... In the absence of relevant C.C.I.R. Recommendations, the technical data to be used in effecting co-ordination shall be determined by agreement among the administrations concerned.
Section B: Co-ordination procedure between broadcasting space stations and space systems of other administrations

3. An administration intending to establish a service of broadcasting by satellite shall, for the purpose of co-ordination with space systems of other administrations, apply the following provisions of Article 9A of the Radio Regulations:

3.1 Numbers 639AA to 639AI inclusive.

3.2.1 Number 639AJ

3.2.2 No co-ordination under paragraph 3.2.1 is required when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase the probability of harmful interference to stations in the Space Radiocommunication Service of other administrations.

3.2.3 Numbers 639AL, 639AM, 639AO, 639AS(a), (c), (e), (f), 639AT, 639AU, 639AV, 639AW, 639AX, 639AY, 639AZ.

Section C: Notification, examination and recording in the Master Register of assignments to broadcasting space stations, treated under this Resolution.

4.1 Any frequency assignment to a broadcasting space station shall be notified to the Board. The notifying administration shall apply (for this purpose) the provisions of Numbers 639BE, 639BF and 639BG of the Radio Regulations.

4.2 Notices made under paragraph 4.1 shall initially be treated in accordance with Number 639BH.

1) The technical data to be used in effecting co-ordination should be based on the most recent C.C.I.R. Recommendations as accepted by the administrations concerned under the terms of Resolution No. ...

2) The expression frequency assignment, wherever it appears in this Resolution, shall be understood to refer either to a new frequency assignment or to a change in an assignment already recorded in the Master International Frequency Register (hereinafter called Master Register).
5.1 The Board shall examine each notice with respect to:

5.2 a) its conformity with the Convention, the Table of Frequency Allocations and the other provisions of the Radio Regulations (with the exception of those relating to the co-ordination procedures and to the probability of harmful interference);

5.3 b) its conformity, where applicable, with the provisions of paragraph 2.1 and Section A above relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

5.4 c) its conformity, where applicable, with the provisions of paragraph 3.2.1 of Section B above relating to co-ordination of the use of the frequency assignment with the other administrations concerned;

5.5 d) where appropriate, the probability of harmful interference to the service rendered by a station in a Space or Terrestrial Radiocommunication Service for which a frequency assignment has already been recorded in the Master Register in conformity with the provisions of Number 501 or 639^R as appropriate, if that assignment has not, in fact, caused harmful interference to the service rendered by a station for which an assignment has been previously recorded in the Master Register and which itself is in conformity with Number 501 or Number 639^R as appropriate.

5.6 Depending upon the findings of the Board subsequent to the examination prescribed in paragraphs 5.2, 5.3, 5.4 and 5.5, further action shall be as follows:

5.7 Where the Board reaches an unfavourable finding with respect to paragraph 5.2 the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Board for this finding and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.8 Where the Board reaches a favourable finding with respect to paragraph 5.2, or where it reaches the same finding after resubmission of the notice, it shall examine the notice with respect to the provisions of paragraphs 5.3 and 5.4 above.

5.9 Where the Board finds that the co-ordination procedures mentioned in paragraphs 5.3 and 5.4 have been successfully completed with all administrations whose services may be affected, the assignment shall be recorded in the Master Register. The date of receipt by the Board of the notice shall be entered in the column 2d of the Master Register with entry in the Remarks column indicating that such recording does not prejudice in any way the decisions to be included in the agreements and associated plans referred to in Resolution No. D/4.
5.10 Where the Board finds that the co-ordination procedures mentioned in paragraphs 5.3 or 5.4 have not, as appropriate, been applied or have been unsuccessfully applied, the notice shall be returned immediately by airmail to the notifying administration with the reason for its return and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.11 Where the notifying administration resubmits the notice and the Board finds that the co-ordination procedures, as appropriate, have been successfully completed with all administrations whose services may be affected, the assignment shall be treated as indicated in paragraph 5.9.

5.12 Where the notifying administration resubmits the notice and states that it has been unsuccessful in endeavouring to effect the co-ordination, the notice shall be examined by the Board with respect to paragraph 5.5.

5.13 Where the Board reaches a favourable finding with respect to paragraph 5.5, the assignment shall be recorded in the Master Register. The appropriate symbol indicating the finding by the Board shall indicate that the co-ordination procedures, as appropriate, referred to in paragraph 2.1 were not successfully completed. The date of receipt by the Board of the notice shall be entered in the column 2d of the Master Register, with the remark mentioned in paragraph 5.9.

5.14 Where the Board reaches an unfavourable finding with respect to paragraph 5.5, the notice shall be returned immediately by airmail to the notifying administration with the reasons for the Board's finding and with such suggestions as the Board may be able to offer with a view to a satisfactory solution of the problem.

5.15 If the administration resubmits the notice unchanged with the insistence that it be reconsidered, but should the Board's unfavourable finding under paragraph 5.5 remain unchanged, the assignment shall be recorded in the Master Register. However, this entry shall be made only if the notifying administration informs the Board that the assignment has been in use for at least one hundred and twenty days without any complaint of harmful interference having been received. The date of receipt by the Board of the original notice shall be entered in column 2d of the Master Register, with the remark mentioned in paragraph 5.9. An appropriate remark shall be placed in column 13 to indicate that the assignment is not in conformity with the provisions of paragraphs 5.2, 5.3, 5.4 or 5.5, as appropriate. In the event that the administration concerned receives no complaint of harmful interference concerning the operation of the station in question for a period of one year from the commencement of operation, the Board shall review its finding.
5.16 If harmful interference is actually caused to the reception of any station in the Broadcasting-Satellite Service whose frequency assignment has been recorded in the Master Register as a result of a favourable finding with respect to paragraphs 5.2, 5.3, 5.4 and 5.5 of this Resolution, as appropriate, by the use of a frequency assignment to a station of the Broadcasting-Satellite Service which has been subsequently recorded in the Master Register in accordance with the provisions of paragraph 5.14 of this Resolution or of No. 6390F of the Radio Regulations, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

5.17 If harmful interference to the reception of any station whose assignment is in accordance with paragraph 5.2 of this Resolution, is actually caused by the use of a frequency assignment which is not in conformity with paragraph 5.2 of this Resolution, or with Numbers 501, 572AB or 639BM of the Radio Regulations, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.
EIGHTH REPORT OF COMMITTEE 6
(REGULATIONS)

The texts appearing in the Annexes to the present report, concerning
- Resolution No. Spa F (Annex 1)
- Recommendations Nos. B and H (Annexes 2 and 3)
- modifications to No. 89 of the Radio Regulations (Annex 4)

were adopted by Committee 6.

M.K. BASU
Chairman
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX 1

RESOLUTION No. Spa /ـF_7

on the use by all countries with equal rights of frequency bands for Space Radiocommunication Services

considering

that all countries have equal rights in the use of both the radio frequencies, allocated to various Space Radiocommunication Services, and the geostationary satellite orbit for these services,

taking into account

that radio frequency spectrum and the geostationary satellite orbit are limited natural resources and should be most effectively and economically used;

having in mind

that the use of the allocated frequency bands and definite fixed satellite positions in the geostationary orbit by individual countries or groups of countries can start at various dates depending on requirements and readiness of technical facilities of countries,

decides

1) that the registration in the I.T.U. of frequency assignments for Space Radiocommunication Services and their use should not provide any permanent priority for any individual country or groups of countries and should not create an obstacle to the establishment of space systems by other countries;
2) that, in this connection, a country or a group of countries, having registered in the I.T.U. frequencies for their Space Radiocommunication Services, should take all practicable measures in order to realize the possibility of the use of new space systems by other countries or groups of countries so desiring;

3) that the provisions contained in items 1 and 2 of this Resolution should be taken into account by the Administrations and the permanent organs of the Union.
ANNEX 2

RECOMMENDATION No. [E]

concerning the examination by the Administrative
Radio Conferences of the situation with regard
to occupation of the frequency spectrum
in space communications

The World Administrative Radio Conference for Space Telecommunications,
Geneva, 1971,

considering

a) that the frequency bands available for space applications are
   limited in number and size;

b) that the possible positions for satellites whose main purpose is to
   establish telecommunication links are limited in number and that certain
   positions are more favourable than others for certain links;

c) that all administrations should be enabled to establish the space
   links which they deem necessary;

d) that the scale and cost of space networks or systems are such that
   their operation and development must be hindered as little as possible;

e) that technology is steadily and rapidly evolving and that the best
   possible use should be made of resources in space radiocommunications;

f) that administrations should ensure that frequency assignments for
   space applications are utilized in the most efficient practicable manner consis­
tent with developing technology and that such assignments are relinquished
   when no longer in use;

g) that despite the provisions of Article 9A of the Radio Regulations
   and the principles adopted by this Conference, which provide for full consulta­
tion between administrations with a view to the maximum accommodation of all
   space systems, it is possible that as the use of frequencies and orbital
locations increases administrations may encounter undue difficulties in one or more frequency bands in meeting their requirements for space radiocommunication;

recommends

that, if this situation arises, it will need to be examined by the next Administrative Radio Conference, which should be empowered to deal with the situation;

invites

the Administrative Council, in the event of such a situation arising, to include in the agenda for the next appropriate Administrative Radio Conference specific provisions enabling it to examine all aspects of the use of the frequency band(s) concerned including, for example, the relevant frequency assignments recorded in the Master International Frequency Register, and to find a solution to the problem.
ANNEX 3

RECOMMENDATION (No. H/)

relating to technical standards for the assessment of harmful interference in the frequency bands above 28 Mc/s

considering

a) that the definition of harmful interference (No. 93 of the Radio Regulations), of a qualitative nature, leads to a purely subjective estimation of the nuisance;

b) that, for the accomplishment of its regulatory tasks, the I.F.R.B. has adopted in its technical standards, for the frequency bands below 28 Mc/s, values for the ratio between the wanted signal and the interfering signal, below which harmful interference may be expected;

c) that "harmful interference" implies a degree of interference or a probability of interference which is considerable;

d) that, as a consequence, it is desirable to determine the level of interference by which any emission, radiation or induction affects a Radio-communication Service beyond specific limits established for its performance with regard to the quality and reliability required by the nature of the service;

e) that the assessment of interference values is related to various factors such as: nature of the services concerned, number of interference sources, percentages of time during which the interfering signal affects the wanted signal, etc.
and noting

a) that the I.F.R.B. has been considering the maximum allowable values of interference given in the pertinent C.C.I.R. Recommendations, as values which ensure a satisfactory service;

b) that, however, the I.F.R.B. does not possess data on the increases of these recommended values and on the associated percentages of time affecting a service beyond the specific limits established for its performance with regard to the quality and reliability required by the nature of the service;

invites the C.C.I.R.

to study this subject and to recommend the technical performance criteria for the frequency bands above 28 Mc/s, allocated to Space, Radio Astronomy, and the concerned terrestrial radiocommunications services, in order to enable the I.F.R.B. and administrations to apply such criteria for these bands;

and invites the I.F.R.B.

to publish its technical standards, for the information of administrations, based upon the relevant provisions of the Radio Regulations and the Appendices thereto, the decisions of Administrative Conferences of the Union as appropriate, the Recommendations of the C.C.I.R., the state of the radio art, and the development of new transmission techniques.
ANNEX 4

Assigned Frequency Band: The frequency band (the centre of which coincides with the frequency assigned to the station) the width of which equals the necessary bandwidth plus twice the absolute value of the frequency tolerance.
NINTH REPORT OF COMMITTEE 6

Section 9: Stations in the Radio Astronomy Service

NOC

Present text
ANNEX 2

RESOLUTION No. Sp. 77/2

considering

a) that it has modified the definitions which appeared in the Radio Regulations and has adopted a series of new definitions for the services and the various categories of earth and space stations;

b) that, within the framework of these modifications, it has changed the headings and the contents of the existing nine Sections of List VIIIA (List of Stations in the Space Service and in the Radio Astronomy Service);

c) that however, in List VIIIA so modified, it is not possible to include all the categories of earth and space stations notified to the I.F.R.B. for inclusion in the Master International Frequency Register;

d) that the Conference has not had the time to make the required modifications;

decides

to invite the Secretary-General, in collaboration with the I.F.R.B. to take the necessary measures, on the basis of the existing Sections of List VIIIA, to have additional Sections added to this List, so that the particulars of all the earth and space stations notified to the I.F.R.B. under Article 9A of the Radio Regulations, for recording in the Master International Frequency Register, be included.
ANNEX 3

APPENDIX 10

1. New symbols

EA : Space station in the Amateur Satellite Service
TA : Space operation earth station in the Amateur Satellite Service
EB : Space station in the Broadcasting-Satellite Service (sound broadcasting)
EV : Space station in the Broadcasting-Satellite Service (television)
TF : Fixed earth station in the Radiodetermination Satellite Service
TL : Mobile earth station in the Radiodetermination Satellite Service
TT : Earth station in the Space Operation Service
TP : Receiving earth station

2. Amendments to existing symbols

Replace :

FE : Earth station (Earth-Space Service)

by

TE : Transmitting earth station
3. The Drafting Committee will have to amend the following symbols to adapt them to the new definitions for the services:

Replace:

EC: Communication-satellite space station
   by
   Space station in the Fixed Satellite Service

TC: Communication-satellite earth station
   by
   Earth station in the Fixed Satellite Service

TH: Space research earth station
   by
   Earth station in the Space Research Service

TM: Meteorological-satellite earth station
   by
   Earth station in the Meteorological-Satellite Service

TN: Radionavigation-satellite earth station
   by
   Earth station in the Radionavigation-Satellite Service
The draft Resolution text appearing in the Annex to the present Report was adopted by Committee 6.

The text relates to the technical criteria recommended by the C.C.I.R. for sharing frequency bands between Space and Terrestrial Radiocommunication Services or between Space Radiocommunication Services.

M.K. BASU
Chairman

Annex : 1
RESOLUTION [A_7

relating to the technical criteria recommended
by the C.C.I.R. for sharing frequency bands
between [space and terrestrial services] or between [space services]

The World Administrative Radio Conference for Space
Telecommunications, Geneva, 1971

considering

a) that, in frequency bands shared with equal rights by [Space and Terrestrial Services], it is necessary to impose certain technical limitations and co-ordination procedures on each of the sharing services in the interest of controlling mutual interference;

b) that, in frequency bands shared by space stations located on geostationary satellites, it is necessary to impose co-ordination procedures in the interest of controlling mutual interference;

c) that the technical criteria and co-ordination procedures referred to in a) and b) above, and as set forth in the Radio Regulations, are mainly based upon Recommendations of the C.C.I.R.;

d) that, in recognition of the successful sharing of frequency bands by [Space and Terrestrial Services], and the continuing improvements in space technology, each Plenary Assembly of the C.C.I.R. subsequent to the Xth Plenary Assembly, Geneva, 1963, has improved upon some of the technical criteria recommended by the preceding Plenary Assembly;

e) that Plenary Assemblies of the C.C.I.R. are held triennially whereas Administrative Radio Conferences, which are empowered to modify the Radio Regulations making substantial use of the Recommendations of the C.C.I.R. are in practice held less frequently and with much less regularity;

f) that the International Telecommunication Convention of Montreux, 1965, recognizes the right of Members and associated Members of the Union to make special agreements on telecommunication matters; however, such agreements shall not be in conflict with the terms of the Convention or of the Regulations annexed thereto, so far as concerns the harmful interference to the radio services of other countries;
is of the opinion

that subsequent Plenary Assemblies of the C.C.I.R. are likely to make further changes in the recommended technical criteria; and

that administrations should be afforded the opportunity to take advantage of the current C.C.I.R. Recommendations on sharing criteria when planning systems for use in frequency bands shared with equal rights by \( \text{Space and Terrestrial Services} \), or between \( \text{space systems} \),

therefore resolves that

1. each Plenary Assembly of the C.C.I.R. should arrange for the Secretary-General of the I.T.U. to be informed of those Recommendations of the C.C.I.R. affecting the technical criteria relating to sharing between \( \text{Space and Terrestrial Services} \) or between \( \text{space services} \);

2. following the distribution to administrations of the relevant C.C.I.R. texts, the Secretary-General shall write to administrations asking them to indicate within one hundred and twenty days, to which of the C.C.I.R. Recommendations or to which specific technical criteria defined in the Recommendations referred to in 1. above they agree for use in the application of the pertinent provisions of the Radio Regulations;

3. the administrations which do not respond to the Secretary-General's enquiry within one hundred and twenty days shall be deemed to wish the application for the time being of the specific technical criteria referred to in the existing Regulations;

4. in those cases where an administration, in its reply to the Secretary-General's enquiry, indicates that a specific C.C.I.R. Recommendation or a specific technical criterion defined in those Recommendations is not acceptable to it, or where an administration has not replied to the Secretary-General's enquiry as in paragraph 3. above, the relevant technical criteria defined in the Radio Regulations shall continue to apply with respect to cases involving that administration;

5. The Secretary-General shall publish, for the information of all administrations, a consolidated list prepared by the I.F.R.B. on the basis of the replies to the enquiry, of the C.C.I.R. Recommendations or of the specific relevant technical criteria defined in those Recommendations, and to which administrations each of those Recommendations or specific relevant technical criteria are acceptable or are not acceptable. This list shall also include those administrations mentioned in paragraph 3. above;
6. the I.F.R.B. be directed to take into account:

a) the applicability of the C.C.I.R. technical criteria consonant with the list referred to in 5. above, when making technical examinations with respect to cases involving only administrations to which such criteria are acceptable;

b) the applicability of the technical criteria defined in the Radio Regulations consonant with the list referred to in 5. above, when making technical examinations with respect to cases involving an administration which does not accept the relevant C.C.I.R. technical criteria.

7. If, at a later date, questions arise concerning the application of the relevant technical criterion or criteria to a case involving administrations described in paragraph 3. above, the I.F.R.B. shall enquire of the administrations concerned whether or not they would agree to the application of the technical criterion or criteria defined in the relevant C.C.I.R. Recommendations referred to in paragraph 1. above. The list published pursuant to paragraph 5. above shall be updated on the basis of the reply of the administration or of the absence of reply.
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of the Socialist Republic of Roumania, the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
Dear Sir,

I should be grateful if you would kindly issue as a document of the World Administrative Radio Conference for Space Telecommunications, 1971, the attached statement by the Delegation of the Socialist Republic of Roumania concerning the presence of certain delegations at the Conference.

Yours faithfully,

Gh. Airinei
Head of the Delegation of the Socialist Republic of Roumania

Geneva, 14 July 1971
Annex

The Delegation of the Socialist Republic of Roumania states on behalf of its Government that only the Government of the People's Republic of China, and not the puppet régime of Taiwan, is entitled to represent that country.

The Roumanian Delegation also considers that the only lawful representative of South Viet-Nam is the Provisional Revolutionary Government of the Republic of South Viet-Nam.

Finally, the Roumanian Delegation questions the right of the Seoul authorities to represent Korea as a whole since that régime cannot represent the Korean people.
MEMORANDUM BY THE SECRETARIAT

FINAL PROTOCOL

Please add the attached annexes to Document No. 402.

Annexes: 2
ANNEX 1

REPUBLIC OF CHILE

The Chilean Delegation reserves the right for the Republic of Chile to take, in cooperation with the International Telecommunication Union, such action as it may consider legitimate to safeguard its sovereignty and interests should any Member or Associate Member fail to comply with any or all of the provisions of the revised Radio Regulations, Geneva, 1971, and the Montreux Convention, 1965, or should reservations made by other countries affect directly or indirectly the interests and/or telecommunication systems of the Republic of Chile.
ANNEX 2

CENTRAL AFRICAN REPUBLIC

The Delegation of the Central African Republic to the World Administrative Radio Conference for Space Telecommunications (Geneva, 1971) signs the Final Acts of the present Conference but reserves for the Government of the Central African Republic the right to take such action as it may consider necessary to safeguard its interests should certain Members or Associate Members fail in any way to comply with the decisions of the present Conference or should action resulting from the reservations made by other countries jeopardize the efficient operation of its telecommunication services.

JAMAICA

The Delegation of Jamaica reserves for its Government the right to take such action as it may consider necessary to safeguard its interests should any Member fail in any way to comply with the decisions of the World Administrative Radio Conference (Geneva, 1971) and in so doing jeopardize the telecommunication services of Jamaica.
MEMORANDUM BY THE SECRETARIAT

FINAL PROTOCOL *)

The attached Annex should be added to Document No. 402.

---

Annex : 1

*) As modified during the 13th Plenary Meeting
ANNEX

GENERAL

The World Administrative Radio Conference for Space Telecommunications, Geneva, 1971, decided that the following Statement by India should be included in the Final Protocol forming part of the Final Acts of the Conference:

"In India, the band 845-935 MHz is also used in the experimentation of satellite broadcasting of television with frequency modulation including energy dispersal, subject to agreement with the administrations having services operating in accordance with the Table which may be affected.

For the protection of Terrestrial Television Services, the power flux-density limit given in Radio Regulation 332A will apply; and for the protection of Fixed and Mobile Services operating in this band, the power flux-density limit given in Radio Regulation 470 NI and the power flux-density limit in Radio Regulation 470 NK will apply."
MEMORANDUM BY THE SECRETARIAT

FINAL PROTOCOL

The attached Annex should be added to Document No. 402.

Annex : 1
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
The World Administrative Radio Conference for Space Telecommunications, Geneva, 1971, decided that the following be included in the Final Protocol forming part of the Final Acts of the Conference:

In India, the band 845-935 MHz is also used in the experimentation of satellite broadcasting of television with frequency modulation including energy dispersal, subject to agreement with the Administrations having services operating in accordance with the Table which may be affected.

For the protection of Terrestrial Television Services the power flux-density limit given in foot-note 332A will apply; and for the protection of Fixed and Mobile Services operating in this band, the power flux-density limits in Article 7, 47OMI and 47OMB will apply.
MEMORANDUM BY THE SECRETARIAT

FINAL PROTOCOL

The attached annexes should be added to Document No. 402.

Annexes: 3
The Delegation of the Republic of Venezuela to the World Administrative Radio Conference for Space Telecommunications, Geneva (1971), declares that, in signing the Final Acts of the Conference, it expressly reserves the right for its Government to adopt or not to adopt the conclusions of the Conference and to take any steps that it may deem fit to safeguard its interests and to protect its telecommunication networks should any Member or Associate Member fail to comply with the provisions of the Radio Regulations as amended or supplemented at the date mentioned above.
ANNEX 2

REPUBLIC OF THE NIGER

The Delegation of the Republic of the Niger reserves for its Government the right to take any steps it may deem fit and adequate to safeguard its interests should any country fail in any way to comply with the provisions contained in the Final Acts of this Conference or should reservations made by any country jeopardize the efficient operation of its telecommunications.

The Delegation of Pakistan further declares that it reserves the right of its Government in accepting implications that may arise through the non-adherence by any other country Member of the Union to the provisions of these Revised Radio Regulations.
Please add the attached annexes to Document No. 402.

Annexes: 4
ANNEX 1

DEMOCRATIC REPUBLIC OF THE CONGO

The Delegation of the Democratic Republic of the Congo to the World Administrative Radio Conference for Space Telecommunications (Geneva, 1971) reserves for its Government the right, in co-operation with the International Telecommunication Union, to take such action as it may consider necessary to safeguard its interests should any Members or Associate Members fail to comply with the provisions of the revised Radio Regulations, or should reservations made by other countries jeopardize the efficient operation of its telecommunication services.
ANNEX 2

ISLAMIC REPUBLIC OF MAURITANIA

The Delegation of the Islamic Republic of Mauritania to the World Administrative Radio Conference for Space Telecommunications (Geneva, 1971), in signing the Final Acts of this Conference, reserves for its Government the right, in co-operation with the International Telecommunication Union, to take such action as it may consider necessary to:

- safeguard its interests, or

- protect, in all the frequency bands concerned, its existing, projected or future telecommunication network, should certain Members or Associate Members fail in any way to comply with the revised and supplemented provisions of the Radio Regulations, or should reservations made by other countries jeopardize the normal operation of its telecommunication services.
ANNEX 3

REPUBLIC OF RWANDA

The Delegation of the Republic of Rwanda, in signing the Final Acts of the World Administrative Radio Conference for Space Telecommunications (Geneva 1971), reserves for its Government the right to take such action as it may consider necessary to safeguard its interests, should any Members or Associate Members fail in any way to comply with the provisions of the Radio Regulations (Geneva 1959) as revised by this Conference or should reservations made by other countries jeopardize the efficient operation of its telecommunication services.
ANNEX 4

REPUBLIC OF THE SENEGAL

The Delegation of the Republic of the Senegal to the World Administrative Radio Conference for Space Telecommunications (Geneva 1971), in signing the Final Acts of this Conference, reserves for its Government the right to take such action as it may consider useful or necessary:

- to safeguard its interests in the use of the frequency bands above 40 Gc/s;

- or should certain Members fail in any way to comply with the decisions of this Conference or should acts deriving from reservations made by other Members jeopardize the efficient operation of its telecommunication services.
On 14 July, at 1800 hours, the following texts had been received for publication in the Final Protocol:

- Federal Republic of Cameroon
- Ceylon
- Republic of the Ivory Coast
- Republic of Indonesia
- Iran
- Republic of Singapore

Annexes: 6
The Delegation of the Federal Republic of Cameroon to the World Administrative Radio Conference for Space Telecommunications (Geneva, 1971), unable at the present state of its development to make pertinent comments on the proposed allocation of frequencies between 40 and 275 Gc/s, yet earnestly wishing to encourage technological progress,
signs the Final Acts of the present Conference but reserves for its Government the right to take such action as it may consider necessary to safeguard its interests, and to protect its telecommunication network should certain Members or Associate Members fail to comply with the provisions of the Radio Regulations thus revised and amplified.
CEYLON

The Delegation of Ceylon reserves for its Government the right to take such action as it may consider necessary to safeguard its interests should certain Members fail in any way to comply with the decisions of the World Administrative Radio Conference (Geneva, 1971), or should reservations by other countries jeopardize its telecommunication services.
ANNEX 3

REPUBLIC OF THE IVORY COAST

The Delegation of the Ivory Coast wishes to declare that, by virtue of the powers conferred on it, it reserves for its Government the right to take such action as it may consider necessary, in co-operation with the International Telecommunication Union, to safeguard its interests should any Members or Associate Members fail in any way whatever to comply with the provisions in the revised version of the Radio Regulations, Geneva (1959), prepared by the World Administrative Radio Conference for Space Telecommunications, Geneva (1971), or should reservations made by other countries jeopardize the efficient operation of its telecommunication services.
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
The Indonesian Delegation is of the firm belief that only through close international co-operation on as broad a basis as possible could the tremendous potential of the satellite communications be realized.

Indonesia being an archipelago with a vast land and sea area looks forward with great hope to the expansion of the satellite communication as to help solving our tremendous communication problems.

The great importance of the satellite communications in helping to diffuse education, information, and other public services to the people in places far away from the capitals is being fully recognized by the developing countries.

There is, however, great need for the developing countries to fully participate in the discussions and in important decisions concerning the future of the satellite systems. They need to be continuously informed with regard to its further progress and development.

Furthermore, the developing countries should not be left with a feeling as being dependent on the goodwill of a small group in order to enjoy the progress of this technology. The use of the satellite system should not be limited to a few rich; assistance measures have therefore to be devised so as to allow even the poorest among the developing countries to take advantage of the progress in the satellite communication systems.

If the progress of this technology is to benefit mankind as a whole and if it is to become a substantial contribution towards the success of the Second Development Decade, then it is necessary that more attention be given to the interest of the developing countries.

Indonesia is grateful to the I.T.U. and the U.N.D.P. for the assistance given so far in the improvement of our communication system. There are, however, projects which are still to be completed such as: the regional telecommunication network in South East Asia, educational projects, telecommunication projects in West Irian in the framework of the Funds for Development for West Irian and others for which further assistance is being required. It is further our sincere hope that Indonesia could be given technical assistance in developing its own national satellite communication system.
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
The Imperial Government of Iran reserves the right to take such action as it may consider necessary to protect and use its services as operated at present or to be brought into operation in the future should they be affected by the services of other countries.

It also reserves the right not to accept the I.F.R.B. procedures for registering the frequencies now used or to be used in the future in respect of its equipment and on its territory.

The Delegation of Iran therefore reserves for its country the right to take such action as may be necessary to meet its requirements in telecommunications and to protect its existing and future services without restriction of any sort as to the equipment used or to be used in the future in all frequency bands.
ANNEX 6

REPUBLIC OF SINGAPORE

In signing the Final Acts of the World Administrative Radio Conference for Space Telecommunications (Geneva, 1971), the Delegation of the Republic of Singapore reserves for its Government the right to take such action as it may consider necessary to safeguard its interests should any country fail in any way to comply with the requirements of the Final Acts of this Conference or should reservations made by any country jeopardize the Telecommunications Services of the Republic of Singapore.
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of the United States of America, the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex: 1
Chairman of the World Administrative Radio Conference for Space Telecommunications

Dear Sir,

The Delegation of the United States of America to the World Administrative Radio Conference for Space Telecommunications regrets the circulation of Document No. 290-B which is not only frivolous and irrelevant to the problems of WARC-ST, but ignores the fact that the Republic of China, the Republic of Korea and the Republic of Viet Nam are members in good standing of the International Telecommunication Union.

Sincerely yours,

Robert C. Tyson
Chairman
Delegation of the United States
MINUTES
OF THE
FOURTH PLENARY MEETING
Monday, 12 July 1971, at 1500 hrs

Chairman : Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed

1. Draft recommendation relating to the use of satellite communication systems in the event of natural disasters, epidemics, famines and similar emergency situations

   Document No. 349

   (Series B7, pp. 03, 04)

2. First reading of texts submitted by the Editorial Committee
   a) Series B4
       Document No. 326
   b) Series B5
       Document No. 343
   c) Series B6
       Document No. 352
   d) Series B7 (pages 01, 02)
       Document No. 360
The Chairman of Committee 2 said that the credentials of the Delegation of Tunisia had that morning been studied and found in order.

1. Draft Recommendation relating to the use of satellite communication systems in the event of natural disasters, epidemics, famines and similar emergencies (Document Nos. 349, 360 (Series B7, pages 03, 04)

It was agreed, since Document No. 349 had been through the Editorial Committee before coming to the Plenary, to discuss the draft Recommendation as it appeared in Series B7, pages 03 and 04 (Document No. 360).

Introducing the draft Recommendation, the Delegate of the Philippines said the changes, other than those of a minor editorial nature, made to the original proposal (Document No. 224) were as follows: the title had been brought into line with United Nations terminology; and, in accordance with suggestions made at the third Plenary meeting, a paragraph 2 had been added to the section under "recommends" (where the original section had been combined into the present paragraph 1) and the paragraphs under "requests" and "invites" had been altered.

After some discussion on whether the word "provide" in paragraph 1 under "recommends", page 03, was too strong, it was agreed to leave the text as it stood. In the same paragraph, it was agreed to delete the word "international" as the paragraph would also apply to national systems.

In reply to a query from the Observer from the World Meteorological Organization, the Secretary-General confirmed that the final text would be in the form of a Recommendation, not a Resolution. Such a procedure was in line with I.T.U. practice, in spite of the inclusion of sections headed "requests" and "invites".

The Director of the C.C.I.R. mentioned that, in view of the interest shown by radio amateurs throughout the world in co-operating with relief operations, delegates might wish on return to their countries to look into the possibilities of using the amateur service in this respect.

The draft Recommendation (pages B7 - 03 to 04), as amended, was adopted.

2. First reading of texts submitted by the Editorial Committee

a) Series B4 (Document No. 326)

In reply to queries from the Delegates of Argentina and Poland, the Chairman said that the parts of the texts of the blue documents that were enclosed in square brackets represented information that was not yet in its final form. That information was being prepared by a small ad hoc drafting group convened by the Chairmen of Committees 4 and 5, after which it would be sent direct to the Editorial Committee for incorporation into the pink documents and would be examined by the Plenary at that stage. The
task of the present meeting would therefore be to examine only the parts of the document not in square brackets.

RePLYING TO A SUGGESTION FROM THE Delegate of Israel that it would be helpful for delegates to have a summary table by frequency range and service for reference when considering any particular provision, the Chairman of Committee 4 said that although the drafting group had considered such a suggestion useful it had not yet had time to complete the drafting of such a table. The Vice-Chairman of the I.F.R.B. said that in any case a similar document was always prepared for the assistance of administrations after each administrative conference.

Page B4 - 01

Following the point raised by the Delegate of Kenya that the frequency sub-divisions listed in MOD 112 did not appear to be followed in parts of the Table of Frequency Allocations (Article 5), or in parts of Articles 9 and 10, a general discussion took place on whether the second and perhaps also the third sentence of the provision should be deleted. However, as the text of MOD 112 referred to the table in that provision only, as departures from the table elsewhere in the Radio Regulations were covered by the third sentence and as no difficulty had been caused in the past by the provision (the only change to the existing RR 112 being the substitution of "hertz" for "cycles per second"), it was agreed to leave the text as it stood.

The Delegate of Argentina pointed out the following corrections to the Spanish text only: the word "gigahertzios" should be inserted in the first line of the third indented sub-paragraph after "en"; and the expression "0,3 x 10^N a 3 x 10^N Hz" in Note 1 should read "0,3 x 10^N a 3 x 10^N Hz".

The proposal of the Delegate of Argentina, supported by the Director of the C.C.I.R. and other speakers, that it would be more correct if the word "Abbreviations" in Note 2 were replaced by "Symbols and prefixes" was approved after a short discussion.

Page 01, as amended, was approved.

Pages B4 - 02 to 03

The Chairman of Committee 7 pointed out the following correction to be made to the text of ADD 470NB: the words "in particular," to be inserted on the second line of page B4 - 03 after "and". The Delegates of the United States of America and of Australia queried the need to have the earth-exploration satellite service mentioned in that and other provisions and it was agreed that Committee 7 should look into the point.
The Chairman of the I.F.R.E. pointed out that the words "where this band service," appearing on the second and third lines of page B4-03 were missing from the Spanish text, which should be amended accordingly.

Pages 02 to 03, as amended, were approved.

Pages B4-04 to 09

Approved.

Pages B4-10

In reply to a query from the Delegate of Austria, the Chairman explained that the provisions given in square brackets in ADD 470 had been included for the guidance of Committee 7 in making the final draft. No question of substance was involved.

Page 10 was approved.

Page B4-11

The Delegate of Canada pointed out that the word "spatiale" was missing after "station" on the fifth line of the French text for ADD 470.

The Delegate of the United States of America proposed the insertion of the words "or Meteorological-Satellite Service" after the "Fixed Satellite Service" on the third line of ADD 470.

Page 11, as amended, was approved.

Page B4-12

Approved.

b) Series B.5 (Document No. 343)

Pages B5-01

The Delegate of France said that "space system" should be replaced by "satellite network" in ADD 470.

Page B5-02

Following a suggestion by the Delegate of France that the final part of the first paragraph should be split into two sentences, it was agreed to leave the redrafting of that paragraph to the Editorial Committee.
c) Series B.6 (Document No. 352)

The Chairman of the Editorial Committee said that certain discrepancies had been found between the different language versions and in view of the importance of Article 9A it was proposed to set up a separate small drafting group including members of Committee 6 to align the three texts.

The Delegates of Canada, the United States of America, the United Kingdom, France and Mexico supported that proposal and said they would participate in the work of the group, the chairmanship to be confirmed later as the Chairman of Committee 6 was not present at the meeting at that moment.

The Chairman therefore requested that all drafting matters be dealt with by the group just set up and that the Committee deal with matters of substance only.

Page B6 - 01

In reply to the Delegate of Syria, the Chairman of Committee 6 said that the square brackets had been left around the reference to stations in the broadcasting satellite service pending a constructive proposal for a separate resolution from Committee 6.

Page 01 was approved, subject to a drafting change noted by the Delegate of Finland.

Pages B6 - 02 and 03

Approved.

Page B6 - 04

Approved, subject to the examination of 639AK a) by the drafting group referred to above.

Page B6 - 05

The Delegate of Pakistan having asked for clarification on the foot-note, the Chairman of the I.F.R.R. explained that no technical data on co-ordination between broadcasting satellite space stations appeared in the Radio Regulations.

Page 05 was approved.
The Chairman of the I.F.R.R. said that Article 9A should be brought into line with Article 9 in the light of the decision taken in Committee 6 to replace fixed or mobile services by terrestrial radiocommunications with an appropriate foot-note.

 Approved, subject to that amendment.

Approved.

Approved, subject to a correction pointed out by the Delegate of Canada.

Approved.

The Delegate of Czechoslovakia asked for the foot-note 639AR.1 to mention Region 1 as well as Region 3 and that proposal was supported by the Delegates of Poland, the U.S.S.R., Belorussia, Bulgaria, Ethiopia and Syria as the countries in question used the bands extensively for other services and co-ordination was essential.

The Delegates of the United Kingdom, Federal Republic of Germany, France and Spain were opposed to the inclusion of Region 1 in the foot-note.

The Delegate of New Zealand proposed that "Region 3" in the foot-note be replaced by "that area of Region 3 north of latitude 15° N". The Delegate of India was prepared to accept the revised foot-note provided that it modified to "north of latitude 10° N"; the Delegate of Indonesia said he could not agree with the proposal and the Delegate of Australia said he shared the New Zealand position and could not accept 10° N.

The Delegate of Pakistan preferred the foot-note to be retained as it stood.

In reply to queries from the Delegates of Kenya and Sweden on the origin of the note, the Delegate of the Netherlands said he had on several occasions explained its existence in the Radio Regulations. Region 3 had been excluded from the application of paragraph c) as a result of a special agreement between some administrations participating in the 1963 Space Conference.

The Delegate of the Democratic Republic of the Congo wondered to what extent such an agreement was binding on an administrative conference.
The Chairman thought a reasonable solution would be to list countries rather than refer to regions. The Delegates of Syria and India did not think that satisfactory as the countries concerned were in fact seeking co-ordination with other countries.

The Delegates of Senegal and Ethiopia agreed with a suggestion by the Delegate of Kenya to include Region 1 in the foot-note, with a note excluding those countries which were prepared to forego co-ordination procedures.

The Delegate of Mexico, supported by the Delegates of Cuba, Argentina, Kuwait and Chile, thought the whole of paragraph c) should be deleted and proposed that a vote be taken on that point.

The Delegate of France, supported by the Delegate of the U.S.S.R., thought a vote was premature and that it should be deferred to the following meeting.

It was so agreed.

Pages B6 - 10 to 19

Approved.

Page B6 - 20

Approved, subject to the correction of the reference in 639CI to numbers 639BP, 639BQ and 639BR.

Pages B6 - 21 to 22

Approved.

Page B6 - 24

Approved, subject to revision of the wording of 639DD by the drafting group.

Pages B6 - 25 to 28

Approved.

The Delegate of Syria reserved the right to revert to the subject if the Broadcasting-Satellite Service were included in Article 9A.
Further to proposals made by the Delegates of France, Greece and Brazil, it was agreed that the definition of satellite network should begin "A satellite system, or part of a satellite system, consisting of ..."

The Delegate of the Netherlands asked what the relation was between the definition of satellite system in B.3 – 02 and the one just adopted. The Chairman of Committee 4 agreed that the definitions would have to be brought into line by the drafting group.

Page 01 approved, subject to amendment.

Page B7 – 02

There was considerable discussion on the necessity for retaining the reference to a geographical map in ADD 105C (Co-ordination contour). The Delegates of the Democratic Republic of the Congo, Poland and Ethiopia were in favour of deleting it, and the Representative of the I.F.R.B. and the Director of the C.C.I.R. also felt it could be removed. The Chairman thought that deletion of the word "geographical" might be a satisfactory solution, whereas the Delegate of Brazil preferred deletion of the whole phrase "on a geographical map on which an earth station location is represented".

The Delegate of the United Kingdom thought that contour had no real meaning without a map and was opposed to deletion of the phrase, but nevertheless agreed to withdraw his opposition.

It was decided that the definition would begin "The line joining the points ...".

Page 02 approved, as amended.

The meeting rose at 1915 hours.

The Secretary: 
C. STEAD

The Chairman:
Gunnar PEDERSEN
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of the Republic of Korea, the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
In the Annex, 2nd and 3rd lines, read:

... by the Delegations of Cuba, Poland and Roumania respectively...

En el Anexo, 2.a línea, léase:

... las Delegaciones de Cuba, de Polonia y de Rumania...

Ne concerne pas le texte français.
ANNEX

STATEMENT

The Delegation of the Republic of Korea regrets that the technical forum of the present Conference is again misused for cheap political propaganda by a certain delegation.

The remarks contained in the statement annexed to Document No. 290-E do not correspond with the purpose of the present Conference and are in total violation of its terms of reference, namely Article 7 of 1965 Montreux Convention on International Telecommunication.

The annexed statement of Document No. 290-E, obviously politically motivated and unrelated to the substance of the present Conference, should therefore be completely disregarded.
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of the Republic of China, the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
With reference to Documents Nos. 290, Annex, 379, Annex and 401, Annex, which have been circulated by the Delegations of Cuba and Poland respectively, the Delegation of the Republic of China wishes to repeat what it expressed at the Second Meeting of Committee 2 on 17 June 1971 and contained in the Summary Record in Document No. 167, Annex 7. In accordance with the provisions of paragraph 12 of Article 2 of the I.T.U. Convention, the Delegation of the Republic of China has every right to attend this Conference as the only legal representative of China.

This statement will equally apply to any other derogatory remarks or statements on the representation of China in this Conference.

RECOMMENDATION No.
relating to the preferred frequency
bands for tropospheric scatter systems

The World Administrative Radio Conference for Space
Telecommunications, Geneva 1971,

considering
the technical and operational difficulties pointed out by the
C.C.I.R., particularly in the Report of the Special Joint Meeting,
Geneva, 1971, in bands shared by tropospheric scatter systems and space
systems;

recognizing, however,
that Administrations will wish to continue to use tropospheric
systems in order to satisfy certain telecommunications requirements;

noting
that the proliferation of such systems in all frequency bands,
particularly those shared with space systems, will only serve to aggravate
an already difficult situation;

requests
that the C.C.I.R. urgently study the radio-frequency requirements
for tropospheric scatter systems and recommend the preferred radio
frequencies for such systems;

invites
the Administrative Council to arrange that a future Administrative
Conference allocate specific frequency bands, unshared with space services,
for use by new tropospheric scatter systems.
DRAFT RESOLUTION No. Spa 1

considering

a) that all necessary action has been taken on the following Resolutions and Recommendations of the Extraordinary Administrative Radio Conference, Geneva, 1963:

- Resolution No. Spa 1 Relating to the Provision and Use of Information regarding International Satellite Systems;
- Resolution No. Spa 2 Relating to Space Vehicles in Distress and Emergency;
- Resolution No. Spa 3 Relating to the Category of the Fixed and Mobile Services in the Band 1 525-1 540 Mc/s;
- Recommendation No. Spa 1 Relating to the Calculation of Co-ordination Distance for Earth Stations;
- Recommendation No. Spa 2 to the C.C.I.R. and to Administrations Relating to the Calculation of the Probability of Interference between Stations within Co-ordination Distance;

b) that the undermentioned Recommendation of the Extraordinary Administrative Radio Conference, Geneva, 1963, is obsolete:
Recommendation No. Spa 6 Relating to the Frequency Requirements in the HF Bands Exclusively Allocated to the Aeronautical Mobile (R) Service;

Points 3 and 4 of Recommendation No. Spa 9 Relating to the Review of Progress in the Field of Space Radiocommunications;

resolves

that the said Resolutions and Recommendations are abrogated.
MEMORANDUM BY THE CHAIRMAN

I have received a letter from the Head of the Delegation of Chile, the text of which is attached hereto.

Gunnar PEDERSEN
Chairman of the Conference

Annex : 1
ANNEX

STATEMENT BY THE DELEGATION OF CHILE

The Chilean Delegation considers that the place reserved for China at this Conference should be occupied by a representative of the Government of the People's Republic of China, which is the lawful representative of the Chinese people.
MINUTES
OF THE
SIXTH PLENARY MEETING

Wednesday, 14 July 1971, at 1100 hrs

Chairman : Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed

1. First reading of texts submitted by the Editorial Committee – Series B.11
   Document No. 381

2. Organization of work
1. First reading of texts submitted by the Editorial Committee - Series B.11 (Document No. 381)

The Delegate of the United Kingdom, speaking on behalf of the small drafting group appointed by Committee 6 to deal with changes in Articles 9 and 9A, said that a few small editorial and typing errors had been noted and would be corrected, and he would only draw the attention of the Plenary Meeting to four substantive changes suggested by the group. On page B.11 - 03, at the end of MOD 490, a comma should be placed after "broadcasting stations" in the third line, the word "or" should be deleted, a comma should be inserted after the last word and the following phrase should be added: "or to stations of the fixed or mobile service which operate in frequency bands listed in Table II of Appendix 28 with e.i.r.p. exceeding the corresponding values listed in that Table"; on page B.11 - 04, foot-note MOD 492A.3 could be deleted, since "co-ordination area" was now a defined term; on page B.11 - 05, in the second line of sub-paragraph b) of MOD 492C, the word "exceed" should be replaced by "increase" and the word "acceptable" should be deleted; and on page B.11 - 15, in sub-paragraph a) of ADD 635A, the word "preparation" should be replaced by "verification" and "No. 492A" by "No. 639AN", to bring the text into line with the corresponding provision of Article 9A. Finally, a change which was not really substantive, although it might seem so, should be made in the title of Sub-Section III on page B.11 - 08, where the square brackets round "terrestrial" should be removed and the words "in the fixed or mobile service" should be deleted.

The Chairman invited delegates who wished to make drafting changes to submit them in writing to the Editorial Committee.

Page B.11 - 01
Approved.

Page B.11 - 02

The Delegate of Canada pointed out that in the French text of NOC 487 the adjective "terrestre", corresponding to "land", had been omitted.

Approved.

Page B.11 - 03

The Delegate of France said he was very glad to be able to announce that if the drafting group's amendment to MOD 490 was accepted, his delegation would not be obliged to raise again in the Plenary Meeting the
question which had been discussed at length in Committee 6 in connection with Document No. 188(Rev.). The amendment offered all administrations protection for their earth stations vis-à-vis terrestrial stations beyond the co-ordination area, a point with which the French Administration was greatly concerned.

Approved, as amended by the drafting group.

Page B.11 - 04

Approved, as amended by the drafting group.

Page B.11 - 05

The Delegate of Pakistan said he found it difficult to accept the drafting group’s amendment to MOD 492C, sub-paragraph b), because the omission of the word "acceptable" left the term "level of interference" unduly vague. The question of the words to be used to qualify interference levels had been discussed at length in Committee 6, which had used the word "permissible" in the version of the sub-paragraph appearing in Document No. 377. He would therefore suggest either that the clause should be left unchanged or that the phrase should read "... not to increase the acceptable level...".

The Delegate of the United States of America agreed that care should be taken to use the correct adjective to qualify the level of interference, but pointed out that in the case at issue there was no need for such a word, as the situation was one where the assignment, having been approved, operated in a stable environment so far as interference to and from the earth stations of other administrations was concerned.

The Delegate of Pakistan said he could accept the amendment on the understanding that the level of interference was not to be increased in relation to the level accepted earlier.

The Director of the C.C.I.R. observed that under the original text increases of the interference level were permitted, but only to the extent that the final level did not exceed the acceptable level. As the clause was now worded, if the interference level was increased slightly but still remained below the acceptable level, co-ordination under No. 492A would be required.
The Delegate of the United Kingdom pointed out that the purpose of the provision was indeed to require co-ordination whenever the risk of interference was increased in any way.

The Chairman of the I.F.R.B. said that the phrase "acceptable level of interference" at the end of MOD 492D, sub-paragraph c), was correct in the English text and that the French and Spanish should be aligned with it.

Approved, as amended.

Pages B.11 - 06 to 09

Approved.

Page B.11 - 10

In reply to the Delegate of Cuba, the representatives of the I.F.R.B. said that the "notified date" referred to in the last paragraph of ADD 570AGC was, according to No. 639CC of the Radio Regulations, the date of putting into use notified by the administration concerned. That date was entered in Column 2c of the Master Register. Moreover, the term "this date" clearly referred to the preceding sub-paragraph, where reference was made to the date when the assignment was brought into use.

Approved.

Pages B.11 - 11 to 14

Approved.

Page B.11 - 15

The Delegate of India suggested that a sentence reading "The Board shall advise the administration concerned before taking such action" should be added at the end of NOC 570BH, to bring it into line with No. 659DA, the corresponding provision of Article 9A.

Approved, as amended

2. Organization of work

At the invitation of the Chairman, the Secretary of the Conference announced that the agenda for the Seventh Plenary Meeting would consist of the first reading of the texts in Series B.12 and the second reading of the
texts in Series B.11 and B.12, the latter on the basis of the amended "blue" documents, since there would be no time to print "pink" versions for texts after Series B.10. At the second reading of "blue" texts, the Secretariat would read out all the substantive changes made during the first reading. Further changes approved would be carefully noted and passed to Committee 7 for incorporation in the final "white" document.

That procedure was approved.

The Secretary of the Conference said that Document Nos. 338, 362, 374 + Add., 375 + Add. and 385 + Add., which concerned the Frequency Allocation Table in Article 5, had been distributed and that another document was being prepared indicating requests made by delegations in Committee 5 for the right to revert to certain decisions, if necessary, when the relevant texts were examined in the Plenary Meeting. The requests would be arranged in order of frequencies. The revised Table would appear in Series B.13, to be considered during the Eighth Plenary Meeting. It was to be hoped that delegations would study the preliminary documents and would seek any necessary clarifications from the Chairman or Secretariat of Committee 5, so as to reduce discussion in the Plenary Meeting as far as possible.

The meeting rose at 1210 hrs.

Secretary: Clifford STEAD
Chairman: Gunnar PEDERSEN
ANNEX 11bis

REVISION OF ARTICLE 41 OF THE RADIO REGULATIONS

Article 41 of the Radio Regulations shall be amended as follows:

Add the following new text at the end of number 1567

ADD 1567A § 6. Space stations in the Amateur Service operating in bands shared with other services shall be fitted with appropriate devices for controlling emissions in the event that harmful interference is reported in accordance with the procedure laid down in Article 15. Administrations authorizing such space stations shall inform the I.F.R.B., and shall insure that sufficient ground command stations are established before launch to guarantee that any harmful interference that might be reported can be terminated by the authorizing Administration. (See No. 470V.)
RECOMMENDATION No. Spa NN

Relating to the Preferred Frequency Bands for Tropospheric Scatter Systems

The World Administrative Radio Conference for Space Telecommunications, Geneva 1971,

considering

the technical and operational difficulties pointed out by the C.C.I.R., particularly in the Report of the Special Joint Meeting, Geneva, 1971, in bands shared by tropospheric scatter systems and space systems;

recognizing, however, that administrations will wish to continue to use tropospheric systems in order to satisfy certain telecommunications requirements;

noting that the proliferation of such systems in all frequency bands, particularly those shared with space systems, will only serve to aggravate an already difficult situation;

requests that the C.C.I.R. urgently study the radio-frequency requirements for tropospheric scatter systems and recommend the preferred radio frequencies for such systems;

invites the Administrative Council to arrange that a future world administrative radio conference consider which frequency bands of the fixed service shall be preferably used by new tropospheric scatter systems, taking into account the allocations to the space radiocommunication services.
The Final Acts of the Space Conference consist of the following:

1. Basic volume
   - Partial revision of the Radio Regulations
   - Annex 7 : Article 9
   - Annex 8 : Article 9A
   - Annex 12 : Appendix 1
   - Annex 13 : Appendix 9
   - Annex 14 : Appendix 10
   - Annex 15 : Appendix 28
   - Annex 16 : Appendix 29
   - Final Protocol (see also Document No. 402 and Addenda)
   - Resolution No. Spa A relating to the Experimental Use of Radio Waves by Ionospheric Research Satellites
   - Resolution No. Spa B relating to the Use of the Band 156-174 MHz by the Maritime Mobile Satellite Service
   - Resolution No. Spa C relating to the inclusion of additional Section in List VIIIA (Article 20, Appendix 9)
   - Resolution No. Spa D relating to the Use by All Countries, with Equal Rights, of Frequency Bands for Space Radiocommunication Services
- Resolution No. Spa E relating to the Technical Criteria recommended by the C.C.I.R. for sharing frequency bands between Space Radiocommunication and Terrestrial Radiocommunication Services or between Space Radiocommunication Services

- Resolution No. Spa F relating to the Establishment of Agreements and Associated Plans for the Broadcasting-Satellite Service

- Resolution No. Spa G relating to the Bringing into use of Broadcasting Space Stations, prior to the entry into force of Agreements and Associated Plans for the Broadcasting-Satellite Service

- Recommendation No. Spa J to the C.C.I.R. and to Administrations Relating to Frequency Bands Shared between Space Radiocommunications Services and between Space and Terrestrial Radiocommunications Services

- Recommendation No. Spa AA relating to the Co-ordination of Earth Stations

- Recommendation No. Spa BB relating to Carrier Energy Dispersal in Systems in the Fixed Satellite Service

- Recommendation No. Spa CC relating to the Use of Space Radiocommunication Systems in the Event of Natural Disasters, Epidemics, Famines and Similar Emergencies

- Recommendation No. Spa EE relating to a Revised Presentation of the Sections of Article 1 of the Radio Regulations

- Recommendation No. Spa FF relating to the Future Use of Bands Allocated to the Inter-Satellite Service

- Recommendation No. Spa GG relating to the Future Use of Certain Frequency Bands between 40 and 275 GHz

- Recommendation No. Spa HH relating to the Future Use of the 41-43 GHz Band by the Fixed and Mobile Services

- Recommendation No. Spa II relating to Future Frequency Allocation Requirements for the Maritime Mobile Satellite Service

- Recommendation No. Spa JJ relating to the Protection of Radio Astronomy Observations on the Shielded Area of the Moon
- Recommendation No. Spa KK relating to the Future Provision of a Band near 10 MHz for the Radio Astronomy Service

- Recommendation No. Spa LL relating to the Examination by World Administrative Radio Conference of the Situation with regard to Occupation of the Frequency Spectrum in Space Radiocommunications

- Recommendation No. Spa MM relating to Technical Standards for the Assessment of Harmful Interference in the Frequency Bands above 28 MHz

2. Document No. 395(Rev.), R.3(Rev.)

- Annex 1: Article 1
- Annex 2: Article 2
- Annex 3: Article 5
- Annex 4: Article 6
- Annex 5: Article 7
- Annex 6: Article 3
- Annex 9: Article 14
- Annex 10: Article 15
- Annex 11: Article 27

- Recommendation No. Spa DD relating to the Criteria to be Applied for Sharing between the Broadcasting-Satellite Service and the Terrestrial Broadcasting Service in the Band 620-790 MHz

3. Table of Frequency Allocations (see also above, under 2, Annex 3)

5. - Annex 11bis: Article 41 (see Document No. 411)

6. - Recommendation No. Spa NN relating to the Preferred Frequency Bands for Tropospheric Scatter Systems (see Document No. 412)
SUMMARY RECORD OF THE SIXTH MEETING OF COMMITTEE 6
Tuesday, 13 July 1971, at 0940 hrs
Acting Chairman: Mr. M.K. BASU (India)

Subjects discussed

   Document No. 358

2. Appendix 9
   Document No. 370

3. Draft new Resolution
   Document No. 376

Annex 1

The Delegate of Canada said that after reconsideration of the discussion at the Committee's previous meeting, he had come to the conclusion that the original draft text in Annex 1, with the amendment to change "neighbouring countries" to "other countries" was the best form of wording.

The Delegates of the United States of America and Brazil endorsed the wording, as did the Delegate of Argentina with the proposal that "as much as possible" should be replaced by "to the maximum possible extent".

Annex 1, as thus amended, was approved.

Annexes 2, 3 and 4

The Convener of Working Group 6A-2 introduced Annexes 2, 3 and 4 of Document No. 358, Annex 2, with the exception of operative paragraph 2, and Annex 3 had been unanimously approved by the Sub-Working Group, but there had been a difference of opinion regarding operative paragraph 2 of Annex 2 and Annex 4. After lengthy discussion it had appeared that the alternatives were: 1) to retain operative paragraph 2 of Annex 2 and delete Annex 4, or, 2) to delete operative paragraph 2 and retain Annex 4.

The Delegate of the United Kingdom said that a third possibility was to maintain both operative paragraph 2 of Annex 2 and Annex 4, there being in his Administration's opinion no conflict between the two texts. Annex 2 was a draft Resolution on the establishment of agreements and associated plans for satellite broadcasting, whereas Annex 4 was a draft Recommendation dealing with one particular frequency band for one particular area. The preambular paragraphs of the draft Recommendation set out a special problem of the European Broadcasting Area: in order to develop terrestrial services in the European Area it was necessary to know as soon as possible which channels would be available to them, and it would be wasteful of the frequency spectrum not to begin such development at an early date.

The Delegate of the U.S.S.R. did not agree that operative paragraph 2 of Annex 2 and Annex 4 were not incompatible. Although his country belonged to Region 1, it bordered on many other Broadcasting Regions. The draft Recommendation in Annex 4 involved a band allocation on a worldwide basis, and its handling by a regional conference would give rise to all sorts of difficulties.
Hence, a World Administrative Conference must precede any Regional Administrative Conferences.

A lengthy discussion ensued in which the Delegates of the Netherlands, Denmark, Italy, Austria and Spain supported the view that both operative paragraph 2 of Annex 2 and Annex 4 should be maintained, while the Delegates of New Zealand, Pakistan, Nigeria, Brazil, Argentina and Poland were in favour of operative paragraph 2 of Annex 2, but wished to delete Annex 4. It was pointed out that under Article 4, No. 118 of the Radio Regulations there was nothing to prevent the European countries from concluding a special agreement among themselves.

The Delegate of Canada, supported by the Delegate of Italy, said that the main opposition to Annex 4 appeared to come from countries outside the European Region, who feared that a prior European Regional Conference would adversely affect the outcome of a World Conference, and suggested that some wording to allay that fear should be added to operative paragraph 3 of Annex 4.

The Delegate of Syria, supporting the retention of operative paragraph 2 of Annex 2, proposed that the word "and/or" should be inserted before "or Regional" in the second line of the paragraph and it was so agreed.

The Delegate of Nigeria said that if it was so vital to submit a recommendation such as that in Annex 4 to the Administrative Council, his Delegation might find it necessary to submit draft recommendations for Regional Administrative Conferences on the 620-790 MHz band and the 2.5 GHz band, to safeguard the interests of the African countries.

The Secretary-General explained that an equally satisfactory procedure would be for a request for the convening of a Regional Administrative Conference to be submitted by a quarter of the total number of Members and Associate Members of the Region, as set out in 654, Chapter 7 of the Montreux Convention.

Finally, the Chairman put to the vote the proposal that operative paragraph 2 of Annex 2, as amended by the Delegate of Syria, be maintained and Annex 4 be deleted.

The proposal was adopted by 24 votes to 14, with 5 abstentions.
The Delegates of the United Kingdom and the Netherlands reserved the right to raise the subject again in a Plenary meeting.

Annex 2, as amended, was approved.

Discussing Annex 3, the Delegate of Argentina, supported by the Delegates of Brazil and Pakistan, said that "the ninety-day period mentioned in operative paragraph 2.3 was not sufficient, particularly for countries distant from Geneva and for those with extensive territories in which there were many broadcasting systems to be considered. He proposed that the period be extended to one hundred and twenty days. It was so agreed and as a consequential change the one hundred and fifty days in operative paragraph 2.6 was changed to one hundred and eighty.

At the proposal of the Delegate of France, it was agreed to delete "as listed in Appendix I.A, Sections A and D" in operative paragraph 2.1 and replace it by "as listed in the appropriate paragraphs in Appendix I.A".

Arising from a question by the Delegate of Denmark, it was agreed that the following wording suggested by the Delegate of Canada, and slightly amended by the representative of the I.F.R.B., should replace operative paragraph 4.1: "Any frequency assignment to a broadcasting space station shall be notified to the Board. The notifying administration shall apply for the purpose the provisions of Numbers 639 BE, 639 BF and 639 BG of the Radio Regulations."

The representative of the I.F.R.B. pointed out that "paragraph 2.1" in operative paragraph 3.2.2 should be "paragraph 3.2.1".

After discussion of operative paragraph 5.3 (b), it was agreed that for the sake of clarity, it should be replaced by two sub-paragraphs, whose wording would be the same as the existing paragraph except for the words: "... the provisions of paragraph 2.1 of Section A relating..." in one, and the words: "... the provisions of paragraph 3.2.1 of Section B relating..." in the other.

It was agreed that in operative paragraph 5.15, in the fifth and sixth lines, the text should read: "... frequency assignment to a station in the Broadcasting Satellite Service which has been subsequently recorded..." and that the last three lines of that paragraph should be aligned with Article 9A by the drafting group.

Annex 3, as thus amended, was approved.
2. **Appendix 9 (Document No. 370)**

The Chairman of Working Group 6A introduced Document No. 370 and explained that because of the difficulties of setting out amendments to Appendix 9 in tabular form, the Working Group had considered the draft Resolution in Annex 2 the best way of dealing with the subject.

Pages 3 to 6 of Document No. 370 were approved.

The draft Resolution in Annex 2 was approved.

3. **Draft new Resolution (Document No. 376)**

The Delegate of New Zealand, who had convened the Ad Hoc Group set up the previous night to re-word the draft Resolution in the Annex to Document No. 286, said that the group, consisting of the Delegates of India, Syria, Brazil, United Kingdom and the United States of America, had produced the draft new Resolution set out in Document No. 376. Preambular paragraph f) in Document No. 376, dealt with a point which had been in dispute, and was intended to indicate that the Conference was entitled to adopt a resolution on the use of the latest C.C.I.R. recommendations about the sharing of frequency bands. The time limit mentioned in operative paragraph 2 had been extended to 120 days, and operative paragraph 3 covered the situation when administrations did not respond to the Secretary-General's inquiry. Changes had been made in operative paragraph 7. The Ad Hoc Group had decided to withdraw operative paragraph 8, which it appeared might protect administrations running services which were not entirely in accordance with the Radio Regulations.

The Delegate of the United States of America explained that the purpose of operative paragraph 8 had been to reassure administrations which continued to apply the existing technical criteria of the Radio Regulations that they would suffer no harmful interference as a result of the application by other administrations of later criteria. The wording of operative paragraph 8 was now felt to be unsatisfactory, and the point was adequately covered by operative paragraph 4.

The Delegate of Cuba said that in Committee 4 his Delegation had questioned the Conference's legal capacity to adopt such a recommendation, which it appeared would modify the Montreux Convention and the Radio Regulations. After receiving assurances from the representative of the Secretary-General and the Delegate of the United States of America that the provisions of Article 44...
of the Convention were broad enough to cover the type of situation contemplated in the draft Resolution, and in view of the general support for the draft Resolution, he accepted it in principle.

The Delegate of Italy said that provided due stress was laid on the word "only" in operative paragraph 6(a), the draft Resolution was fully in conformity with the Convention.

The Delegates of Canada, U.S.S.R., India, Syria and the United Kingdom supported the deletion of operative paragraph 8. It was so agreed.

The Delegate of India, supported by the Delegates of Syria and the United Kingdom proposed the addition in operative paragraph 4, fourth line, after "... acceptable to it," of the words "or has not replied to the Secretary-General's inquiry in 3 above," so as to cover the case of administrations which by not replying implied that they wished the status quo to continue.

That amendment was adopted.

The Delegate of France proposed two amendments to operative paragraph 7 and after some discussion the principle of those amendments was approved, and it was agreed that the words "criterion or" should be inserted before "criteria" in the second line of operative paragraph 7, and similarly in the fourth line of operative paragraph 4, and that the last sentence of operative paragraph 7 should read: "The list published pursuant to paragraph 5 above shall be updated on the basis of replies received from administrations."

The draft new Resolution in Document No. 376, as amended, was approved.

The meeting rose at 1320 hrs.
MINUTES
OF THE
SEVENTH PLENARY MEETING
Wednesday, 14 July 1971, at 1600 hrs
Chairman : Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed

1. First reading of texts submitted by the Editorial Committee
   - Series B.12

2. Second reading of texts submitted by the Editorial Committee
   - Series B.11*)
   - Series B.12*)

*) As modified at the first reading.
1. First reading of texts submitted by the Editorial Committee  
Series B.12 (Document No. 382)

The Chairman invited delegates to submit directly to the Editorial Committee changes which were purely of a drafting nature, or which appeared necessary because the text in one language was not correctly aligned with the approved version.

Pages B.12 - 01 to 04

Approved.

Page B.12 - 05

The Vice-Chairman of the I.F.R.B. pointed out that in Item 7 the words "in accordance with Article 2 and Appendix 5" applied to all three sub-paragraphs and not merely to sub-paragraph c), and should therefore be placed before sub-paragraph a).

After some discussion of Item 8b), it was agreed that the English and Spanish texts should be brought into line with the French text, particularly as regarded the translation of the word "worst".

Approved, as amended.

Pages B.12 - 06 to 12

Approved.

Page B.12 - 13

The Vice-Chairman of the I.F.R.B. said that in order to align the text of 3) Note exactly with the text of Item 5 a) on page 12, it should read: "The arcs specified in 1) and 2) will be indicated by the geographical longitude of the extremes of these arcs on the geostationary satellite orbit."

Approved, as amended.

Pages B.12 - 14 to 18

Approved.
The Vice-Chairman of the I.F.R.B. said that the word "capability" should be deleted from Item 9 d), and after a brief discussion that was agreed, after confirmation by the Chairman of the Editorial Committee that the majority of texts submitted to the Editorial Committee after approval in the other Committees had not contained the word "capability".

Approved, as amended.

The Vice-Chairman of the I.F.R.B. drew attention to a mistake in the English text of Item 13, where "conducted" should be replaced by "affected".

Approved.

The Vice-Chairman of the I.F.R.B. indicated that the words "in kHz" should be added to Item 4, and the reference to Item 1 was incorrect and should read Item 4, in both Item 6 and Item 8.

Approved.

Pages B.12 - 22 to 24

Approved.

The Chairman of Committee 6 said that the words "(see Article 9A)" should be inserted after the title of the Appendix.

Approved, as amended.

Pages B.12 - 26 to 30

Approved.
2. Second reading of texts submitted by the Editorial Committee
   Series B.11 (Document No. 361, as modified at the first reading)

Page B.11 - 01 to 02

Approved.

Page B.11 - 03

The Chairman of Committee 6 queried the inclusion of the amendment
on page 3, which was a matter of substance that had not been approved when
the text was discussed in Committee 6.

The delegate of the United Kingdom explained that the point at
issue had still been outstanding after Committee 6 had held its last meeting.
A small drafting group had produced a form of words for the Plenary to
consider, and that had been approved without argument at the preceding
Plenary meeting.

Approved.

Page B.11 - 04

Approved.

Page B.11 - 05

The delegate of New Zealand said that in MOD 492D the word "data"
should be added at the end of paragraph 4) b).

Approved, as amended.

Page B.11 - 06 to 09

Approved.

Page B.11 - 10

After some discussion of the words "this date" in the last
paragraph of ADD 570AGC, it was agreed that it should read "that date" in
the English and Spanish texts, and the French text should remain unchanged.

Approved, as amended.
Page B.11 - 11 to 15

Approved.

Pages B.12 - 01 to 04

Approved.

Page B.12 - 05

After some discussion on the use of the word "worst" in the third and fourth lines in Item 8 b), English text only, it was agreed to leave the word as it stood in this paragraph and wherever else it occurred in the document.

Approved.

Pages B.12 - 06 to 13

Approved.

Page B.12 - 14

Item 10 c), last line (French text only): it was agreed to replace the word "lobe" by "faiseau". This correction also applied to page B.12 - 19, Item 9 c), fourth line.

Approved, as amended.

Pages B.12 - 15 to 22

Approved.

Page B.12 - 23

The delegate of France proposed a drafting amendment to the French text of the note at the bottom right hand corner of the page.

Approved, as amended.
The delegate of France proposed several drafting amendments.

Approved, as amended.

Pages B.12 - 25 to 26

Approved.

Page B.12 - 27

Item 3, second line: it was agreed to insert the word "within" after "range".

Approved, as amended.

Pages B.12 - 28 to 30

Approved.

The meeting rose at 1835 hrs.

OF THE
FIFTH PLENARY MEETING

Tuesday, 13 July 1971, at 1515 hrs

Chairman: Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed

1. Credentials of the Republic of Upper Volta

2. First reading of texts submitted by the

   Editorial Committee:
   - Series B6, page 09, paragraph c) 352
   - Series B7, pages 07 to 12 360
   - Series B8 361
   - Series B9 364
   - Series B10 369

3. Publication of the Final Acts
1. Credentials of the Republic of Upper Volta

The Chairman of Committee 2 announced that he had received that morning the credentials of the Republic of Upper Volta which had been checked and found in order.

2. First reading of the texts submitted by the Editorial Committee

Series B6 (Document No. 352)

Page B6-09, paragraph c)

The Chairman, after briefly recalling that paragraph c) on page B6-09 had already been discussed at length, asked participants if they agreed that the paragraph should be deleted.

It was so decided by 55 votes to none, with 5 abstentions.

The series B6, as amended, was approved.

Series B7 (Document No. 360)

Page B7-06

The delegate of the United States said that Committee 4 had decided to make the following amendment to No. MOD 470H: the word "or" after "No. 47003" should be replaced by a comma and the words "No. 4700A and No. 4700B" should be inserted after "No. 4700A,"

Page B7-06, as amended, was adopted.

Page B7-07

The delegate of Canada indicated that in the English text of MOD 470L after the words "concerned or" in the fourth line, the words, "those whose services may be" should be added.

The same addition would be made to the Spanish text.

Subject to the above, page B7-07 was approved.

Page B7-09

Replying to a question by the delegate of Argentina, the Chairman of Committee 5 said that in sub-paragraph a) under "taking into account" it was understood that community reception was referred to, although that was not specified.
The delegates of the U.S.S.R., Denmark, Poland, the United Kingdom and Israel took part in a discussion on whether the type of reception should be specified. Since most speakers considered that that was unnecessary, it was decided to leave the text unchanged.

Following a discussion on the wording of sub-paragraph a) under "considering", in which the delegates of the Netherlands, Italy, India and Israel took part, it was decided to use the same text as that of footnote 52A, adopted by Committee 5, concerning the frequency bands in question.

Page B7-09, as amended, was approved.

Page B7-10

A remark by the Chairman of the I.F.R.B. on what was meant, at the present stage, by the words "a preliminary co-ordination procedure" gave rise to comments by the Chairman of Committee 4 and the delegates of Poland, U.S.S.R. and the United Kingdom.

The delegate of Canada said that the co-ordination procedure for Satellite Broadcasting had been examined by Committee 6 and that the document now being considered dealt with the technical criteria for frequency sharing between Broadcasting-Satellite and Terrestrial Broadcasting Services. To solve the problem raised by the Chairman of the I.F.R.B., he proposed that the second and third lines of paragraph 1 under "recommend" should read:

"... provide for preliminary sharing criteria, on a provisional basis ...".

The Chairman of the I.F.R.B. accepted that proposal.

The delegate of France said that in a paragraph which was essentially technical it was unnecessary to refer to a co-ordination procedure which would be dealt with in the foot-note in the Table of Frequency Allocations.

The Canadian proposal was approved.

Page B7-10, as amended, was approved.

Series B7, as amended was approved.
The Chairman of Committee 4 said that he would provide the Editorial Committee with a copy of the document in which all the mathematical symbols were correct.

Page B8-01

The Chairman of the I.F.R.B. said that, following the discussions in Committee 6, the square brackets around the title could be removed.

The Vice-Chairman of Committee 6 said that the square brackets within the title could also be removed.

It was so decided.

The delegate of France pointed out that the word "systèmes" should be replaced by "réseaux" throughout the French text except at certain points which he would indicate as they arose. He also suggested that it would be better to say "degree of the interference" rather than "level of the interference".

It was decided that the Editorial Committee would amend the title in the light of the above remarks.

The Chairman of the Editorial Committee proposed that the square brackets around the words "of an earth station receiver" should be deleted. The sub-paragraph in square brackets at the beginning of paragraph 2 should also be deleted and replaced by a foot-note referring to a definition.

It was so decided.

Page B8-01, as amended, was approved.

Page B8-02

The Chairman of Committee 4 said that the passages in parentheses opposite "p_s" and "p_e" should read "(averaged over the worst 4 kHz band for carriers below 15 GHz or over the worst 1 MHz band for carriers above 15 GHz)."

Page B8-02, as amended, was approved.
The delegate of France said that the definition of \( \gamma \) at the top of the page should read:

"transmission gain of the link estimated from the receiving antenna output of the space station \( S \) to the receiving antenna output of the earth station \( E_r \) (numerical power ratio, usually less than 1)".

In his view the word "system" which occurred three times on the page should be replaced by "link".

In the French text of the paragraph beginning: "Cet accroissement...", the words "... et ceux des stations terriennes ..." should be replaced by "... et celui de la station terrienne ...".

It was decided that the French delegate would submit the above amendments in writing to the Editorial Committee.

Subject to the above, page B8-03 was approved.

The delegate of the U.S.S.R. asked for it to be recorded that, in his view, the values for the increase in equivalent noise temperature had not been sufficiently studied and justified.

Page B8-04 was approved.

The Chairman of the Editorial Committee said that, in the French text, the square brackets around the words "\( \int \) contours de gain\( ^{\gamma} \)" in the 9th line from the bottom of the page should be deleted and the word "\( \int \) d'émission\( ^{\gamma} \)" in the same line should be replaced by the words "de réception". Similar amendments should be made to the Spanish text.

The delegate of France requested that the sentence beginning "L'emplacement le plus défavorable ..." should be translated into English literally and that the present English text should be amended accordingly.

Subject to the above, page B8-05 was approved.
Page B8-06

The delegate of the United States proposed that the words "the transponder" in the 3rd line of the first paragraph should be replaced by the words "a particular transponder".

It was so decided.

Page B8-06, as amended, was approved.

Page B8-07

It was decided to replace the word "systems" in the 4th line from the bottom by the word "links".

Page B8-07, as amended, was approved.

Page B8-08

The Chairman of Committee 4 said that "c/s" should be replaced by "Hz" in the English text and that the third term in the formula for Receiver input under Step 1 should be "1" instead of "e_u".

Page B8-08, as amended, was approved.

Pages B8-09 and B8-10

Pages B8-09 and B8-10 were approved.

Series B8, as amended, was approved.

Series B9 (Document No. 364)

Page B9-02

In view of the explanations given by the Chairman of Committee 5 and the Chairman of the I.F.R.B., it was decided to use the expression "à titre secondaire" rather than "accessoirement" in the French text of No. MOD 415, sub-paragraphs 2(1) a) and b) and "secundario" rather than "accesorio" in the Spanish text. In the English text, the square brackets around "on a secondary basis" should be deleted.

Page B9-02, as amended, was approved.
Page B9-03

Page B9-03 was approved, the square brackets in No. MOD 952 being deleted.

Pages B9-11 and B9-12

Pages B9-11 and 12 were approved, the square brackets being deleted.

Series B9, as amended, was approved.

The Observer for the Intergovernmental Consultative Maritime Organization (I.N.C.O.), referring to the two recommendations on pages B9-11 and 12, made a statement, the text of which is reproduced in Annex 1.

The Observer for the International Radio Maritime Committee (C.I.R.M.) made a statement, the text of which is reproduced in Annex 2.

Series B10 (Document No. 369)

Pages B10-01

Subject to minor drafting amendments and the insertion of the words "Geneva, 1971", after the words "Special Joint Meeting" in sub-paragraph a) under "recognizing", page B10-01 was approved.

Page B10-04

It was decided that sub-paragraph c) would be redrafted by the Editorial Committee which would delete the square brackets around the words "fixed and mobile services" and delete the words "terrestrial radiocommunication services".

Page B10-04, as amended, was approved.

Pages B10-05 and B10-08

Following a long discussion it was decided, by 26 votes to 15, with 29 abstentions, to delete sub-paragraph 1 on page B10-05 and sub-paragraph 2.16 on page B10-08.

The figure "XIIIth" in the 5th line of paragraph 1 under "recommends" was deleted.
The delegate of Denmark said that the word "proposed" in the 2nd line of sub-paragraph m) should be replaced by the word "adopted".

It was so decided.

Page B10-05, as amended, was approved.

Page B10-06

The Editorial Committee was instructed to bring the French and English texts of paragraphs 2.5 and 2.14 (on page B10-08) into line.

With this reservation, page B10-06 was approved.

Page B10-07

At the proposal of the Chairman of the Editorial Committee, it was decided to adopt the word "networks" rather than "systems" in paragraphs 2.6 and 2.7.

Page B10-07, as amended, was approved.

Page B10-08

As indicated above, it was decided that the Editorial Committee should reconsider the words "acceptable" and "unacceptable".

With that reservation, page B10-08 was approved.

The French delegate said that, in view of previous decisions some parts of the pages of Series B10 which had already been approved ought to have been deleted, namely: sub-paragraphs c), d) and e) on page B10-04; paragraphs 2.9 and 2.11 on page B10-07 and the whole of paragraph 3 on page B10-08.

It was so decided.

Series B10, as amended, was approved.

3. Publication of Final Acts

Replying to a question by the delegate of Poland concerning the reprinting of the Radio Regulations which had been amended, the Secretary of
the Conference said that the amended Regulations would be published shortly before the date when the Final Acts of the Conference entered into force.

As in the case of other I.T.U. publications, their price would depend on the number of subscribers replying to the appeal sent out by the General Secretariat.

The meeting rose at 1825 hours.

The Secretary:
Clifford STEAD

The Chairman:
Gunnar PEDERSEN

Annexes: 2
ANNEX 1

I.M.C.O. STATEMENT

As an observer of I.M.C.O., I should like to express my disappointment that this Conference has not been able to allocate suitable and sufficient frequencies to satisfy the maritime operational requirements, due mainly to the conflicting requirements of existing terrestrial services. I am particularly referring to a world-wide satellite system for distress, safety and radionavigation, suitable for all ships.

It is my personal belief that the decision of this Conference not to allocate a frequency spectrum of about 2 MHz somewhere in the bands between 200 and 600 MHz will seriously restrict the development of a maritime satellite system.

I.M.C.O. will review the requirements for the maritime mobile service in the light of the decisions taken by this Conference and I trust that a future I.T.U. Conference will be in a better position to give adequate priority to a service which is completely dependent upon the use of radio for distress, safety and operational communications.

I am very grateful to this Conference for giving a great deal of its time to the discussion of this subject and in particular for the efforts made by several delegations to find an effective solution to this problem.
ANNEX 2

STATEMENT BY C.I.R.M.

The Conference, its Committees 4 and 5, and their Working Groups have devoted a great deal of their time to consideration of the requirements of the maritime mobile service and have shown a good understanding of the needs.

However, it has not been able to find anywhere in the 200-600 MHz area to accommodate the 1% of spectrum needed by the maritime mobile service or made any arrangement for the future, such as clearing spectrum space by some specified date.

This is a restriction on the development of a service that is one of the oldest and most deserving in the use of radio, and that, directly or indirectly, is essential to all the countries of the world, including those represented here.

To some extent, reliance is being placed on the hope that technological development at 1.5 GHz will solve the difficulties concerning smaller ships, that could, we know, be overcome to-day by using frequencies of the order of 400 MHz.

Efforts will have to be made to use the 1.5 GHz allocations to satisfy all the operational needs set out by I.M.C.O., by the S.J.M., and endorsed by many delegates to this Conference. These efforts will undoubtedly cost a great deal, and we in C.I.R.M. are certain that any 1.5 GHz system will cost many times that of a corresponding 400 MHz system. Moreover, if at the end the problems are not solved, there will be no allocations permitting all the "have not" ships who cannot fit 1.5 GHz equipment to enjoy the advantages of a reliable fade free global service and contribute to the Safety of Life at Sea. Even worse time will be lost with all that is implied in loss of efficiency, loss of property, loss of human life, and damage to the ecology.

There seems to be no doubt that the region of the spectrum between 200 and 600 MHz has advantages for use by space communications, particularly in connection with mobile applications, and more particularly for maritime mobile use.
In these circumstances, and in the light of this relatively recent knowledge, we feel that long term plans should be made to free such bands, or at least sufficient space in these bands, from other usage where the same considerations do not apply. Clearly sufficient time has to be given for present equipment to be amortized, or for aerials or crystals to be changed, but if the bands to be cleared are not too wide, the cost involved and the inconvenience suffered need only be quite small. The gains, however, would be large.

We would suggest that the administrations in conjunction with the I.F.R.B. study this problem with the object of suggesting where in the 400 MHz region of the spectrum two bands, each about 2 or 3 MHz wide, can be allocated to the maritime mobile service, with the least possible inconvenience to other users.
MINUTES
OF THE
EIGHTH PLENARY MEETING
Thursday, 15 July 1971, at 1100 hrs

Chairman : Mr. Gunnar PEDERSEN (Denmark)

Subject discussed

Table of frequency allocations

1. Frequency band 435-438 MHz

2. Frequency bands
   - 5 650-5 925 MHz
   - 1 215-1 300 MHz
   - 10 000-10 500 MHz

3. Frequency band 845-935 MHz

Document No. 374

Document No. 374 p.7 and 315

342

Addendum to Document No. 374
Table of Frequency Allocations

1. Frequency band 435-438 MHz (Documents Nos. 374, page 7, and 315)

The delegate of the United Kingdom introduced the proposed amendments to Article 5 of the Radio Regulations contained in Document No. 315 and they were supported by a number of delegations.

The delegate of France recalled the French position on the principle of the amateur service, which had been explained at length at the beginning of the Conference, i.e. that the amateur satellite service should only be introduced in exclusive worldwide bands to preserve the essential services from amateur service interference. The guarantees proposed did not seem adequate to prevent amateurs from causing interference to certain services concerning the safety of human life. However, that position did not prevent France from supporting the United Kingdom proposal since in the 435-438 MHz band there would be no risk of interference with the radiolocation service.

The delegate of Greece supported the United Kingdom proposal but wished to protect the fixed and mobile services which also operated in that band; he therefore proposed the following addition at the end of note J20A:

"in accordance with the provisions of No. 1567 bis".

The delegate of the United Kingdom accepted that amendment, pointing out that the amateur service "may be authorized" by the administration granting licences, which constituted an effective protective clause.

The delegate of Malaysia was opposed to the introduction of the amateur service in the band in question because in his country there was a risk that amateurs would interfere with the maritime radio-telephony service.

The delegate of the Philippines, whose view was shared by the delegates of Saudi Arabia and Uganda, warmly supported the United Kingdom proposal, since in the Philippines, as elsewhere, the amateur service had helped to set up thousands of extremely useful calls, particularly in the case of natural disasters and emergencies. The contribution of radioamatours and the infrastructure represented by the totality of their equipment were of great value.

The United Kingdom proposal on the amateur satellite service, as amended at the request of Greece, was adopted by 63 votes to 3, with 14 abstentions.
2. Frequency bands 5,650-5,925 MHz, 1,215-1,300 MHz and 10,000-10,500 MHz
(Document No. 342)

At the request of the delegate of France, who was opposed to the use of space techniques in the bands concerned, it was decided to examine the three proposals contained in the document separately.

Proposal A: frequency band 5,650-5,670 MHz

The delegate of Greece, supported by the delegate of Australia, was in favour of the proposal; he considered, however, that it would be advisable to split the 20 GHz band allocated to the amateur service into two sub-bands of 10 GHz, one for up-links and the other for down-links.

Furthermore, at the end of the note, the text of 320A just adopted should be added: "Administrations authorizing such use shall ensure that any harmful interference caused by emissions from amateur satellites is immediately eliminated in accordance with the provisions of No. 1567 bis."

The delegate of the U.S.S.R., supported by the delegate of Sweden, while recognizing the importance of radioamateur activities, was opposed to all three proposals presented by Italy.

The delegate of the United States of America supported the Italian proposal amended by the delegate of Greece but thought that to allow the service more flexibility it would be preferable not to specify the bands to be used in the up and down directions.

The delegate of Israel, who also supported the Italian amended proposal, considered that without specifying the bands to use in each direction, a separate band should be foreseen for up- and down-links.

The two amendments proposed by the delegate of Greece were adopted by 21 votes to 20, with 21 abstentions.

The amended proposal A was rejected by 42 votes to 25, with 9 abstentions.

Proposal B: frequency band 1,215-1,230 MHz

The delegate of France was categorically opposed to the use of the band in question by radioamateurs in view of the risk of possible harmful interference to air safety services and referred to No. 343 of the Radio Regulations in that respect.
Proposal B was rejected by 42 votes to 12, with 13 abstentions.

Proposal C: frequency band 10 350-10 400 MHz

Following a discussion in which the delegates of France (who referred to paragraph 2 of Document No. 386), the United States of America, New Zealand, the United Kingdom and Sweden took part, the proposal was rejected by 36 votes to 30*, with 7 abstentions.

3. Frequency band 845 - 935 MHz (Addendum to Document No. 374)

The Chairman of Committee 5 explained that the draft of note ADD 339B had given rise to considerable discussion in Committee 5 and that the Committee had accepted the idea of inserting a text for which India had been invited to submit a new draft taking account of all the points mentioned in the discussion.

The delegate of India recalled that the importance of the broadcasting satellite service had been stressed on many occasions during the Conference and the experiment planned by his country would be of benefit to the entire world and in particular the developing countries. He pointed out that the experiment would involve work analogous to space research and that the text of ADD 339B had been prepared on the basis of the majority views expressed in Committee 5.

The question gave rise to a lengthy discussion in which the delegates of Nigeria, Australia, Canada and the United States of America said they were in favour of adding the foot-note because of the technical importance of the experiment for many countries.

The delegate of the United States of America asked for the words "also allocated for use" in the first and second lines of ADD 339B to be deleted.

The delegate of India accepted the suggestion but insisted on retention of the word "also", the text thus reading:

"In India, the band 845-935 MHz is also used in the experimentation of satellite broadcasting of television with frequency modulation including energy dispersal, subject to agreement with the administrations having services operating in accordance with the Table which may be affected.

For the protection of terrestrial television services the power flux-density limit given in foot-note 332A will apply; and for the protection of fixed and mobile services operating in this band the power flux-density limits in Article 8, Nos. 470NI and 470MB shall be applied".
The delegates of Malaysia, Pakistan, Kenya (speaking also for Uganda and Tanzania), China and Cyprus, on the other hand, thought that the use of the 845–935 MHz band for the Indian project might harm already existing services and particularly those using tropospheric scatter and transhorizon links, and the development of radio networks.

Several of those speakers, supported by the delegates of Greece, the United Arab Republic, the United Kingdom, France, Italy and Mexico, considered that the insertion of such a foot-note would constitute a dangerous precedent and would partially abrogate the Frequency Allocation Table. Lower bands (620–790 MHz, for example) had already been allocated to broadcasting satellite systems and India should keep within the possibilities thus offered. The proposed foot-note would be contrary to the spirit of the Radio Regulations and would amount to an actual allocation; the experiments planned by India could not be limited to that country's own frontiers and would cause problems for other countries, even situated at some distance.

The delegate of the United Kingdom thought that if the Indian proposal were accepted, it might encourage other administrations to introduce satellite broadcasting services in the band concerned and to ask, in due course, for their name to be added to that of India, and that would weaken the results of the Conference. He thought the solution would be to have the text of ADD 339B appear in the Final Protocol, with a slight drafting amendment to the English text.

That suggestion was supported by the delegate of Greece.

The delegate of India explained his country's position and said that important investments had already been made for the testing of a satellite of the broadcasting satellite service for television programmes. Certain date-limits had been fixed and any delay would compromise seriously the result of the efforts that had been made. He reminded the meeting that Committee 5 had pronounced itself in favour of the principle of such a foot-note and that the plenary meeting would decide on the text.

The Chairman of Committee 5 recalled for information that the result of the voting in the Committee on the question of principle had been 36 votes in favour, 12 against and 5 abstentions.
The delegate of Sweden proposed that note ADD 339B be accepted with an explanation in the minutes of the meeting that the action had been taken as an exceptional measure in view of the importance of the experiment and its repercussions on the development of technique.

The delegate of India agreed with that suggestion.

The Chairman, before putting the United Kingdom suggestion to the vote, said that the result of its adoption would be for there to be no footnote in the Table of Frequency Allocations but for the text to appear in the Final Protocol.

The delegate of Brazil said that he had asked for the insertion of the following footnote in paragraph 9 of Document No. 586: "In Brazil, the band 845-890 MHz is also allocated to the fixed service". He considered that that proposal should be examined at the same time as the question of footnote ADD 339B since for his country it was a case of protecting already-established systems in the bands concerned which might be affected adversely by the Indian experiment.

The delegate of Italy wondered whether the Conference was competent to deal with the note mentioned by the delegate of Brazil, adding that the Indian experiment could take place within the terms of No. 115 of the Radio Regulations.

The delegates of Argentina and Chile associated themselves with the views expressed by the delegate of Brazil and thought the Conference was competent to deal with the matter.

The Chairman pointed out that the delegate of Italy's comment about No. 115 did not constitute a formal suggestion.

With regard to the question of the Indian experiment, the Chairman put to the vote the solution suggested by the delegate of the United Kingdom which had been supported by the delegate of Greece and other delegations: the solution was approved by 42 votes to 18, with 10 abstentions, and the amended text of ADD 339B would therefore appear in the Final Protocol.

The meeting rose at 1310 hrs.

The Secretary of the Conference: Clifford STEAD

The Chairman: Gunnar PEDERSEN
MINUTES
OF THE
NINTH PLENARY MEETING

Thursday, 15 July 1971, at 1510 hrs

Chairman: Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed

1. Table of Frequency Allocations:
   (Article 5 of the Radio Regulations)
   1.1 Frequency bands 2 500–2 690 MHz
       ADD 364C, ADD 364D, ADD 364F
   1.2 Frequency band 2 655–2 690 MHz
       ADD 364H
   1.3 Frequency band 11.7–12.5 GHz
       ADD \(\frac{A}{4}\), \(\frac{D}{4}\) and \(\frac{E}{4}\)

2. Second reading of texts submitted by the Editorial Committee:
   Series R1
   Series R2
3.First reading of texts submitted by the Editorial Committee:
   Series B14

4. Second reading of texts submitted by the Editorial Committee:
   Series B14*)
5. Statement by the delegate of the Syrian Arab Republic
6. Announcement by the Chairman of Committee 2

*) As amended at the first reading.
The Chairman announced that the head of the Kenyan delegation, Mr. Rajab M. Yusuf, had been ill in hospital for several days, and requested the delegation to convey to him the Conference's best wishes for his speedy recovery.

The delegate of Uganda, speaking on behalf of the delegations of Kenya, Tanzania and Uganda, thanked the Chairman for that expression of concern on the Conference's part, and assured him that the message would be conveyed.

The Chairman welcomed the Deputy Director-General of the Universal Postal Union who was present at the meeting.

1. Table of Frequency Allocations

(Article 5 of the Radio Regulations)

1.1 Frequency band 2 500-2 690 MHz
ADD 364c, ADD 364d, ADD 364f (Document No. 375, page 6)

The Chairman of Committee 5 stated that in Document No. 375, page 5, in the box at the bottom of the page under Region 1, "364c" should be inserted after "FIXED 364", and in the box under Regions 2 and 3, the square brackets round 364d should be removed.

Referring to page 6 of Document No. 375, he said that after the adoption of ADD 364c and ADD 364d by Committee 5, it had been pointed out that there was perhaps some inconsistency between those two footnotes. Because of pressure of time, Committee 5 had agreed to leave it to the delegations concerned to seek a solution and raise the matter in Plenary.

The delegate of Canada, supported by the delegates of Italy, Federal Republic of Germany, Australia, Japan and India, proposed that the band limits in ADD 364c be changed to 2 500-2 655 MHz.

The delegate of Pakistan reserved his delegation's position regarding compliance with ADD 364d, and said that if the Canadian proposal was adopted he would like language similar to that in 364c to apply to Pakistan for the 2 655-2 690 MHz band.

The delegate of the U.S.S.R. said that his Administration could not possibly accept the Canadian proposal regarding 364c, nor could it accept 364d, because it had a very large and developing network in that part of the spectrum.
The delegate of Nigeria suggested that 364F should be considered in conjunction with 364C and 364D. It was necessary to clarify the implications of 364F which, with reference to No. 145 of the Radio Regulations, appeared to suggest that the countries listed in 364F did not recognize the allocation to the Broadcasting-Satellite Service in the band 2,500-2,690 MHz, and could thus create problems in future for co-ordination between countries having only the Fixed and Mobile Services in that band and countries attempting to establish the Broadcasting-Satellite Service. It would be better if 364F said "... is also allocated" and not "... is allocated ... only".

The delegate of the U.S.S.R. said he could see no connection between 364F and 364C and D. There had always been Fixed and Mobile Services in the band 2,500-2,690 MHz, and although the Conference had now included the Broadcasting-Satellite Service in Region 1 in that band, the countries listed in 364F intended to continue to use it for the Fixed and Mobile Services only. They were making no new allocation and therefore No. 145 of the Radio Regulations was not applicable.

After some further discussion, in the course of which alternative draftings for 364F were proposed by the delegates of Brazil and Sweden, but not retained, the delegate of Nigeria said he would not press his point regarding 364F.

The delegate of Ethiopia agreed that the point could be dropped, but stated that he understood that 364F would not impose any limitations of the power flux-density provisions contained in Article 7 of the Radio Regulations, in so far as the Broadcasting-Satellite Service was concerned.

The delegate of Uganda supported that statement.

The delegate of the U.S.S.R. said that the sharing criteria which appeared in Article 7 had been accepted by all delegations and were therefore valid for all. His delegation had made no reservation in that connection.

The Chairman put to the vote the proposal that ADD 364D be deleted.

The proposal was adopted by 22 votes to 17, with 15 abstentions, and ADD 364D was accordingly deleted.

The delegate of Canada withdrew his proposal for the amendment of ADD 364C.
In reply to a question by the delegate of Sweden, the Chairman confirmed that once the countries listed in 364F had signed the Final Acts, the provisions of 364C would apply to them.

Returning to the need for special protection for the uplink in the band 2 655-2 690 MHz, the delegate of the United States of America proposed the inclusion of a new foot-note to replace 364D reading as follows:

"Administrations shall make all practicable efforts to avoid developing new tropospheric scatter systems in the band 2 655-2 690 MHz."

After a discussion as to whether or not it would be correct for the meeting to consider the United States proposal, which some delegates believed merely resurrected the provisions of the deleted 364D, the Chairman put the United States proposal to the vote.

The proposal of the United States delegate was adopted by 41 votes to 22, with 9 abstentions.

The delegate of France, speaking as a member of the Editorial Committee, asked whether a decision had been taken regarding the deletion of existing foot-note 364 of the Radio Regulations.

The Chairman of Committee 5 said that a meeting of the Joint Working Group had agreed to delete 364 on the understanding that it would be covered by 364C and 364D which had just been adopted.

The delegate of the United Kingdom did not believe that the Conference was competent to delete foot-note 364, because it related entirely to co-ordination between Fixed and Mobile Services and tropospheric scatter systems, and no Space Service was involved in it. He proposed that 364 be amended to read, in the third line, "those having terrestrial radiocommunication services operating", thus retaining its original sense.

The delegate of the U.S.S.R. said that when 364 had been adopted, there had been only Terrestrial Services in the band concerned, but that situation had now changed.

After a discussion in which the delegates of Israel, Syria, Denmark and India took part, the Chairman put to the vote the proposal that foot-note 364 be deleted.

The proposal was rejected by 34 votes to 23, with 10 abstentions.
The Chairman put to the vote the amendment proposed by the United Kingdom delegate to foot-note 364.

The amendment was adopted by 35 votes to 7, with 14 abstentions.

1.2 Frequency band 2.655-2.690 MHz
ADD 364H (Document No. 375, page 7, Corrigendum (item 5) to 375)

The Chairman of Committee 5 explained that many delegates had found it difficult to accept ADD 364H, particularly the figure of -277 dBW/m²/Hz, and its deletion was indicated in the Corrigendum (item 5) to Document No. 375.

The delegate of the United Kingdom said that his Government had made very substantial investment in radio astronomy equipment, and was concerned to ensure adequate protection of the band 2.690-2.700 MHz. He therefore proposed an alternative foot-note 364H reading: "In the design of systems in the broadcasting-satellite service, administrations are urged to take all necessary steps to protect radio astronomy observations in the band 2.690-2.700 MHz."

The delegates of Greece and Jamaica supported the proposal, and the delegate of Denmark, while supporting it in principle, urged that the word "necessary" be changed to "practicable".

The delegate of the United Kingdom, supported by the delegates of New Zealand and the United States of America maintained the word "necessary" pointing out that it should be read in conjunction with the words "are urged to take", and was not strictly mandatory.

The delegate of Australia supported the United Kingdom proposal, and suggested it should read "to protect the radio astronomy service", and that alteration was accepted by the delegate of the United Kingdom.

The Chairman put to the vote the text proposed by the delegate of the United Kingdom for foot-note 364H.

The proposal was adopted by 42 votes to 5, with 13 abstentions.

1.3 Frequency band 11.7-12.5 GHz, ADD $A$, $D$ and $E$
(Document No. 385, page 3)

Introducing the document, the Chairman of Committee 5 said that the point before the Plenary for decision was the action to be taken on foot-notes $A$, $D$ and $E$ enclosed in square brackets at the foot of page 3. The
foot-notes as they stood represented the best obtainable compromise, arrived at after a great deal of work and discussion, on a subject about which many delegations had strong feelings. In consideration of this, and in spite of the doubts expressed by the delegate of the Netherlands as to the legality of the implied infringement in foot-notes /A/ and /D/ of the concept of equal rights for all primary services, it was decided by 58 votes to 4 with 5 abstentions to delete the square brackets from the three foot-notes and insert them as they stood (with the replacement of the words "Recommendation No. /.../" in A, seventh line, by "Resolution D") in the relevant part of the blue document concerned (B13).

As that blue document had still to be examined by the Plenary, it was agreed that points raised by the delegates of Nigeria and Senegal, and any other comments on the text of Document No. 385, would be dealt with during the first reading.

2. Second reading of texts submitted by the Editorial Committee

Series R1 (Document No. 387)

Pages R1 - 01 to 03

Approved.

Page R1 - 04

The Chairman of Committee 7 pointed out that in the two last lines of the title under the heading "Article 9A", the square brackets should be replaced by parentheses.

Approved, as amended.

Pages R1 - 05 to 06

Approved.

Page R1 - 07

It was agreed to delete note 639AK.1 in view of the fact that the redrafted text of provision 639AK made it redundant.

Approved, as amended.
As proposed by the delegate of the U.S.S.R., it was decided to delete note 639AK.2, since its subject-matter had been covered by a separate Resolution.

Approved, as amended.

Pages Rl - 09 - 11

Approved.

Page Rl - 12

The Representative of the I.F.R.B. pointed out that paragraph b) of 639AR required the same amendment as had been made for provision 492C, namely: on the second line the word "exceed" should be replaced by "increase" and the word "permissible" deleted.

Approved, as amended.

Pages Rl - 13 to 17

Approved.

Pages Rl - 18 and 19

In reply to queries from the delegates of New Zealand and Syria, the Chairman of the I.F.R.B. said that the square brackets enclosing "570AB" in provisions 639BQ on page 18 and 639BR on page 19 were to be removed, in accordance with what had been agreed at the first reading of Series BII.

Approved, as amended.

Page Rl - 20

Approved.

Page Rl - 21

It was agreed that, in the first paragraph, fourth line of the Spanish text only, the word "this" should be replaced by "that".
On a point raised by the delegate of Nigeria and in accordance with what had been agreed at the first reading of Series B2, page 6, it was agreed to replace the words "this type of satellite is" on paragraph e), first line, of the English and Spanish texts only, by "these types of satellite are".

Approved, as amended.

The Chairman pointed out that the mention "\[\text{In}\]" should be deleted whenever it appeared in Recommendation No. Spa AA as Table Ia no longer existed as such and had been combined into Table I.

In reply to a query from the delegate of Chile, the Chairman said that Committee 7 would make sure that the mention "\[c/s\]", wherever it occurred, would be replaced by "Hz" in the final text.

The Chairman of Committee 4 said that for clarity the word "World" should be inserted before "Administrative" on page R1 - 35 in view of the fact that the Convention provided for the convening of both world and regional administrative conferences.

Approved, as amended.

To improve the presentation and following a suggestion from the Secretary-General, it was agreed to place the word "invites" and the paragraph beneath it between paragraph 2 and the word "requests".
The Chairman of Committee 4 pointed out a number of drafting amendments to be made to these pages.

The delegate of the United States of America said he had a list of small typographical errors occurring in the document and would hand over to Committee 7.

Approved, as amended.

Pages R2 - 09 to 10

Approved.

Pages R2 - 11 to 12

The Chairman of Committee 4 pointed out a number of drafting amendments to be made to Table C.

Approved, as amended.

Pages R2 - 13 to 32

Approved.

3. First reading of texts submitted by the Editorial Committee

Series B14 (Document No. 384 + Add. No. 1)

The Chairman of Committee 7 said that due to pressure of time pages B14 - 19 to 41 (Figures 1 - 23) had been given to the printer in the form in which Committee 4 had submitted them to Committee 7. Committee 7 had, however, a number of drafting corrections to make to these pages.

The Addendum was to be inserted between pages 45 and 46.

The Chairman of Committee 4 pointed out some drafting amendments to be made to pages 03 and 18 and said he would give a note of these together with some other small corrections to Committee 7 for processing.
The delegate of the United Kingdom suggested that the word "of azimuth" be added after "direction" in the first paragraph of Item 1, second line, and that, in accordance with a decision of Committee 4 to refer to co-ordination area, not distance, the words "calculating co-ordination distance" in the last paragraph, first and second lines, should be replaced by "the determination of the co-ordination area".

After a short discussion on the best place for the paragraph in bold type, "It must be emphasized... Interference", it was agreed to leave the matter in the hands of Committee 7.

Approved, with the amendments being left to the consideration of Committee 7.

The Chairman of Committee 7 pointed out that the words "and using" should be inserted after the word "obtaining" in the second paragraph, eighth line.

Approved, as amended.

The delegate of Chile pointed out a drafting amendment to Note 1), Spanish text only.

The delegate of the United States of America pointed out that the expression "J ≤ -8.5dB" in Note 1), tenth line, should read "J ≥ -8.5dB".

Approved, as amended.

The delegate of Chile pointed out that the title of item in the English and Spanish texts only, should be altered to "Radio Climatic Zones".

Approved, as amended.
Adopted.

Page Bl4 - 10

The delegate of the United States of America said that the first equation of the English text should be aligned with that given in the French text.

Approved, as amended.

Pages Bl4 - 11 to 15

Approved.

Page Bl4 - 16

The delegate of the United States of America suggested that the word "Values" in item 7, third paragraph, last line, should be replaced by "The values to be used".

Approved, as amended.

Page Bl4 - 17

Approved, subject to a drafting amendment pointed out by the delegate of the United States of America.

Page Bl4 - 18

Approved, subject to the amendments pointed out by the Chairman of Committee 4.

Bl4 - Figures 1 to 16

Approved.

Bl4 - Figure 17

In response to a query from the delegate of Poland, it was agreed to replace the figures "1, 2, etc...5" at the bottom left-hand corner by "Rain Climate 1, Rain Climate 2, etc...".

Approved, as amended.
The Chairman of Committee 7 pointed out that an extra frequency band, 8,025-8,400 GHz allocated to the earth exploration satellite service, was to be included in Table IV. The same amendment applied to Table II, page 18.

Approved, as amended.

Pages B14 - 46 to 47

Approved.

Addendum No. 1 to Document No. 384 (Series B14)

Approved.

In response to an observation from the delegate of Poland on the likelihood of errors having gone unnoticed during the review of documents due to pressure of time, the Secretary-General confirmed that it was usual ITU practice after an administrative conference for the Chairman of the I.F.R.B. in co-operation with the General Secretariat to review the text for such errors before the final printing.

4. Second reading of texts submitted by the Editorial Committee

Series B14 (Document No. 384 + Add. No. 1 as amended at the first reading)

Approved.
5. **Statement by the delegate of the Syrian Arab Republic**

   The delegate of the Syrian Arab Republic made the statement which appears at the Annex to the present document.

6. **Announcement by the Chairman of Committee 2**

   The Chairman of Committee 2 announced that the credentials of the Republic of Mali had been received, examined and found in order. He requested that the necessary corrections be made to the documents concerned.

   The meeting rose at 1920 hours.

---

The Secretary: Clifford STEAD

The Chairman: Gunnar PEDERSEN

Annex: 1
PAGE INTENTIONALLY LEFT BLANK

PAGE LAISSEE EN BLANC INTENTIONNELLEMENT
ANNEX

STATEMENT

The Delegation of the Syrian Arab Republic would like to draw attention to the fact that wherever the name of the United Arab Republic appeared in the provisions of the 1959 World Administrative Radio Conference, it ipso facto included the Syrian Arab Republic. The I.F.R.B. is hereby requested to take the necessary steps to add the name of the Syrian Arab Republic separately to any provision of the 1959 World Administrative Radio Conference in which the name of the United Arab Republic appears.
MINUTES
OF THE
TENTH PLENARY MEETING
Thursday, 15 July 1971, at 2115 hrs

Chairman : Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed

1. First reading of texts submitted by the
Editorial Committee :

Series B.15

2. Second reading of texts submitted by the
Editorial Committee :

Series B.15 *)

*) As amended at first reading.
1. First reading of texts submitted by the Editorial Committee:

Series B.15 (Document No. 394)

Page B.15/01
Approved.

Page B.15/02
The Delegate of Argentina said that the Spanish text of "resolves" paragraph 2 should be aligned with the French.
Approved.

Pages B.15/03 to B.15/05
Approved.

Page B.15/06
The Chairman of the I.F.R.B. said that the word "and" in the English text of paragraph 5.3 should be replaced by "of".
Approved.

Page B.15/07
The Chairman of the I.F.R.B. said that the last part of the fourth line of paragraph 5.13 should be amended to read "referred to in paragraphs 2.1 and 3.2.1".
Approved, as amended.

Page B.15/08
The Chairman of the I.F.R.B. said that, to bring the English and French texts of paragraph 5.16 into line, the word "space" should be inserted between "any" and "station" in the second line and the sixth line should be altered to read "to a space station which has been...".
The Delegate of France said that that amendment would change the meaning of the whole paragraph. The entire Resolution was concerned with the Broadcasting-Satellite Service, and if a station in that service, recorded in the Master Register according to paragraph 5.15 and No. 639CP, caused interference to another space station, it was the first assignment that should immediately cease such interference. Great caution should be exercised in changing the provision.

The Chairman of the I.F.R.B. said that the point raised by the French Delegate might be covered by referring to the case of a space broadcasting station which caused interference to the space station of another space service. The whole difficulty was due to the existence of two parallel co-ordination procedures, one of which had not been mentioned. Perhaps the problem could be solved by the drafting group which had worked on the question.

It was so agreed.

After a brief interval, the Delegate of the United Kingdom, speaking on behalf of the drafting group, suggested that paragraph 5.16 should be amended by inserting the word "space" before "station" in the second line and changing the sixth line to read "to a space broadcasting station which has" and that a new paragraph 5.17 should be inserted, reading as follows:

"5.17 If harmful interference is actually caused to the reception of any space radiocommunication station using an assignment recorded in the Master Register following a favourable finding with respect to Nos. 639BM, 639BN, 639BO, 639BF, 639BE, or 639 BB, as appropriate, by the use of an assignment to a broadcasting satellite station subsequently recorded in accordance with paragraph 5.15 of this Resolution, the station using the latter assignment must, on receipt of advice thereof, immediately eliminate this harmful interference."

In reply to the Delegate of the U.S.S.R., the Chairman of the I.F.R.B. said that the new paragraph 5.17 filled the gap due to the omission of reference to the parallel procedure in cases where a broadcasting satellite station caused interference to the other space services mentioned in the six numbers of the Radio Regulations cited in the new text.
The Delegate of France said that the French text of the new paragraph was not quite clear and should be aligned with the English. Moreover, the Editorial Committee should clarify the last paragraph of the Resolution.

The Delegate of Cuba, supported by the Delegate of Syria and Rwanda, pointed out that no provision was made for cases of harmful interference to terrestrial stations caused by stations in the Broadcasting-Satellite Service, despite the statement in "considering" paragraph c) that a broadcasting space station might cause such interference. He therefore suggested that a new paragraph 5.18 should be inserted, identical with the new paragraph 5.17, except that the words "space radiocommunication" in the first phase should be replaced by "terrestrial" and the references to numbers of the Radio Regulations should be replaced by "No. 501".

It was so agreed.

Page B.15/08, as amended, was approved.

Page B.15/09

Approved.

Page B.15/10

In reply to a question by the Delegate of Brazil, the Vice-Chairman of the I.F.R.B. confirmed that "resolves" paragraph 3 did not prevent an administration from agreeing to the application of new C.C.I.R. Recommendations after the limit of one hundred and twenty days had expired.

Approved.

Pages B.15/11 and B.15/12

Approved.

Page B.15/13

The Delegate of the U.S.S.R. said that the word "operative" in the first line of the English text of paragraph 3) should be deleted.

Approved.
Page B.15/14

Approved.

Page B.15/15

The Delegate of New Zealand said that the "recommends" paragraph would be clarified by a reference to "considering" paragraph f) or g).

The Delegate of Canada, supported by the Delegates of Brazil and Austria, said that the word "World" should be inserted before "Administrative Radio Conference" in the title of the Recommendation and in the "recommends" and "invites" paragraphs.

Approved, as amended.

Pages B.15/16 and B.15/17

Approved.

Page B.15/18

In reply to the Delegate of Cuba, the Vice-Chairman of the I.F.R.B. explained that during the discussion of No. 89 in Committees 4 and 5, the words now in parentheses had been deemed to be redundant in the light of the provision of No. 85. The representatives of the I.F.R.B. had expressed the view that the phrase should nevertheless be retained, because it had been found useful in the past in connection with single sideband and asymmetric sideband emissions. He suggested that the text might be left as it had stood since the 1959 Conference; in that case, page B.15/18 might be deleted.

The Delegates of the United Kingdom and Cuba supported that suggestion.

Page B.15/18 was deleted.

Pages B.15/19 to B.15/24

Approved, with the deletion of the square brackets on pages B.15/22 and B.15/24.

The texts in Series B.15, as amended, were approved on first reading.
2. Second reading of texts submitted by the Editorial Committee:

Page B.15/01

The Chairman of Committee 7 said that the word "la" should be deleted from the French text of the title of Section IA.

Page B.15/04

The Delegate of Chile suggested that the words "as from the date of the relevant Weekly Circular" should be inserted after "one hundred and eighty days" in paragraph 2.6.

It was so agreed.

Page B.15/06

The Delegate of Syria suggested that paragraph 5.6 should be slightly amended so as to form a heading for the subsequent paragraphs.

The Chairman of the I.F.R.E. said that the paragraph could not be changed into a title or into an introduction to the subsequent paragraphs, but suggested that it might be renumbered 6.1, with consequential renumbering of the following paragraphs, so that that part of the resolution would correspond to the "recording in the Master Register" mentioned in the title of Section C.

It was so agreed.

Page B.15/24

The Delegate of Finland, supported by the Delegate of Italy, suggested that the phrase "and the various categories of earth and space stations" should be deleted from "considering" paragraph a), since the Conference had in fact omitted nearly all the definitions given in the earlier Regulations.

It was so agreed.
The texts in Series B.15, as amended, were approved on second reading.

The meeting rose at 2355 hours.

Secretary of the Conference:
Clifford STEAD

Chairman of the Conference:
Gunnar PEDERSEN
In the statement of the Delegate of the U.S.S.R. on page 13, the expression "in the band 1 535-1 542.5 MHz" should be replaced by "in the band 1 535-1 550 MHz".
1. Page 9 (Page B.13/06, second paragraph) should be amended as follows:

Replace - "The delegate of Uruguay"
by - "The delegate of Jamaica".

2. Page 10 (B.13/19 - ADD 308A) should be amended as follows:

The delegate of Poland said that his delegation could accept only the bands 240-300 MHz and 344-399.9 MHz for use in the Mobile-Satellite Service.
PLENARY MEETING

MINUTES
OF THE
ELEVENTH PLENARY MEETING

Friday, 16 July 1971, at 1000 hrs

Chairman: Mr. Gunnar Pедерсен (Denmark)

Subjects discussed:

1. Second reading of texts submitted by the Editorial Committee
   - Series R.3

2. First reading of texts submitted by the Editorial Committee
   - Series B.13

3. Second reading of texts submitted by the Editorial Committee
   - Series B.13*)

4. Draft Resolution: Planning and administration of the resources of the geostationary satellite orbit

---

*) As amended at first reading.
1. Second reading of texts submitted by the Editorial Committee - Series R.3 (Document No. 395)

Pages R.3/01 - 03
Approved.

Page R.3/04

The Observer from I.A.T.A. proposed that the third sub-paragraph be aligned with 84AG to read: "and if the system so requires, for connection between these space stations and one or more earth stations at specific fixed points".

Approved, with that amendment.

Pages R.3/05 - 09
Approved.

Page R.3/10

The Chairman of the Editorial Committee said that MOD 89 was to be deleted following the decision taken at the previous meeting.

The Chairman of the I.F.R.B. pointed out that it had been decided to retain the existing definition of harmful interference and MOD 93 should therefore also be deleted, and Section III would begin NOC 85-98.

Approved, as amended.

Pages R.3/11 - 15
Approved.

Page R.3/16

Following comment by the Observer of I.C.A.O., the delegate of the United States of America proposed that the definition should begin "Earth stations on board aircraft ...".

Approved, with that amendment.
The delegate of New Zealand said that in the English text of ADD 428A, the word "practicable" should be inserted after "to the maximum extent".

The Chairman of Committee 4 said that the word "space" should be substituted for "satellite" in the second line of ADD 470AA.1.

Approved, as amended.

The Chairman of Committee 4 suggested that the band 400-4700 MHz should be inserted in the list of frequency bands in MOD 470D, but withdrew the suggestion following an explanation by the delegates of France and Italy.

The delegate of Cuba pointed out that, in view of the reference in the first line of the introductory passage of MOD 470D, services other than the Fixed-Satellite and Meteorological-Satellite Services were involved, and suggested that Committee 7 might modify the paragraph to take that fact into account.

The Chairman considered that no such far-reaching changes should be introduced at the stage of the second reading.

Approved.

The Chairman of Committee 4 said that the reference to No. 470AC should be deleted from ADD 470DB, because no limits were in fact given in it.

Approved, as amended.

In response to a comment by the Chairman of Committee 4, it was agreed that Committee 7 would consider placing MOD 470H after ADD 470HS.

Approved.
The Chairman of Committee 4 suggested that, in the light of consultations in Committee 7, a reference to the Space Research and Earth Exploration-Satellite Services should be included in the introductory part of MOD 470J; he withdrew the suggestion after the Chairman of Committee 7 had said that in all cases it would be necessary to ascertain whether or not deep-space research was involved.

The Chairman of Committee 7 said that the words "(Regions 2 and 3)" should appear against the band 2 655-2 690 MHz.

The Chairman of Committee 4 said that the entry against the band 12.50-12.75 GHz should read "(Region 2 and for the countries mentioned in No. 405BA)".

Approved, as amended.

The Chairman of Committee 7 pointed out that the limit in MOD 470M in fact concerned only the physical limit of antenna power and did not apply to MOD 470L; as there was no corresponding number to ADD 470LA, the simplest course would be to delete MOD 470M, making it clear that MOD 470L and ADD 470LA would apply in all cases cited in those provisions and consequently to the corresponding allocations in the Table in Article 5.

Approved, as amended.

In reply to a query by the delegate of the United States of America concerning the frequency range in MOD 470N and a suggestion by the delegate of France that the range should be 1 670-1 700 MHz because the case was one of sharing between the Meteorological-Satellite Service and the Meteorological Aids Services, the Chairman of Committee 4 and the delegate of the United Kingdom pointed out that the limit of 1 690-1 700 MHz was correct where the Fixed Service was on a secondary basis and the stricter limit of 1 670-1 690 MHz obtained where the allocation to that Service was on a primary basis. The delegate of France observed that the result of retaining the range 1 690-1 700 MHz would imply elimination of sharing criteria between the Meteorological-Satellite Service and Meteorological Aids Service.
At the proposal of the delegate of the United Kingdom, it was agreed not to amend MOD 470N.

The delegate of Brazil, referring to a suggestion that the upper limit in ADD 470ND should be increased to 2 690 MHz, said that the amendment was unnecessary because the highest limit for the services listed in ADD 470NF was 2 535 MHz.

The delegate of France said that unless the upper limit of 2 690 MHz was inserted in ADD 470ND and ADD 470NG, there would be contradictory provisions in the Radio Regulations.

The delegate of Canada pointed out that in Article 5 the band 2 555-2 690 MHz was allocated to the Fixed-Satellite Service (Earth-to-space), and that ADD 364C cited the values in No. 470NH in respect of the space-to-Earth direction. The upper limit of 2 535 MHz was therefore correct.

It was agreed not to change ADD 470ND and ADD 470NG.

The delegate of France said that the band 2 200-2 290 MHz should be added to the list in ADD 470NG. The band was allocated to the Space Research Service in Regions 2 and 3 and to the Fixed Service in all regions.

Pages R.3/24 to R.3/27 were approved, as amended.

Page R.3/28

The delegate of the United States of America, supported by the delegate of the United Kingdom, suggested that the second entry under ADD 470NO should be deleted, since in that band services were not shared with equal rights with the Fixed or Mobile Services.

Approved, amended.

Page R.3/29

Approved.

Page R.3/30

The Chairman of Committee 7 said that, in the French text, the first figure in the second sub-paragraph of ADD 470NU should be "-148".

Approved.
The delegate of New Zealand said that the words in brackets in the second line of ADD 470NW should read "(in Region 3 and for the countries mentioned in No. 405BA)".

The delegate of the United States of America proposed that the first line of ADD 470NW should be deleted, as the Fixed-Satellite Service in that band was subject to overall regional plans involving several services and, consequently, the sharing criteria were subject to regional agreements. Moreover, since the Broadcasting-Satellite Service normally used higher power flux-densities than the Fixed-Satellite Service, it seemed to be inadvisable automatically to impose such different limits on the two services.

The delegate of Cuba said he could not support that proposal.

The Chairman put the United States proposal to the vote.

There were 7 votes in favour, 7 against and 23 abstentions.

Consideration of the matter was postponed to a later meeting.

The Chairman of Committee said that the upper limit in ADD 470NX should be 22 GHz, not 23 GHz.

Approved, as amended.

The delegate of the United Kingdom, supported by the delegate of the U.S.S.R., proposed that Section VIIIA should be deleted, as a result of the allocations now approved in Article 5.

Approved, as amended.
The Chairman of Committee 7 said that the term "/>b/<" in No. 470VE should be replaced by "No. 470VD".

Approved.

The delegate of the United States of America proposed that the words "and the Meteorological-Satellite Service (Earth-to-space)" should be inserted after "Fixed-Satellite Service (Earth-to-space)" in ADD 470VG, as an allocation had been made to the former service in the Table. Moreover, the two services would be occupying the geostationary orbit, whereas the Earth Exploration-Satellite Service would use a random orbital device, so that protection for the Meteorological-Satellite Service was necessary.

Approved, as amended.

Approved, subject to checking of references by the Chairman of the I.F.R.B. and the Editorial Committee.

In line with the amendment made on page 16, the two definitions would begin: "Stations on board aircraft ..." and "For this purpose stations on board aircraft ..." respectively.

Approved, as amended.

The delegate of Roumania, supported by the delegate of Cuba, suggested amending considering (a) in the light of the text of ADD 332A and suggestions were made to insert the words "per channel" after "power flux-density limits" or to clarify which channel was meant. There was a lengthy discussion in which the delegates of the United States of America, France,
U.S.S.R., New Zealand, Argentina, Poland, Denmark and Cuba took part on the best way of avoiding ambiguity and the delegate of the United Kingdom supported by the delegates of Cuba, Israel, U.S.S.R. and Nigeria finally proposed that the wording of ADD 222A be followed, i.e. that considering (a) read "that within the frequency band 620-790 MHz, assignments may be made to television stations using frequency modulation in the broadcasting-satellite service".

In "taking into account" (b), Spanish text, "menos rigurosos" would be replaced by "más prudentes".

Page R.3/40 was approved as amended.

Page R.3/41

Approved, subject to checking of the reference to Recommendation 427-2 by the Director of the C.C.I.R.

Page R.3/42

Approved.

2. First reading of texts submitted by the Editorial Committee - Series B.13 (Document No. 383 + Add. No. 1)

The Chairman of Committee 3, introducing the document, stressed that reference would be to the page numbers in the bottom right-hand corner.

Page B.13/01

The delegate of New Zealand, supported by the delegate of Italy said that in ADD 201A the words "for terrestrial services" should be inserted after "in force".

Approved, with that amendment.

Pages B.13/02 - 04

Approved.
Page B.13/05: Spanish text, correct 21 150 kHz to 21 450 kHz.

The delegate of Uruguay requested that the name of his country be inserted in foot-note ADD 222A. Agreed.

Approved as amended.

Page B.13/06

Similarly, in foot-note 233A, the words "and Uruguay" were to be inserted after "Argentina" and "Brazil" in the first and third lines.

The delegate of Uruguay asked for the minutes to confirm that the provisions of the foot-notes were applicable only in the countries mentioned therein.

Agreed.

Approved, with the above additions.

Page B.13/07

Approved, with the insertion of MOD before 233.

Page B.13/08

Approved.

Page B.13/09

Approved, following an explanation by the Secretary-General on a point raised by the delegate of Kenya concerning the inclusion of Rhodesia in MOD 273.

Page B.13/10

ADD 281AA: The delegate of Cuba asked for the name of his country to be deleted. The delegates of Kenya, Uganda, Tanzania and Malaysia requested that the names of their countries be included in the new foot-note. Agreed.

Approved, as amended.
Page B.13/11
Approved, with the deletion of Algeria from MOD 281C.

Page B.13/12
Approved, with the inclusion of SUP 282.

Page B.13/15
The delegates of Liechtenstein and Switzerland requested that the names of their countries be included in foot-note ADD 282A. Agreed.

Approved, with these additions.

Pages B.13/14 - 18
Approved.

Page B.13/19
ADD 308A :

The delegate of Poland said that his delegation could accept only the bands 240-340 MHz and 344-399.9 MHz for use in the Mobile-Satellite Service.

The delegate of the U.S.S.R. stated that in the Soviet Union the Mobile-Satellite Service would use the band up to 350 MHz only. These comments were noted.

Approved.

Pages B.13/20 - 21
Approved.

Page B.13/22
ADD 317A :

The delegate of the United States of America proposed inserting the words "low power (not to exceed 5 watts)" before "emergency". Agreed.
At the request of their delegations, it was agreed to add the names of the following countries in ADD 317B: Kenya, Kuwait, Liechtenstein, Switzerland, Rwanda, Austria, India, Malaysia, Iran and Chile.

Approved, as amended.

Page B.13/25 + Add. No. 1

The Secretary of Committee 5 said that as MOD 317 was identical with ADD 235AA the earlier number would be used, and as a result of a decision taken the day before, foot-note 320A would be added in the framed part of the Table for Region 1 (band 430-440 MHz) and also for Regions 2 and 3.

Approved, with the amendments indicated.

Page B.13/24

ADD 324C:

In reply to the delegate of Cuba, the Secretary of Committee 5 confirmed that from his records the direction was correctly shown as space-to-Earth.

Approved, with the insertion of 320A in the framed part of the Table for the frequency bands concerned.

Page B.13/25

The Secretary of Committee 5 recalled that as a consequence of a decision of the Plenary Meeting of the previous day, foot-note ADD 339B was deleted from the framed part of the Table on page 25 and from page 26.

The delegate of Uruguay requested that the name of his country be included in ADD 325A. Agreed.

Approved, with inclusion of Uruguay in ADD 325A and deletion of 339B in the framed part of the Table.
The delegate of the Netherlands pointed out that the wording of the foot-note was unusual and asked what the status of an assignment to a station in the Broadcasting-Satellite Service would be once it was recorded, and the implications with regard to existing adopted frequency assignment plans for stations in the Terrestrial-Broadcasting Service.

The Secretary of Committee 5 replied, that from the records of Committee 3, texts along the lines of those contained in ADD 332A had been used in each case where the Committee had decided not to make an allocation at the present time of the entire frequency band in question to an "additional" Space Radiocommunication Service with equal rights to those of the existing primary service(s) in the band; but where it had wished to make provision for the use of the band by stations of an "additional" Space Radiocommunication Service on an assignment by assignment basis and subject to the obligation of first obtaining, for each specific assignment, the agreement of all administrations having existing or future planned services (in accordance with the Table) which might be affected, Committee 5 had placed on record that only after such agreement had been reached and the assignment had been notified, together with information on the agreement, for recording in the Master Register, could the assignment be considered and recorded as being in conformity with the Table of Frequency Allocations.

The Chairman suggested that in the light of that explanation the foot-note be left unchanged and the Chairman of Committee 5 supported that suggestion.

The proposal to add "for angles of arrival < 20°" after "-129 dBW/m²" was adopted by 63 votes to 1, with 5 abstentions.

The Chairman of the I.F.R.B. mentioned that the explanation which had been given was not an interpretation of the Radio Regulations but indeed an explanation of the text supplied by Committee 5 and pointed out that the words "see Articles 9 and 9A or" should be deleted, leaving simply the reference to the Resolution.

The delegate of Chile noted that the Spanish text should begin "Algunas frecuencias ...". It was agreed that the three texts would be aligned.

Approved, on that understanding, with the above amendments and with the deletion of the text between square brackets [ADD 339B].
In the band 1.525–1.535 MHz in Region 2, Spanish text, EXPLOTACION ESPACIAL, should be replaced by OPERACIONES ESPACIALES.

Approved, as amended.

The delegate of the U.S.S.R. said that in view of the decision that there would also be Mobile-Satellite Service communications in the band 1.555–1.542.5 MHz, his administration would not be able to guarantee absence of interference in the band concerned. That comment was noted.

Approved.

The delegates of the following countries asked for the names of their countries to be included in MOD 354A: Jordan, Uganda, Tanzania, Kenya, Syrian Arab Republic, Israel and Ethiopia. Agreed.

Approved, after the deletion of Algeria and with those additions.

The delegate of Switzerland proposed modifying foot-note 356 in the Radio Regulations to bring it closer into line with the Table, i.e. "... service, and the band 1.770–1.790 MHz is also allocated, on a secondary basis, to the meteorological-satellite service".

The delegate of Mexico, supported by the delegates of India, Cuba, Chile, Uganda, Israel and Venezuela, suggested that the texts of Nos. 356, 356AB and 356AA be modified to the effect that the allocations concerned were on a secondary basis.
The delegate of the United States of America advised against a hasty decision and the delegate of the United Kingdom pointed out that the inclusion of the "subject to agreement" clause implied that nothing could be done without the consent of the countries concerned.

The Chairman put to the vote the motion to retain the foot-notes as they appeared on pages 34 and 35, and it was adopted by 39 votes to 17, with 9 abstentions.

Approved.

Page B.13/76

The Secretary of Committee 5 indicated the following changes: in the framed part of the Table for the band 2 550-2 655 MHz add foot-note 364; add the same number 364 in the band 2 655-2 690 MHz for Region 1 and delete the square brackets around foot-note 364D.

The Spanish version for the band 2 550-2 655 MHz should be aligned with the French and English versions.

Approved, with those amendments.

Page B.13/77

ADD 361B:

It was agreed to replace "(see Articles 9 and 9A or Resolution No. )" by "(see Resolutions Nos. G and F)", Resolution No. F being of a general nature and Resolution No. G an interim provision.

The Secretary of Committee 5 said that foot-note MOD 364 should be included, the wording to be reproduced from No. 364 of the Radio Regulations with the addition of the words "terrestrial radiocommunication" before "services".

MOD 364A:

The delegate of Algeria asked for his country to be deleted from the foot-note, and the delegates of Uganda, Kenya, Tanzania, Jordan, Syria, Ethiopia and Cuba asked to be added.
The latter request gave rise to a discussion on whether the Conference was competent to take such action; the delegates of Italy and Canada were against the inclusion of new names and the delegate of the United Kingdom said that in a band where there had been no change to the Radio Astronomy Service there was no justification for increasing the allocation to the Fixed and Mobile Services. The Chairman of the I.F.R.B. said that if the Conference had kept strictly to the letter of its terms of reference in all cases, it would have had great difficulty in completing its work; however, he asked those countries requesting inclusion to do so only if they considered it absolutely essential.

The delegates of Syria and Ethiopia did not insist but the delegates of Uganda, Kenya and Tanzania pressed for inclusion in the foot-note.

The Chairman of Committee 5 said that there had been similar discussions in the Committee and finally the countries having made such requests in similar circumstances had agreed not to press the issue.

The Chairman put to the vote the inclusion of additional names: the result of the vote was 13 in favour, 17 against and 21 abstentions and the list of countries was therefore left as it was, with the reinsertion of the name of Cuba which appeared in the foot-note in the existing Radio Regulations.

The Secretary of Committee 5 said that the agreed wording of ADD 364D was:

"Administrations shall make all practicable efforts to avoid developing new tropospheric scatter systems in the band 2 655-2 690 MHz".

Approved, as amended.

Page B.15/58

ADD 364E:

The delegate of the United States of America proposed inserting "(see Article 9A)" at the end of the sixth line, and at the end of the paragraph "... shall not exceed the value given in No. 4750E of Article 7".

There was some discussion on the advisability of quoting No. 4750NI and it was finally decided to state in the minutes of the meeting that both 4750NE and 4750NI were applicable.
The Secretary of Committee 5 recalled that ADD p64-H, with the wording adopted at the previous meeting, should appear in numerical order.

Approved, as amended.

Page B.13/39
Approved.

Page B.13/40
Approved, with deletion of 392A in the framed part of the Table for the band 4 400–4 700 MHz.

Approved.

The delegate of Australia, having asked for the name of Australia to be removed from No. 394A of the Radio Regulations, it was agreed that the text thus amended would be included with the indication MOD 394A.

Approved, as amended.
Page B.13/47

Approved.

Page B.13/48

The Secretary of Committee 5 said that the square brackets should be removed throughout the page and the texts contained in the brackets should remain. In foot-note A the words in parentheses should read "(see Resolution No. F)".

The delegate of Nigeria proposed that the provisions of foot-note ADD E be applied also to Region 1, with some slight modifications of the text. The delegates of Ghana and Uganda associated themselves with the Nigerian proposal, particularly the suggestion to add "or sub-region" after "domestic".

The delegate of Italy, supported by the delegate of the U.S.S.R., thought that the provisions of foot-note E could not be applied to Region 1.

The Chairman of Committee 5 suggested that page 48 be adopted as it stood, with the removal of the square brackets, and he was supported by the delegates of Sweden, France and Spain.

The Chairman put to the vote the proposal to apply the provisions of foot-note E to Region 1 and it was rejected (5 votes in favour, 41 against and 13 abstentions).

The delegate of the United States of America noted that the phrase "(see Article 9 and Resolution G)" should be added at the end of paragraph E.

Approved, as amended.

Page B.13/49

The delegates of the following countries asked for the names of their countries to be deleted or added as shown.

ADD 405BA :

Austria to be deleted and Senegal and Niger added.
ADD 405BB:

Nigeria and Senegal to be deleted, Liechtenstein, Uganda, Kenya and Tanzania added. Agreed.

Approved, with those amendments.

Page B.13/50

The delegate of the United Kingdom, supported by the delegate of Canada, said that in the bands 14-14.3 and 14.3-14.4 GHz it was recognized that some sharing criteria were necessary; the best Committee 4 had been able to do was to include a paragraph in Recommendation No. Spa 3 asking the C.C.I.R. to carry out studies. He therefore proposed the following new note:

"The use of the bands 14-14.3 GHz and 14.3-14.4 GHz by the Radiolocation Service and the Radionavigation Satellite Service respectively shall be such as to afford adequate protection to space stations of the Fixed-Satellite Service (see Recommendation No. Spa 3, paragraph 2.14)."

The delegate of Japan said he had reserved the right to make a statement in connection with the band in question. The Japanese Administration, recognizing the fact that frequencies were important natural resources, had proposed allocating almost all frequency bands for Fixed-Satellite Services on a shared basis with terrestrial Fixed Services since sharing criteria between those services had been established technically. The 14-14.3 GHz band was proposed for the Fixed-Satellite Service sharing with the Radionavigation Service. His Administration believed that sharing between Fixed-Satellite and Radionavigation Services, including various kinds of radar, would be much more difficult because of the lack of sharing criteria. On the other hand, the band 12.75-13.25 GHz allocated to Fixed and Mobile Services could easily be shared with the Fixed-Satellite Service. For that reason, they were reluctant to accept frequency allocations for the band 14-14.3 GHz. However, if the majority were ready to support that allocation they would accept it and wait for C.C.I.R. studies and recommendations on sharing criteria.

Approved, as amended.

Page B.13/51

Approved.
The Secretary of Committee 5 said that the term "SUP 410" should appear at the top of the page, a vertical line be drawn between Regions 2 and 3 in the framed part of the Table for the band 22.5-23 GHz. Also the square brackets around the reference to 410B and the foot-note itself should be deleted.

The delegate of Brazil pointed out that the Conference was not competent to include a reference to the Terrestrial Broadcasting Service in the framed part of the Table for the band 22.5-23 GHz and suggested that the reference to the Broadcasting-Satellite Service should also be deleted as it might be enough to refer to that service in the foot-note. If that were done, the indications in the Table and foot-note 410B could be made applicable to all Regions, and the words "in Region 3" could be deleted from the foot-note.

The Chairman of Committee 5, supported by the delegates of the United States of America, New Zealand, the United Kingdom, Cuba and Japan, suggested that the entry in the Table and the foot-note should remain unchanged, except for the deletion of the reference in the Table to the Terrestrial Broadcasting Service.

Approved, as amended.

Pages B.13/53 - 54

Approved.

Page B.13/55

The delegate of the Federal Republic of Germany suggested that the directions of the Fixed-Satellite Service in the 40-41 GHz and 50-51 GHz bands should be reversed for reasons of economy and to reduce filtering problems and interference to broadcasting receivers.

The delegates of Japan, the United States of America, the U.S.S.R. and India supported the proposal.

Approved, as amended.

Pages B.13/56 - 59

Approved.
The texts in Series B.13, as amended, were approved at first reading.

The delegate of Malaysia said that, with regard to the application of modifications and additions to foot-notes in the course of the Conference, it should be borne in mind that the foot-notes relating to Malaysia introduced into the Radio Regulations by the 1959 and 1963 Administrative Radio Conferences had included Singapore, which had since become a separate State. Accordingly, it should be understood that the foot-notes amended or added during the current Conference in which the name of Malaysia appeared no longer included the State of Singapore, but applied only to the territory of Malaysia.

The delegate of the United States of America pointed out that the new foot-note 320A, giving status to the Amateur-Satellite Service in the band 435-438 MHz, contained a reference to No. 1567A, whereas no such provision appeared in the existing Radio Regulations.

The delegate of the United Kingdom said that the text of a proposed No. 1567A appeared in Document No. 315 and expressed the hope that it would be considered before the end of the Conference.

3. Second reading of texts submitted by the Editorial Committee Series B.13 (as amended at first reading) (Document No. 383)

The Secretary of Committee 5 read out the amendments agreed previously page by page.

Page B.13/24

The Secretary of Committee 5 confirmed once more that the decision of Committee 5 concerning the direction to be mentioned in the Table and in foot-note ADD 324C was correctly reproduced; nevertheless, eight countries had reserved their positions on the foot-note.

Approved.

Page B.13/45

The Chairman of Committee 7 said that "392A" should be deleted from the last line.

Approved.
The delegate of Ethiopia said that his country's name should be added to foot-note 405BB. Agreed.

Approved, with that addition.

The Chairman of Committee 7 said that the number assigned provisionally to the new foot-note in the 14-14.3 GHz and 14.3-14.4 GHz bands was 405BF.

410B:

The delegates of Mexico and Nigeria thought that there might be no need for foot-note 410B, since the allocation to the Broadcasting-Satellite Service was made on a primary basis in the Table. The Chairman of the I.F.R.B. pointed out that the foot-note introduced a necessary proviso and therefore created no inconsistency in the Radio Regulations.

In reply to the delegate of Syria, the Chairman of Committee 4 said that as a result of the reduction of the upper limit in No. 470NX from 23 GHz to 22 GHz, Article 7 no longer laid down a power limit for the Broadcasting-Satellite Service in the band concerned. The delegate of the United Kingdom, supported by the delegate of New Zealand, said that when the service was brought into operation a power flux-density limit would be agreed upon in the co-ordination arrangements. The delegate of Syria pointed out that the provision contained no reference to future agreements between administrations, but the delegate of the United Kingdom stressed that such an agreement would of necessity have to be reached before the service became operational.

The delegates of France, Brazil and Nigeria, thought the wisest course might be to delete the service from the Table and either merely refer to it in the foot-note or delete the foot-note as well.

The delegate of Canada suggested that the word "also" should be deleted from foot-note 410B.

Approved, with the Canadian amendment.
The Chairman of Committee 7 said that in the framed part of the Table for the band 24.05-24.25 GHz, "410" should be changed to "410c" and that "MOD 410" should be changed to "ADD 410c".

In reply to a suggestion by the delegate of Norway that the words "except aeronautical mobile" should be added to "mobile" wherever that service appeared in conjunction with the Fixed-Satellite Service throughout the Table, the Chairman said that such a change fell outside the competence of the Space Conference.

The texts in Series B.13, as amended, were approved at second reading.

The delegate of Australia observed that under No. 763 of the Montreux Convention, the approval of texts on second reading sufficed to bring the Final Acts into existence. There would therefore be no need to print the texts in Series B.13 in "whites" before the signature of the Final Acts.

The Chairman of Committee 5 said that on the occasion of the final approval at the second reading of the revised Table of Frequency Allocations (Article 5) he wished specially to thank the Chairman of the Conference for his wise guidance and moral support and to express his sincere gratitude to the Vice-Chairman of Committee 5, the Chairmen of the Working Groups and Sub-Working Groups, the Committee's Editorial Group, the Members of the I.F.R.B. and their staff and, in particular, the Secretary of Committee 5, who had been the real heart and brain of the Allocations Committee throughout the Conference.

4. Draft Resolution: Planning and administration of the resources of the geostationary satellite orbit (Document No. 138)

The delegate of Mexico said that the preoccupations which had caused his delegation to submit the draft resolution had been completely covered by Resolutions Nos. Spa 4, F and G, Recommendation No. LL and the revised texts of Articles 9 and 9A that had been adopted on second reading. He therefore withdrew the draft resolution.

The meeting rose at 1755 hours.

Secretary of the Conference: Clifford STEAD

Chairman of the Conference: Gunnar PEDERSEN
Subjects discussed

1. Second reading of texts submitted by the Editorial Committee:
   a) Series R.3
   b) Proposed addition to Article 41 of the Radio Regulations

3. Draft Recommendation relating to the preferred frequency bands for tropospheric scatter systems
1. Second reading of texts submitted by the Editorial Committee

a) Series R.3 (Document No. 395)

The delegate of Canada, referring to the proposal to delete the first line of ADD 470NW which had not been adopted at the preceding meeting, said that the bands in question in Region 2 would be the subject of planning procedures, under which the countries of the Region would be provided with appropriate channels for satellite broadcasting and yet, in between channels allocated on a geographical basis, would allow for fixed and mobile services. The power flux-density limits would be among the many factors taken into account in such planning, and the application to the broadcasting satellite service of limits which would normally apply to the communication satellite service would be prejudicial to the plan and to the countries of Region 2.

The Chairman put to the vote the proposal to delete the first line of ADD 470NW.

The proposal was adopted by 11 votes to 9.

The texts in Series R.3, as amended, were approved at second reading.

b) Proposed addition to Article 41 of the Radio Regulations (Document No. 315)

Approved at second reading.

The Chairman of Committee 7 said that all the texts appearing in square brackets in the "considering" part of the draft Resolution had either been superseded by new texts or had become obsolete.

The Secretary of the Conference suggested that the last "considering" paragraph should be preceded by the words "c) that" and that the words "are obsolete" should be added at the end.

It was agreed to delete the square brackets from the draft Resolution.
The Chairman of Committee 7 pointed out that, owing to an oversight by the 1963 Conference, Recommendation No. 36 had been retained in the Radio Regulations, although it was a recommendation of the 1959 Conference relating to the convening of the 1963 Conference. He therefore proposed the addition of a "considering" paragraph d), reading "that Recommendation No. 36 relating to the convening of an Extraordinary Administrative Radio Conference to Allocate Frequency Bands for Space Radiocommunication Purposes is obsolete".

Approved, as amended.

3. **Draft Recommendation relating to the preferred frequency bands for tropospheric scatter systems** (Document No. 407)

   The delegate of Canada, introducing the draft recommendation on behalf of its six sponsors, said that the text had been submitted in the belief that many difficult problems were due to proposals for sharing between tropospheric scatter and space systems and that measures could be taken with a view to achieving better spectrum management in that regard.

   The word "World" should be inserted before "Administrative Conference" in the "invites" paragraph.

   The delegate of France, supported by the delegates of Italy, New Zealand and Mexico, said that her delegation agreed with the substance of the proposal, but would suggest that the last paragraph should be amended to read: "invites the Administrative Council to arrange that a future World Administrative Radio Conference should specify, in the frequency bands allocated to the fixed services, those which are specially intended for tropospheric scatter systems". The reason for that amendment was that the existing text implied a complete revision of allocations in the bands between 800 Mc/s and 5 Gc/s, which would obviously be impossible.

   Approved, as amended.

   The meeting rose at 1820 hrs.

Secretary of the Conference: Clifford STEAD

Chairman of the Conference: Gunnar PEDERSEN
MINUTES
OF THE
THIRTEENTH PLENARY MEETING

Friday, 16 July 1971, at 2130 hrs

Chairman: Mr. Gunnar PEDERSEN (Denmark)

Subjects discussed:

1. Minutes of the Third Plenary Meeting
2. Minutes of the Fourth Plenary Meeting
3. Final report by the Budget Control Committee
4. Statements for inclusion in the Final Protocol

Document No.
378
404
363
402 + Add. 1 – 5
1. Minutes of the Third Plenary Meeting (Document No. 378)

Approved, subject to an amendment to page 3 to be handed in by the delegate of Algeria.

2. Minutes of the Fourth Plenary Meeting (Document No. 404)

Approved.

3. Final Report by the Budget Control Committee (Document No. 363)

The Chairman pointed out that in accordance with the Convention the Conference was called upon to consider and approve the report and make such observations as it found necessary; the report would then be transmitted to the Secretary-General for submission to the following session of the Administrative Council.

Approval of the report was expressed by the delegates of Yugoslavia, Spain, Argentina, Canada, U.S.S.R. and the United Kingdom, the delegate of the United States of America adding his regret that the budget had been unrealistic and his hope that the Council would be able to rectify the situation and find some way of meeting the excess expenditure.

The delegate of Yugoslavia thanked all those in the Conference secretariat who had enabled the Conference to complete its work. He pointed out that Committees 4, 5 and 6 had stressed the role played by the I.F.R.B. and the Conference's Technical Secretariat, and he thought the Conference should draw the attention of the Council to the fact that the I.F.R.B. would need additional staff to implement the decisions just taken. That kind of action was normally the subject of a resolution but he suggested that the Conference might - if there was no objection - have the summary records of the meeting passed to the Administrative Council.

The delegates of Spain, India, Mali, Argentina, Venezuela, Iran, Mexico and Japan, supported the suggestion by the delegate of Yugoslavia, paying tribute to the efforts made during the Conference by the I.F.R.B. Secretariat and the necessity for the I.F.R.B. to be reinforced to assume the additional responsibilities conferred upon it by the Conference. The delegates of Canada, the U.S.S.R., Cuba, the United Kingdom and the United States of America, while endorsing the expressions of appreciation to the I.F.R.B., and thanking the C.C.I.R., which had laid down the technical foundations of the Conference, and the rest of the I.T.U. Secretariat, said
that the attention of the Administrative Council would certainly be drawn
to the decisions taken at the Conference and the resulting technical and
administrative measures, but it was then for the Council itself to decide
what action was appropriate. The delegate of Chile said that developing
countries had found the exchange of opinions made possible by the Conference
most valuable, and he associated himself with the expressions of gratitude
to all those who had contributed in any way to its success.

The final report of the Budget Control Committee was adopted.

The Chairman requested the Secretary-General to transmit the
report and the above observations to the Council.

4. Statements for inclusion in the Final Protocol (Document No. 402,
Addenda 1 - 5)

Document No. 402

Annexes 1 - 6 - were agreed for inclusion in the Final Protocol.

Addendum No. 1

Annexes 1 - 4 - were agreed for inclusion in the Final Protocol.

Addendum No. 2

Annexes 1 - 3 - were agreed for inclusion in the Final Protocol.

Addendum No. 3

The delegate of the United Kingdom suggested that since the text
under discussion was intended to be included in the Final Protocol "foot-
note 332A" should be replaced by "Radio Regulation 332A" to ensure that
No. 332A was identified as a Radio Regulation.

Furthermore it had been decided not to include 470MB in the
Radio Regulations so it should be replaced in the text of Add.3 to
Document No. 402 by 470NK which contained the same power limit. The
reference to 470NI remained unchanged.

The delegate of India said that the suggestions made by the
delegate of the United Kingdom were quite acceptable to the Indian
dlegation.
The delegate of the United States of America, while agreeing with the technical correction thus made, thought the statement was out of order in the form in which it was presented.

The delegate of Greece suggested that the introductory paragraph be reworded to the effect that India had submitted a statement and a phrase added stating that the Conference expressed its interest in the experiment. That suggestion was supported by the delegates of Mexico and Italy.

The delegates of Pakistan, Malaysia, France, Uganda, Cuba and the United States of America said their understanding had been that the decision taken was that India could make such a statement in the Final Protocol.

The delegates of Canada, Brazil and Sweden thought that the text as it appeared in Addendum No. 3 correctly reflected the decision taken.

The delegate of India pointed out that the text was not a reservation and in that it differed from the other statements included in the Final Protocol, it was in fact an expression of the wish of the Conference and not merely an Indian statement.

The Deputy Secretary-General said that the Secretariat, in publishing what had been submitted to it, had thought it reasonable to include it at the end of the reservations and immediately preceding the signatures; an alternative would be to have it in the form of an Additional Protocol.

The delegate of Spain thought that consideration should be given to that alternative.

The delegate of the United Kingdom proposed that in the second line after "following", the words "statement by India" be added.

The delegates of Canada and Malaysia found that amendment acceptable and the Deputy Secretary-General felt that the amended text put the situation in the correct perspective.

The Chairman put the United Kingdom amendment to the vote and it was adopted by 61 votes to 2, with 10 abstentions.

The delegate of India thanked the delegates for the consideration they had shown with regard to the project; it was his firm conviction that it would open up a new vista and prove beneficial to many countries throughout the world.
The delegate of Sweden said he had abstained because in his view the vote just taken was incorrect.

Addendum No. 3, as amended, was agreed for inclusion in the Final Protocol.

Addendum No. 4

Annex 1 - was agreed for inclusion in the Final Protocol.

Addendum No. 5

Annexes 1 and 2 - were agreed for inclusion in the Final Protocol.

The meeting rose at 23:40 hrs.

Secretary of the Conference: Clifford STEAD

Chairman of the Conference: Gunnar PEDERSEN
MINUTES

OF THE

FOURTEENTH AND LAST PLENARY MEETING

Saturday, 17 July 1971, at 0600 hrs

Chairman: Mr. Gunnar PEDERSEN (Denmark)

Vice-Chairmen: Mr. A. BADALOV (U.S.S.R.)
Ambassador R.C. TYSON
(United States of America)

Subjects discussed

1. Signing of Final Acts
2. Statement by the Chairman
3. Closure of the Conference
1. **Signing of the Final Acts**

The Chairman of the Credentials Committee said that the provisional credentials of the delegations of Jordan and Panama had not been confirmed and they were therefore not empowered to sign the Final Acts of the Conference.

The Secretary-General then called the roll and signatures were successively appended in respect of the following Members of the Union:

- Algeria (Algerian Democratic and Popular Republic)
- Saudi Arabia (Kingdom of)
- Argentine Republic
- Australia (Commonwealth of)
- Austria
- Belgium

2. Statement by the Chairman

The Chairman made the statement attached hereto as the Annex.

3. Closure of the Conference

The delegate of Spain, doyen of the meeting, congratulated the Chairman on behalf of all those present for bringing the work of the Conference to a successful conclusion. He recalled earlier Conferences at which the discussions had been very similar. In 1932 at Madrid, for example, radio broadcasting was in its infancy, but the development of terrestrial broadcasting since that date was well known. The results of the 1971 Conference would be judged by those who would use telecommunications in future with the aim of uniting peoples, encouraging the development of countries and increasing co-operation and goodwill. In conclusion, he associated himself with the tributes paid during the Conference to Mr. Yusuf and to the three Soviet cosmonauts.
The delegate of Saudi Arabia, representing one of the developing countries which would benefit from the Final Acts of the Conference, also expressed his admiration for the excellent manner in which the Chairman had conducted the meetings and enabled the Conference to perform its work in a traditional friendly and co-operative atmosphere. The Conference had taken a wise step in electing Mr. Pedersen Chairman and had benefited from his lengthy and valuable personal experience. He also wished to congratulate the Secretary-General, his collaborators and all the organs of the I.T.U. and last but not least thank the Swiss Administration for its hospitality.

The delegate of India said that it was worthwhile to look back over the six-week duration of the Conference and compare what had been expected with what had been achieved. A new era was beginning with new services created and others appearing in a new form. Finally, he thanked the Chairman and the two Vice-Chairmen, the Secretary-General and General Secretariat, the Director of the C.C.I.R., Chairman of the I.F.R.B. and the Swiss Administration.

The Chairman declared closed the World Administrative Radio Conference for Space Telecommunications.

The meeting rose at 0710 hrs.

Secretary of the Conference:
Clifford STEAD

Chairman of the Conference:
Gunnar PEDERSEN

ANNEX

STATEMENT BY MR. GUNNAR PEDERSEN, CHAIRMAN

We have now concluded our work and I feel that we have been able to solve the problems that faced us in a very constructive atmosphere. We have in our work followed the good old traditions of the I.T.U., but in addition we have demonstrated to the world that the I.T.U. is more than ever before at the forefront in the field of telecommunications in space as well as on the ground.

We have created new and revised rules which will give space communications the greater flexibility which is needed in our dynamic society. The new rules will make space communication the most effective instrument to take good care of the immense new requirements in this period of information explosion.

It has been necessary to work quite hard during the last six weeks, and for an outsider it may be rather difficult to understand that we needed such a long time.

We have all come here with a good knowledge of our own problems, but it was during these six weeks that we had to learn to understand the problems of our neighbours, and that has necessarily been a time-consuming process.

In addition, we had to learn that a solution which in itself is not fully acceptable considering our own needs, may, all the same, turn out to be to our advantage. That will be the case if such a solution has obtained the general acceptance which gives the necessary background for the most efficient use of the radio spectrum on the earth and in space. Only in this way all nations and services will benefit in the future.

The very fact that the many specialists in the field of space and telecommunications technology, from all parts of the world, have been able to solve the problems in connection with radio services for space exploration and utilization, is in itself most encouraging. I believe that within the next decade the results of our Conference will play a most important role in the world's economic and social development. In the long run, the results of our Conference may even prove to be of greater value to mankind in general than the solution of many of the present-day political problems.
Thanks to the valuable technical work which had been carried out in the C.C.I.R., and especially at the Special Joint Meeting under the chairmanship of Mr. Marchand of Canada, we all knew that the Conference had a fine technical background for its work. But even so, I have felt it a heavy responsibility to preside over this Conference.

I have, however, had extremely good and valuable help from the two Vice-Chairmen, Mr. Badalov of the U.S.S.R., and Mr. Tyson of the U.S.A. I can assure you that their good advice has been of the greatest value to the Conference and to me personally. We have been able to discuss the most difficult problems in a most friendly and constructive atmosphere, and I am very grateful to Mr. Badalov and to Mr. Tyson.

The main part of the work has, of course, been carried out in the Committees and in the Working Groups and smaller groups, and here I must pay a special tribute to the Committee Chairmen.

Mr. Martinez of the Credentials Committee did a fine job in connection with the examination of the credentials, and Mr. Constantinescu has taken good care of the Budget Control Committee which was faced with certain difficulties.

The Technical Committee, under the chairmanship of Mr. Sandbach, has solved very difficult problems and it was in such a way that the work of the other committees was facilitated.

Mr. Kieffer, the Chairman of the Allocations Committee, has had perhaps the most difficult and important problems, and he has solved them with energy and drive to a degree seldom seen.

Mr. Basu took very good care of the very complicated problems of modifying the Radio Regulations and finding methods and language to cover the many new ideas which came into the Radio Regulations by way of space.

Mr. Job, as Chairman of the Editorial Committee, has had to work I believe day and night to get the many pages published in fine and correct language. It has always been the good tradition that the delegate of France is Chairman of this Committee, and we certainly have not been disappointed this time.
I must also thank, for the good advice which I have received in meetings and outside meetings, the Secretary-General, Mr. Mill, and the Deputy Secretary-General, Mr. Butler.

I also want to extend my warm thanks to the Chairman and members of the I.F.R.B. for the extremely good help which has been given to the Conference and to me personally from the I.F.R.B. and its staff.

Also, Mr. Herbstreit of the C.C.I.R. has been most helpful in making sound technical suggestions during the work of the Conference.

I am very grateful for the excellent assistance given by Mr. Stead and the members of the Conference Secretariat. I know it has been a most difficult task as the time was short and the work of the Committees was not always concluded in good time.

I must also express my thanks to the very fine interpretation system. It has worked so well during the much too long hours that most of the time we almost forgot that there actually were human beings behind the windows of the booths. I believe that is the greatest compliment you can pay to the interpretation service.

To conclude, I sincerely hope that the results of our work will serve to improve telecommunications in all regions of the world and I hope that the I.T.U. will continue to fulfill its role in the space age.
