- Given that the first commercial IMT-2000 systems are not planned to be introduced until after 2002, any calculations of spectrum requirements are theoretical and not based on actual market development for IMT-2000 systems.
- The “core” spectrum identified for IMT-2000 under No. S5.388 is sufficient to satisfy the minimum spectrum requirements for the terrestrial component of IMT-2000 in the initial stages of development for up to six operators. The UMTS Forum came to the conclusion that if the market does not develop as strongly as forecast then, when there are more than two national operators, they will be confronted with serious problems of return on investment. This means that additional spectrum requirements for the development of IMT-2000 networks in the medium term may be satisfied with the “core” spectrum.
- The allocation and identification of additional channels to satisfy peak spectrum requirements in particular urban areas (“hot spots”) does not require any amendment of the provisions of the Radio Regulations and is an inalienable right of every telecommunication administration.
- IMT-2000 is one member of a whole family of advanced technologies providing wideband data transmission services, its distinctive feature being global mobility. Thus, when making market forecasts for IMT-2000 services detailed account has to be taken of the mutual impact of future wideband data transmission services offered by systems based on other technologies, such as cable TV networks, “quasi”-telecommunication services (voice/fax) over the Internet, delivery of broadcasting services over cable telecommunication networks, high-density FS systems (MWS), wideband wireless access systems and enhanced data transmission speeds in second-generation mobile radiocommunication systems.

4 The worldwide harmonization of frequency allocations for IMT-2000 will facilitate global roaming and also bring down the price of equipment and avoid additional complications for the introduction of IMT-2000.

5 The principle of harmonizing spectrum allocations for IMT-2000 is fundamental for manufacturers in order to reduce the cost of equipment, something which is particularly important for the successful introduction and profitable operation of IMT-2000 in both the developed and developing countries. This principle confers a higher status on the frequency bands identified for IMT-2000 in relation to other land mobile service systems, and this is considered to be particularly important in view of the significance of the IMT-2000 project within ITU and the major efforts deployed by both ITU and other standardization bodies in developing harmonized standards for IMT-2000.

6 The positions of individual telecommunication administrations during CPM-99 with respect to current and future use of specific candidate extension bands varied considerably. The interested administrations did not unanimously support any one of the proposed candidate bands. Moreover, some administrations were unequivocally opposed to global identification of particular

frequency bands for IMT-2000. Clear opposition of individual administrations in respect of particular frequency bands at the Conference could lead to the identification of specific bands on a national basis, which would constrain their worldwide use and run counter to the principle of global harmonization of spectrum for IMT-2000.

7 It is very important to point out that all the currently proposed extension bands are used intensively by radiocommunication service systems other than land mobile service systems and that such use is proposed for the future. As stated in the CPM Report, "in those cases where sharing is impossible ... the only way to solve the problem of implementing IMT-2000 would be transition of the existing services to other frequency bands", which would entail significant financial expense. Special studies on the problem of reallocating spectrum ought to be carried out before actually embarking on a process of migration of existing services to other bands.

8 In order to take a decision on frequency allocation, studies have to be carried out on such problems as shared use of the frequency bands with existing systems in other services, the technical and economic consequences of reallocation, the basic aspects of the process of migration of existing systems to other bands, harmonization of frequency plans, completion of the standardization process and consideration of the impact of actual market evolution on overall spectrum resource requirements, etc.

RUS/33/7

The Russian Federation proposes that no change should be made to the Radio Regulations in respect of the bands 806-960 MHz and 1 710-1 885 MHz used by first- and second-generation cellular systems and that studies be continued on those bands to investigate the feasibility of their reallocation and use of IMT-2000 in the longer term.

Reasons:

1 The frequency bands 862-960 MHz in Region 1, 806-902 MHz in Region 2 and 806-960 MHz in Region 3 are allocated on a primary basis to the land mobile service, the frequency band 1 710-1 885 MHz is allocated worldwide to the fixed and mobile services on a primary basis and a large part of those bands is used in many countries by second-generation land mobile service systems. The bands are used by second-generation systems in accordance with national frequency plans. Thus, the bands 806-960 MHz and 1 710-1 885 MHz are genuine candidates for band extension for IMT-2000 in the longer term in those Regions, as and when use of existing services decreases.

2 Second-generation mobile radiocommunication systems have only been introduced in certain portions of the above bands (70 MHz in Europe below 1 GHz and 155 MHz in the range from 1 GHz to 2 GHz).

3 Certain portions of those bands are used intensively in some countries by systems in other services and some administrations have signified their intention to continue such operation in the foreseeable future. In countries where the bands in question are used by second-generation cellular communication systems, their availability for third-generation systems can only be achieved in the longer term, taking into account the significant investment made in existing systems.

4 Actual time-scales for availability of these bands for IMT-2000 will differ from country to country, ranging from the very short to the much longer term, according to their different technical approaches to the evolution from second- to third-generation systems, specific regulatory characteristics and economic situation. At present, different countries use different frequency plans for second-generation systems in the bands in question. It is necessary to develop a harmonized frequency plan for those bands in order to avoid potential barriers to the overall harmonization of IMT-2000 worldwide.

5 ITU should carry out supplementary studies on issues such as the feasibility of shared use of the bands by IMT-2000 and existing systems in other services, the technical and economic consequences spectrum reallocation, aspects relating to the phasing out of existing systems and the development of harmonized frequency plans.

Agenda item 1.6.2

RUS/33/8

The Russian Federation supports the conclusion in the CPM Report that there is no need for a global control channel.

Agenda item 1.9

a) Resolution 220 (WRC-97)

Introduction

The Russian Federation considers that the results of ITU-R studies and the CPM-99 Report clearly indicate that no part of the band 1 559-1 610 MHz can be allocated for the mobile-satellite service. Accordingly, it is proposed that no amendment be made to Article S5 and that Resolution 220 (WRC-97) be deleted.

Reasons: Criteria have not been identified that would ensure protection of the operation and development of existing systems.

Agenda item 1.12

RUS/33/12

The Russian Federation supports the conclusion of CPM-99 to the effect that this agenda item may be resolved by means of ITU-R recommendations and does not require any amendment of the Radio Regulations. Resolution 121 (Rev.WRC-97) may be deleted.

Agenda item 1.15.1

The Russian Federation supports allocation of the band 1 260-1 300 MHz for the radionavigation-satellite service subject to the preliminary establishment of a pfd limit of –133 dB(W/m^2/MHz).

Introduction

1 In accordance with the Radio Regulations, the band 1 260-1 300 MHz is allocated on a primary basis in all the ITU Regions to the Earth exploration-satellite (active) service and on a secondary basis to the amateur service. Under footnote S5.331, in a number of countries the band is also allocated to the radionavigation service on a primary basis. Under footnote S5.282, the amateur-satellite service (Earth-to-space) may operate in the 1 260-1 270 MHz band subject to not causing harmful interference to other services operating in accordance with the Table (see No. S5.43). The primary allocations are similar to the allocations in the band 1 215-1 260 MHz, which is already allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis.

2 In order to support the development of highly reliable and accurate systems, new allocations are required for the radionavigation-satellite service (RNSS), since the previously allocated bands are insufficiently wide. Moreover, new allocations have to be sufficiently wide to accommodate various different systems.

3 It is considered that the sharing scenario will be similar to the situation in the 1 215-1 260 MHz band, where RNSS systems have successfully operated for many years for non-safety-of-life applications. Use of the band by high-power radars rules out safety-of-life applications on account of the risk of blocking RNSS receivers at distances of up to 700 metres if the combination of main beams is calculated. In order to protect radiolocation and radionavigation systems in the 1 260-1 300 MHz band, a provisional pfd limit of –133 dB(W/m^2/MHz) is proposed for each individual RNSS satellite, subject to review in accordance with Resolution YYY.

4 When properly used, ground-based RNSS receivers will suffer interference only in very small areas around radar sites.

MOD RUS/33/13

The power flux-density from the radionavigation-satellite service at the Earth's surface shall not exceed –133 dB(W/m^2/MHz) for each individual RNSS satellite, subject to review under Resolution **YYY**.

Reasons: CPM Report § 2.4.1.1.2.

ADD RUS/33/15

RESOLUTION YYY (WRC-2000)

Use of portions of the frequency bands 1 151-1 215 MHz and 1 260-1 300 MHz by systems in the radionavigation-satellite service (space-to-Earth)

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that, in accordance with the Radio Regulations, the band 960-1 215 MHz is allocated on a primary basis to the aeronautical radionavigation service in all three Regions;

b) that, in accordance with No. **S5.328**, the band 960-1 215 MHz is reserved on a worldwide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based facilities;

c) that, in accordance with the Radio Regulations, in all three Regions the bands between 1 215 and 1 300 MHz are allocated on a primary basis to the Earth exploration-satellite (active) service, the radiolocation service and the space research (active) service, and the bands between 1 240 and 1 300 MHz are also allocated on a secondary basis to the amateur service; that, in addition, in accordance with No. **S5.331**, in a number of countries the bands are allocated to the radionavigation service on a primary basis; and that in accordance with No. **S5.282**, the amateur-satellite service (Earth-to-space) may operate in the band 1 260-1 270 MHz subject to not causing harmful interference to other services operating in accordance with the Table (see No. **S5.43**);

d) that this Conference has decided to include in Article **S5** of the Radio Regulations a new allocation for the radionavigation-satellite service (space-to-Earth) in the frequency bands 1 151-1 215 MHz and 1 260-1 300 MHz, subject to preliminary power flux-density limits;

e) that preliminary power flux-density limits for the radionavigation-satellite service have been set in new footnotes, which need verifying and possibly refining,

resolves

1 that, as from 2 June 2000:

1.1 systems in the radionavigation-satellite service (space-to-Earth) planned to operate in the frequency bands 1 151-1 215 MHz and 1 260-1 300 MHz shall comply with the provisional limits set in Nos. **S5.328A** and **S5.329A** of the Radio Regulations or the corresponding sub-bands;

1.2 such systems shall, as from the end of WRC-03, comply with the limits in the corresponding sub-bands adopted by WRC-03, irrespective of the date of receipt of the complete information for the system in question;

1.3 as from the end of WRC-03, it shall be considered that an administration planning to use a system in the radionavigation-satellite service (space-to-Earth) in the corresponding sub-band which complies with all the requirements in terms of the limits adopted by WRC-03 fulfils its obligations irrespective of when the complete notice for the radionavigation-satellite service (space-to-Earth) system was submitted to the Bureau,

requests ITU-R

1 as a matter of urgency, and in time for WRC-03, to carry out technical, operational and regulatory studies in order to review the provisional pfd limits for systems in the radionavigation-satellite service (space-to-Earth) in the frequency bands 1 151-1 215 MHz and 1 260-1 300 MHz from the point of view of ensuring that the radionavigation-satellite service (space-to-Earth) does not cause harmful interference to the aeronautical radionavigation, radionavigation and radiolocation services;

2 to carry out studies, as a matter of urgency, prior to WRC-03, on the relevant technical and operational aspects and on sharing between the radionavigation-satellite and aeronautical radionavigation services in the band 960-1 215 MHz;

3 to report to CPM-03 on the results of these studies,

instructs the Radiocommunication Bureau

after the end of WRC-03, to review and if necessary modify any previous findings for compliance with the limits for radionavigation-satellite service (space-to-Earth) systems in the corresponding sub-bands notified before the end of WRC-03; this review shall be carried out on the basis of the values in the corresponding sub-bands as revised, if appropriate, by WRC-03,

instructs the Secretary-General

to bring this Resolution to the attention of ICAO for appropriate action.

Reasons: The need to refine the provisional pfd limits in the bands 1 151-1 215 MHz and 1 260-1 300 MHz in order to protect the aeronautical radionavigation, radionavigation and radiolocation services.

Agenda item 1.19

RUS/33/16

The Russian Federation participated actively in ITU-R studies on BSS replanning, realizing the huge importance of that task for the international community and the interest of many countries in obtaining capacity to develop national networks. Having carefully examined the results of the studies, the Russian Federation expresses the following views:

1) It is basically feasible to establish a BSS plan providing each country with a number of channels at least equivalent to 10 analogue TV channels.

2) In the studies, account was taken of the specific requests of a number of countries, including a request from Region 3 countries to provide them with 12 channels and a request from the Russian Federation and Australia to maintain their existing frequency assignments already in the WRC-97 Plan. Furthermore, account was taken of the request by Germany, Switzerland, Liechtenstein and Austria to allocate frequency assignments to those countries at one orbital position using the same (common) subregional beam covering all four countries.

   We propose to support accommodating the specific requests of the administrations when establishing the Plan.

3) The studies carried out by the IRG Group have shown that the most complex replanning problem is the problem of compatibility of the new BSS plan with other services using the planned frequency band with equal rights. The problem of sharing with the FSS is particularly acute, affecting the proposed plan assignments of 125 countries. Sixty-three countries are affected by interference between BSS and terrestrial services.

In order to resolve the problem of compatibility between the Plan and other services, when developing the Plan one has to either take existing services into account in the planning process or confer superprimary status on the new Plan, thereby making the other services secondary in relation to the Plan.

4) WRC-2000 will have to draw up and adopt a resolution laying down the principles and technical bases for establishment of the new BSS Plan. The resolution may be developed on the basis of Resolution 532 (WRC-97), but specifying also some additional points which arose when developing the IRG example plan, including whether account should be taken in the plan of networks at the implementation stage or already implemented but not having completed the process under Article 4 or Article 5 of Appendices S30/S30A.

The planning principles must also specify means of resolving the problem of compatibility with other services (in particular with terrestrial services and the FSS) which is exacerbated when developing the new BSS plan with at least 10 channels for each country.

It is important to mention in the planning principles the need to maintain the same proportions as in the 1977 and 1997 Plans, specifically the need to maintain in the new Plan the same number of channels for countries which have more than 10 channels in the current Plan.

5) It is proposed that the following principles be adopted for establishment of the BSS Plan:

- Provide all Region 1 and 3 countries with a capacity at least equivalent to 10 analogue TV channels, while maintaining the proportions used in establishing the 1977 and 1997 Plans. The existing number of channels must be maintained for countries having more than 10 channels in the 1997 Plan.
- Planning should be based primarily on national coverage. At the same time, account should be taken of the wishes of neighbouring countries for the allocation of unified orbital positions for the possible establishment of multi-national systems.
- In the planning, only digital transmission methods are to be used.
- Where possible, specific requests of countries concerning orbital positions, frequency channels and feeder-link frequency band should be accommodated.
- Planning must maintain and protect: Plan frequency assignments which have been brought into service, and for which the date of bringing into service has been confirmed; Plan frequency assignments which have not yet been brought into service but for which the date of bringing into service has been determined by a notice under Article 5 of Appendices S30/S30A and for which, where appropriate, information has been submitted in accordance with Resolution 49 (WRC-97). These assignments shall not claim greater protection than in the 1997 Plan.
- Equitable access to the BSS orbit/spectrum resource shall be ensured, to which end in the planning a common arc for Regions 1 and 3 shall be maintained as was adopted in establishing the 1977 and 1997 Plans.

- Countries’ requests concerning the establishment of subregional systems should be accommodated where possible. In this process, allocation of the orbit/spectrum resource to subregional systems shall not constrain allocation of the necessary resource to national systems.
- Compatibility of the plan shall be ensured with other services in all three Regions having frequency assignments recorded in the frequency register, i.e. only with those which are compatible or have been coordinated with the existing (1997) or initial (1977) Plans.

Agenda item 1.20

RUS/33/17

The Russian Federation supports the approach proposed by CPM on procedures for the use of guardbands to perform space operation functions, and does not object to the deletion of Articles 6 and 7 from Appendices S30/S30A along with corresponding amendment of Article S9 and Appendix S5.

Agenda item 7.2

The Russian Federation expresses concern at the excessively heavy agendas of conferences, in particular WRC-97 and WRC-2000, since this adversely affects the efficiency and effectiveness of conference work and decisions. While willing to discuss the inclusion in the agenda of future conferences of any matters proposed by a large number of administrations, the Russian Federation considers that the agenda must be confined to the most pressing issues in respect of which ITU-R studies are either completed or have achieved significant results endorsed within the Study Groups.

Resolutions of the Plenipotentiary Conference (Minneapolis, 1998)

We are still studying this item and will be submitting relevant proposals in due course.

The Russian Federation’s proposals in respect of other WRC-2000 agenda items are reflected in the proposals of the regional organizations of which the Russian Federation is a member.

Attachment: Study to determine the impact of a multinational beam for Lithuania and Latvia

ATTACHMENT

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF A MULTINATIONAL BEAM FOR LITHUANIA AND LATVIA

1 Introduction

The Radiocommunication Bureau received a telefax dated 31 March 2000 from the Administrations of Lithuania (Republic of) and Latvia (Republic of) requesting to investigate the inclusion of a multinational composite beam at the orbital position 23° E covering their territories with ten channels per country in the replanning feasibility studies replacing their national beams.

As the request was received after the last IRG meeting, the Bureau informed these Administrations that their request would be studied at the end of the “basic” downlink and feeder-link feasibility studies, together with other national preferences yet to be studied, if time and resources permit.

This document provides the results of this additional study conducted by the Bureau for consideration by WRC-2000.

2 Methodology

At the end of the “basic” downlink and feeder-link feasibility studies, the national beams of Lithuania and Latvia are removed from the orbital positions 23° E and 50° E respectively in both the “basic” downlink and feeder-link files.

Downlink and feeder-link composite beams are then added for these two countries at the orbital position 23° E with ten channels each in both downlink and feeder-link files.

Downlink and feeder-link MSPACE analyses are then performed to assess the new interference situation of the downlink and feeder-link files.

In order to resolve possible incompatibilities, in particular due to the use of different orbital positions for these countries in the “basic” feasibility studies, the methodology described in Document WRC2000/34 and its Corrigendum 1 may be applied.

3 Technical assumptions

3.1 Downlink

At the request of the Administrations of Lithuania and Latvia, the test points assumed in the study for the downlink multinational composite beam are those used for these countries in the Appendix S30 Plan, as follows:

Ref.	**TP1**	**TP2**	**TP3**	**TP4**	**TP5**	**TP6**	**TP7**	**TP8**	**TP9**	**TP10**
Latitude	54.38	54.50	55.25	55.58	56.08	56.25	55.66	56.10	56.15	56.25
Longitude	22.80	25.50	21.27	26.50	21.08	24.75	26.57	21.10	27.96	24.25
Ref.	**TP11**	**TP12**	**TP13**							
Latitude	57.50	57.55	57.90							
Longitude	21.75	27.25	24.40							

The subsidiary ellipse parameters of the downlink composite beam located at the orbital position 23° E were derived from the ellipse characteristics of the beams used for these countries in the Appendix S30 Plan (see Annex A to this document).

3.2 Feeder link

At the request of the Administrations of Lithuania and Latvia, the test points assumed in the study for the downlink multinational composite beam are those used for these countries in the Appendix S30 Plan, as follows:

Ref.	**TP1**	**TP2**	**TP3**	**TP4**	**TP5**	**TP6**	**TP7**	**TP8**	**TP9**	**TP10**
Latitude	53.99	54.15	55.28	55.50	56.00	56.20	55.66	56.10	56.15	56.25
Longitude	23.49	25.68	26.78	21.50	21.25	23.50	26.57	21.10	27.96	24.25
Ref.	**TP11**	**TP12**	**TP13**							
Latitude	57.50	57.55	57.90							
Longitude	21.75	27.25	24.40							

The subsidiary ellipse parameters of the downlink composite beam located at the orbital position 23° E were derived from the ellipse characteristics of the beams used for these countries in the Appendix S30 Plan (see Annex B to this document).

4 Downlink results

The national beams of Lithuania and Latvia (LTU06100 and LVA06100) were removed from the "basic" feasibility study downlink file. They were each replaced with the downlink multinational composite beam described in section 3.1 above at the orbital position 23° E.

A Victim and Culprit study was then performed. The result of this exercise was that the beam could not be accommodated with the required number of channels. There were incompatibilities with other "planned" assignments and "existing" systems. The e.i.r.p. was then adjusted in order to try and resolve incompatibilities. The result of this exercise was that the multinational composite beam still could not be accommodated into the draft downlink file without any EPM excess.

The multinational composite beam was replaced by a single ellipse covering the territories of Lithuania and Latvia. A Victim and Culprit study was then performed. The result of this exercise was that the beam still could not be accommodated with the required number of channels. The improved fast roll-off space station transmit antenna as described in Recommendation ITU-R BO.1445 was then applied to the multinational single ellipse beam. The result of this exercise was that the beam still could not be accommodated. The e.i.r.p. was then adjusted in order to try and resolve incompatibilities. The result of this exercise was that the multinational single ellipse beam still could not be accommodated into the draft downlink file without any EPM excess.

The only other action that could be taken was to change orbital position. However, this action was not attempted as it was not requested by the two Administrations. Alternatively, the two Administrations may wish to accept some negative EPM to the multinational beam. The worst-case EPM for the multinational composite beam with power adjustment applied was –2.3 dB. The worst-case EPM for the multinational single ellipse beam with improved fast roll-off antenna and power adjustment applied was –1.9 dB.

5 Feeder-link results

The national beams of Lithuania and Latvia (LTU06100 and LVA06100) were removed from the “basic” feasibility study 17 GHz feeder-link file. They were each replaced with the multinational feeder-link composite beam described in section 3.2 above, which was located at the orbital position 23° E.

As a first attempt, channels: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 CR were assigned to the composite beam LTU06100, as for the beam LTU06100 in the “basic” feeder-link feasibility study, and channels: 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CL were assigned to the composite beam LVA06100.

An MSPACE run was then performed to assess the new interference situation of the so-revised 17 GHz feeder-link file. The results showed incompatibilities at the orbital positions 23° E.

In order to resolve the EPM excess found for the beams AZE06400 (i.e.: –0.84 dB EPM), LVA06100 (i.e.: –0.80 dB EPM) and SOM31200 (i.e.: –0.62 dB EPM), a ±0.2° orbital position offset was applied to the beams AZE06400, LTU06100 and LVA06100, which were thus shifted at the orbital positions 22.8° E, 23.2° E and 23.2° E respectively.

A new MSPACE run was then performed to confirm that the multinational composite beam for Lithuania and Latvia were accommodated into the draft 17 GHz feeder-link file without any EPM excess.

Another MSPACE run was then performed to check the impact of these ±0.2° orbital position adjustments on the downlink study. The results showed that this orbital position shift had no impact on the downlink results obtained in section 4 above.

6 Summary

The results of this study show that the multinational downlink beam cannot be accommodated at the orbital position 23° E without suffering some negative EPM.

The results of this study also show that it is possible to accommodate at the orbital position 23.2° E the proposed multinational feeder-link composite beam for the Administrations of Lithuania and Latvia with ten channels per country without any EPM excess. However, this is only possible with the application of a ±0.2° offset to one beam of another Administration at the nominal orbital position 23° E.

Director, Radiocommunication Bureau

STUDY TO ASSESS THE IMPACT OF USING AN ORBITAL POSITION WITHIN THE ORBITAL ARC 25° W TO 10° E FOR TUNISIA

1 Introduction

The Radiocommunication Bureau received a telefax dated 31 March 2000 from the Administration of Tunisia requesting a preference for an orbital position within the orbital arc from 25° W to 10° E instead of the orbital position 30° W, which was used in the "basic" feasibility studies.

As the request was received after the last IRG meeting, the Bureau informed this Administration that its request would be studied at the end of the "basic" downlink and feeder-link feasibility studies, together with other national preferences yet to be studied, if time and resources permit.

This document provides the results of this additional study conducted by the Bureau for consideration by WRC-2000.

2 Methodology

At the end of the "basic" downlink and feeder-link feasibility studies, the national beams of Tunisia are removed from the orbital position 30° W in both the "basic" downlink and feeder-link files.

A search for a new orbital position within the orbital arc from 25° W to 10° E is conducted for the downlink. For that purpose, a Step 4 run is performed (see the Step 4 methodology described in Attachment 1 to Document CMR2000/34 and its Corrigendum 1).

Once the required number of downlink channels have been found at an orbital position within the requested orbital arc, a feeder-link study is performed to find the required number of feeder-link channels at the same orbital position (see the feeder-link methodology described in Attachment 1 to Document CMR2000/34 and its Corrigendum 1).

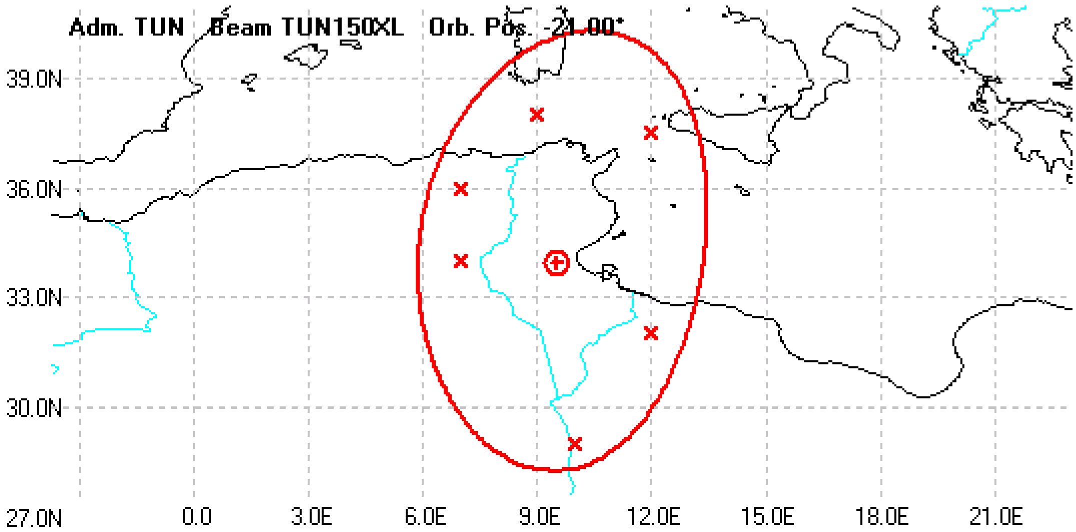
3 Downlink results

The Step 4 run firstly considered the orbital position 25° W. It was not possible to find a block of ten channels at that position. All nominal orbital positions within the arc >25° W to 10° E were then considered. Again, it was not possible to find a block of ten channels at those nominal orbital positions. A further search at non-nominal orbital positions was also unsuccessful.

The Step 4 run was repeated with the improved fast roll-off space station transmit antenna as described in Recommendation ITU-R BO.1445 applied to the TUN15000 beam. This run found that it was possible to accommodate the national downlink beam of Tunisia (TUN15000) at the non-nominal orbital position 21° W without any EPM excess.

A further Step 4 run was performed with the improved fast roll-off antenna applied and the e.i.r.p. of the TUN15000 adjusted. The result of this exercise was that it was not possible to accommodate the TUN15000 beam at a nominal orbital position within the arc 25° W to 10° E; it was only possible to accommodate the beam at the non-nominal orbital position 21° W without any EPM excess.

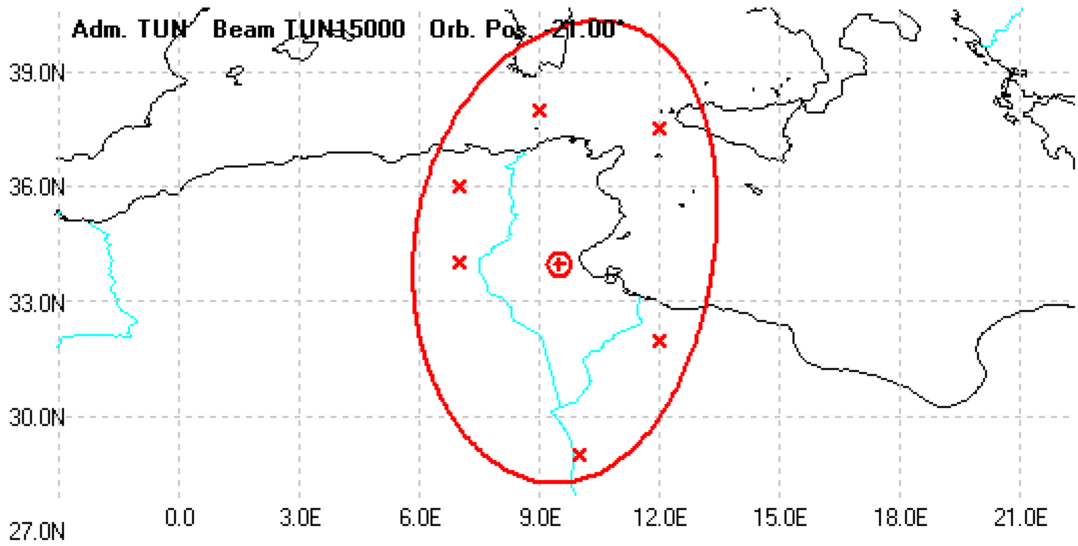
The ellipse parameters and a plot of the resulting downlink beam shape at 21° W are provided below.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
43.23 dB	33.95° N	9.51° E	1.70°	0.78°	115.63°

4 Feeder-link results

The orbital position of the Tunisia national feeder-link beam (TUN15000) was changed from 30° W to the orbital position found in the downlink study: 21° W. The ellipse parameters were recalculated using the ITU/EBU ellipse software. The feeder-link ellipse parameters and a plot of the resulting beam shape at 21° W are provided below.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
43.23 dB	33.95° N	9.51° E	1.70°	0.78°	115.63°

An MSPACE run was then performed to assess the new feeder-link interference situation resulting from the use of the channels 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CL, which were those found at 21° W in the downlink study, after a transposition of these ten channels to the feeder-link frequency band at 17 GHz.

The results showed that it was possible to accommodate into the feeder-link file the national feeder-link beam of Tunisia at the orbital position 21° W without any EPM excess.

5 Summary

The results of this BSS-to-BSS study show that it is possible to accommodate the national downlink and feeder-link beams of Tunisia at 21° W without any EPM excess in both the downlink and feeder-link respectively.

STUDIES TO ASSESS THE IMPACT OF AN ADDITIONAL OR ALTERNATIVE USE OF THE 14 GHz AND/OR THE 17 GHz FREQUENCY BANDS FOR THE ADMINISTRATIONS OF INDIA, IRAN (ISLAMIC REPUBLIC OF), ISRAEL (STATE OF), MOROCCO, AND SEYCHELLES

1 Introduction

The Administrations of India (Republic of), Iran (Islamic Republic of), Morocco (Kingdom of) and Seychelles (Republic of) requested at the last IRG meeting to assess the impact on the feeder-link feasibility study of the additional or alternative use of the 14 GHz and/or 17 GHz frequency bands for their feeder-link channels instead of the channels used for these countries in the “basic” feeder-link feasibility study (see sections 6.4.6 and 6.4.9 of the IRG Final Report: Document WRC2000/34).

The IRG agreed to investigate these proposals and asked the Radiocommunication Bureau to perform additional studies at the end of the basic study in order to determine the impact of these requests.

On the same issue, the Bureau received a telefax dated 10 January 2000 from the Israel (State of) Administration requesting to assess the impact on the feeder-link feasibility study of the use of the 14 GHz frequency band for its feeder-link channels instead of the 17 GHz frequency band. As the request was received after the last IRG meeting, the Bureau informed this Administration that its request would be studied at the end of the “basic” feeder-link feasibility study, together with other national preferences yet to be studied, if time and resources permit.

This document provides the results of all these additional studies conducted by the Bureau for consideration by WRC-2000.

2 Methodology

At the end of the “basic” feeder-link feasibility study the required number of channels are added into the relevant feeder-link file (14 GHz file or 17 GHz file). BSS-to-BSS interference analyses are then conducted separately to assess the impact of each request on the feeder link.

3 Results of the feeder-link studies

3.1 Case of India (Republic of) at 56° E and 68° E

The beams INDA__1XR, INDA__1YL, INDB__1XR and INDB__1YL at the orbital position 56° E, and the beams IND0371XR, IND037YL, IND0471XR, IND047YL, INDD__1XR and INDD__1YL at the orbital position 68° E were all added to the “basic” feasibility study 14 GHz feeder-link file in order to provide 12 channels to all the beams of the Administration of India (Republic of) in the 14 GHz frequency band.

An MSPACE run was then performed to assess the new interference situation of this revised 14 GHz feeder-link file.

After several trials, the results showed that:

- Only one of the two composite beams of this Administration at 56° E can be accommodated with 12 channels in the 14 GHz feeder-link file without any EPM excess.
- Only the composite beam and one of the two elliptical beams of this Administration at 68° E can be accommodated with 12 channels in the 14 GHz feeder-link file without any EPM excess, but with the application of a ±0.2° orbital position offset to these two Indian beams.

3.2 Case of Iran (Islamic Republic of) at 34° E

The beams IRN109XR and IRN109YL were added at the orbital position 34° E to the "basic" feasibility study 14 GHz feeder-link file in order to provide 12 channels (block E) to the Administration of Iran (Islamic Republic of) in the 14 GHz frequency band.

An MSPACE run was then performed to assess the new interference situation of this revised 14 GHz feeder-link file.

The results showed that it is possible to provide the Administration of Iran (Islamic Republic of) with 12 channels at the orbital position 34° E in the 14 GHz feeder-link file without any EPM excess.

3.3 Case of Seychelles (Republic of) at 42.5° E

The beams SEY000XL and SEY000YR were added at the orbital position 42.5° E to the "basic" feasibility study 14 GHz feeder-link file in order to provide ten channels (block E') to the Administration of Seychelles (Republic of) in the 14 GHz frequency band.

An MSPACE run was then performed to assess the new interference situation of this revised 14 GHz feeder-link file.

The results showed that it is possible to provide the Administration of Seychelles (Republic of) with ten channels at the orbital position 42.5° E in the 14 GHz feeder-link file without any EPM excess.

3.4 Case of Morocco (Kingdom of) at 25° W

The beam MRC20900 was added at the orbital position 25.0° W to the "basic" feasibility study 17 GHz feeder-link file in order to provide ten channels to the Administration of Morocco (Kingdom of) in the 17 GHz frequency band.

Several MSPACE runs were then performed to try to provide one block of ten channels to this Administration in the 17 GHz feeder-link file either at the orbital position 25.0° W, 25.2° W or 24.8° W.

The results showed that some of the beams at the orbital positions 25.0° W, 25.2° W or 24.8° W have EPM excesses.

In order to resolve this situation, one solution could be to move the beam TCD14300 to the 14 GHz frequency band. The 17 GHz feeder-link file was then revised in order to remove the beam TCD14300 and to add the beam MRC20900 at the orbital position 25.2° W with channels 22, 24, 26, 28, 30, 32, 34, 36, 38, 40 CR (i.e. block D). A new MSPACE run of this revised 17 GHz feeder-link file was then performed. In parallel, the 14 GHz feeder-link file was also revised in order to add the beams TCD143XR and TCD143YL, both at the orbital position 25.2° W with channels 5, 7, 9, 11, 13 CR and 6, 8, 10, 12, 14 CR respectively (i.e. block E'), and to remove the beams MRC209XR and MRC209YL. A new MSPACE run of this revised 14 GHz feeder-link file was then performed. The results of both runs showed that it is possible to provide the Administration of Morocco (Kingdom of) with ten channels at the orbital position 25.2° W in the 17 GHz feeder-link file without any EPM excess, provided that the beam TCD14300 is moved to the 14 GHz frequency band at the orbital position 25.2° W.

Alternatively, another solution could be to make some changes with respect to the ±0.2° orbital position offset or the channel arrangements, as well as to apply some e.i.r.p. adjustments to some of the beams at the orbital positions 25.0° W, 25.2° W or 24.8° W in order to maintain all these beams in the 17 GHz frequency band. The 17 GHz feeder-link file was then revised in order to make the following modifications:

– Use channels 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CR (i.e. block C') for the beam AGL29500 at the orbital position 25.2° W with an e.i.r.p. reduction of 0.8 dB (i.e. an e.i.r.p. of 83.2 dBW).

– Use channels 22, 24, 26, 28, 30, 32, 34, 36, 38, 40 CR (i.e. block D) for the beam LBY28021 (same as beams LBY28000 and LBY32100) at the orbital position 24.8° W.

– Use channels 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CL (i.e. block C) for the beam TCD14300 at the orbital position 25.2° W.

– Use channels 22, 24, 26, 28, 30, 32, 34, 36, 38, 40 CL (i.e. block D') for the beam MRC20900 at the orbital position 24.8° W with an e.i.r.p. reduction of 1.8 dB (i.e. an e.i.r.p. of 82.2 dBW).

A new MSPACE run of this revised 17 GHz feeder-link file was then performed. The results showed that it is also possible, alternatively, to provide the Administration of Morocco (Kingdom of) with ten channels at the orbital position 24.8° W in the 17 GHz feeder-link file without any EPM excess, provided that some changes (i.e. different ±0.2° orbital position offset or different channel arrangements) are made to the beams AGL29500, LBY28021 and TCD14300 and that some e.i.r.p. reductions are applied to the beams AGL29500 (i.e. 0.8 dB) and MRC20900 (i.e. 1.8 dB).

3.5 Case of Israel (State of) at 4° W

The beams ISR110XL and ISR110YR were added at the orbital position 4.0° W to the "basic" feasibility study 14 GHz feeder-link file in order to provide ten channels (block E) to the Administration of Israel (State of) in the 14 GHz frequency band.

An MSPACE run was then performed to assess the new interference situation of this revised 14 GHz feeder-link file.

The results showed that it is possible to provide the Administration of Israel (State of) with ten channels at the orbital position 4.0° W in the 14 GHz feeder-link file without any EPM excess.

With respect to the second request of this Administration, to study the compatibility between these 12 Israel channels in the 14 GHz feeder-link file and the other services sharing the same frequency band, no analysis was performed in accordance with the methodology related to this compatibility case, which is described in Attachment 3 to Document CMR2000/34. Information on the compatibility between any 14 GHz feeder-link channel and the other services sharing the same frequency band is provided in section 1.2 of Annex 1 of Addendum 4 to Document WRC2000/34.

4 Summary

The results of these BSS-to-BSS studies show that:

– For the Administrations of Iran (Islamic Republic of), Seychelles (Republic of) and Israel (State of), the required number of channels can be assigned to these countries in the 14 GHz feeder-link file without causing any excess of interference to any beam.

– For the Administration of India (Republic of), only one of its two beams at 56° E and two of its three beams at 68° E (±0.2°) can be assigned the required number of channels in the 14 GHz feeder-link file without causing any excess interference to any beam.

– For the Administration of Morocco (Kingdom of), the required number of channels can be assigned to this country in the 17 GHz feeder-link file without causing any excess of interference to any beam, provided that either the beam TCD14300 is moved to the 14 GHz frequency band, or different ±0.2° orbital position offset, different channel arrangements and some e.i.r.p. reductions (i.e. 0.8 dB to the beam AGL29500 and 1.8 dB to the beam MRC20900) are applied.

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF
ALTERNATIVE FEEDER-LINK BEAMS FOR AUSTRALIA

1 Introduction

The Administration of Australia requested at the last IRG meeting that 10 (12) channels be provided to all Australian test points including its offshore territories for both the downlink and feeder link.

The IRG agreed to investigate the proposal and asked the Radiocommunication Bureau to perform an additional study at the end of the basic study in order to determine the impact of the request.

After the last IRG meeting, the Administration of Australia clarified further this request. It indicated with more details its preferences with respect to its feeder-link assignments (see section 3 below). With respect to its downlink assignments, this Administration indicated that the assumptions taken to carry out the feasibility study presented at that meeting were satisfactory with a small caveat concerning the antenna patterns.

This document provides the results of a feeder-link study conducted by the Bureau, which includes the Australian preferences for consideration by WRC-2000.

2 Methodology

In accordance with the IRG decision on the issue, at the end of the basic feeder-link feasibility study, the modifications described in section 3 below are implemented, and MSPACE interference analyses are conducted.

3 Technical assumptions

Bearing in mind that the Administration of Australia requested earlier not to change its assignments of the Appendix S30A Plan, this Administration requested to use specific arrangement of beams and channels when implementing additional feeder-link channels for Australia in the feasibility studies.

3.1 Preferred feeder-link channels

The Administration of Australia requested to use channels 1, 5, 9, 13, 17, 21 CL (or alternatively 27, 31, 35, 39, 25, 29) at the orbital position 152° E, and channels 4, 8, 12, 16, 20, 24 CL (or alternatively 30, 34, 38, 24, 28, 32) at the orbital position 164° E.

Since the additional channels 1, 5, 9 CR and 4, 8, 12 CL were assigned to Australia at the orbital positions 152° E and 164° E respectively in the “basic” downlink feasibility study, the feeder-link channels 1, 5, 9 CL and 4, 8, 12 CL were used at these orbital positions respectively for the purpose of this additional study, in addition to the Appendix S30A Plan channels assigned to the other feeder-link beams of this Administration. It should be noted that these preferred additional channels were not used in the “basic” feeder-link feasibility study because they would have produced negative EPMs.

3.2 Preferred feeder-link beams

The Administration of Australia requested to use the Appendix S30A Plan feeder-link antenna pattern ellipses “AUS0040A” and “AUS0070A” for the creation of full “national coverage beams” in combination with minimum size spot beams covering its offshore territories.

Consequently, for the purpose of this additional study, the beams “AUS0060G” at 152° E and “AUS0070G” at 164° E were removed from the feeder-link feasibility study file and replaced by two composite beams: “AUSA0000” at 152° E and “AUSB0000” at 164° E respectively (see Annexes A and B to this document). It should be noted that it was not possible to use the fast-roll antenna patterns (R123FR) requested by this Administration since no fast-roll antenna pattern was adopted by the relevant ITU-R Study Group in the case of composite beams.

In addition to these composite beams, for each of the six Australian beams of the Appendix S30A Plan (AUS00400/AUS0040A, AUS00500, AUS00600 at 152° E and AUS00700/AUS0070A, AUS00800, AUS00900/AUS0090A at 164° E), six spot beams covering respectively the six Australian offshore territories identified by that Administration were created and grouped with their respective Appendix S30A Plan beam (see Annexes C and D to this document).

4 Results of the feeder-link study

An MSPACE run was performed to assess the new interference situation of the revised feeder-link file, as described in section 3 above.

The results showed some excess of interference received by the proposed new composite beams (i.e. –12.2 dB EPM for beam “AUSA0000” and –11.9 dB EPM for beam “AUSB0000”) and by some of the Australian beams of the Appendix S30A Plan (i.e. –3.3 dB EPM for beam “AUS00500”, –2.9 dB EPM for beam “AUS00700” and –3.1 dB EPM for beam “AUS0070A”).

A detailed analysis indicated that, at both orbital positions, the negative EPMs of the Australian beams of the Appendix S30A Plan are due to additional adjacent channel interference from the preferred channels used for the composite beams (see section 3.1 above). Considering that the Administration of Australia indicated that for the feeder-link Australia may consider accepting some level of negative EPMs where such EPMs are due to adjacent channel interference from other Australian beams, no solution is proposed in this document to improve this particular situation for the cases where the negative EPM was approximately –3 dB.

Another detailed analysis indicated that, at both orbital positions, only the test-points of the proposed new composite beams, which are located within Australia’s mainland territory have negative EPMs. This analysis indicated also that these negative EPMs are due to adjacent channels transmitted from the offshore territories.

In order to resolve the low negative EPMs (e.g. –12.2 dB), the use of the same approach for the additional channels as for the other channels of this Administration was implemented, i.e. using several elliptical beams grouped together instead of using composite beams, as described in Annexes E and F to this document. With this alternative option, it was then possible to use the requested fast-roll antenna patterns (R123FR) for the beam covering Australia’s mainland territory.

With these new modifications, a new MSPACE run was performed to confirm that the feeder-link beams and channels preferred by Australia could be accommodated into the draft feeder-link file with no EPM more negative than –3.2 dB for the Australian beams, and without any other EPM excess.

5 Summary

The results of this study show that with some specific assumptions (i.e. replacement of composite beams by elliptical beams grouped together), it is possible to accommodate into the draft feeder-link file the feeder-link beams and channels preferred by Australia with no EPM more negative than –3.2 dB for the Australian beams, and without any other EPM excess.

Director, Radiocommunication Bureau

STUDY TO ASSESS THE IMPACT OF MOVING
QATAR NATIONAL BEAM TO THE ORBITAL POSITION 20° E

1 Introduction

The Radiocommunication Bureau received a telefax dated 16 February 2000 from the Qatar (State of) Administration requesting a study to examine the impact of moving its national beam to the orbital position 20° E.

As the request was received after the last IRG meeting, the Bureau informed this Administration that its request would be studied at the end of the "basic" downlink and feeder-link feasibility studies, together with other national preferences yet to be studied, if time and resources permit.

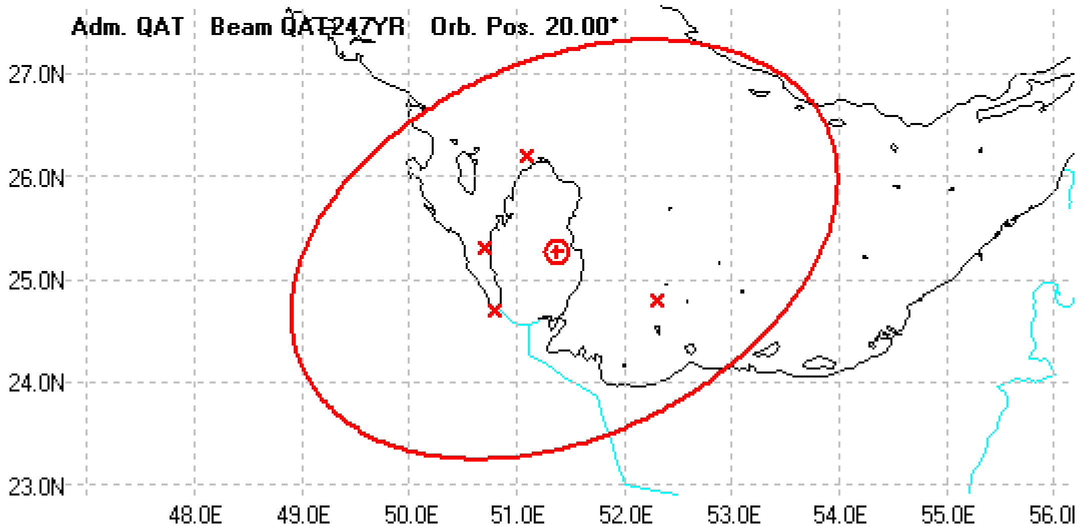
This document provides the results of this additional study conducted by the Bureau for consideration by WRC-2000.

2 Methodology

At the end of the "basic" downlink and feeder-link feasibility studies, the orbital position of the Qatar national beam is changed to 20° E. A BSS-to-BSS interference analysis is then conducted to assess the impact of the orbital position change on the downlink and feeder link.

3 Downlink results

The orbital position of the Qatar national downlink beam (QAT24700) was changed from 17° E to 20° E. The ellipse parameters were recalculated using the ITU/EBU ellipse software. The ellipse parameters and a plot of the resulting beam shape at 20° E are provided below.



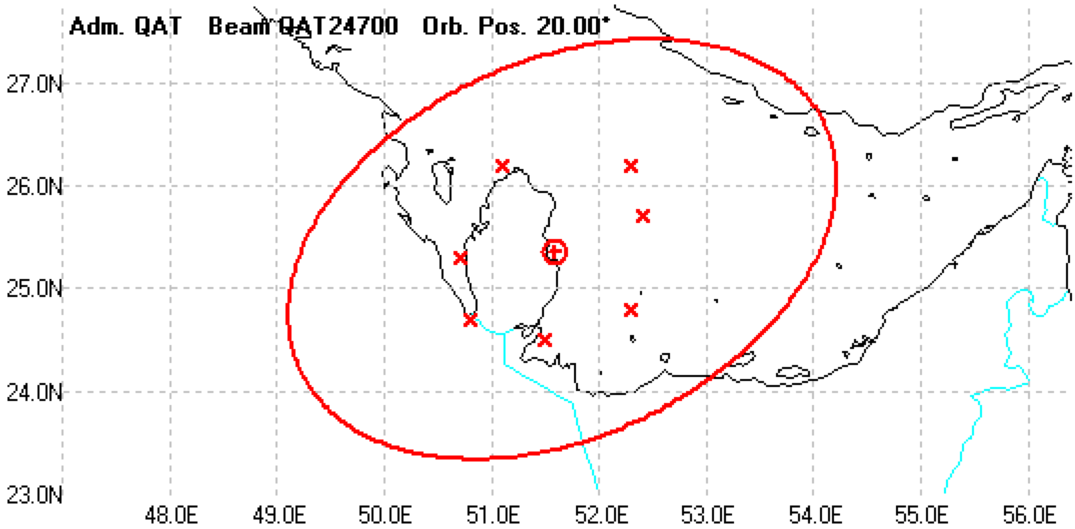
Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
48.88 dB	25.26° N	51.38° E	0.6°	0.6°	0°

A Victim and Culprit study was then performed to determine whether a block of 10 channels were available at 20° E. The result of this exercise was that the beam could not be accommodated with a block of 10 channels.

The e.i.r.p. of the beam was then increased by 1.1 dB to 57.9 dBW in order to resolve incompatibilities with neighbouring beams. With this change, the Qatar national downlink beam was able to be accommodated into the draft downlink file without any EPM excess.

4 Feeder-link results

The orbital position of the Qatar national feeder-link beam (QAT24700) was changed from 17° E to 20° E. The ellipse parameters were recalculated using the ITU/EBU ellipse software. The ellipse parameters and a plot of the resulting beam shape at 20° E are provided below.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
48.88 dB	25.34° N	51.59° E	0.6°	0.6°	0°

An MSPACE run was then performed to assess the new feeder-link interference situation resulting from the use of the 10 channels, which were found for the beam QAT24700 at 20° E in the downlink study, after a transposition of these 10 channels in the feeder-link frequency band at 17 GHz.

The results showed that the Qatar national feeder-link beam was able to be accommodated into the draft feeder-link file without any EPM excess.

5 Summary

The results of this BSS-to-BSS study show that it is possible to accommodate the Qatar national downlink and feeder-link beams at 20° E without an EPM excess in both the downlink and feeder link respectively.

STUDY TO DETERMINE THE IMPACT OF A 33 MHz
EMISSION BANDWIDTH FOR LAO P.D.R.

1 Introduction

The Administration of Lao People's Democratic Republic requested at the last IRG meeting to study a 33 MHz emission bandwidth for its national assignments (see Section 6.4.9 of the IRG Final Report: Document WRC2000/34).

The IRG agreed to investigate the proposal and asked the Bureau to perform an additional study at the end of the basic study in order to determine the impact of the request. The Bureau also received a telefax dated 21 December 1999 from the Lao P.D.R. Administration requesting the use of a 33 MHz emission bandwidth for national assignments in the replanning feasibility studies.

The Bureau has conducted a study based on this advice. This document provides the results of the study for consideration by WRC-2000.

2 Methodology

In accordance with the IRG decision on the issue, at the end of the "basic" downlink and feeder-link feasibility studies, the emission bandwidth for the Lao P.D.R. national beam (LAO28400) is changed from 27 MHz to 33 MHz. A BSS-to-BSS interference analysis is then conducted to assess the impact of the bandwidth change on the downlink and feeder link. In the absence of specific protection ratios and protection masks for this non-standard emission, those described in Appendices S30 and S30A were used.

3 Downlink results

The assigned bandwidth was changed to 33 MHz and the designation of emission changed to 33M0G7W for the Lao P.D.R. national beam (LAO28400) in the MSPACE downlink file.

An MSPACE run was then performed to assess the new interference situation resulting from the 33 MHz emission bandwidth.

The results showed that only a slight degradation in EPM occurred to neighbouring downlink beams and that there was no EPM excess.

4 Feeder-link results

The assigned bandwidth was changed to 33 MHz and the designation of emission changed to 33M0G7W for the Lao P.D.R. national beam (LAO28400) in the MSPACE feeder-link file.

An MSPACE run was then performed to assess the new interference situation resulting from the 33 MHz emission bandwidth.

The results showed that only a slight variation in EPM occurred to neighbouring feeder-link beams and that there was no EPM excess.

5 Summary

The results of this BSS-to-BSS study show that it is possible to accommodate a 33 MHz emission bandwidth for the Lao P.D.R. national beam without an EPM excess in both the downlink and feeder link.

It should be noted that due to time and resource constraints, the impact of this study in relation to principle 8 of Annex 1 to Resolution 532 (WRC-97) was not examined and that the results may be different in situations where there are a greater density of beams at a particular orbital position.

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF INCLUDING
12 CHANNELS AT 109.85° E FOR JAPAN

1 Introduction

The Administration of Japan requested at the last IRG meeting to study a proposal to include 12 channels at 109.85º E in addition to and grouped with its assignments at 110º E (see Section 6.4.9 of the IRG Final Report: Document WRC2000/34).

The IRG agreed to investigate the proposal and asked the Bureau to perform an additional study at the end of the basic study in order to determine the impact of the request.

The Bureau has conducted a study based on this advice. This document provides the results of the study for consideration by WRC-2000.

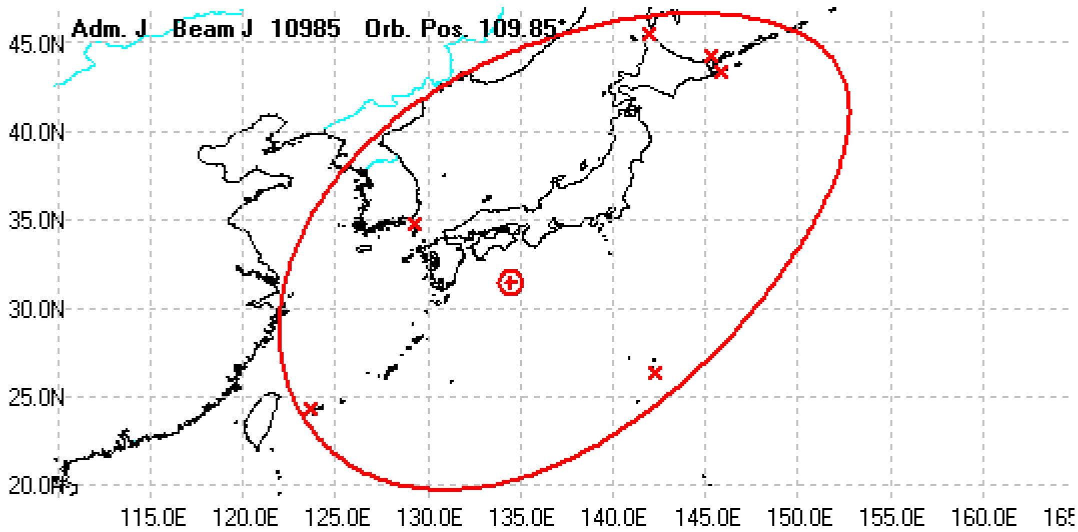
2 Methodology

In accordance with the IRG decision on the issue, at the end of the basic downlink and feeder-link feasibility studies, a new Japanese beam with 12 channels is added at 109.85º E and grouped with the Japanese assignments at 110° E. An interference analysis is then conducted to assess the impact of the additional beam.

3 Technical assumptions

3.1 Downlink beam

The new downlink beam at 109.85° E was assumed to have the same ellipse characteristics as the existing downlink beam at 109.85° E. A plot of the beam shape and ellipse parameters at 109.85° E are provided below.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
33.80 dB	31.50° N	134.50° E	3.52°	3.30°	68.00°

In accordance with IRG decisions, the 12 channels added at 109.85º E have new protection ratios (i.e. 21 dB co-channel, 16 dB adjacent-channel), new rotational accuracy (i.e. 1°), reduced e.i.r.p. (i.e. from 58.2 dBW to 59.4 dBW), digital modulation, 34.5 MHz bandwidth and MODRES receiving earth station antenna type.

3.2 Feeder-link beam

The new feeder-link beam at 109.85º E was assumed to have the same ellipse characteristics as the existing feeder-link beam at 109.85º E, also same as the downlink beam. A plot of the beam shape and ellipse parameters at 109.85° E are provided in Section 3.1 above.

In accordance with IRG decisions, the 12 channels added at 109.85º E have new protection ratios (i.e. 27 dB co-channel, 22 dB adjacent-channel), new pointing accuracy (i.e. 0.1°), digital modulation, 34.5 MHz bandwidth, MODRES receiving space station antenna type and MODTES transmitting earth station antenna type.

4 Downlink results

An MSPACE run was performed to assess the new interference situation resulting from the additional Japanese downlink beam described in Section 3.1 above.

The results showed that the additional beam could be accommodated into the draft downlink file at 109.85º E with 12 channels without any EPM excess.

5 Feeder-link results

An MSPACE run was performed to assess the new interference situation resulting from the additional Japanese feeder-link beam described in Section 3.2 above.

The results showed that the additional beam could be accommodated into the draft feeder-link file at 109.85º E with 12 channels without any EPM excess.

6 Summary

The results of this study show that it is possible to include 12 channels at 109.85º E for Japan in addition to and grouped with its assignments at 110º E.

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF SPLITTING THE PLM/SMA AND GUM/MRA COMPOSITE BEAMS OF THE UNITED STATES

1 Introduction

The Administration of the United States of America requested at the last IRG meeting to investigate a proposal to split the composite beam between American Samoa (SMA) and Palmyra Atoll (PLM) to have two individual beams. The same request was made for the Guam (GUM) and Mariana Islands (MRA) beam (see Section 6.4.9 of the IRG Final Report: Document WRC2000/34).

The IRG agreed to investigate the proposal and asked the Bureau to perform an additional study at the end of the basic study in order to determine the impact of the request.

The Bureau has conducted a study based on this advice. This document provides the results of the study for consideration by WRC-2000.

2 Methodology

In accordance with the IRG decision on the issue, at the end of the basic downlink and feeder-link feasibility studies, the PLM/SMA downlink and feeder-link composite beams are split into individual beams, and an interference analysis is conducted. The exercise is then repeated for the GUM/MRA downlink and feeder-link composite beams.

3 Technical assumptions

3.1 PLM/SMA downlink beams

The PLM/SMA downlink composite beam consists of the PLM33700 ellipse and the SMA33500 ellipse with a minimum size spot beam (see Annex C of Attachment 2 to Document WRC2000/34). The PLM33700 ellipse is split from the SMA33500 ellipse and minimum size spot beam. The SMA33500 ellipse and minimum size spot beam remains as a composite beam. A plot of the resulting beams is provided in Annex A.

3.2 GUM/MRA downlink beams

The GUM/MRA downlink composite beam consists of the GUM33100 ellipse and the MRA33200 ellipse (see Annex C of Attachment 2 to Document WRC2000/34). The composite beam is split into two separate ellipses. A plot of the resulting ellipses is provided in Annex A.

3.3 PLM/SMA feeder-link beams

The PLM/SMA feeder-link composite beam consists of the PLM33700 and SMA33500 ellipses, which are identical and cover both PLM and SMA territories, and of the PLM33701 and SMA33501 ellipses, which are also identical and cover west part of United States mainland territory (see Annex D of Attachment 2 to Document WRC2000/34). The composite beam is split into two separate but identical composite beams, the first one consisting of PLM33700 and PLM33701 ellipses and the second one consisting of SMA33500 and SMA33501 ellipses. Plots of the resulting composite beams are provided in Annex B.

3.4 GUM/MRA feeder-link beams

The GUM/MRA feeder-link composite beam consists of the GUM33100 and MRA33200 ellipses, which are identical and cover both GUM and MRA territories, and of the GUM33101 and MRA33201 ellipses, which are also identical and cover part of Hawaii territory (see Annex D of Attachment 2 to Document WRC2000/34). The composite beam is split into two separate but identical composite beams, the first one consisting of GUM33100 and GUM33101 ellipses and the second one consisting of MRA33200 and MRA33201 ellipses. Plots of the resulting composite beams are provided in Annex B.

4 Downlink results

The PLM/SMA composite beam was removed from the “basic” feasibility study downlink file. It was replaced with the split beams described in Section 3.1 above.

A Victim and Culprit study was then performed to determine whether 12 channels could be assigned to each beam. The results showed that the split beams could be accommodated into the draft downlink file with 12 channels per beam without any EPM excess.

The GUM/MRA composite beam was then removed from the “basic” feasibility study downlink file. It was replaced with the two separate ellipses described in Section 3.2 above.

A Victim and Culprit study was then performed to determine whether 12 channels could be assigned to each beam. The results showed that the split beams could be accommodated into the draft downlink file with 12 channels per beam without any EPM excess.

5 Feeder-link results

The PLM/SMA and GUM/MRA composite beams were removed from the “basic” feasibility study 17 GHz feeder-link file. They were replaced with the four composite beams described in Sections 3.3 and 3.4 above.

An MSPACE run was then performed to assess the new interference situation of the revised 17 GHz feeder-link file.

In order to resolve the EPM excess at the orbital position 170° E, the 12 channels assigned in the basic feeder-link feasibility study to the PLM/SMA composite beam were used for the PLM composite beam, and channels 29, 31, 33, 35, 37, 39 CR grouped with channels 30, 32, 34, 36, 38, 40 CL were used for the SMA composite beam.

In order to resolve the EPM excess at the orbital position 122° E, the 12 channels assigned in the basic feeder-link feasibility study to the GUM/MRA composite beam were used for the GUM composite beam, and 12 channels of the 14 GHz frequency band were used for the MRA composite beam. It was not possible to assign all channels for both GUM and MRA composite beams at 122° E in the 17 GHz frequency band even by using a ±0.2° offset around the orbital position 122° E.

A new MSPACE run was then performed to confirm that the split composite beams could be accommodated into the draft downlink file with 12 channels per beam without any EPM excess.

6 Summary

The results of this study show that it is possible to split the downlink and feeder-link composite beams for PLM/SMA and GUM/MRA and assign 12 channels per beam without any EPM excess.

STUDY TO DETERMINE THE IMPACT OF AN ALTERNATIVE FEEDER-LINK ELLIPTICAL BEAM FOR BULGARIA

Please find attached to this document additional information to that contained in Document WRC2000/34.

Yoshio UTSUMI
Secretary-General

Attachment: Study to determine the impact of an alternative feeder-link elliptical beam for Bulgaria

ATTACHMENT

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF AN ALTERNATIVE
FEEDER-LINK ELLIPTICAL BEAM FOR BULGARIA

1 Introduction

The Administration of Bulgaria requested at the last IRG meeting to investigate the use of its Appendix S30 Plan beam (downlink) instead of its Appendix S30A Plan beam (feeder link) which was used in the basic feeder-link feasibility study (see Section 6.4.9 of the IRG Final Report (Document WRC2000/34)).

IRG-5 agreed to investigate the proposal and asked the Bureau to perform an additional study at the end of the basic study in order to determine the impact of the request (see Section 2.6.3 of Corrigendum 2 to Document WRC2000/34).

The Bureau has conducted a study based on this advice. This document provides the additional assumptions and the results of the study for consideration by WRC-2000.

2 Methodology

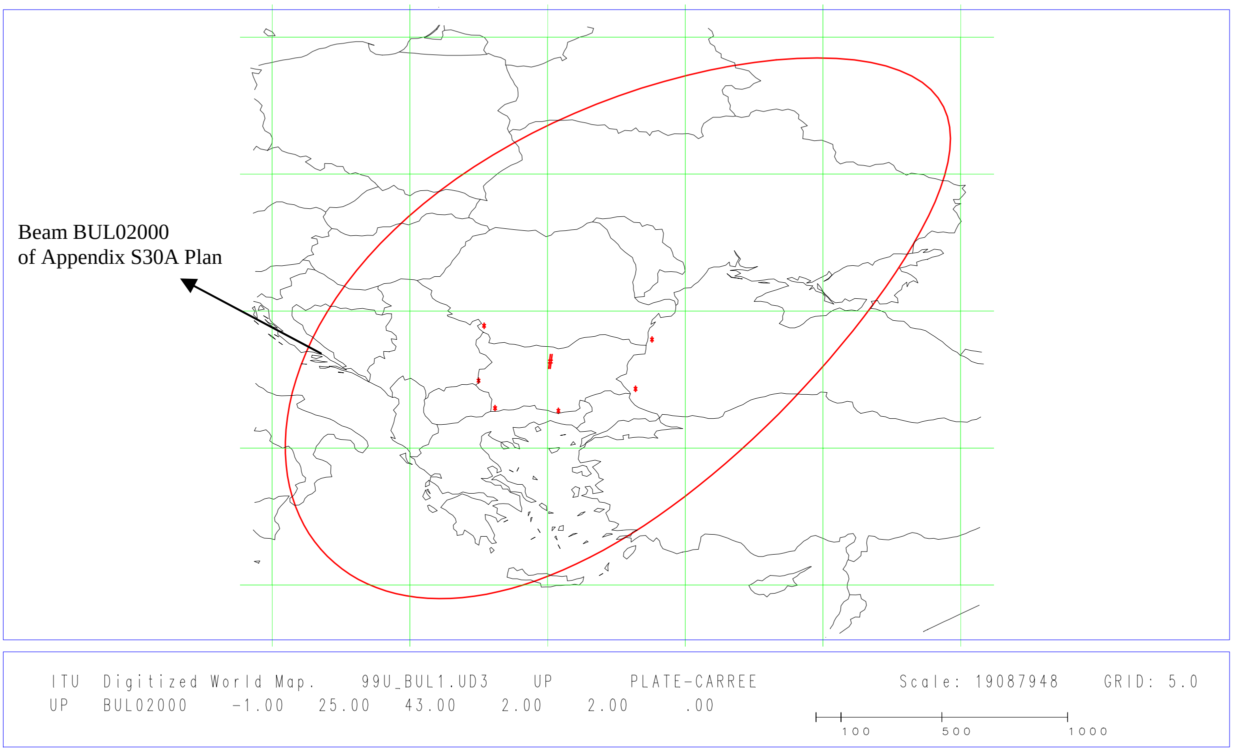
In accordance with the IRG decision on this issue, at the end of the basic feeder-link feasibility study, the feeder-link beam used for Bulgaria in this basic study at the orbital position 1º W is replaced with the Bulgarian Appendix S30 Plan beam (downlink) at the same orbital position.

The blocks of channels assigned as a result of the basic feeder-link feasibility study are maintained.

3 Technical assumptions

3.1 Characteristics of the Bulgarian Appendix S30A Plan beam (feeder link)

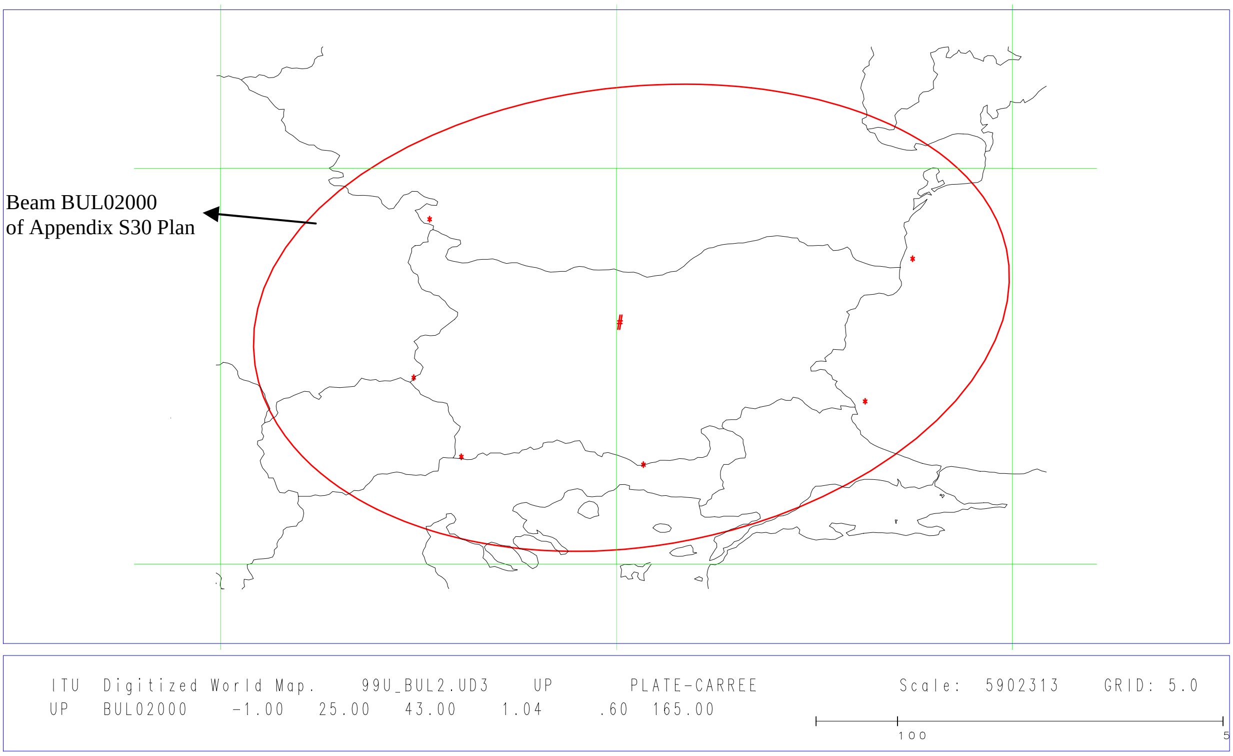
The characteristics of the feeder-link beam used for Bulgaria in the basic feeder-link feasibility study are as follows:



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
38.43 dB	43.00° N	25.00° E	2.00°	2.00°	0.00°

3.2 Characteristics of the Bulgarian Appendix S30 Plan beam (downlink)

The characteristics of the Bulgarian Appendix S30 Plan beam (downlink) to be used as the alternative feeder-link beam for Bulgaria in this additional study are as follows:



Antenna gain	**Boresight latitude**	**Boresight longitude**	**Major axis half-power beamwidth**	**Minor axis half-power beamwidth**	**Major axis orientation**
46.50 dB	43.00° N	25.00° E	1.04°	0.60°	165.00°

3.3 Test-points

It should be noted that the test-points of both beams described in Sections 3.1 and 3.2 above are identical and defined as follows:

Reference	TP1	TP2	TP3	TP4	TP5	TP6
Latitude (in ° N)	41.20	41.30	42.00	42.30	43.80	44.30
Longitude (in ° E)	25.30	23.00	28.10	22.40	28.70	22.60

4 Results of the study

An MSPACE run was performed to assess the new interference situation resulting from the replacement of the Bulgarian Appendix S30A beam, as described in Section 3.1 above, with the Bulgarian Appendix S30 beam, as described in Section 3.2 above.

The results showed that the Bulgarian Appendix S30 beam and its associated test-points, as described in Section 3.2 above, can be accommodated in the draft 17 GHz feeder-link file without any EPM excess.

5 Summary

The results of this study show that it is possible to accommodate with ten channels the proposed Appendix S30 beam (downlink) for the Administration of Bulgaria, instead of its Appendix S30A Plan beam (feeder link), without any EPM excess.

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF ALTERNATIVE FEEDER-LINK ELLIPTICAL BEAMS FOR CHINA

1 Introduction

After the last IRG meeting, the Administration of China requested the Radiocommunication Bureau to investigate the use of some of its WRC-97 feeder-link elliptical beams at the orbital positions 62º E, 92º E and 134º E (i.e. a new orbital position for the beam formerly located at 79.8º E) instead of the feeder-link composite beams used in the basic feeder-link feasibility study (see section 6.4.9 of the IRG Final Report (Document WRC2000/34)), and to assign 24 channels at each orbital position in order to provide the same amount of channels per orbital position in both downlink and feeder-link files.

This document provides the additional assumptions and the results of the study conducted by the Bureau for consideration by WRC-2000.

2 Methodology

At the end of the basic feeder-link feasibility study, the three composite beams and their associated test points used for China at the orbital positions 62º E, 92º E and 134º E are replaced with the three feeder-link elliptical beams and their associated test points requested by China at the orbital positions 62º E, 92º E and 79.8º E, respectively.

At each of these three orbital positions, the block of 12 channels assigned as a result of the basic feeder-link feasibility study is maintained. In addition, a new block of 12 channels is assessed.

3 Technical assumptions

The three feeder-link elliptical beams to be used in this study were referred to by the Administration of China in its request to IRG as being the Chinese Appendix S30A Plan beams defined by specific sets of test points.

In addition, after the last IRG meeting, this Administration requested to use 24 channels for its country at each orbital position: 62º E, 92º E and 134º E. This Administration also provided further clarifications on the beam characteristics located at 134º E.

3.1 Beams at the orbital position 62º E

The following set of test points was referred to by the Administration of China in its request to IRG:

Reference	TP1	TP2	TP3	TP4	TP5
Latitude (in ° N)	48.00	43.30	22.90	40.00	32.60
Longitude (in ° E)	118.00	128.20	112.30	116.40	86.50

Four Chinese Appendix S30A Plan beams at that orbital position are using this set of test points: CHN15400, CHN15500, CHN15600 and CHN15700.

All beams have the same beam characteristics:

Antenna gain	**Boresight latitude**	**Boresight longitude**	**Major axis half-power beamwidth**	**Minor axis half-power beamwidth**	**Major axis orientation**
32.90 dB	35.50° N	101.90° E	5.10°	2.80°	143.00°

After the last IRG meeting, this Administration indicated that beams CHN15400 and CHN15500 should be used each with a block of 12 different channels, in place of the composite beam CHNA_100, which was used in the basic feeder-link feasibility study.

As a first attempt for the purpose of this study, channels 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23 CL were assigned to beam CHN15400 and channels 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24 CR were assigned to beam CHN15500.

3.2 Beams at the orbital position 92º E

The following set of test points was referred to by the Administration of China in its request to IRG:

Reference	**TP1**	**TP2**	**TP3**	**TP4**
Latitude (in ° N)	40.00	45.40	23.10	33.40
Longitude (in ° E)	116.40	124.30	117.00	93.20

Three Chinese Appendix S30A Plan beams at that orbital position are using this set of test points: CHN16000, CHN16100 and CHN16200.

All beams have the same beam characteristics:

Antenna gain	**Boresight latitude**	**Boresight longitude**	**Major axis half-power beamwidth**	**Minor axis half-power beamwidth**	**Major axis orientation**
31.44 dB	33.70° N	108.10° E	5.00°	4.00°	148.00°

After the last IRG meeting, this Administration indicated that beams CHN16000 and CHN16100 should be used each with a block of 12 different channels, in place of the composite beam CHNC_100, which was used in the basic feeder-link feasibility study.

As a first attempt for the purpose of this study, channels 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23 CL were assigned to beam CHN16000 and channels 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24 CR were assigned to beam CHN16100.

3.3 For the beam to be located at the orbital position 134º E

The following set of test points was referred to by the Administration of China in its request to IRG:

Reference	**TP1**	**TP2**	**TP3**	**TP4**
Latitude (in ° N)	40.00	36.40	30.80	31.30
Longitude (in ° E)	116.40	102.00	104.00	121.30

Two Chinese Appendix S30A Plan beams at the orbital position 79.8º E are using this set of test points: CHN15800 and CHN15900.

Both beams have the same beam characteristics at the orbital position 79.8º E:

Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
31.78 dB	32.50° N	106.00° E	5.00°	3.70°	150.00°

After the last IRG meeting, this Administration indicated that beams CHN15800 and CHN15900 should be used each with a block of 12 different channels, in place of the composite beam CHNB_100, which was used in the basic feeder-link feasibility study.

In addition, this Administration requested to use for both beams the following characteristics:

Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
31.39 dB	34.27° N	113.21° E	6.40°	3.16°	10.74°

Annex A to this document contains a plot of revised beams CHN15800 and CHN15900.

As a first attempt for the purpose of this study, channels 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23 CR were assigned to revised beam CHN15800 and channels 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24 CL were assigned to revised beam CHN15900.

3.4 Feeder-link coverage of Chinese national territory

Annex B to this document contains a plot of the feeder-link coverage provided by all the Chinese feeder-link beams which were assumed in this feeder-link feasibility study.

4 Results of the study

An MSPACE run was performed to assess the new interference situation resulting from the replacement of the three composite beams with the corresponding elliptical beams, as described in section 3 above.

The results showed negative Equivalent Protection Margins (EPM) for the following beams:

- CHN15400 (–0.5 dB EPM) and CHN15500 (–0.5 dB EPM) at the orbital position 62º E;
- CHN16000 (–1.6 dB EPM) and CHN16100 (–8.1 dB EPM) at the orbital position 92º E;
- CHN15800 (–1.8 dB EPM) and CHN15900 (–2.4 dB EPM) at the orbital position 134º E.

In order to improve the interference situation at the orbital position 92º E, the polarization of the beams CHN16000 and CHN16100 was reversed. A new MSPACE run resulted in the following new situation at 92º E: CHN16000 (–6.3 dB EPM) and CHN16100 (–1.8 dB EPM).

A detailed analysis of the situation at 92º E indicated that both beams CHN16000 and CHN16100 created an excess of interference to each other and that the beam MLA__100 at 91.5º E (i.e. subsidiary beams MLA22700 and MLA22800) also created an excess of interference to beam CHN16000.

In order to overcome this situation at 92º E, two options would be possible:

– Option 1: assigned channels 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23 CL to beam CHN16000, and channels 29, 31, 33, 35, 37, 39 CL and 30, 32, 34, 36, 38, 40 CR to beam CHN16100, and group the adjacent channel's beam CHN16100.

– Option 2: assigned channels 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23 CR to beam CHN16000 and channels 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24 CL to beam CHN16100, move both beams CHN16000 and CHN16100 to the orbital position 92.2º E (i.e. application of a ±0.2° offset).

New MSPACE runs were performed. The following new situations at the orbital position 92º E were found:

– Option 1: both beams CHN16000 and CHN16100 at 92º E have EPM > 0 dB.

– Option 2: at 92.2º E, beams CHN16000 and CHN16100 have negative EPM: –2.2 dB and –1.5 dB, respectively. Another MSPACE analysis was performed to check that this shift of the Chinese beams to the orbital position 92.2º E has no impact on the downlink.

Alternatively, with respect to the second option at 92.2º E, as well as with respect to the orbital positions 62º E and 134º E, considering that the excesses of interference in these cases are mainly due to adjacent channel interference between two Chinese beams sharing the same orbital position, it would be possible to provide all beams with no EPM excess by grouping these Chinese beams at each orbital position.

7 Summary

The results of this study show that it is possible without any EPM excess to accommodate the feeder-link beams and channels requested by the Administration of China, instead of its three composite beams which were used in the basic feeder-link feasibility study.

STUDY TO DETERMINE THE IMPACT OF ALTERNATIVE
FEEDER-LINK ELLIPTICAL BEAMS FOR CHINA

1 Introduction

The Administration of China requested at the last IRG meeting to investigate the use of some of its WRC-97 feeder-link elliptical beams at the orbital positions 62º E, 92º E and 134º E (i.e. a new orbital position for the beam formerly located at 79.8° E) instead of the feeder-link composite beams used in the basic feeder-link feasibility study (see Section 6.4.9 of the IRG Final Report (Document WRC2000/34)).

IRG-5 agreed to investigate the proposal and asked the Bureau to perform an additional study at the end of the basic study in order to determine the impact of the request (see Section 2.10.2.2 of Corrigendum 2 to Document WRC2000/34).

The Bureau has conducted a study based on this advice. This document provides the additional assumptions and the results of the study for consideration by WRC-2000.

2 Methodology

In accordance with the IRG decision on this issue, at the end of the basic feeder-link feasibility study, the three composite beams and their associated test-points used for China at the orbital positions 62º E, 92º E and 134º E are replaced with three feeder-link elliptical beams and their associated test-points used for China in the Appendix S30A Plan at the orbital positions 62º E, 92º E and 79.8º E respectively.

The blocks of channels assigned as a result of the basic feeder-link feasibility study are maintained.

3 Technical assumptions

The three feeder-link elliptical beams to be used in this study were referred to by the Administration of China in its request to IRG as being the Chinese Appendix S30A Plan beams defined by specific sets of test-points, as indicated in the following sections.

3.1 For the beam at the orbital position 62º E

The following set of test-points was referred to by China:

Reference	TP1	TP2	TP3	TP4	TP5
Latitude (in ° N)	48.00	43.30	22.90	40.00	32.60
Longitude (in ° E)	118.00	128.20	112.30	116.40	86.50

Four Chinese Appendix S30A Plan beams at that orbital position are using this set of test-points: CHN15400, CHN15500, CHN15600 and CHN15700.

All beams have the same beam characteristics:

Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
32.90 dB	35.50° N	101.90° E	5.10°	2.80°	143.00°

Beam CHN15400 was used for the purpose of this study in place of the composite beam CHNA_100, which was used in the basic feeder-link feasibility study.

3.2 For the beam at the orbital position 92º E

The following set of test-points was referred to by China:

Reference	TP1	TP2	TP3	TP4
Latitude (in ° N)	40.00	45.40	23.10	33.40
Longitude (in ° E)	116.40	124.30	117.00	93.20

Three Chinese Appendix S30A Plan beams at that orbital position are using this set of test-points: CHN16000, CHN16100 and CHN16200.

All beams have the same beam characteristics:

Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
31.44 dB	33.70° N	108.10° E	5.00°	4.00°	148.00°

Beam CHN16000 was used for the purpose of this study in place of the composite beam CHNC_100, which was used in the basic feeder-link feasibility study.

3.3 For the beam to be located at the orbital position 134º E

The following set of test-points was referred to by China:

Reference	TP1	TP2	TP3	TP4
Latitude (in ° N)	40.00	36.40	30.80	31.30
Longitude (in ° E)	116.40	102.00	104.00	121.30

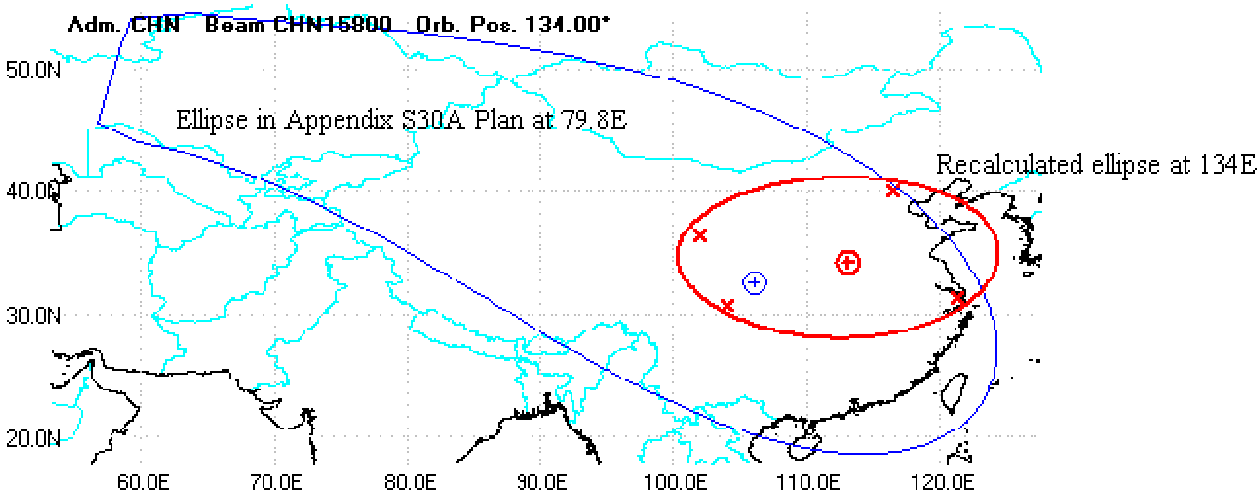
Two Chinese Appendix S30A Plan beams at the orbital position 79.8º E are using this set of test-points: CHN15800 and CHN15900.

Both beams have the same beam characteristics at the orbital position 79.8º E:

Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
31.78 dB	32.50° N	106.00° E	5.00°	3.70°	150.00°

Beam CHN15800 was assumed for the purpose of this study.

In accordance with the IRG decision on the change of orbital position (see Section 6.3.5 of Document WRC2000/34 and Section 2.6 of its Attachment 2), the ellipse parameters of beam CHN15800 were recalculated at its new orbital position 134.0º E.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
37.36 dB	34.19° N	113.08° E	3.13°	1.63°	10.97°

Beam CHN15800 with its new characteristics at the orbital position 134.0º E was thus used for the purpose of this study in place of the composite beam CHNB_100, which was used in the basic feeder-link feasibility study.

3.4 Feeder-link coverage of Chinese national territory

Annex A to this document contains a plot of the feeder-link coverage provided by all the Chinese feeder-link beams which were assumed in this feeder-link feasibility study.

4 Results of the study

An MSPACE run was performed to assess the new interference situation resulting from the replacement of the three composite beams with the corresponding three large elliptical beams, as described in Sections 3 and 4 above.

The results showed that, in the case of China, its three composite beams can be replaced with its three large elliptical beams in the draft 17 GHz feeder-link file without any EPM excess.

5 Summary

The results of this study show that it is possible to accommodate the proposed large feeder-link beams for the Administration of China, instead of its three composite beams, with twelve channels each without any EPM excess.

ANNEX A

Chinese feeder-link beams assumed in the feeder-link feasibility study at orbital positions: 62° E, 92° E, 122.2° E and 134° E

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF A MULTINATIONAL BEAM FOR JORDAN, LEBANON AND SYRIA

1 Introduction

The Administrations of Lebanon and the Syrian Arab Republic requested IRG-5 to investigate the inclusion of the multinational beam SYR33900 covering their territories with ten channels per country in the replanning feasibility studies replacing their national beams, with possible extension to two additional neighbouring countries if so requested by them. Those Administrations also requested that their current national beams continue to be taken into account in the ongoing feasibility studies until the final clarification of the acceptability of inclusion of the proposed multinational beam.

IRG-5 agreed to investigate the proposal and asked the Bureau to perform a study to determine the impact of the request. The Administration of Jordan (Hashemite Kingdom of) advised the Bureau of its intention to also be included in the proposal. The Bureau has conducted a study to determine the impact of a multinational beam for Jordan, Lebanon and Syria based on this advice. This document provides the results of the study for consideration by WRC-2000.

2 Methodology

The study was performed in accordance with these guidelines given in Section 6.4.8 of the IRG Final Report (Document WRC2000/34) and in Section 2.11.7 of Corrigendum 2 to Document WRC2000/34.

That is, three identical multinational beams covering the territory of Jordan, Lebanon and Syria, each with ten channels are to be substituted to the national beams of Jordan, Lebanon and Syria and the e.i.r.p. of this multinational beam be reduced if necessary to a level which does not create more interference than the previous situation (i.e. the three national beams with ten channels). The result of this modification i.e. the level of e.i.r.p. and the EPM associated to this new multinational beam is proposed to the Administrations of Jordan, Lebanon and Syria for agreement or otherwise.

3 Orbital position

It was requested to conduct the study with a preferred orbital position between 10.5° E and 11.5° E. If that orbital position was found to be incompatible, then any other orbital position that leads to a successful result would be accepted. As a result of the "basic" feasibility studies, it was possible to accommodate all three national beams (JOR22400, LBN27900 and SYR22900) at 11° E. Thus, the orbital position 11° W was used as a starting point in this study.

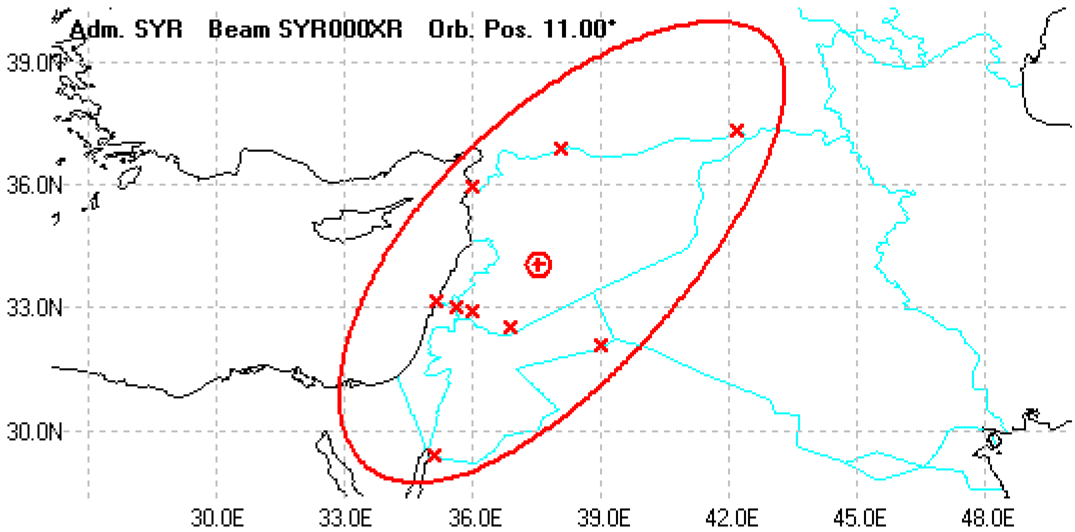
4 Technical assumptions

4.1 Downlink

The test points assumed in the study for a single-ellipse multinational beam for the downlink provided and agreed by the Administrations of Jordan, Lebanon and Syria were as follows:

Ref.	TP1	TP2	TP3	TP4	TP5	TP6	TP7	TP8	TP9
Latitude	37.30	33.00	35.93	36.86	32.50	32.90	29.40	33.14	32.10
Longitude	42.19	35.60	35.98	38.08	36.90	36.00	35.10	35.15	39.00

The downlink ellipse parameters were calculated using the ITU/EBU ellipse software. The ellipse parameters and a plot of the resulting beam shape at 11° W are provided below.



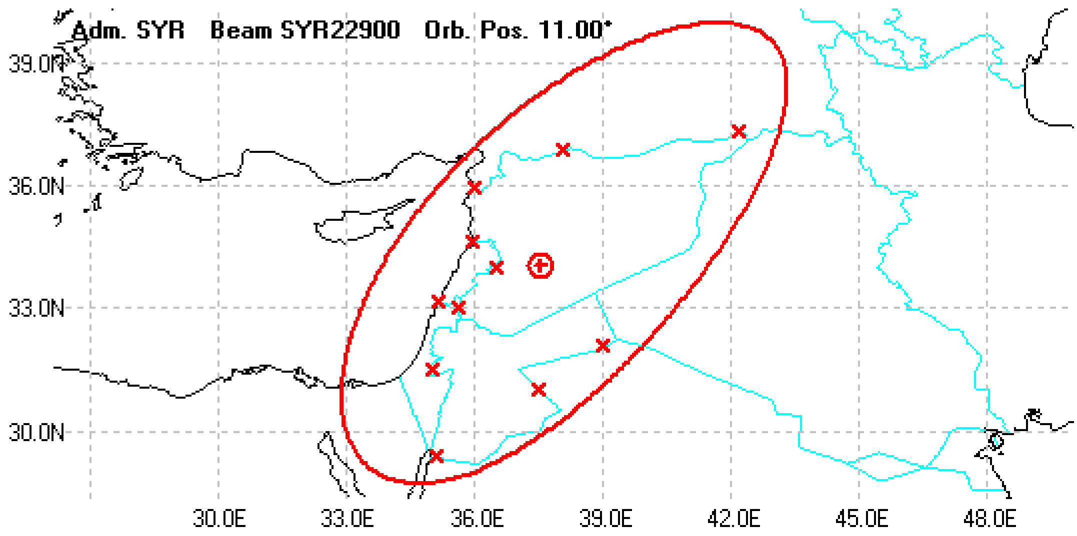
Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
43.19 dB	34.02° N	37.55° E	1.47°	0.91°	73.16°

4.2 Feeder link

The test points assumed in the study for a single-ellipse multinational beam for the feeder link provided and agreed by the Administrations of Jordan, Lebanon and Syria were as follows:

Ref.	TP1	TP2	TP3	TP4	TP5	TP6	TP7	TP8	TP9	TP10	TP11
Latitude	34.00	34.65	37.30	31.00	31.50	33.00	35.93	36.86	29.40	33.14	32.10
Longitude	36.50	35.97	42.19	37.50	35.00	35.60	35.98	38.08	35.10	35.15	39.00

The feeder-link ellipse parameters were calculated using the ITU/EBU ellipse software. The ellipse parameters and a plot of the resulting beam shape at 11° W are provided below.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
43.19 dB	34.02° N	37.55° E	1.47°	0.91°	73.16°

5 Downlink results

The national beams of Jordan, Lebanon and Syria (JOR22400, LBN27900 and SYR22900) were removed from the "basic" feasibility study downlink file. They were each replaced with the downlink multinational beam described in Section 4.1 above. The multinational beam SYR33900 with 1 channel at the orbital position 43.8° E was also removed from the "basic" feasibility study downlink file.

A Victim and Culprit study was then performed. The result of this exercise was that all three beams could not be accommodated. There were incompatibilities with other "planned" assignments, and, in particular, with an "existing" system at an adjacent orbital position.

The improved fast roll-off space station transmit antenna as described in Recommendation ITU-R BO.1445 was then applied to the three multinational beams. The result of this exercise was that all three beams could still not be accommodated. The e.i.r.p. of each beam was then adjusted to 55.5 dBW in order to resolve remaining incompatibilities. With these changes, all three multinational beams were accommodated into the draft downlink file without any EPM excess.

6 Feeder-link results

The national beams of Jordan, Lebanon and Syria (JOR22400, LBN27900 and SYR22900) were removed from the "basic" feasibility study 17 GHz feeder-link file. They were each replaced with the multinational beam described in Section 4.2 above. In order to be consistent with the downlink study described in Section 5 above, the multinational beam SYR33900 with 1 channel at the orbital position 43.8° E would have also to be removed from the "basic" feasibility study 14 GHz feeder-link file.

An MSPACE run was then performed to assess the new interference situation of the so revised 17 GHz feeder-link file. The results showed incompatibilities at the orbital position 11° E.

In order to resolve the EPM excess of the beam LBN27900 at 11° E, the feeder-link e.i.r.p. of the beam JOR22400 was reduced by 1 dB to bring it to the same level as the other beams sharing that orbital position (i.e. 84 dBW). The use of identical multinational feeder-link beams for the JOR22400, LBN27900 and SYR22900 beams can also justify this e.i.r.p. adjustment.

However, although this e.i.r.p. reduction resolved the EPM excess found on beam LBN27900, it resulted in a new EPM excess on beam JOR22400.

After several unsuccessful assessments of different combinations of blocks of channels, it was found necessary to apply a ±0.2° offset around the orbital position 11° E.

The beams JOR22400, LBN27900 and SYR22900 were thus shifted to the orbital position 10.8° E and beam RRW31000 was shifted to the orbital position 11.2° E.

A new MSPACE run was then performed to confirm that the multinational feeder-link beams for Jordan, Lebanon and Syria were accommodated into the draft 17 GHz feeder-link file without any EPM excess.

Another MSPACE run was then performed to check the impact of these ±0.2° orbital position adjustments on the downlink study. The results showed that there was still no EPM excess.

7 Summary

The results of this study show that it is possible to accommodate the proposed multinational downlink and feeder-link beams for the Administrations of Jordan, Lebanon and Syria with ten channels per country without any EPM excess. However, this is only possible with an e.i.r.p. of 55.5 dBW for each of the downlink multinational beams of these three countries, and with the application of a ±0.2° offset to all the beams at the nominal orbital position 11° E, together with the use of a feeder-link e.i.r.p. of 84 dBW for the feeder-link beam JOR22400.

Director, Radiocommunication Bureau

STUDY TO DETERMINE THE IMPACT OF A MULTINATIONAL BEAM FOR CROATIA, CZECH REPUBLIC, HUNGARY AND SLOVAK REPUBLIC

1 Introduction

The Administrations of Croatia, Czech Republic, Hungary and Slovak Republic requested IRG-5 to investigate the inclusion of a new multinational beam covering their territories with ten channels per country in the replanning feasibility studies replacing their national beams. Those four Administrations also requested that their current national beams (HRV14800, HNG10600, SVK14400, CZE14400) continue to be taken into account in the ongoing planning study until the final clarification of the acceptability of inclusion of the proposed multinational beam.

IRG-5 agreed to investigate the proposal and asked the Bureau to perform a study to determine the impact of the proposal on the replanning process. The Bureau has conducted a study based on this advice. This document provides the results of the study for consideration by WRC-2000.

2 Methodology

In Section 6.4.7 of the IRG Final Report (Document WRC2000/34), the following guidelines were given:

"2) At the end of this exercise, four identical multinational beams covering the territory of Croatia, Hungary, Slovak Republic and Czech Republic, each with ten channels will be substituted to the national beams of Croatia, Hungary, Slovak Republic and Czech Republic and the e.i.r.p. of this multinational beam be reduced if necessary to a level which does not create more interference than the previous situation (i.e. the four national beams with ten channels). The result of this modification i.e. the level of e.i.r.p. and the EPM associated to this new multinational beam is proposed to the Administrations of Croatia, Hungary, Slovak Republic and Czech Republic for agreement or otherwise."

(See also Section 2.11.6 of Corrigendum 2 to Document WRC2000/34).

The study was performed in accordance with these guidelines.

3 Orbital position

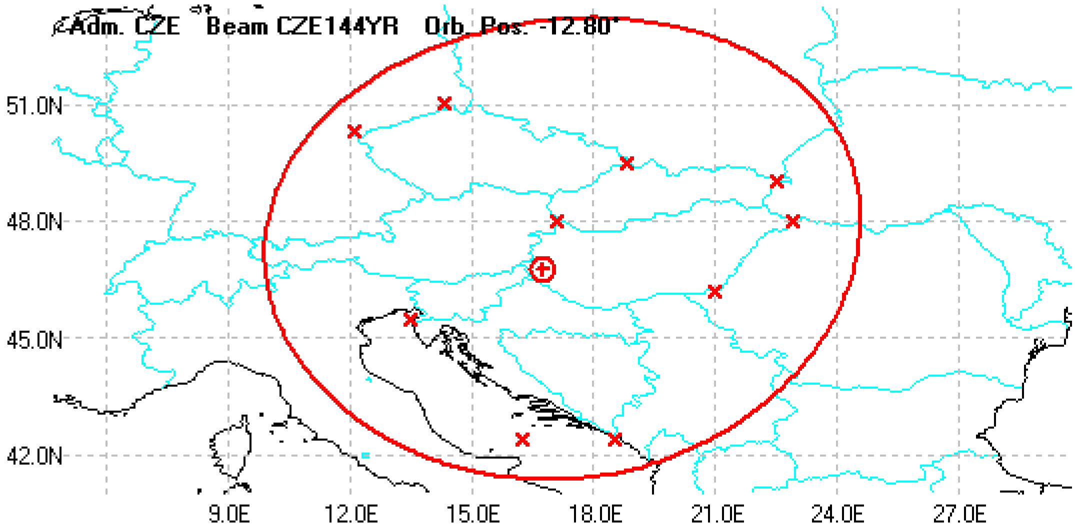
The requested preferred orbital position for the study was 34° E. If that position was found to be not possible, then an appropriate position within the range 13° W to 34° E should be found. As a result of the "basic" feasibility studies, it was not possible to accommodate the four national beams (HRV14800, HNG10600, SVK14400, CZE14400) at 34° E. However, a common orbital position was found at 12.8° W. Thus, the orbital position 12.8° W was used in this study in accordance with IRG guidelines.

4 Technical assumptions

The test points assumed in the study for a single-ellipse multinational beam for both the downlink and feeder-link were as per telefaxes from the Administrations of Croatia, Czech Republic, Hungary and Slovak Republic as follows:

Ref.	TP1	TP2	TP3	TP4	TP5	TP6	TP7	TP8	TP9	TP10
Latitude	50.32	51.05	49.52	49.05	48.00	46.20	42.39	42.39	45.50	48.03
Longitude	12.11	14.32	18.84	22.50	22.90	21.00	18.54	16.26	13.51	17.10

The downlink and feeder-link ellipse parameters were calculated using the ITU/EBU ellipse software. The ellipse parameters and a plot of the resulting beam shape at 12.8° W are provided below.



Antenna gain	Boresight latitude	Boresight longitude	Major axis half-power beamwidth	Minor axis half-power beamwidth	Major axis orientation
42.64 dB	46.78° N	16.77° E	1.71°	0.89°	149.15°

5 Downlink results

The Croatia, Czech Republic, Hungary and Slovak Republic national beams (HRV14800, CZE14400, HNG10600, SVK14400) were removed from the “basic” feasibility study downlink file. They were each replaced with the multinational beam described in Section 4 above.

A Victim and Culprit study was then performed. The result of this exercise was that all four beams could not be accommodated. There were still incompatibilities with other “planned” assignments, in particular with the beam MLT14700.

As a second option, the four single-ellipse multinational beams were replaced with four identical composite beams each consisting of four ellipses using the test points provided by the four Administrations. Another Victim and Culprit study was performed. The result of this exercise was that all four beams could not be accommodated. There were still incompatibilities with other “planned” assignments, in particular with the beam MLT14700.

The improved fast roll-off space station transmit antenna as described in Recommendation ITU-R BO.1445 was then applied to the four single-ellipse multinational beams. The result of this exercise was that all four beams could still not be accommodated. The e.i.r.p. of each beam was also adjusted but could not resolve incompatibilities.

The only other possible solution was to change the parameters of the beam MLT14700. A solution was found by moving the beam MLT14700 to 1° W (using Step 4 methodology), reducing the e.i.r.p. of the D 087 multinational beam from 60.5 dBW to 59.8 dBW, and by applying the improved fast roll-off space station transmit antenna with e.i.r.p. adjustments to the four multinational beams under consideration. With these changes, all four single-ellipse multinational beams were accommodated into the draft downlink file without any EPM excess.

6 Feeder-link results

The Croatia, Czech Republic, Hungary and Slovak Republic national beams (HRV14800, HNG10600, SVK14400, CZE14400) were removed from the "basic" feasibility study 17 GHz feeder-link file. They were each replaced with the multinational beam described in Section 4 above. In addition, in order to be in line with the downlink study, the beam MLT14700 was moved from orbital position 13.2° W to 1° W.

An MSPACE run was then performed to assess the interference situation. The results showed incompatibilities for beams located within ±0.2° around both orbital positions 13° W and 1° W.

In order to resolve the EPM excess found on beam HNG10600 at 12.8° W, its e.i.r.p. was re-adjusted back to 84 dBW, i.e. the e.i.r.p. reduction applied on that beam in the basic feasibility study (see Addendum 3 to Document WRC2000/34), was no longer appropriate.

In order to resolve the EPM excesses of interference found on beams located within ±0.2° around orbital position 1° W, a new block of channels (block D' instead of block B) was assigned to beam MLT14700. In addition, it was necessary to shift beams BOT29700, MLT14700 and ZWE13500 by 0.2° to orbital position 1.2° W, and to reduce by 0.6 dB the e.i.r.p. of beam ZWE13500 (i.e. use of 84.4 dBW instead of 85.0 dBW). As an alternative to that e.i.r.p. reduction, channel 40 of beam BIFROS22 would have to accept an EPM excess of 0.02 dB.

A new MSPACE run was then performed to confirm that all multinational beams of the four Administrations mentioned above were accommodated into the draft 17 GHz feeder-link file without any EPM excess.

Another MSPACE run was then performed to check the impact of these ±0.2° orbital position adjustments on the downlink study. The results showed that there was still no EPM excess.

7 Summary

The results of this study show that it is possible to accommodate the proposed multinational beam for the Administrations of Croatia, Czech Republic, Hungary and Slovak Republic with ten channels per country without any EPM excess. However, this is only possible with the beam MLT14700 moved from 13.2° W to 1.2° W, the beams BOT29700 and ZWE13500 shifted by 0.2° to 1.2° W, and the e.i.r.p. of the D 087 multinational beam reduced to 59.8 dBW.

PLENARY MEETING

Note by the Secretary-General

REVIEW AND POSSIBLE REVISION OF THE 1997 BROADCASTING-SATELLITE SERVICE PLANS FOR REGIONS 1 AND 3

COMPATIBILITY ANALYSES WITH OTHER SERVICES AND THE REGION 2 PLAN

Please find attached to this document complementary/updated information to that contained in Section 6.5 and Attachment 5 to Document WRC2000/34.

Yoshio UTSUMI
Secretary-General

Attachment: Compatibility analyses with other services and the Region 2 Plan

ATTACHMENT

Director, Radiocommunication Bureau

COMPATIBILITY ANALYSES WITH OTHER SERVICES
AND THE REGION 2 PLAN

1 Introduction

In addition to the Regions 1 and 3 BSS-BSS compatibility analysis, planning principles 7 and 8 of Annex 1 to Resolution 532 (WRC-97) require a compatibility examination to ensure protection of the Region 2 Plan and not to require more protection from assignments in Region 2. Moreover, it is further necessary to ensure the compatibility between the draft Regions 1 and 3 Plan and those services sharing the same frequency bands (FSS and terrestrial services) in all three Regions.

This document provides the result of compatibility analyses performed by BR for proposed BSS assignments for Regions 1 and 3 except assignments which are considered as “existing” systems as per Resolution 532 existing assignments.

The analyses comprise both:

- compatibility studies from proposed Regions 1 and 3 BSS Plan assignments into other services or into Region 2 BSS; and
- compatibility studies into the proposed Regions 1 and 3 BSS Plan assignments from other services or from Region 2 BSS.

Both feeder-link and downlink conditions have been investigated.

The input data used for the compatibility analyses was obtained from the results of the downlink and feeder-link feasibility studies contained in Addenda 2 and 3 to Document WRC2000/34 for downlink and feeder-link respectively.

The satellite systems data that were contained in the SNS database as of 25 February 2000 were used in the calculation, i.e. all networks which have been received by the Bureau before 30 April 1998 have been taken into account, as well as those networks for which the complete information has been received between 30 April 1998 and 19 August 1999. It is to be noted that those satellite networks not yet processed by the Bureau have not been taken into account in these compatibility analyses.

Compatibility analysis between the draft Regions 1 and 3 BSS Plan and the Region 2 BSS Plan has been based on the present Region 2 BSS Plan assignments and the modifications of the Region 2 Plan already processed and published by the Bureau (up to 25 February 2000).

Two important points should be taken into account in interpreting the results contained in this document.

1) The results of the compatibility analyses will change if the list of satellite systems contained in the SNS database is modified, i.e. new satellite systems/assignments are included in the list or cancelled as a result of application of relevant provisions of Article S11 (FSS and non-planned BSS in Regions 2 and 3) or Articles 4/5 of Appendices S30/S30A (BSS of Region 2).

2) The tables of identified administrations show cases where there is a possibility of harmful interference if various additional circumstances apply. Such tables do not imply that harmful interference will actually occur, they merely provide a warning flag that further investigation of the necessity of actual coordination may be required.

2 Criteria and methodology for assessment of compatibility with the Region 2 Plan and other services

Sharing criteria and methodologies for the compatibility analyses have been developed by IRG based on those in Appendices S30 or S30A and their associated Rules of Procedure. The criteria that have been applied are summarized in Table 1 below. The details of the calculation basis for each compatibility condition are explained in Attachment 3 to Document WRC2000/34 and its Corrigendum 3.

TABLE 1

Criteria for assessing compatibility between Plans and services

Interference source: Feeder-link assignments in the draft Regions 1 and 3 BSS Plan

Protected assignments/service	RR provision	Criteria/methodology
Region 2 Plan assignments	4.2.1.4 of Article 4 of APS30A	APS8 (section 5 of Annex 1 of APS30A)
Receiving station of the terrestrial service	4.2.1.3 of Article 4 of APS30A	APS7 (section 2 of Annex 1 of APS30A)/list of existing stations
Receiving FSS specific earth station	4.2.1.2 of Article 4 of APS30A	Annex 4 of AP30A (section 1 of Annex 1 of AP30A)/list of existing stations

Interference source: Downlink assignments in the draft Regions 1 and 3 BSS Plan

Protected assignments/service	RR provision	Criteria/methodology
Region 2 Plan assignments	4.3.1.2 of Article 4 of APS30	pfd (section 3 of Annex 1 of APS30)
Receiving station of the terrestrial service	4.3.1.4 of Article 4 of APS30	pfd (sections 4, 8 of Annex 1 of APS30)
FSS space station associated with a receiving FSS earth station that may suffer interference	4.3.1.5 of Article 4 of APS30	pfd (section 6 of Annex 1 of APS30)

Protected assignments: Feeder-link assignments in the draft Regions 1 and 3 BSS Plan

Interference source	RR provision	Criteria/methodology
Region 2 Plan assignments	4.2.3.4 of Article 4 of APS30A	APS8 (section 5 of Annex 1 of APS30A)
Space station of FSS (Regions 1 and 3)	7.1 of Article 7 of APS30A	Annex 4 of APS30A with modification of satellite system noise temperature 600 K and ΔTs/Ts 6%
Space station of unplanned BSS (Region 2)	7.1 of Article 7 of APS30A	Annex 4 of APS30A with modification of satellite system noise temperature 600 K and ΔTs/Ts 6%

Protected assignments: Downlink assignments for in the draft Regions 1 and 3 BSS Plan

Interference source	RR provision	Criteria/methodology
Region 2 Plan assignments	4.3.3.2 of Article 4 of APS30	pfd (section 3 of Annex 1 of APS30)
Terrestrial service	6.1.1 of Article 6 of APS30	Frequency overlap and Annex 3 of APS30
Space station of FSS	7.2.1 of Article 7 of APS30	Frequency overlap and Annex 4 of APS30

3 Compatibility analysis results

A summary of compatibility analysis results obtained are included in Table 2 below. Further details of the results are contained in the Annex to this document.

TABLE 2

Compatibility analyses

The results below apply to the assignments in “the draft Regions 1 and 3 BSS Plan” except assignments which are considered as “existing” as per Resolution 532.

1 Compatibility with respect to the draft Regions 1 and 3 Plan assignments causing interference

1.1 Feeder link

Protected assignments/service	Number of administrations receiving interference from the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan causing interference to the subject assignments/service
Region 2 Plan assignments	2	3

Protected assignments/service	Number of existing stations sharing the same frequency bands with the draft Regions 1 and 3 Plan assignments
Terrestrial service (all three Regions)	1 142 (14 GHz)* 489 (17 GHz)*
Earth station of FSS (all three Regions)	34
* In addition, there are transmitting terrestrial stations which do not have corresponding receiving terrestrial stations recorded in MIFR (e.g. Typical stations).	

1.2 Downlink

Protected assignments/service	Number of administrations/organizations receiving interference from the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan causing interference to the subject assignments/service
Region 2 Plan assignments	3	2
Terrestrial service (all three Regions)	93	59
FSS space station associated with a receiving FSS earth station that may suffer interference (Region 2 11.7-12.2 GHz) (Region 3 12.2-12.5 GHz)	25	102

2 Compatibility with respect to the draft Regions 1 and 3 Plan assignments receiving interference

2.1 Feeder link

Assignment/service causing interference to draft Regions 1 and 3 Plan assignments	Number of administrations/organizations causing interference to the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan receiving interference from the subject assignments/service
Region 2 Plan assignments	3	4
Space station of FSS (all three Regions)	13	111
Space station of unplanned BSS (Region 2)	0	0

2.2 Downlink

Assignment/service causing interference to draft Regions 1 and 3 Plan assignments	Number of administrations/organizations causing interference to the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan receiving interference from the subject assignments/service
Region 2 Plan assignments	0	0
Terrestrial service (all three Regions)	0	0
Space station of FSS (Region 2 11.7-12.2 GHz) (Region 3 12.2-12.5 GHz)	18	128

ANNEX

Detailed result of the compatibility analyses with other services and the Region 2 Plan

1 Feeder link causing interference

1.1 Compatibility analysis for BSS feeder link into FSS (space-to-Earth) (paragraph 4.2.1.2 of Article 4 of Appendix S30A)

Country	The name of earth station using assignments in the frequency band 17.7-18.1 GHz	Latitude	Longitude	Associated space station name	Orbital position

SYR	2	0
TUR	0	31
YEM	2	0
USA	0	10

The BSS feeder link beams (* indicates subsidiary beams of a composite beam) using the 14 GHz band are:

AFS02100, ARS34000, CME30000, CPV30100, ETH09200, MLI32700*, MLI32800*, MOZ30700, MRC20900, NIG11900, NMB02500, PAK12700, PNG13100, SDN23000*, SDN23200*, SYR33900, TGO22600, TUN27200, WAK33400*, WAK33401*, YEM26600*,YEM26700*, YYY00000.

The BSS feeder link beams using the 17 GHz band are listed in paragraph 1.3 below.

1.3 Compatibility analysis for BSS feeder link into Region 2 BSS Plan (paragraph 4.2.1.4 of Article 4 of Appendix S30A)

NOTE 1 - * indicates subsidiary beams of a composite beam.

NOTE 2 - This compatibility analysis applies to 17 GHz band only.

2.2 Compatibility analysis for BSS downlink into terrestrial service (paragraph 4.3.1.4 of Article 4 of Appendix S30)

NOTE 1 - The number appearing after affected administrations indicates the excess in pfd (dB).

NOTE 2 - Comparison between a corresponding former assignment (on the same channel) of the WRC-97 Plan and a new proposed assignment was implemented. The pending coordination from the WRC-97 Plan was incorporated in the list of the identification of affected/affecting administration.

NOTE 3 - A check was made on whether or not the administrations identified have frequency assignments in the broadcasting-satellite service for the channel concerned.

NOTE 4 - * indicates subsidiary beams of a composite beam.

2.3 Compatibility analysis for BSS downlink into FSS (space-to-Earth) (paragraph 4.3.1.5 of Article 4 of Appendix S30)

NOTE 1 - Comparison between a corresponding former assignment (on the same channel) of the WRC-97 Plan and a new proposed assignment was implemented. The pending coordination from the WRC-97 Plan was incorporated in the list of the identification.

NOTE 2 - * indicates subsidiary beams of a composite beam.

3.3 Compatibility analysis for Region 2 unplanned BSS into BSS feeder link (paragraph 7.1 of Article 7 of Appendix S30A)

Due to the fact that in Region 2 the allocation to the broadcasting-satellite service in the band 17.3-17.8 GHz (downlink) shall come into effect on 1 April 2007, it is not necessary, at this time, to perform compatibility analyses with respect to the Region 2 unplanned BSS.

4 Downlink receiving interference

4.1 Compatibility analysis for Region 2 Plan into BSS downlink (paragraph 4.3.3.2 of Article 4 of Appendix S30)

PLENARY MEETING

Note by the Secretary-General

REVIEW AND POSSIBLE REVISION OF THE 1997 BROADCASTING-SATELLITE SERVICE PLANS FOR REGIONS 1 AND 3

RESULTS OF THE FEEDER-LINK FEASIBILITY STUDY

Please find attached to this document complementary/updated information to that contained in Attachment 4 to Document CMR2000/34.

Yoshio UTSUMI
Secretary-General

Attachment: Results of the feeder-link feasibility study

ATTACHMENT

Director, Radiocommunication Bureau

RESULTS OF THE FEEDER-LINK FEASIBILITY STUDY

0 Summary

A feeder-link feasibility study on the “Planning Approach” has been conducted in accordance with the methodology and the technical assumptions described in Attachments 1 and 2 of Document CMR2000/34 respectively.

The results indicate that:

- all national beams can be accommodated in the “example Plans” with 10 channels in Region 1 and 12 channels in Region 3 and no excess of interference; and
- eight of the eleven multinational beams (i.e. one “existing”[1] beams and ten “planned”[2] beams) can be accommodated with the required number of channels.

1 Introduction

For the purpose of carrying out feeder-link feasibility study associated with the downlink feasibility study, the IRG developed specific methodology and technical assumptions which are described in Attachments 1 and 2 of Document CMR2000/34 respectively, and complemented by information contained in Corrigenda 1 and 2 to Document CMR2000/34 respectively.

In accordance with Principle 3 of Annex 1 to Resolution 532 (WRC-97), thirteen “existing” systems were included in the feeder-link feasibility study, i.e. ten which were considered in the study for IRG-5 (Beam J 11100 renamed J 1110E, HISPASAT-1 (27 MHz Analogue and Digital), KOREASAT-1 (Analogue and Digital), BS-3N, Beam S 13902, SIRIUS, RST-1 (8 channels), BIFROST-2) plus three additional networks that became “existing” systems after IRG-5 (HISPASAT-1 (33 MHz Digital), BIFROST and EUTELSAT B-13E) (see also Annex A of Corrigendum 2 to Document CMR2000/34).

The results of the feeder-link feasibility study conducted by the Radiocommunication Bureau at the request of the IRG are presented in this document for consideration by WRC-2000.

2 Description of Annex 2 tables

The results of the feeder-link feasibility study of the “Planning Approach” are provided in the order of orbital position as appearing in Annex 2 of this document.

---

[1] Whenever the term “existing” is used in this document, it refers to notified assignments that are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

[2] Whenever the term “planned” is used in this document, it refers to assignments/beams other than those of "existing" systems.

- The column titled "**ADM**" contains, generally, the ITU symbol of the Administration responsible for the proposed draft new assignments considered in the feeder-link feasibility study.
- The column titled "**Beam name**" contains the beam name as per the Appendix 30A feeder-link Plans, except in few cases for "existing" systems and new beams.
- The columns titled "**WRC-97: Pol. | Feeder-link channels**" contain the Appendix S30A channels and polarization for each beam, if it existed at the time of the establishment of that Appendix. In cases where the Appendix S30A beam has been moved, the Appendix S30A orbital position is also indicated.
- The columns titled "**Action 2: Polarization and channel(s) | Affected channel(s) | Worst EPM**" (i.e. Equivalent Protection Margin) contain information related to Action 2 of the feeder-link feasibility study (section 8.3 of Attachment 1 to Document CMR2000/34), i.e. feeder-link compatibility analysis using the downlink channels defined at Step 6 of the downlink feasibility study and transposed in the 17 GHz frequency band. The information provided in these columns corresponds respectively to:
  – The polarization and channel number(s) or the block[3] assigned to each beam (the orbital position used at Action 2 is also provided in cases where a different orbital position was used at Action 3).
  – The affected channel(s) of each beam.
  – The EPM in dB of the worst test-point of the worst affected channel of each beam.
- The columns titled "**Action 3: Orbital position | Polarization and channel(s) | Affected channel(s) | Worst EPM**" contain information related to Action 3 of the feeder-link feasibility study (section 8.4 of Attachment 1 to Document CMR2000/34 and its Corrigendum 1), i.e. manual adjustment of the Action 2 situation by using opposite type of polarization and/or different channels and/or, as a last resort, ±0.2° offset around a nominal orbital position[4]. The information provided in these columns corresponds respectively to:
  – The orbital position assigned to each beam, which, in particular, indicates the implementation or not of ±0.2° offset around a nominal orbital position (orbital positions in bold type highlight a change from the WRC-97 orbital position due to either an orbital position preference request or as a result of the downlink and feeder-link feasibility studies).
  – The polarization and channel number(s) or the block[3] assigned to each beam.
  – The affected channel(s) of each beam.
  – The EPM in dB of the worst test-point of the worst affected channel of each beam.

[3] A block of channels corresponds to a set of ten or twelve contiguous channels in one or two polarizations (see, in Annex 1 to this document, the description of the feeder-link blocks used in the analysis).

[4] The use of improved fast-roll antenna patterns at the receiving space station has not been used in this study since such an improved antenna was not provided by ITU-R JWP 10-11S at its October 1999 meeting.

3 Results of the feeder-link feasibility study

3.1 Overall results

The feeder-link feasibility study results constitute two “example Plans (i.e. at 14 GHz and 17 GHz)” and are not the only solution, nor it is the optimum one.

The results indicate that among 227 beams[5] relating to 51 nominal orbital positions considered in the feeder-link feasibility study, including 28 “existing” beams[5], 118 beams[5] relating to 28 nominal orbital positions contain affected channels after the implementation of Action 1 (i.e. reuse of downlink channels after a frequency transposition at 17 GHz), and that no beam[5] contain affected channels after the implementation of Action 3 (i.e. manual adjustments of the Action 2 situation).

Consequently, 100% of the beams[5] considered in the feeder-link feasibility study can get feeder-link channels with no excess interference (i.e. EPM ≥ -0.45 dB or EPM ≥ (Reference EPM - 0.45 dB)), noting that, the three multinational beams, which were not successfully accommodated with the required number of channels at Step 6 of the downlink feasibility study, were not considered in the feeder-link feasibility study.

Details of the reference situation can be found in the form of MSPACE Input files. They are available from the ITU website at:

http://www.itu.int/brconf/irg-gte/index.html

3.2 Application of the ±0.2° orbital position offset

In accordance with IRG decision, a ±0.2° orbital position offset has been used only where it was not possible to maintain the beams at the nominal orbital position.

These results include the application of ±0.2° orbital position offset for 69 beams[5] relating to 9 nominal orbital positions (see the orbital position values provided under the “Action 3” column of the tables of Annex 2 to this document).

3.3 Use of the 14 GHz frequency band

In accordance with IRG decision, the 14 GHz frequency band has been used only where necessary, i.e. it has been used where it was not possible to use the 17 GHz frequency band, and it has been used in priority for those beams, which have been assigned channels in the 14 GHz frequency band in the Appendix S30A Plan.

The 14 GHz frequency band has been assigned to 20 beams[5] (see the polarization and channels provided the “Action 3” column of the tables of Annex 2 to this document), among which 11 beams[5] have already been assigned channels in this frequency band in the Appendix S30A Plan. On the other hand, it was possible to use the 17 GHz frequency band for 21 other beams[5], which have been assigned channels in the 14 GHz frequency band in the Appendix S30A Plan.

3.4 Required orbital position changes

As indicated in the IRG Report, it was expected that few orbital position changes might be necessary in order to find a solution to the feeder-link feasibility study.

---

[5] A "beam" in this context is either a single elliptical beam, a composite beam or a shaped beam corresponding to an entry in the MSPACE input file, i.e.: a satellite system can be composed of several beams (e.g. two beams for HISPASAT-1 (analogue 27 MHz), four beams for RST-1).

Indeed, in order to resolve incompatibility problems encountered during the feeder-link feasibility study at 13° W, 7° W and 44° E, it was required to move the following 4 beams at another orbital position (see Note 1 of the tables of Annex 2 to this document):

- ALB29600 and TCD14300 from 7° W to 25° W;
- HOL21300 from 13° W to 25° W;
- MDA06300 from 44° E to 50° E.

In accordance with IRG decision, all beams that have moved to a new orbital position have had their ellipse parameters recalculated, except in the case of a ±0.2° orbital position offset. In few cases, it was necessary to add some temporary test-points within the national territory of a given country in order to ensure that the recalculated beam provides proper coverage of the national territory of that country. These temporary test-points were only added for the purpose of ellipse recalculation and were removed in subsequent actions in order not to be considered as new additional test-points. Plots of the recalculated ellipses are at Annex 3 to this document.

3.5 Required e.i.r.p. adjustment

Finally, as an exceptional measure, the following e.i.r.p. adjustments were implemented (see Notes a), b), c), or d) of the tables of Annex 2 to this document) in order to meet the required feeder-link objective (i.e. EPM ≥ -0.45 dB or EPM ≥ (Reference EPM - 0.45 dB)).

- 0.3 dB e.i.r.p. reduction on all channels of beam HNG10600 at 12.8° W in order to provide beam CZE14400 at 12.8° W with an EPM > -0.45 dB (an alternative solution would have been to use 0.4° orbital separation between these two beams, but it has not been implemented since the respective Administrations have requested the use of a common orbital position for these two beams). Should no e.i.r.p. reduction be applied, a worst EPM excess of 0.15 dB would have been found for beam CZE14400.
- 0.4 dB e.i.r.p. reduction on all channels of beam MCO11600 at 7.2° W in order to provide beam YUG14800 at 6.8° W with an EPM > -0.45 dB. Should no e.i.r.p. reduction be applied, a worst EPM excess of 0.19 dB would have been found for beam YUG14800.
- 3.5 dB e.i.r.p. reduction on channel 21 only of beam CYP08600 at 4.8° E in order to provide “existing” beam SIRIUS02 at 5.2° E with an EPM ≥ (Reference EPM - 0.45 dB). Should no e.i.r.p. reduction be applied, a worst EPM excess of 1.11 dB would have been found for beam “existing” beam SIRIUS02 on its channel 20 only, noting that no EPM Excess were found on its other channels.
- 2 dB e.i.r.p. reduction on all channels of beam ROU13600 at 43.8° E in order to provide beam TKM06800 at 44.2° E and beam UZB07100 at 43.8° E with an EPM > -0.45 dB, noting that the resulting e.i.r.p. level used for beam ROU13600 is 84 dBW which corresponds to the e.i.r.p. level of all the other beams sharing the same orbital position. The 86 dBW e.i.r.p. level, which was required for beam ROU13600 at its Appendix S30A orbital position: 1° W, is thus no longer necessary. Should no e.i.r.p. reduction be applied, a worst EPM excess of 0.76 dB and 0.52 dB would have been found for beams TKM06800 and UZB07100 respectively.

ANNEX 1

Feeder-link channel raster

A.1 Channel raster b) at 17 GHz

Yoshio UTSUMI
Secretary-General

Attachment: Results of the downlink feasibility study

ATTACHMENT

Director, Radiocommunication Bureau

RESULTS OF THE DOWNLINK FEASIBILITY STUDY

0 Summary

A downlink feasibility study based on the “Planning Approach” has been conducted in accordance with the methodology and technical assumptions described in Attachments 1 and 2 of Document CMR2000/34 respectively.

The results indicate that:

- all national “planned” beams can be accommodated with 10 channels in Region 1 and 12 channels in Region 3; and
- eight of the eleven multinational beams (one “existing”[1] and ten “planned”[2]) can be accommodated with the required number of channels.

1 Introduction

The IRG defined a study approach for replanning feasibility studies and referred to it as the “Planning Approach”. The methodology of the “Planning Approach” consists of six steps and is described in Attachment 1 of Document CMR2000/34. Details of the technical assumptions used in performing studies on the “Planning Approach” are given in Attachment 2 to Document CMR2000/34.

In accordance with Principle 3 of Annex 1 to Resolution 532 (WRC-97), fifteen “existing” systems were included in the downlink feasibility study. They included those considered in the feasibility study for IRG-5 (beam J 11100 renamed to J 1110E, HISPASAT-1 (27 MHz analogue), HISPASAT-1 (27 MHz digital), KOREASAT-1 (analogue), KOREASAT-1 (digital), BS-3N, beam S 13902, SIRIUS, RST-1(8 channels), BIFROST-2 and DBL-19.2E) plus four additional networks that became “existing” systems after IRG-5 (HISPASAT-1 (33 MHz digital), BIFROST, EUTELSAT B-13E and DBL-28.2E) (see also Annex A of Corrigendum 2 to Document CMR2000/34).

The results of the downlink feasibility study conducted by the Radiocommunication Bureau at the request of the IRG are presented in this document for consideration by WRC-2000.

2 Description of Annex 3

The results of the downlink feasibility study are provided in orbital position order in Annex 3 of this document.

---

[1] Whenever the term “existing” system is used in this document, it refers to a system with notified assignments that are in conformity with Appendices S30 and S30A, that have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

[2] Whenever the term “planned” is used in this document, it refers to assignments/beams other than those of “existing” systems as defined in the footnote above.

- The column titled "**ADM**" contains, generally, the ITU symbol of the Administration responsible for the proposed draft new assignments considered in the downlink feasibility study.
- The column titled "**Beam name**" contains the beam name as per Appendix S30.
- The column titled "**Orbital position**" indicates the orbital position of each beam. Orbital positions in bold type indicate a change in orbital position from the WRC-97 orbital positions due to either an orbital position preference request or as a result of the implementation of Step 4 (nearest suitable orbital position), Step 5 or from orbital position adjustments resulting from the feeder-link feasibility study.
- The column titled "**Status code**" contains the status of the assignments according to Article 11 of Appendix S30. It should be noted that "existing" systems that have entered into the Plan after WRC-97 are identified with status code "PU".
- The column titled "**WRC-97 Pol. channels**" contains the Appendix S30 channels and polarization for each beam.
- The column titled "**Channels found at Step 3**" provides the channels and polarization for each beam that was accommodated at Step 3.
- The column titled "**Channels found at Step 4**" provides the channels and polarization for each beam that was not accommodated at Step 3 but was accommodated at Step 4.
- The column titled "**Channels found at Step 5 or 6**", according to the case, provides the channels and polarization for each national beam that was not accommodated at Step 3 or 4 but was accommodated at Step 5 or, in the case of a multinational beam, at Step 6. Adjustments made due to the feeder-link feasibility study are also indicated in this column.

3 Step 3 results

An orbital separation limit[3] of 15º (co-polar)/9º (cross-polar) and an EPM degradation tolerance of 0.45 dB were applied in the downlink feasibility study. The order in which each beam was treated in the feasibility study was derived from the criteria in section 4 of the methodology document (Attachment 1 of Document CMR2000/34). A table showing the initial beam order (indicated in Column 1 of the table) is contained in Annex 1.

The MSPACE input file resulting from the implementation of Steps 1 and 2 was used to create the "Step 3 Starting Point Plan"[4] for the implementation of Step 3. An initial Step 3 run was performed without a preference for choosing blocks that contain the WRC-97 channels for a given beam. A second Step 3 run was performed with a preference for WRC-97 channels. The success rate was slightly higher with the preference for WRC-97 channels. Therefore, the Step 3 run with WRC-97 channel preference was used as the "draft Step 3 Plan".

3.1 Specific orbital position preferences

An examination of the "draft Step 3 Plan" revealed that a number of beams that had a preferred orbital position were not accommodated in the draft plan. Those beams were then treated in

---

[3] When the orbital separation limit is applied, interference from assignments located at orbital positions greater than a certain angular offset from the nominal orbital position of the wanted assignment is not taken into account.

[4] All references to "Plan" in this document are to be considered as referring to the results of feasibility studies.

accordance with section 4.3.1 of the methodology document (Attachment 1 of Document CMR2000/34). Techniques such as changing the order of treatment, recalculating ellipse parameters, application of fast roll-off antenna and power adjustment were used to overcome incompatibility problems. Details of the actions taken are provided in Annex 2.

As a result, the initial order of treatment was changed. The revised order of treatment of beams is indicated in Column 2 of the table in Annex 1.

Annex 3 provides information on the channels found at Step 3 after orbital position preferences were taken into consideration.

202 beams[5] were considered at Step 3. All 15 existing systems were successfully accommodated. 158 of the 187 national beams were successfully accommodated with ten channels in a continuous band of 400 MHz in Region 1 and 12 channels[6] in a continuous band of 500 MHz in Region 3 utilizing channel raster “B” [7]. A statistical summary of the Step 3 results is given in Table 1 below.

TABLE 1

Step 3 result statistics

Beam category	Successful	Unsuccessful	Total
Existing	15	--	15
National	158	29	187
Total	*173 (86%)*	*29 (14%)*	*202*

The 29 beams that did not pass Step 3 were considered at Step 4. Three of those beams (DNK08900/DNKFRO, FIN10300 and HOL21300) had orbital position preferences that were unable to be satisfied at Step 3.

4 Step 4 results

Details of the channels and orbital positions found at Step 4 are provided in Annex 3.

[5] A "beam" in this context is a single elliptical beam, a composite beam or a group of beams forming a satellite system (e.g. DBL, RST-1).

[6] Due to time and resource constraints, the automated software was not modified to find a block of 12 channels for Region 3 beams at Steps 3 and 4. It remained unmodified i.e. set to find a block of 10 channels for all beams. The additional 2 channels were manually added to Region 3 beams at the end of Step 5 with a few very minor channel adjustments necessary. The result of this action was considered to have had the same effect as finding a block of 12 channels at Steps 3 and 4. Thus the results at Annex 3 show that 12 channels were found at Steps 3 and 4 for Region 3 beams when this was not strictly the case.

[7] Except RUS00401.

Of the 29 beams considered at Step 4, 28 were successfully accommodated with ten channels in a continuous band of 400 MHz in Region 1 and 12 channels[8] in a continuous band of 500 MHz in Region 3 utilizing channel raster "B" at the nearest suitable orbital position. A statistical summary of the Step 4 results is given in Table 2 below.

TABLE 2

Step 4 result statistics

Beam category	Successful	Unsuccessful	Total
National	28	1	29

The overall success rate after Step 4 was 99.5%. Since a suitable orbital position could not be found for the FIN10300 beam at Step 4, it was considered at Step 5.

5 Step 5 results

The FIN10300 beam was treated at Step 5 by studying other orbital positions within its service arc with adjustment of beam parameters such as e.i.r.p. and transmit antenna pattern (fast roll-off antenna). It was not possible to accommodate the beam with 10 channels in a continuous band of 400 MHz at other orbital positions.

The best solution possible, as prescribed by IRG, was the allotment of 9 channels in a continuous band of 400 MHz (channels 22,24,26,28,30,32,34,36,38) and a 10th channel within the 800 MHz (channel 1) at 5º E with a reduced e.i.r.p. of 56.7 dBW.

A statistical summary of the Step 5 results is given in Table 3 below.

TABLE 3

Step 5 result statistics

Beam category	Successful	Unsuccessful	Total
National	1	0	1

6 Step 6 results

Ten "planned" multinational beams were considered at Step 6. Of the ten "planned" multinational beams considered, seven were successfully accommodated with the required number of channels. Note that one "existing" multinational beam was accommodated at Step 3. A statistical summary of the Step 6 results is given in Table 4 below.

---

[8] Due to time and resource constraints, the automated software was not modified to find a block of 12 channels for Region 3 beams at Steps 3 and 4. It remained unmodified i.e. set to find a block of 10 channels for all beams. The additional 2 channels were manually added to Region 3 beams at the end of Step 5 with a few very minor channel adjustments necessary. The result of this action was considered to have had the same effect as finding a block of 12 channels at Steps 3 and 4. Thus the results at Annex 3 show that 12 channels were found at Steps 3 and 4 for Region 3 beams when this was not strictly the case.

TABLE 4

Multinational beam result statistics

Beam category	Successful	Unsuccessful	Total
Multinational	7	3	10

7 Overall results

The downlink feasibility study results constitute an example Plan that is not the only solution, nor is it an optimum one.

The results indicate that all existing and national beams can be successfully accommodated with the required number of channels. However, three of the ten "planned" multinational beams cannot be accommodated with the required number of channels. A statistical summary of the overall downlink feasibility study results is given in Table 5 below.

TABLE 5

Overall result statistics

Beam category	Successful	Unsuccessful	Total
Existing	15	0	15
National	187	0	187
Multinational	7	3	10
Total	*209*	*3*	*212*

8 Adjustments due to the feeder-link feasibility study

In order to resolve incompatibility problems encountered during the feeder-link feasibility study at 13° W, 7° W and 44° E, the orbital positions of the beams ALB29600, HOL21300, MDA06300 and TCD14300 were changed. This was achieved by applying the Step 4 methodology to the above-mentioned beams in order to find an alternative suitable orbital position. The new orbital positions were then applied to the feeder-link plan. This iterative process was repeated until all incompatibility problems were resolved.

A shift of ±0.2 degrees around the nominal orbital position was also necessary for several beams in the feeder-link feasibility study. These orbital position shifts were transferred from the feeder-link plan to the downlink plan. A check of downlink plan revealed an incompatibility problem with the MCO11600 beam. This was resolved by applying the improved fast roll-off antenna and a 0.6 dB power increase to the beam.

9 Beam Recalculation

In accordance with an IRG decision, all beams that have moved to a new orbital position have had their ellipse parameters recalculated, except in the case of a ±0.2° orbital position shift. In a few cases, it was necessary to add some temporary test-points within the national territory of a given country in order to ensure that the recalculated beam provides proper coverage of the national territory of that country. These temporary test-points were only added for the purpose of ellipse recalculation and were removed in subsequent actions in order not to be considered as new additional test-points. Plots of the recalculated ellipses are at Annex 4 of this document.

10 Reference situation

An examination of the MSPACE results after the feeder-link orbital position shifts had been transferred to the downlink plan revealed that all national “planned” beams had no excess EPM degradation. However, a few “existing” systems had test points with an excess EPM degradation that exceeded the 0.45 dB EPM degradation tolerance as shown below.

TABLE 6

Beams with an Excess EPM Degradation

Beam	CHN	TP	ADM	POSN	Margin	Reference	Degradation
S 13902	40	4	S	5.1	-1.54	-0.58	**-0.96**

E127ASCA	37	20	F	12.9	-1.25	-0.21	**-1.04**
E133ASCB	34	20	F	12.9	-1.00	-0.41	**-0.59**
E127ASZA	37	14	F	12.9	-2.05	-1.53	**-0.52**
E133ASZB	22	2	F	12.9	-0.53	-0.02	**-0.51**
E133ASZB	26	2	F	12.9	-0.54	-0.03	**-0.51**
E133ASZB	30	2	F	12.9	-0.54	-0.06	**-0.48**
E127ASWA	37	20	F	12.9	-1.79	-1.26	**-0.53**
E127DSWA	37	20	F	12.9	-1.19	-0.66	**-0.53**
D3128VI1	18	10	LUX	28.3	-4.76	-4.19	**-0.57**
S 13800	2	3	S	4.9	-0.81	-0.29	**-0.52**

This excess degradation can be ignored pursuant to the application of a principle contained in Step 5 of the methodology document which states that “when test points with very low EPM (less than about -10 dB) receive excess interference, such test points can be ignored for the purpose of the replanning exercises”.

Details of the reference situation can be found in the form of an MSPACE Input file. It is available from the ITU website at:

http://www.itu.int/brconf/irg-gte/index.html

11 Annex 7 of Appendix S30

In this feasibility study, there were some cases where the provisions of Annex 7 of Appendix S30 were not met. They occurred at the orbital positions 25.2° W, 19.2° W, 13.2° W, 7.2° W, 4° W, 1.2° W and 4.8° E. In all cases, except at 4° W, this was due to -0.2 degree orbital position shifts applied during the feeder-link feasibility study.

+ Shaded background indicates a preferred orbital position.
& Determined by multiplying the beam's major axis (in degrees) by its minor axis (in degrees).
% Existing system.
* Composite beam.
# Multinational beam.

ANNEX 2

Treatment of beams at Step 3 where a specific orbital position was requested

The following actions were taken at Step 3 in order to accommodate beams with orbital position preferences into the draft Step 3 Plan.

S 13800 A change in the order of treatment was not possible because there were no preceding beams to change with. Re-calculated ellipse did not work. Fast roll-off antenna did not work. In order to reduce negative EPM to BIFROST22 and EUTELSAT, a 6.8 dB power decrease (to 55.3 dBW) was applied. This made channels 2,4,6,8,10,12,14,16,18,20 (CR) available for the beam.

DNK A change in the order of treatment was not possible because there were no preceding beams to change with. Re-calculated ellipse did not work. Fast roll-off antenna did not work because the incompatibility problem also exists in the receiving side.
Power: In order to reduce negative EPM of channel 40 (CR), a power increase was required. This increased e.i.r.p. caused unacceptable interference to other beams which could not be overcome by a fast roll-off antenna. Therefore, power adjustment does not work.
Other beams: There is no national preference which has an impact on this situation.
Conclusion: The beam should be treated in Step 4.

FIN A change in the order of treatment was not possible because there were no preceding beams to change with. Re-calculated ellipse did not work. Fast roll-off antenna did not work because the incompatibility problem also exists in the receiving side.
Power: In order to reduce negative EPM of channel 40 (CR), a power increase was required for channel 40. This increased e.i.r.p. caused unacceptable interference to other beams.
Other beams: There is no national preference which has an impact on this situation.
Conclusion: The beam should be treated in Step 4.

KRE A change in the order of treatment was not possible because there were no preceding beams to change with. The second preferred orbital position at 140º E was tried and found to be successful.

UKR A change in the order of treatment was not possible because there were no preceding beams to change with. Re-calculated ellipse did not work. Fast roll-off antenna did not work. A 0.8 dB e.i.r.p. reduction (to 58.1 dBW) was applied and found to be successful.

HOL It is not possible to collocate 5 beams (HOL, D, AUT, SUI and LIE) at 19° W. As D, AUT, SUI and LIE were in the draft Step 3 Plan at 19º W, this beam was treated at Step 4.

TUR A change in the order of treatment was not possible because there were no preceding beams to change with. The second preferred orbital position at 50º E was applied and found to be successful.

ALG A change in the order of treatment with TGO was applied and found to be successful.

I__02900 A change in the order of treatment was not possible because there were no preceding beams to change with. The application of the fast roll-off antenna did not work. Power adjustment did not work. Other preferred orbital positions were tried. Application of the improved fast roll-off antenna at the fifth preferred orbital position (5º E) was tried and found to be successful.

IRN A change in the order of treatment was not possible because there were no preceding beams to change with. The application of the improved fast roll-off antenna was successful.

SYR A change in the order of treatment was not possible because there were no preceding beams to change with. The application of the improved fast roll-off antenna was successful.

JOR A change in the order of treatment was not possible because there were no preceding beams to change with. The application of the improved fast roll-off antenna with 2 dB e.i.r.p. reduction (to 56.1 dBW) was applied and found to be successful.

LBN A change in the order of treatment was not possible because there were no preceding beams to change with. The application of the improved fast roll-off antenna with 1 dB e.i.r.p. reduction (to 55.6 dBW) was applied and found to be successful.

CHN15500 A change in the order of treatment such that it and the CHNA_62E composite beam is treated before the INDB_56E composite beam was successful.

CZE/HNG/HRV/SVK All beams to be co-located at a common orbital position. The preferred common orbital position at 34º E did not work for all four beams. A search for a common orbital position within the requested preferred orbital arc (13º W to 34º E) was performed. The four beams were accommodated at 13º W with the improved fast roll-off antenna applied to all four beams.

MCO It is not possible to collocate 5 beams (MCO, D, AUT, SUI and LIE) at first preferred orbital position (19° W). It is also not possible to collocate 5 beams (MCO, CZE, HNG, HRV and SVK) at second preferred orbital position (13° W). The third preferred orbital position at 7º W was applied and found to be successful.

Addendum 1 to
Document 34-E
7 April 2000
Original: English

PLENARY MEETING

Note by the Secretary-General

REVIEW AND POSSIBLE REVISION OF THE 1997 BROADCASTING-SATELLITE SERVICE PLANS FOR REGIONS 1 AND 3

ORBITAL POSITIONS USED AS A STARTING POINT IN BSS REPLANNING FEASIBILITY STUDIES

Please find attached to this document additional information to that contained in Document WRC2000/34.

Yoshio UTSUMI
Secretary-General

Attachment: Orbital positions used as a starting point in BSS replanning feasibility studies

ATTACHMENT

Director, Radiocommunication Bureau

ORBITAL POSITIONS USED AS A STARTING POINT IN
BSS REPLANNING FEASIBILITY STUDIES

This document provides the orbital positions used as a starting point in the replanning feasibility studies for WRC-2000. This document also includes orbital position preferences received by the Bureau after Circular Letter CR/132 was published. A list of all orbital position preferences as of the date of this document is provided in Annexes 1, 2 and 3 to this document.

These annexes contain the following information:

- the orbital positions of beams currently contained in Appendices S30 and S30A of the Radio Regulations (except beams included in the Plan after successful application of Article 4 procedures);
- the orbital positions preferred by administrations communicated to the Bureau in response to Circular Letter CR/117. The absence of a number (blank column) indicates that no response was received. Numbers in bold indicate a change in orbital position from that of WRC-97;
- the date on which the response to Circular Letter CR/117 was received by the Bureau; and
- the orbital positions used as a starting point in the replanning feasibility studies.

It should be noted that some orbital positions may have changed from the "starting point" orbital positions listed in Annexes 1, 2 and 3 during the replanning feasibility studies in order to meet the requirements and objectives of Annex 1 to Resolution 532 (WRC-97) and the guidelines established by the IRG. See Addendum 2 and 3 to Document WRC2000/34.

ANNEX 1

Downlink orbital positions (12 GHz)

(except beams included in the Plan after successful application of Article 4 procedures)

(a) Beam taken into account in a “composite beam”.
(b) Multinational beam.
(c) Six channels assigned to this beam in accordance with IRG-4 decision.
(f) Orbital position suggested by AGTE.
(i) Understood as the Kingdom of Saudi Arabia’s preferred orbital position from IRG-4 discussions.

ATTACHMENT

Director, Radiocommunication Bureau

COMPLEMENTARY/UPDATED INFORMATION ON COMPATIBILITY ANALYSES WITH OTHER SERVICES AND THE REGION 2 PLAN

Attachment 3 to Document WRC2000/34 contains a description of the methodologies used to carry out the compatibility analyses with other services and the Region 2 Plan.

Section 4.3.2 Methodology

Replace the first paragraph of this section with the following:

The administrations having a fixed-satellite service transmitting space station in the frequency bands 11.7-12.2 GHz (Region 2) and/or 12.2-12.5 GHz (Region 3) which is likely to affect Regions 1 and 3 BSS assignment(s), should be identified with the criteria specified in Annex 4.

ATTACHMENT

Director, Radiocommunication Bureau

COMPLEMENTARY/UPDATED INFORMATION ON BASIC TECHNICAL ASSUMPTIONS FOR THE PLANNING APPROACH

Attachment 2 to Document WRC2000/34 contains a description of the basic technical assumptions used to carry out downlink and feeder-link feasibility studies of the “Planning Approach” prior to the last IRG meeting.

The information provided in this Corrigendum to Document WRC2000/34 incorporates the IRG decisions taken at its last meeting. This information is presented hereafter in terms of revised sections to the text provided in Attachment 2 to Document WRC2000/34, i.e. the Final Report of the IRG (*Notes in italic characters indicate the areas in which the text of the IRG Final Report has to be modified*).

Consequently, with this Corrigendum, the basic technical assumptions used by the Radiocommunication Bureau, on behalf of the IRG, to conduct the downlink and feeder-link feasibility studies are more accurately described.

Section 1 Introduction

Add the following paragraph at the end of this section:

Based on the results of new feasibility studies carried out and presented by the Radiocommunication Bureau, on behalf of the GTE, at the last IRG meeting, and considering new requests formulated by some administrations, the IRG took some decisions which impact on the basic technical assumptions. They are incorporated in the following sections.

Section 2.2 Emission type and channel bandwidth

Replace the last paragraph of this section with the following:

Considering a request from the Administration of Japan at the GTE-4 meeting, and based on the results of an additional study presented at the IRG-5 meeting, the IRG decided to include in the basic studies a bandwidth of 34.5 MHz for the assignments of Japan in the feasibility studies.

During the IRG-5 meeting, the Lao People’s Democratic Republic requested to use a bandwidth of 33 MHz for their assignments in the feasibility studies. The IRG decided to study this request at the end of the basic study, together with other national preferences not yet studied.

Section 2.3 Antenna types

Replace the text of footnote 2 with the following:

[2] Improved space station receiving antenna characteristics may be used in special circumstances to solve compatibility problems (e.g. fast roll-off antenna described in Annex 3 to Appendix S30A). In such cases the Administration for which the improved antenna is to be applied should be consulted. However, in this case, the relevant ITU-R Study Group did not approve new improved space station receiving antenna patterns, as was the case for the space station transmitting antenna.

Section 2.4.1 Possible Regions 1 and 3 channel arrangements

Replace all paragraphs of this section with the following:

Based on the results of an additional study (see Stage 2 of section 2.4.2 of Attachment 2 to Document WRC2000/34), the IRG decided at its last meeting to use four channel arrangements utilizing a continuous band of 400 MHz in Region 1 and 500 MHz in Region 3:

a) ten defined channels in Region 1 and twelve defined channels in Region 3, with 38.36 MHz frequency spacing, grouped in a continuous band of 400 MHz in Region 1 and 500 MHz in Region 3, with one predetermined type of polarization. The channel scheme is based on co-channels only;

b) ten defined channels in Region 1 and twelve defined channels in Region 3, with 38.36 MHz frequency spacing, grouped in a continuous band of 400 MHz in Region 1 and 500 MHz in Region 3, with one predetermined type of polarization. The channel scheme assumes adjacent-channels;

c) ten defined channels in Region 1 and twelve defined channels in Region 3, with 38.36 MHz frequency spacing between co-polarized channels, grouped in a continuous band of 200 MHz in Region 1 and 250 MHz in Region 3, with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be co-channels). The channel scheme is based on co-channels only; and

d) ten defined channels in Region 1 and twelve defined channels in Region 3, with 38.36 MHz spacing between co-polarized channels, grouped in a continuous band of 200 MHz in Region 1 and 250 MHz in Region 3, with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be adjacent channels with a frequency spacing of 19.18 MHz).

The four corresponding Region 1 channel rasters are shown in Figure 1.1 below.

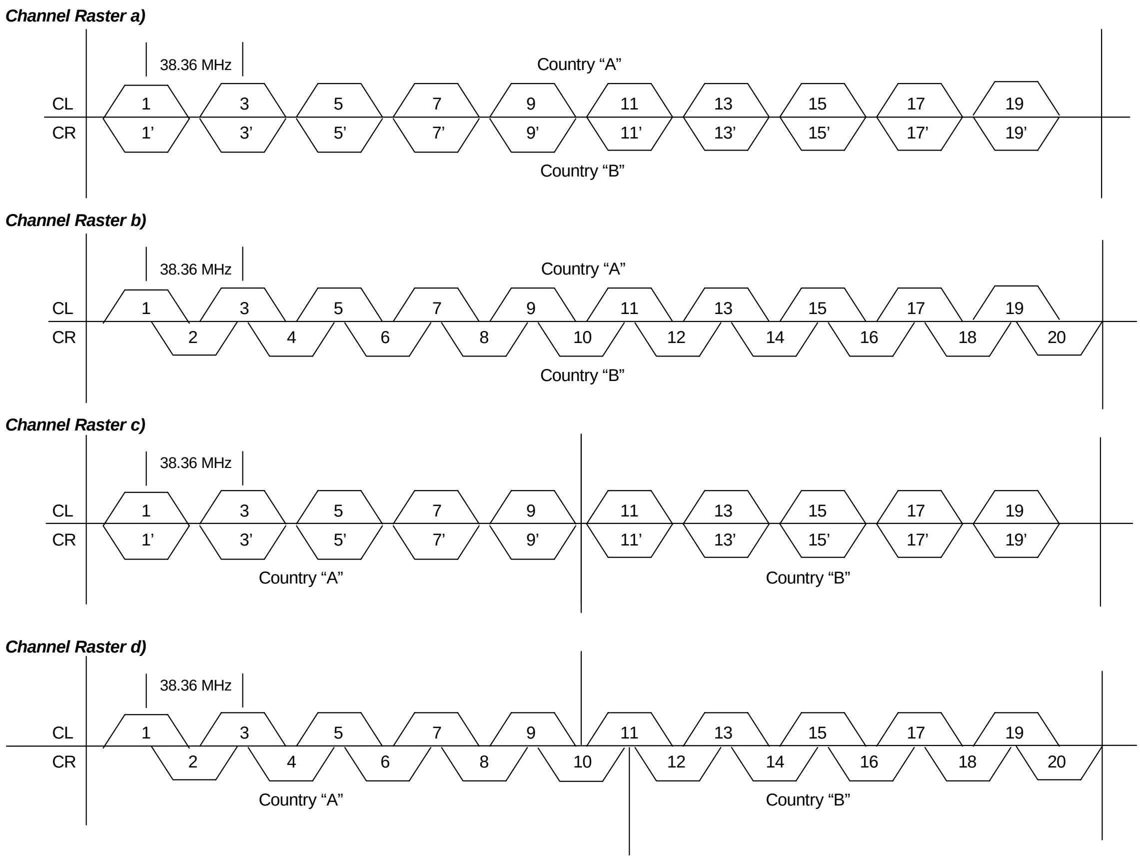

FIGURE 1.1

The four corresponding Region 3 channel rasters are shown in Figure 1.2 below.

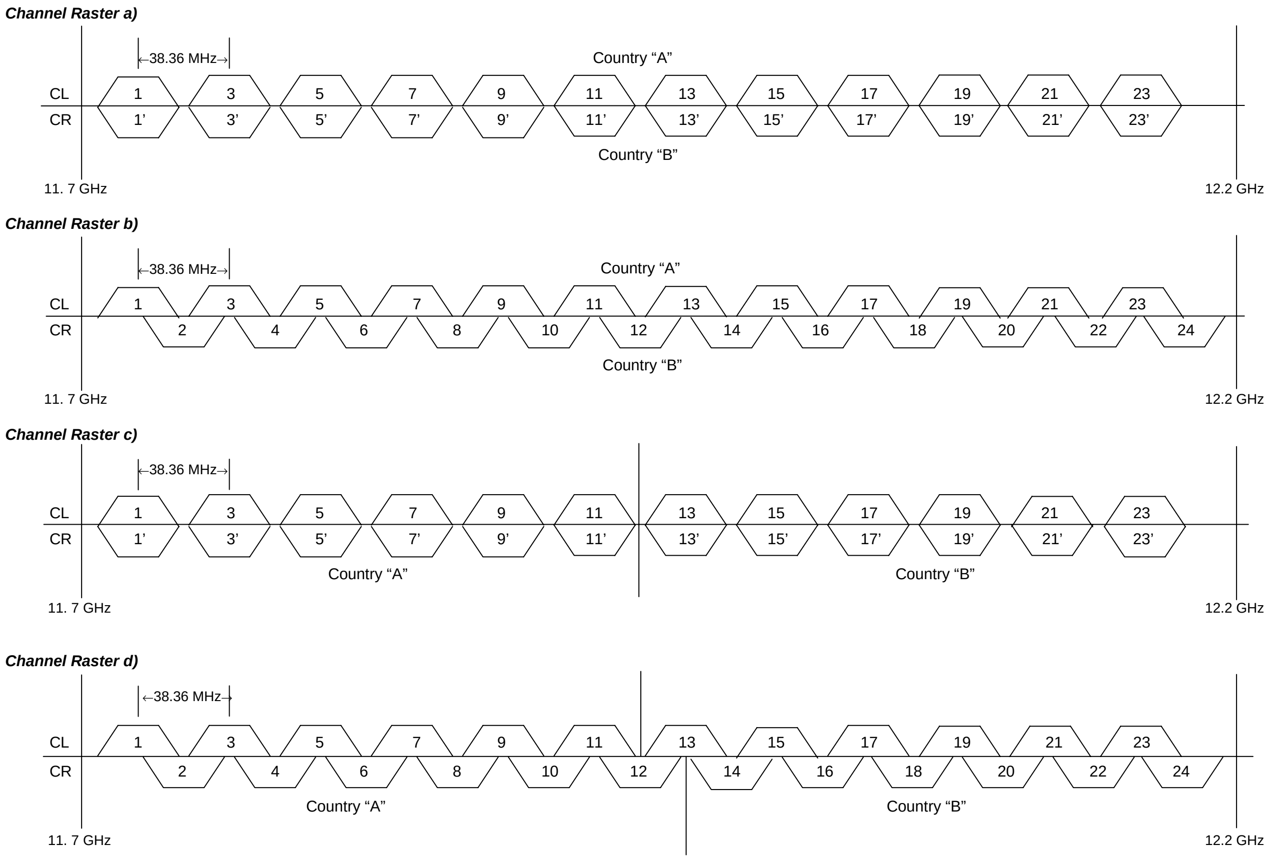

FIGURE 1.2

Studies were generally based upon raster b) of Figures 1.1 and 1.2.

The IRG decided to assume both the 14 GHz and the 17 GHz frequency bands in the feeder-link replanning feasibility studies in order to provide all assignments with the required number of channels and protection and also in order to accommodate specific preferences expressed by some administrations.

With respect to the 14 GHz feeder-link band, it was concluded to use the WRC-97 channel raster, i.e. similar to raster d) above, but reduced to the 14 available channels in that band (seven channels per circular polarization). It was also concluded to initially assign channels from the top of the band whilst not taking into account the internal adjacent channel interference effect.

Section 2.4.2 Alternative Region 3 channel arrangements

Delete this section since the IRG decided to include the alternative Region 3 channel arrangements into the basic feasibility studies.

Section 2.4.4.1 Channels preferred by AUS

Add the following new paragraphs at the end of this section:

Further to the IRG decision mentioned in section 2.4.1 above (i.e. 12 channels in Region 3), three channels per beam were assigned to the additional national coverage beam at two orbital positions (152° E and 164° E).

During the last IRG meeting, the Administration of Australia requested that 12 channels be provided to all Australian test-points including its offshore territories for both the downlink and feeder-link. The IRG decided to study this request at the end of the basic study, together with other national preferences yet to be studied.

Section 2.4.4.4 Channels preferred by IRN

Replace the paragraph of this section with the following:

The Administration of the Islamic Republic of Iran requested to study their feeder-links at both the 14 GHz and 17 GHz frequency bands. The results of an additional study presented at the last meeting of the IRG indicated that the required number of feeder-link channels could be assigned to this country either at 14 GHz or 17 GHz without causing any excess interference to any other beam. Based on these results, the IRG decided that the 17 GHz frequency band will be assumed in the basic study, whereas the 14 GHz frequency band will be studied at the end of the basic study together with other national preferences, yet to be studied.

Section 2.4.4.5 Channels preferred by KOR

Replace the paragraph of this section with the following:

The Administration of the Republic of Korea requested to study their feeder links at both the 14 GHz and 17 GHz frequency bands. The results of an additional study presented at the last IRG meeting indicated that the required number of feeder-link channels could be assigned to this country either at 14 GHz or 17 GHz without causing any excess interference to any other beam. Based on these results, and pursuant to the request of that Administration, the IRG decided to use the 17 GHz frequency band in the basic study for this country.

New sections

Add the following four new sections after section 2.4.4.5:

2.4.4.6 Channels preferred by MRC

At the last IRG meeting, the Administration of the Kingdom of Morocco requested to investigate the use of the 17 GHz frequency band instead of the 14 GHz frequency band for its feeder-link assignments. Should the results indicate that both frequency bands are possible, that Administration, once informed, should make its choice of the use of either the 14 or 17 GHz frequency bands.

The IRG decided that the 17 GHz frequency band will be used in the basic study, whereas the 14 GHz frequency band will be studied at the end of the basic study together with other national preferences, yet to be studied.

2.4.4.7 Channels preferred by SEY

At the last IRG meeting, the Administration of the Republic of Seychelles requested to investigate the use of the 14 GHz frequency band in addition to the 17 GHz frequency band for its feeder-link assignments. Should the results indicate that both frequency bands are possible, the Administration, once informed, should make its choice of the use of either the 14 or 17 GHz frequency bands.

The IRG decided that the 17 GHz frequency band will be assumed in the basic study, whereas the 14 GHz frequency band will be studied at the end of the basic study together with other national preferences, yet to be studied.

2.4.4.8 Channels preferred by J

At the last IRG meeting, the Administration of Japan requested to study the use of 12 channels at 109.85° E in addition to and grouped with its assignments at 110° E. The IRG decided to study this request at the end of the basic study, together with other national preferences.

2.4.4.9 Channels preferred by ISR

After the last IRG meeting, the Administration of the State of Israel requested to perform a comparative study (BSS to BSS in Region 1 as well as a comparative study with other Regions and services) between the use of the 14 GHz or the 17 GHz frequency bands for its feeder-link assignments, indicating that, based on a specific request by Administration at that time, the feeder-link channels of Israel are at 14 GHz in the Appendix S30A Plan. The 17 GHz frequency band will then be used in the basic study, whereas the 14 GHz frequency band will be studied, if time and resources permit, at the end of the basic study together with other national preferences yet to be studied.

Section 2.5.1 Revised downlink test-points for MRC

Add the following sentence at the end of the last paragraph of this section:

(See the recalculated beam in an updated version of Annex C of Attachment 2 to Document WRC2000/34, which is attached to this document.)

Section 2.5.2 Revised downlink test-points for MCO

Add the following sentence at the end of the last paragraph of this section:

(See the recalculated beam in an updated version of Annex C of Attachment 2 to Document WRC2000/34, which is attached to this document.)

Section 2.5.3 Revised downlink test-points for RUS

Add the following sentence at the end of the last paragraph of this section:

(See the recalculated beam in an updated version of Annex C of Attachment 2 to Document WRC2000/34, which is attached to this document.)

New sections

Add the following two new sections after section 2.6.1:

2.6.2 New ellipse for the Mongolian feeder-link beam

At the last IRG meeting, no objection was made to the proposal to consider in the basic feasibility study a new feeder-link beam for Mongolia. This new beam was recalculated using the Appendix S30A Plan test-points of this country in order to provide a complete coverage of its national territory. (See the new beam in an updated version of Annex D of Attachment 2 to Document WRC2000/34, which is attached to this document.)

2.6.3 Preferred ellipse for the Bulgarian feeder-link beam

At the last IRG meeting, the Administration of the Republic of Bulgaria requested to also study the feeder link with its beam at 1° W with the same beam ellipse and orientation of its downlink beam. The IRG decided to study this request at the end of the basic study together with other national preferences yet to be studied.

Section 2.10.2.2 Downlink situation of CHN

Replace the title of this section as follows:

2.10.2.2 Feeder-link and downlink situation of CHN

Add the following paragraphs at the end of this section:

At the last IRG meeting, the Administration of the People's Republic of China requested a change in orbital position from 79.8º E to 134º E for all its feeder-link and downlink elliptical and composite beams. IRG decided to include this modification in the basic feasibility studies and thus to recalculate at 134º E the Chinese elliptical and composite beams previously located at 79.8º E. (See the recalculated beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document.)

At that meeting, that Administration also requested to use its WRC-97 large elliptical feeder-link beams at 62º E, 92º E and 134º E (i.e. the beam formerly located at 79.8º E) instead of the feeder-link composite beams referred to in the paragraph above. The IRG decided to study this request at the end of the basic study, together with other national preferences yet to be studied.

Section 2.10.2.3 Feeder-link and downlink situation of IND

Add the following new paragraph at the end of this section:

The IRG decided that the 17 GHz frequency band will be assumed in the basic study, whereas the 14 GHz frequency band will be studied at the end of the basic study together with other national preferences yet to be studied.

Section 2.10.2.4 Downlink situation of the United States

Replace the title of this section as follows:

2.10.2.2 Feeder-link and downlink situation of the United States of America

Add the following new paragraph at the end of this section:

At the last IRG meeting, the Administration of the United States of America requested to split the composite beam between PLM and SMA to have two individual (non-composite) beams. The same request was made for MRA and GUM. The IRG decided to study these requests at the end of the basic study together with other national preferences yet to be studied.

Section 2.10.2.5 Downlink situation of F

Replace the title of this section as follows:

2.10.2.5 Feeder-link and downlink situation of F

Replace the last paragraph of this section with the following:

No objection to this course of action was made at the last meeting of the IRG, which was thus considered in the basic feasibility studies.

Section 2.11 Orbital positions[7]

Replace the last paragraph of this section with the following:

At the request of the APT Group of Technical Experts (AGTE) from Region 3, the default orbital positions proposed by AGTE in Document GTE99-4/9, 24 September 1999, will be used as default orbital positions for Region 3 in the replanning feasibility studies, unless a different preferred orbital position had been requested by an administration in that Region in response to CR/117. The Region 3 administrations for which a default orbital position was proposed by the AGTE which is different from that of Appendices S30 and S30A, will be consulted by the Bureau in order to confirm or otherwise this course of action, noting that absence of reply will mean agreement with the choice of orbital position indicated in Document GTE99-4/9. A list providing all preferred and default orbital positions used as a starting point in the studies was published in Circular Letter CR/132 of 5 January 2000. Based on recent communications from certain administrations, an updated list of orbital positions is provided in Addendum 1 to Document WRC2000/34. (See the recalculated beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document.)

Add the following new paragraphs at the end of this section:

From this updated list of orbital positions, it could be noted that the requests made at the last IRG meeting by the Administration of the Islamic Republic of Iran and the Administration of the Lao People's Democratic Republic to change the orbital position of their beam respectively from 34º E to 54º E and from 122º E to another orbital position were not confirmed. Indeed, these Administrations confirmed after this meeting that 34º E and 122º E respectively are still their preferred orbital position.

Addendum 1 to Document WRC2000/34 includes the new orbital positions requested and agreed at the last IRG meeting by the Administration of the People's Republic of China (see section 2.10.2.2 above) and by the Administration of Malaysia (see the recalculated composite beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document).

After the last IRG meeting, the Administration of the State of Qatar requested a change in its orbital position from 17º E to 20º E. Considering that this request was submitted after the feasibility studies were commenced, it would be studied, if time and resources permit, at the end of the basic feasibility study together with other national preferences yet to be studied.

After the last IRG meeting, the Administration of Tunisia requested to use for its beams an orbital position within the orbital arc from 17º E to 25º W. Considering that this request was submitted after the feasibility studies were commenced, it would be studied, if time and resources permit, at the end of the basic feasibility study together with other national preferences yet to be studied.

After the last IRG meeting, the Administration of the Democratic People's Republic of Korea requested a change in its orbital position from 110º E to 140º E. Considering that this request was submitted after the feasibility studies were commenced, it would be studied, if time and resources permit, at the end of the basic feasibility study together with other national preferences yet to be studied.

[7] NOTE - During the GTE-3 meeting, the Syrian Administration emphasized the importance for each Administration to enjoy full freedom to select its existing nominal orbital position or to modify it to meet its requirements during the exercise. This should not necessarily be a nominal orbital position. It could be any angular value between nominal orbital positions.

Section 2.11.3 New multinational beam and multiple orbital positions for D[8]

Replace the title of this section as follows:

2.11.3 New multinational beam for AUT, D, LIE and SUI, and multiple orbital positions for D[8]

Add the following new paragraph before the last paragraph of this section:

Based on the results of an additional study presented at the last IRG meeting, the IRG decided to include in the replanning feasibility studies a multinational beam replacing the national beams of these four administrations with ten channels for each of the administrations concerned (see the corresponding new beam in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document).

Section 2.11.5 Requested new beam(s)

Replace the title of this section as follows:

2.11.5 Requested new beams for SEY and CHN/MAC

Replace the last paragraph of this section with the following:

At its last meeting, the IRG confirmed this course of action, which was thus considered in the basic feasibility studies (see the corresponding beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document).

Add the following new paragraph at the end of this section:

At the last IRG meeting, Portugal requested the inclusion of a new minimum sized spot beam to cover the territory of Macao, preferably at 122º E. The IRG decided to include this request in the basic feasibility studies (see the corresponding beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document).

New sections

Add the following three new sections after section 2.11.5:

2.11.6 New multinational beam for CZE, HNG, HRV and SVK

At the last IRG meeting, the Administrations of Croatia, Hungary, Slovak Republic and Czech Republic requested to investigate the inclusion of a new multinational beam covering their territories with ten channels per country in the replanning feasibility studies replacing their national beams. The Administrations of Croatia, Hungary, Slovak Republic and Czech Republic requested that their current national beams (HRV14800, HNG10600, SVK14400, CZE14400) continue to be taken into account in the ongoing planning study until the final clarification of the acceptability of inclusion of the proposed multinational beam. IRG-5 agreed to investigate the proposal and include the results in its report to be submitted to WRC-2000. The same evaluation process will be followed as was used in studying the request in section 2.11.3 above, i.e.:

---

[8] The German Administration has agreed to the conclusions of IRG-4. However, it reserves its right to reiterate the request for including, into the replanning feasibility studies, both national beams of Germany as contained in Appendices S30 and S30A at two orbital positions when the results of the studies described in this section and their further treatment within the IRG are known.

1) Continue the planning exercises based on national coverage with ten channels (principles 1 and 2 of Annex 1 of Resolution 532) at the same orbital position.

2) At the end of this exercise, four identical multinational beams covering the territory of Croatia, Hungary, Slovak Republic and Czech Republic, each with ten channels will be substituted to the national beams of Croatia, Hungary, Slovak Republic and Czech Republic and the e.i.r.p. of this multinational beam be reduced if necessary to a level which does not create more interference than the previous situation (i.e. the four national beams with ten channels). The result of this modification i.e. the level of e.i.r.p. and the EPM associated to this new multinational beam is proposed to the Administrations of Croatia, Hungary, Slovak Republic and Czech Republic for agreement or otherwise.

IRG decided to ask these Administrations to provide to the Bureau new test points before 31 December 1999 if needed.

In providing the requested information after the last IRG meeting, these four countries confirmed the use in the feasibility studies of 34° E, as the preferred orbital position for their beams, and that in the case of an unsuccessful result, to use for their beams a common orbital position within the orbital arc from 34º E to 13º W (see the national beams recalculated at 34º E in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document).

2.11.7 New multinational beam for JOR, LBN and SYR

At the last IRG meeting, the Administrations of Syria and Lebanon requested to investigate the inclusion of the multinational beam SYR33900 covering their territories with ten channels per country in the replanning feasibility studies replacing their national beams, with possible extension to two additional neighbouring countries if so requested by them. The Administrations of Syria and Lebanon requested that their current national beams continue to be taken into account in the ongoing planning study until the final clarification of the acceptability of inclusion of the proposed multinational beam. IRG-5 agreed to investigate the proposal and include the results in its report to be submitted to WRC-2000. The same evaluation process will be followed as was used in studying the request in section 2.11.3, and described in section 2.11.6 above.

IRG decided to ask these two administrations to provide to the Bureau new test points before 31 December 1999 if needed.

In providing the requested information after the last IRG meeting, these two countries, joined by the Administration of Jordan, confirmed the use in the feasibility studies of 11° E, as the preferred orbital position for their beams, and that in the case of an unsuccessful result, to use for their beams a common orbital position at least within the orbital arc from 10.5º E to 11.5º E.

2.11.8 New multinational composite beam for LTU and LVA

After the last IRG meeting, the Administrations of Lithuania and Latvia requested to investigate the inclusion of a multinational composite beam covering their territories with ten channels per country in the replanning feasibility studies replacing their national beams. Both countries requested the use in the feasibility studies of 23° E, as the preferred orbital position for their beams.

Considering that this request was submitted after the last IRG meeting, it would be studied, if time and resources permit, at the end of the basic study together with other national preferences yet to be studied.

Section 2.12 "Existing systems"[9, 3]

Add the following paragraph before section 2.12.1:

The list of the "existing systems" taken into account in the feasibility studies is provided at Annex A.

Section 2.12.1 Case of E

Replace the first paragraph of this section with the following:

New national downlink beam arrangements for Spain, E 12900 and CNR13000, with ten channels (ch. 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CL) with WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type, were created at orbital position 30° W. In order not to exceed a total of ten channels and to be compatible with the "existing" beams HISPASA4, HISPA27D, HISP33D1 and HISP33D2 (ch. 23, 27, 31, 35, 39 CL), all Spanish beams were grouped.

Section 2.12.2 Case of J

Replace the first and second paragraphs of this section with the following:

A new national downlink beam for Japan, J 11100, with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CR) with reduced e.i.r.p., new protection ratios, digital modulation, 34.5 MHz bandwidth (see section 2.2 above) and MODRES receiving earth station antenna type, was created at orbital position 110° E. In order not to exceed a total of ten channels and to be compatible with the "existing" beam J 11100, now renamed J 1110E, at 110° E (ch. 1, 3, 5, 7, 9, 11, 13, 15 CR) and with "existing" beam 000BS-3N at 109.85° E, all Japanese beams were grouped.

A similar course of action was taken with respect to the feeder-link beam for Japan, J 11100, which was created at orbital position 110° E with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CR), with new protection ratios, digital modulation, 34.5 MHz bandwidth (see section 2.2 above) and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

Section 2.12.3 Case of KOR

Add the following sentence at the end of the first paragraph of this section:

(See the recalculated beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document.)

Section 2.12.5 Case of NOR

Replace the second paragraph of this section with the following:

According to the request from the Administration of Norway, a new national beam NOR12000 was created at orbital position 0.8° W. This beam has been assigned ten channels (ch. 22, 24, 26, 28, 30,

---

[9] See definition in section 2.2. Currently there are thirteen systems which fall into this category (see Annex A).

[3] The Administrations of Morocco and Syria consider that the total number of channels per coverage area shall not exceed either ten channels or the number of channels of an "existing system" which is greater than 10. This is with the understanding that the planning conference will decide on the status of those channels of "existing systems" that exceed the number 10.

32, 34, 36, 38, 40 CR) with WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type. In order not to exceed a total of ten channels within a sub-frequency band of 400 MHz, and in order to be compatible with some channels (ch. 23, 27, 31, 35, 39 CL, and 24, 28, 32, 36, 40 CR) of the "existing" system BIFROST-2 at 0.8° W, beams BIFROS21 and BIFROS22 of BIFROST-2 and beam NOR12000 were grouped. Because the orbital position of the national beam NOR12000 was changed from 5° E to 0.8° W, new ellipse parameters were calculated as described in section 2.6 above. (See the recalculated beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document.)

Section 2.12.6 Case of F

Add the following sentence at the end of the first paragraph of this section:

(See the recalculated beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document.)

Section 2.12.7 Case of LUX

Replace the first and second paragraphs of this section with the following:

Although the Administration of Luxembourg has not requested to move beam LUX11400 from orbital position 19.0° W to orbital position 19.2° E or 28.2° E where its "existing" systems DBL are located, for the replanning feasibility studies, beam LUX11400 has been moved to orbital position 28.2° E in order to be included successfully in the draft new Plan with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CL), WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type. In order to be compatible with the same channels used by the "existing" system DBL at 28.2° E, all beams of this DBL network and beam LUX11400 were grouped. Because the orbital position of the national beam LUX11400 was changed from 19.0° W to 19.2° E, new ellipse parameters were calculated as described in section 2.6 above. (See the recalculated beams in an updated version of Annexes C and D of Attachment 2 to Document WRC2000/34, which are attached to this document.)

Despite the fact that the feeder-link part of these DBL systems are not yet considered as "existing" feeder-link systems, a similar course of action was taken with respect to the feeder-link beam for Luxembourg, LUX11400, which was created at orbital position 28.2° E with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CL) with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

Section 2.12.8 Case of RUS

Add the following sentence to the last paragraph of this section:

No objection to the GTE conclusion on this issue was formulated at the last meeting of the IRG.

Section 2.14 Application to feeder-link studies

Add the following paragraph at the end of this section:

In using the 14 GHz frequency band for beams, which already have channel(s) in this band in the Appendix S30A Plan, the polarization direction and the e.i.r.p. level of the "reused" channel(s) have to be maintained if possible.

Annex A Protection ratios applicable to "existing" systems in the replanning studies

Replace the title of this Annex as follows:

Protection ratios applicable to "existing" systems in the feasibility studies

Replace Notes 4 and 5 of the table of this Annex with the following:

4) RST-1, BIFROST-2, BIFROST, EUTELSAT-B 13° E.

5) RST-1, DBL 19.2° E (downlink only), HISPASAT-1 (27 MHz bandwidth), EUTELSAT-B 13° E, DBL 28.2° E (downlink only), HISPASAT-1 (33 MHz bandwidth).

Annex C (to Attachment 2)

Add the following title to this Annex:

**Recalculated elliptical beams and composite beams
at their starting point orbital position
for the downlink feasibility study**

Replace the first paragraph of Annex C of Attachment 2 to Document WRC2000/34 with the following:

The downlink beams plotted in this Annex are based on the default or preferred orbital positions, according to the case.

The Appendix S30 Plan beams, which were considered in the downlink feasibility study but not modified, have not been provided.

Should any of the beams considered in the downlink feasibility study be shifted by more than ±0.2° from its default or preferred orbital positions, according to the case, to another orbital position, it would be then plotted in Annex 4 to Addendum 2 to Document WRC2000/34.

With respect to the figures provided in this Annex and in Annex 4 to Addendum 2 to Document WRC2000/34, it should be noted that:

The tracing of borders does not imply on the part of ITU any position with respect to the status of a country or geographical area, or official recognition of these borders.

Add the beams plotted in Annex C to this Corrigendum to those provided in Annex C of Attachment 2 to Document WRC2000/34.

Annex D (to Attachment 2)

Add the following title to this Annex:

**Recalculated elliptical beams and composite beams
at their starting point orbital position
for the feeder-link feasibility study**

Replace the first paragraph of Annex D of Attachment 2 to Document WRC2000/34 with the following:

The feeder-link beams plotted in this Annex are based on the default or preferred orbital positions, according to the case.

The Appendix S30A Plans beams, which were considered in the feeder-link feasibility study but not modified, have not been provided.

Should any of the beams considered in the feeder-link feasibility study be shifted by more than ±0.2° from its default or preferred orbital positions, according to the case, to another orbital position, it would be then plotted in Annex 3 to Addendum 3 to Document WRC2000/34.

With respect to the figures provided in this Annex and in Annex 3 to Addendum 3 to Document WRC2000/34, it should be noted that:

The tracing of borders does not imply on the part of ITU any position with respect to the status of a country or geographical area, or official recognition of these borders.

Add the beams plotted in Annex D to this Corrigendum to those provided in Annex D of Attachment 2 to Document WRC2000/34.

Annexes: 2

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Corrigendum 1 to Document 34-E
10 April 2000
Original: English

PLENARY MEETING

Note by the Secretary-General

REVIEW AND POSSIBLE REVISION OF THE 1997 BROADCASTING-SATELLITE SERVICE PLANS FOR REGIONS 1 AND 3

COMPLEMENTARY/UPDATED INFORMATION ON METHODOLOGY TO IMPLEMENT THE PLANNING APPROACH

Please find attached complementary/updated information to that contained in Attachment 1 to Document WRC2000/34.

Yoshio UTSUMI
Secretary-General

Attachment: Complementary/updated information on methodology to implement the planning approach

ATTACHMENT

Director, Radiocommunication Bureau

COMPLEMENTARY/UPDATED INFORMATION ON METHODOLOGY
TO IMPLEMENT THE PLANNING APPROACH

Attachment 1 to Document WRC2000/34 contains a description of the methodology used to carry out downlink and feeder-link feasibility studies of "the Planning Approach" prior to the last IRG meeting.

The information provided in this Corrigendum 1 to Document WRC2000/34 incorporates the IRG decisions taken at its last meeting. This information is presented hereafter in terms of revised sections to the text provided in Attachment 1 to Document WRC2000/34, i.e. the IRG Final Report (*Notes in italic characters indicate the areas in which the text of the IRG Final Report has to be modified*).

Consequently, with this Corrigendum, the methodology used by the Radiocommunication Bureau, on behalf of the IRG, to conduct the downlink and feeder-link feasibility studies are more accurately described.

Section 2 Step 1 implementation: Definition of *a priori* selected orbital position

Replace the last paragraph of this section with the following:

At the request of the APT Group of Technical Experts (AGTE) from Region 3, the default orbital positions proposed by AGTE in Document GTE99-4/9, 24 September 1999, will be used as default orbital positions for Region 3 in the replanning feasibility studies, unless a different preferred orbital position had been requested by an administration in that Region in response to Circular Letter CR/117. The Region 3 administrations for which a default orbital position was proposed by AGTE which is different from that of Appendices S30 and S30A, will be consulted by the Bureau in order to confirm or otherwise this course of action, noting that absence of reply will mean agreement with the choice of orbital position indicated in Document GTE99-4/9. A list providing all preferred and default orbital positions used as a starting point in the studies was published in Circular Letter CR/132 of 5 January 2000. Based on recent communications from certain administrations, an updated list of orbital positions is provided in Addendum 1 to Document WRC2000/34.

Section 3 Step 2 implementation: Creation of composite beams

Replace the last paragraph of this section with the following:

Further to this consultation, the Bureau created a set of composite beams to be used in feasibility studies (see Annexes C and D to Attachment 2 to Document WRC2000/34 and its Corrigendum 2).

Section 4.2 Implementation of the 1st criterion: downlink "existing" beams

Replace the second and third paragraphs of this section with the following:

For each downlink "planned" beam falling in this category, ten "new" channels in Region 1, or twelve[#] "new" channels in Region 3, with new parameters are added in the sub-frequency band already assigned to the "existing" assignments as contained in Appendices S30 and S30A of the corresponding downlink "existing" beam. An MSPACE "group" is created between the new channels and their corresponding "existing" assignments, so as not to exceed a total number of ten channels per Region 1 country, or twelve[#] channels per Region 3 country, or the number of channels of an "existing system" which is greater than ten in Region 1 or twelve[#] in Region 3.[3]

A BSS-BSS compatibility analysis is then conducted in order to check if these ten in Region 1 or twelve[#] in Region 3 "new" channels are acceptable or not, i.e. these ten or twelve[#] "new" channels are acceptable if their EPM is positive **and** if they do not degrade[4] by more than 0.45 dB the EPM, if already negative, of the other "existing" assignments (see also Annex 1).

Replace the last but one paragraph of this section with the following:

If a beam cannot get ten "new" channels in Region 1 or twelve[#] "new" channels in Region 3 in the sub-frequency band already assigned to its corresponding downlink "existing" beam, it is then not included in the "Draft Step 3 Plan" at that stage and will be considered together with other beams under section 4.3 below.

Section 4.3 Implementation of national single or composite downlink "planned" beams

Replace the third paragraph of this section with the following:

Then, for each downlink "planned" beam falling in this category, a Victim Study and a Culprit Study (see Annex 1) are conducted in order to assign the most suitable sub-frequency band (with ten channels in Region 1 and twelve[#] channels in Region 3).

Section 4.3.1 Treatment of downlink "planned" beams not included in the "Draft Step 3 Plan" but for which at least one specific orbital position was requested

Replace item C of this section with the following:

C Use of fast roll-off antenna

The IRG agreed to investigate whether the use of a fast roll-off space station antenna, if available, for the downlink "planned" beam under consideration would allow for its inclusion in the "Draft Step 3 Plan" at its preferred orbital position.

[#] Due to time and resource constraints, the automated software was not modified to find a block of 12 channels for Region 3 beams at Steps 3 and 4. It remained unmodified i.e. set to find a block of 10 channels for all beams. The additional 2 channels were manually added to Region 3 beams at the end of Step 5 with a few minor channel adjustments necessary. The result of this action is considered to have had the same effect as finding a block of 12 channels at Steps 3 and 4.

[3] Sweden and Norway reserve their position on this paragraph.

[4] It is to be noted that during the implementation of all steps, such degradations do not accumulate.

Section 5.3.2 Step 4 Orbital spacing study

Replace item A of this section with the following:

A For each possible sub-frequency band (eight with ten channels each in Region 1, four with twelve[#] channels each in Region 3) for the selected beam, perform the three following actions:

Section 6.2 Description of the Step 5 methodology

Replace the third paragraph of this section with the following:

As an optional measure to resolve particular specific cases of remaining incompatibilities in Region 1, and on an exceptional basis, the use of different channel repartition may be envisaged (e.g. in Region 1, spreading the ten channels over the 800 MHz instead of 400 MHz in one polarization). In such a case, the concerned administration(s) should be informed.

The note at the end this section is no longer necessary since IRG decided at its last meeting to include in the basic study 12 channels per beam in Region 3.

Section 8.2 Action 1: Establishment of the "draft new feeder-link Plan" at both 14 GHz and 17 GHz

Replace the third paragraph of this section with the following:

In order to simplify the establishment of the "draft new feeder-link Plan", GTE-4 concluded to start by assigning to each of the feeder-link "planned" beams in the 17 GHz frequency band the block of channels selected for their corresponding downlink "planned" beam at the end of the implementation of the "draft new downlink Plan" (i.e. result of Steps 3, 4, 5 and 6 above).

Section 8.3 Action 2: Analysis of the interference situation

Replace the second paragraph of this section with the following:

Excessive EPM degradations are identified as follows:

a) in the case of "existing" systems, identifying positive reference EPM degraded below –0.45 dB or negative reference EPM degraded by more than 0.45 dB. The reference EPMs are those of the WRC-97 reference situations as evolve;

b) in the case of "planned assignments", identifying negative EPMs below –0.45 dB.

Replace the fourth paragraph of this section with the following:

In order to resolve this situation, the IRG agreed to apply the following measures in an appropriate order:

- reverse the polarization direction;
- assign different channels in the same or the alternative frequency band (i.e. at 14 GHz) if allocated and assigned;

[#] Due to time and resource constraints, the automated software was not modified to find a block of 12 channels for Region 3 beams at Steps 3 and 4. It remained unmodified i.e. set to find a block of 10 channels for all beams. The additional 2 channels were manually added to Region 3 beams at the end of Step 5 with a few minor channel adjustments necessary. The result of this action is considered to have had the same effect as finding a block of 12 channels at Steps 3 and 4.

Add the following text before the last paragraph of this section in order to explain in details how the feeder-link methodology has been implemented.

The practical application of the above-mentioned measures at a given orbital position where beam(s) with EPM degradation(s) have been identified is as follows:

A. A first study is performed in order to find a solution at that orbital position in the 17 GHz frequency band by using:

i) different polarization direction, and/or

ii) different channel arrangements.

B. If the first study is not successful (i.e. there is still excessive EPM degradation(s)) and there is one beam at that orbital position with channel(s) in the Appendix S30A Plan at 14 GHz, this beam is moved to the 14 GHz frequency band and a second study is performed in the 17 GHz frequency band without this beam by using:

i) different polarization direction, and/or

ii) different channel arrangements.

C. If the second study is not successful (i.e. there is still excessive EPM degradation(s)) and/or there is no beam at that orbital position with channel(s) in the Appendix S30A Plan at 14 GHz, then a third study is performed by using:

i) different polarization direction, and/or

ii) different channel arrangements, and/or

iii) a shift of ±0.2 degrees around the nominal orbital position.

D. If the third study is not successful (i.e. there is still excessive EPM degradation(s)), then the most sensitive beam is moved to the 14 GHz frequency band, provided that this beam is located in a Region where this frequency band is allocated, and a fourth study is performed by using:

i) different polarization direction, and/or

ii) different channel arrangements, and/or

iii) if necessary, a shift of ±0.2 degrees around the nominal orbital position.

E. If the fourth study is not successful (i.e. there is still excessive EPM degradation(s)), then one beam has to be moved to another orbital position. This beam is chosen among those which do not have preferred orbital position and/or those which have been moved due to incompatibilities found during the downlink feasibility study. The selection of the beam to be moved is then based on the order of treatment defined for the downlink feasibility study, with the aim to minimize the orbital position changes required to resolve the feeder-link incompatibilities. A fourth study is then performed by using:

i) different polarization direction, and/or

ii) different channel arrangements, and/or

iii) if necessary, a shift of ±0.2 degrees around the nominal orbital position.

Section 8.4 Action 3: Second run of interference calculation

Replace the last paragraph of this section with the following:

As an exceptional measure to resolve the remaining incompatibilities, which could not be resolved by iterations of Action 2 measures, some minor e.i.r.p. adjustments could be implemented in order to meet the required feeder-link objective, i.e. EPM ≥ –0.45 dB or EPM ≥ (Reference EPM - 0.45 dB).

However, any e.i.r.p. adjustment(s) or any remaining EPM degradation(s) will be reported for further appropriate action.

Annex 1 Section A1.2.1 Definition of "artificial" Reference EPM for Culprit study purposes

Add the following definition to the assumptions:

- D is the EPM degradation tolerance (i.e. D = 0.45 dB).

Replace the definition of NR with the following:

If R < 0

If E > (R-D)

$NR = -10 \, Log[(10^{(-R/10)} x 10^{(D/10)}) - 10^{(-E/10)}] + 10 \, Log[10^{(D/10)} - 1]$

Else

NR = 99.99

End if

Else

If E < 0

NR = R

Else

$NR = -10 \, Log[10^{(D/10)} - 10^{(-E/10)}] + 10 \, Log[10^{(D/10)} - 1]$

End if

End if

In addition, the Single Entry C/I Criterion/Limit definition as a function of NR is as follows:

$$C2ILimt = PR - 10 \, Log[10^{(NR/-10)} x (10^{(D/10)} - 1)]$$

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Document 34-E
17 March 2000
Original: English

PLENARY MEETING

Note by the Secretary-General

REVIEW AND POSSIBLE REVISION OF THE 1997 BROADCASTING-SATELLITE SERVICE PLANS FOR REGIONS 1 AND 3

Under the provisions of *resolves* 2 of Resolution 532 (WRC-97), the Director of the Radiocommunication Bureau shall present to the Conference the results of studies undertaken in accordance with the Resolution. The attached document is the Report by the Inter-conference Representative Group (IRG) established for the purpose of undertaking the required studies.

The Conference is invited to consider the results of the studies as outlined in the attached Report.

Yoshio UTSUMI
Secretary-General

Appendix: 1

APPENDIX

FINAL REPORT OF THE
INTER-CONFERENCE REPRESENTATIVE GROUP (IRG)

CONTENTS

1 Introduction

The 1997 World Radiocommunication Conference (WRC-97) reviewed the broadcasting-satellite service (BSS) planning principles proposed by several administrations and those adopted by the 1995 World Radiocommunication Conference (WRC-95) in Resolution 531 (WRC-95) for the revision of Appendix 30/S30 and Appendix 30A/S30A by WRC-97. WRC-97 agreed to establish an Inter-conference Representative Group (IRG) and tasked it:

- to study the feasibility of increasing the minimum capacity for countries in Regions 1 and 3 to around the equivalent of ten analogue channels in accordance with the principles set out in Annex 1 to Resolution 532 (WRC-97);[1]
- to examine Annex 7 in light of its studies for possible revision of the BSS Plans and with respect to decisions taken by WRC-97, such as the reduction of the downlink e.i.r.p. Its advice on the relevance of that Annex in providing protection to all services sharing the planned bands, and particularly the Region 2 BSS Plan, should be reported to WRC-99;
- to consider concerns identified by WRC-97: modifications of the Plans for additional requirements and subregional systems should not lead to monopolization of the use of the bands by a country or group of countries. Advice on how to address these concerns should be reported to WRC-99.

Pursuant to Annex 2 of Resolution 532 (WRC-97), IRG was established and structured to include a Group of Technical Experts (GTE) working under the guidance of IRG. As a result, administrative circular letters were sent to all Member States and Sector Members, regional broadcasting organizations and regional telecommunications organizations inviting them to participate in the activities of IRG and GTE. IRG held five meetings during 1998 and 1999.

Council 1998 by Resolution 1129 modified the proposed agenda of the Conference as follows:

"1.19 to consider the report of the Inter-conference Representative Group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system;

1.19*bis* in accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board's Rules of Procedure relating to the application of RR 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference;"

The same Resolution also instructed the IRG to conduct its work in strict conformity with the principles listed in Annex 1 to Resolution 532 (WRC-97).

This report details the actions that were performed by IRG to implement Resolution 532 (WRC-97).

---

[1] All references to "draft Plans" in this report are to be considered as referring to the results of these feasibility studies.

2 Unused

3 Outline of the IRG and GTE meetings

3.1 IRG

The first meeting of the Inter-conference Representative Group (IRG) was convened from 2 to 4 February 1998 in response to Circular Letter CR/83 of 15 December 1997. The meeting was attended by 41 representatives of 24 administrations and international organizations.
Mr Robert W. Jones, Director of the Radiocommunication Bureau, noted that IRG had been established as a result of Resolution 532 (WRC-97). That Resolution established the primary mandate of IRG and the Group of Technical Experts (GTE).

Mr Ralph Zeitoun (Canada) was unanimously elected Chairperson of IRG. The Vice-Chairpersons elected to represent different areas were:

Africa	Mr I. Samake (Republic of Mali)
Arab Group	Mr N. Kisrawi (Syrian Arab Republic)
Asia & Asia Pacific	Mr E. Behdad (Islamic Republic of Iran)
Europe	Mr A. Frederich (Sweden)
Region 2	Mr E. Reinhart (United States of America)

It was also agreed that Mr K. Arasteh of the Radiocommunication Bureau would chair GTE and it was expected that GTE would operate in a manner similar to the BSS Planning Exercises Team (PXT) which prepared the draft revised Regions 1 and 3 Plan for WRC-97. In the conclusions of the first IRG meeting (IRG-1), three approaches to replanning the Region 1 and 3 BSS Plan were defined (Approaches A, B and C) as summarized in section 4 of this report.

The second meeting of IRG (IRG-2) was convened in Geneva from 1 to 4 September 1998 in response to Circular Letter CR/98 of 3 July 1998. The meeting was attended by 55 representatives of 34 administrations and international organizations. At IRG-2, the Bureau presented results of replanning studies on "Approach A" and possible requirements needed to implement Approaches B and C. The IRG-2 meeting decided to reduce the number of study approaches by merging a modified "Approach A" and "Approach C" into a new approach, "Approach 1". IRG-2 also reviewed an alternative approach, "Approach 2" (initially referred to as "Approach D").

The third meeting of IRG (IRG-3) was convened in Geneva on 17 February 1999 in response to Circular Letter CR/111 of 8 December 1998. It was attended by 89 representatives of 49 administrations and international organizations. Mr Yoshio Utsumi, the Secretary-General of ITU, addressed the meeting and highlighted the importance of modernizing the BSS Plans for Regions 1 and 3. IRG-3 considered both planning approaches and concluded that a new planning approach that combined elements from both Approaches 1 and 2 should be pursued. This was named "The Planning Approach".

The fourth meeting of IRG (IRG-4) was held in Geneva on 1-2 July 1999 in response to Circular Letter CR/121 of 31 March 1999. The meeting was attended by 106 representatives of 53 administrations and international organizations. It agreed on the methodology and basic technical assumptions to be used in the replanning studies under the "Planning Approach".

The fifth meeting of IRG (IRG-5) was held in Geneva on 29 November - 3 December 1999 in response to Circular Letter CR/130 of 31 March 1999. The meeting was attended by 98 representatives of 51 administrations and international organizations. At this meeting, the report of the Director, BR to WRC-2000, as specified by item 1.19 of the agenda, was prepared.

3.2 GTE

The first meeting of GTE (GTE-1) was convened from 6 to 9 April 1998 in Geneva in response to Administrative Circular CA/52 of 15 December 1997. This meeting was attended by 46 representatives of 32 Member States and Sector Members. Mr K. Arasteh of the Radiocommunication Bureau chaired this and subsequent meetings as designated by IRG.

The second meeting of GTE (GTE-2) was held in Geneva over four days during the period 15-16 and 18-19 February 1999 in response to Administrative Circular CA/56 of 4 December 1998. This meeting was attended by 124 representatives of 67 Member States, Sector Members and other organizations.

The third meeting of GTE (GTE-3) was held in Geneva during the period 28-30 June 1999 in response to Administrative-Circular CA/65 of 15 April 1999. The meeting was attended by 88 representatives of 58 Member States, Sector Members and other organizations.

The fourth meeting of GTE (GTE-4) was held in Geneva during the period 27 September - 1 October 1999 pursuant to Administrative Circular CA/68 of 16 August 1999. This meeting was attended by 81 representatives of 51 Member States, Sector Members and other organizations.

4 Brief review of the initial Planning Approaches

The planning approaches referred to above are hereby reviewed briefly to provide a context for the replanning studies that were considered:

Approach A - Incremental approach based on maintaining the current 1997 Plan structure as it evolves and studying the possibility of adding more channels one by one, up to ten channels, to serve each test point/service area while maintaining the same proportionality principle adopted by WARC BS-77.

Approach B - Additional orbital position approach based on maintaining the current 1997 Plan structure as it evolves and studying the possibility of providing additional channels from another orbital position (it might be the same orbital position for some countries) to form subregional coverage instead of national coverage while maintaining the same proportionality principle adopted by WARC BS-77.

Approach C - Complete replanning approach based on maintaining "existing"[2] systems and reshuffling the rest of the available capacity in order to provide a minimum of ten channels to each test point/service area while maintaining the same proportionality principle adopted by WARC BS-77.

Approach D - Complete replanning approach based on maintaining "existing" systems and allotting in a band of 400 MHz a minimum of ten channels to each test point/service area while maintaining the same proportionality principle adopted by WARC BS-77.

---

[2] Whenever the term "existing" system is used in this report, it refers to a system with notified assignments that are in conformity with Appendices S30 and S30A, that have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

5 Further Planning Approaches

Approach 1 - Based on maintaining the WRC-97 Plan as it evolves. Additional channels are assigned in order to bring the total number of channels to ten per test point for countries with between five and ten channels per test point in the WRC-97 Plan.

Approach 2 - Based on an allotment Plan, splitting the planned band in Region 1 into sub-bands of 400 MHz each, and 500 MHz in Region 3. The replanning consists in allotting to each country/coverage area a sub-band (or block) of 400 MHz with one polarization in Region 1, and 500 MHz with one polarization in Region 3. The replanning is based on the principles contained in Resolution 532 and uses the technical assumptions and methodology defined for Approach 1.

Details of Planning Approaches A, B, C, D as well as Approaches 1 and 2 are contained in the Final Report of GTE (CA/73 posted on the ITU website and TIES).

6 The "Planning Approach"

The "Planning Approach" was defined by IRG at its third meeting. It is based on elements from Approach 1 and Approach 2.

6.1 Description of the "Planning Approach"

The feasibility study is performed on the basis of ten defined channels (see Resolution 532 (WRC-97)) grouped in a continuous band for each country in Regions 1 and 3. There are two options:

i) ten defined channels, with a spacing of 38.36 MHz, grouped in a continuous band of 400 MHz with one predetermined polarization; and

ii) ten defined channels, with a spacing of 38.36 MHz between co-polarized channels, grouped in a continuous band of 200 MHz with two predetermined polarizations.

If studies in Region 3 utilizing 500 MHz demonstrate that more channels could be assigned for some Region 3 countries without creating undue constraints on BSS in Region 1, the results of these studies are to be taken into account.

6.2 Choice of orbital positions

In accordance with Resolution 1129 of Council-98, IRG advised the Bureau to consult with administrations regarding the orbital positions to be used in studies based on the "Planning Approach".

A Circular Letter, CR/117 dated 1 March 1999 (and a reminder), was sent to all administrations of Regions 1 and 3 requesting them to inform the Bureau of their preferred orbital position(s) for their beam(s). The Bureau received replies from 53 administrations in response to that circular letter.

In absence of reply, the nominal orbital positions contained in Appendices S30 and S30A were used as default orbital positions in the case of Region 1 countries, and those provided by the APT Group of Technical Experts (AGTE) from Region 3 were used as default orbital positions in the case of Region 3 countries after consultation with the concerned Region 3 administrations.

A list providing all preferred and default orbital positions used as a starting point in the studies was published in Circular Letter CR/132 of 5 January 2000.

With regard to Annex 7 to Appendix S30, see also section 8.

6.3 Technical assumptions and input data

The basic technical assumptions for the "Planning Approach" are described in **Attachment 2**. A summary is provided below.

Generally, technical assumptions as contained in Appendix S30 and Appendix S30A Plans were used, except in the cases mentioned hereafter.

6.3.1 Emission type and channel bandwidth

Studies were to be based on digital modulation with a reference bandwidth of 27 MHz. However, other bandwidths, such as for example 33 MHz or 34.5 MHz (as requested by Japan for their assignments in the exercises), were to be considered before final adoption of the Plan. ITU-R JWP 10-11S confirmed that interference analysis involving non-standard bandwidth cases or non-standard channel spacing cases could be performed by applying Recommendation ITU-R BO.1293 or the worst-case approach according to the case.

6.3.2 Antenna types

The improved fast roll-off space station transmitting antenna characteristics as defined by JWP 10-11/S (see Document GTE99-3/14) was used in special circumstances to solve compatibility problems after consultation with the concerned administration. However, JWP 10-11S informed that, at least for the time-being, this improved fast roll-off antenna should not be used in the case of composite beams (see definition in section 6.3.9 below).

To improve the interference situation, a receiving earth station antenna diameter of 0.9 m was used for a beam of Russia at test points outside the -3 dB contour but still within the national territory of that Administration.

6.3.3 Polarization, channel configuration and number of channels

Among the four channel arrangements studied, it was decided to use generally one channel raster (raster b)): ten defined channels, with 38.36 MHz frequency spacing, grouped in a continuous band of 400 MHz with one predetermined type of polarization. Adjacent channels, with the opposite sense of polarization will be frequency offset by 19.18 MHz. If necessary on a case-by-case basis it was decided to use a second raster, channel raster d): ten defined channels, with 38.36 MHz spacing between co-polarized channels, grouped in a continuous band of 200 MHz with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be adjacent channels with a frequency spacing of 19.18 MHz).

The requests of the Administrations of Australia and Russia to use specific channels was agreed and implemented in the studies.

Studies were performed in response to requests of the Administrations of the Republic of India, the Islamic Republic of Iran and the Republic of Korea to consider for their feeder-link assignments the 14 GHz frequency band alternatively or in addition to the 17 GHz frequency band (see section 6.4.6 below).

6.3.4 Test points

New downlink test points were used for the Administrations of Morocco and Russia. One downlink test point of the Administration of Monaco outside its territory was removed.

6.3.5 Ellipse calculations

Ellipse parameters were recalculated using the ITU/EBU software application only if orbital positions changed or if test points were changed.

6.3.6 Protection ratios and reference EPM

Negative Equivalent Protection Margins of WRC-97 Plans for "existing"[3] systems were kept because it was considered that those negative EPM were accepted together with the protection margins at that time when those assignment were included in the Plans or were brought into use.

After confirmation by ITU-R JWP 10-11S, it was agreed to use in the studies new co-channel protection ratios only in the case of protection of the "planned"[4] digital assignments against interference from other digital assignments: 20 dB overall, 21 dB for the downlink and 27 dB for the feeder link. Otherwise, it was agreed to use the WRC-97 protection ratios.

6.3.7 Downlink e.i.r.p. level

Generally, it was agreed to assign the minimum downlink e.i.r.p. level of each WRC-97 beam to all the channels of each beam, except in the case of Japan and the Republic of Korea for which the "planned" beams are associated with "existing" systems.

It was agreed to determine the power density value assuming a uniform power density over a 27 MHz bandwidth.

6.3.8 Minimum elevation angle

It was agreed to use a minimum elevation angle of 20° within the downlink service area without any specific value for mountainous areas, and to use 40° for those downlink test points located in areas subject to high precipitation (rain-climatic zones M, N, P and Q).

6.3.9 Composite beams in replanning studies

In general, composite beams[5,6] ("simulated shaped beams") are created for administrations which have more than one beam at a given orbital position in the current WRC-97 Regions 1 and 3 BSS Plan. Composite beams have been formed by combining the elliptical beams of the relevant administration at the orbital position in question.

Administrations' preferences were generally taken into account in the studies for Australia, China, India, Saudi Arabia, the United States/American Samoa, and France/New Caledonia and France/Wallis and Futuna Islands.

In order to evaluate whether or not these national preferences impose undue constraints to the replanning process, it was agreed to conduct a comparison with respect to the Bureau's original suggestions and to evaluate the results on a case-by-case basis, where required.

---

[3] Whenever the term "existing" is used in this document, it refers to notified assignments that are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

[4] Whenever the term "planned" is used in this document, it refers to assignments/beams in the results of the feasibility study other than those of "existing" systems as defined in footnote 3 above.

[5] The Administrations of Indonesia and Algeria reserve their positions on the definition of composite beams (see also section 6.3.2).

[6] The United States reserves its position on the use of composite beams for its territories.

6.3.10 Orbital positions

Some countries/administrative regions (CHN/HKG, D, NZL, PNG) were covered by channels from two orbital positions in the WRC-97 Plan. It was agreed to use a separate beam for Hong Kong at 122°, and in the case of Germany, New Zealand and Papua New Guinea, to use an ellipse and associated test points at one of their orbital positions (D: 19° W, NZL: 158° E and PNG: 128° E).

Moreover, the Administration of Germany requested that in addition to the beam D 08700 at 19° W, the beam D2-216000 at 1° W continue to be taken into account in the study until the final clarification of the inclusion of the multinational beams proposed by the Administrations of Germany, Austria, Switzerland and Liechtenstein (see the results of this study in relevant paragraph of section 6.4.5 below).

In response to Circular Letter CR/117 of 1 March 1999, some administrations expressed their wishes to co-locate their beams with the beams of certain other administrations. If it is necessary to move one of these administrations to another orbital location, the other administrations who wish to be co-located should also be moved to the new location. If a given number of administrations insist on a given orbital position in which they are incompatible with one another, this shall in no way impose constraints on the replanning process or limit the capacity of other countries. The concerned countries have to accept any resulting interference or reduction in capacity. See also section 6.2 above.

6.3.11 "Existing" systems[7]

Where an administration has an "existing" system in the Plan and that administration wished to co-locate its national beam with the "existing" system, a new national beam with ten channels was created and grouped with the "existing" system.

In accordance with Principle 3 of Annex 1 to Resolution 532 (WRC-97), eight "existing" systems were considered in the downlink study and seven in the feeder-link study.

At the request of the Administrations of France and Norway, their "existing" systems at 19º W and 5º E respectively in the WRC-97 Plans were not considered in the study.

6.3.12 Multinational beams

It was agreed to maintain in the study the WRC-97 multinational beams with the number of channels they have been assigned in the WRC-97 Plans. It was also agreed to treat the "existing" multinational beam(s) at the same time as other "existing" beams (see section 6.4.1 below).

6.4 BSS/BSS replanning studies (downlink and feeder link)

6.4.1 Methodology

The methodology to implement the "Planning Approach" is described in detail in **Attachment 1**. A summary is provided below.

The methodology was defined assuming the use of channel raster b) (see channel raster definition in section 6.3 above). It is a stepwise approach composed of two parts. The first part corresponds to the downlink study and includes six steps and the second part to the feeder-link study and includes three actions.

---

[7] Sweden and Norway reserve their position with respect to the principles for selection of channels for administrations having "existing" systems in the Plan.

6.4.1.1 Downlink study

The downlink study consisted of six steps. Steps 1 and 2 provide for the initial preparation of the downlink study. They are related to the definition of *a priori* selected orbital position and the creation of composite beams respectively.

Step 3 of the downlink study consisted of the establishment of a downlink "starting point plan" composed of the "existing" assignments of all the downlink "existing" systems and their associated "planned" assignments/beams, in order to ensure that Principle 3 of Resolution 532 (WRC-97) is met.

The remaining part of Step 3, and Steps 4 to 5 of the downlink study were based on the successive inclusion in the draft new downlink Plan of all the "planned" beams to be considered, according to the following order:

I beam with minimum service-arc size (high latitude countries with low elevation angles);

II composite beams;

III maximum beam size;

IV multinational beam (see also section 6.3.12 above).

Steps 3, 4 and 5 were separated in order to provide an incremental flexible means to ease the inclusion of the "planned" beams in the draft new downlink Plan.

Thus, Step 3 only considers the possibility of including the "planned" beams at their preferred or default orbital positions, as referred to in section 6.2 above. However, in order to accommodate as much as possible the preferred orbital position(s), specifically those requested by administrations, further enhanced means can be implemented such as: changes in the order of treatment, recalculation/readjustment of the elliptical beam parameters, use of fast roll-off antenna, application of power adjustments.

The purpose of Step 4 was to try to include the remaining "planned" beams after Step 3 at other orbital positions.

Finally, if few "planned" beams remained to be included in the draft new downlink Plan after Step 4, Step 5 considers other manual possibilities to accommodate these Step 5 "planned" beams by changing the channels and/or default orbital positions assigned to the "planned" beams included at Steps 3 and 4, and/or by improving or adjusting some technical parameters. On a specific case-by-case basis, the ten channels assigned could be spread over 800 MHz instead of 400 MHz and the administration of an affected "existing" system could be invited, if necessary, to accept an e.i.r.p. increase up to 1 dB or accept a degradation in EPM up to 1 dB.

Should a significantly high number of beams remain to be included after Step 4, the implementation of both Step 3 and Step 4 would have to be repeated with a reduced number of channels.

Step 6 of the downlink study provides for the successive inclusion in the draft new Step 5 downlink Plan all the "planned" multinational beams to be considered, according to the following order:

I beam with minimum service-arc size (high latitude countries with low elevation angles);

II maximum beam size.

In application of Steps 3, 4, 5 and 6, the following criteria had to be respected:

a) in the case of "existing" assignments/systems, no positive reference EPM is degraded below -0.45 dB and no negative reference EPM is degraded by more than 0.45 dB. The reference EPM values were those of the WRC-97 reference situation as it evolves;

b) in case of "planned" assignments, no negative reference EPM below -0.45 dB, noting that interference from beams located beyond a certain orbital separation was not included in the downlink EPM calculation. See **Attachment 1** for further details.

6.4.1.2 Feeder-link study

Action 1 of the feeder-link study consisted of creating a "draft new feeder-link Plan" by using the "existing" feeder-link systems with their "existing" assignment(s), and by assigning to each of the feeder-link "planned" beams the block of channels and the orbital position selected for their corresponding downlink "planned" beam at the end of the implementation of the "draft new downlink Plan".

Action 2 of the feeder-link study consisted of calculating interference and analysing the "draft new feeder-link Plan" defined at Action 1. The interference incompatibilities were then resolved by using different polarization direction and/or different channels in the same or the alternative frequency band if allocated (i.e. 17 GHz/14 GHz). As a last resort, a shift of ±0.2 degrees around the nominal orbital position, in both the feeder-link and downlink plans, could be envisaged between the beams involved in the incompatibility situation.

Finally, the purpose of Action 3 was to check that the solutions implemented at Action 2 provided successful results in order to ensure that the following criteria were respected:

a) in the case of "existing" assignments/systems, no positive reference EPM is degraded below -0.45 dB and no negative reference EPM is degraded by more than 0.45 dB. The reference EPM values were those of the WRC-97 reference situation as it evolves;

b) in case of "planned" assignments, no negative reference EPM below -0.45 dB;

c) with respect to the resolution of negative equivalent protection margin of ten beams in the feeder-link studies, the same approach/principle used in the downlink implementation to be used i.e. change of orbital position(s) if it was not specifically requested while applying the order of beam treatment according to the size of service arc and minimizing the number of changes.

See **Attachment 1** for further details.

6.4.2 Summary of results

6.4.2.1 Results of downlink study[8]

An initial downlink study based on analogue emissions with ten channels in Regions 1 and 3 utilizing channel raster b) found that 80% of the beams considered were successfully allotted ten channels in a continuous band of 400 MHz at Step 3. The Step 4 process accommodated most of the remaining beams at other orbital positions.

A second replanning study was conducted for the downlink based on the "Planning Approach" using the new digital protection ratios. The results found that 95% of the 198 beams considered were successfully allotted ten channels in a continuous band of 400 MHz. The Step 5 process could

---

[8] The Spanish and Russian Administrations observe that the results of this study cannot be considered as final in so far as frequency assignments currently in the WRC-97 Plan pending only of being brought into use, will meet all the requirements of Resolution 532 as soon as they are brought into use, thus qualifying for inclusion in the feasibility study, which will in turn result in the modification of the obtained results. The Spanish Administration has currently frequency assignments in the WRC-97 Plan ready to be brought into use in the immediate future, which will fall into the above described situation. The Russian Administration has the same situation.

not resolve incompatibility problems associated with the remaining ten beams. These beams were located in "Europe". A source of incompatibility emanated from "existing"[9] systems.

A third downlink study based on the "Planning Approach" and revised methodology that included changes to a number of technical parameters[10] found that:

- all national "planned" beams could be accommodated with ten channels in a continuous band of 400 MHz for Region 1 and 12 channels in a continuous band of 500 MHz for Region 3 utilizing channel raster b) as well as all "existing" systems;
- three[11] of the ten multinational "planned" beams that were in the WARC-77 Plan and confirmed in the WRC-97 Plan could be accommodated with the required number of channels. The Conference is recommended to consider this matter; and
- five of the 77 national preferences for orbital positions and channels could not be accommodated as requested.

Details of the downlink study results are in **Attachment 4**.

6.4.2.2 Results of feeder-link study[12]

Results of replanning studies on the feeder link assuming primarily the 17 GHz frequency band indicate that 95% of the beams can be accommodated with 10 channels for Region 1 and 12 channels for Region 3 utilizing channel raster b) or channel raster d), as appropriate, with no excess of interference.

Among the 10 beams[13] remaining with an excess of interference at the end of the study, only four beams at three nominal orbital positions (7° W, 1° W and 44° E) present a high degree of incompatibility. Solutions consisting of moving these beams to other orbital positions have been identified, however, this can be done only by revising together the downlink and feeder-link Plans.

Details of the feeder-link study results are in **Attachment 4**.

---

[9] Administrations of Morocco, Syria, Algeria, Tunisia and Kenya consider that the total number of channels per coverage area shall not exceed either 10 channels or the number of channels of an "existing system" which is greater than 10. This is with the understanding that the planning conference will decide on the status of those channels of "existing systems" that exceed the number 10.

[10] A number of European administrations are of the view that some of these changes still need to be proven by studies of their appropriateness.

[11] One "existing" multinational beam was accommodated at Step 3.

[12] The Spanish and Russian Administrations observe that the results of this study cannot be considered as final in so far as frequency assignments currently in the WRC-97 Plan pending only of being brought into use, will meet all the requirements of Resolution 532 as soon as they are brought into use, thus qualifying for inclusion in the feasibility study, which will in turn result in the modification of the obtained results. The Spanish Administration has currently frequency assignments in the WRC-97 Plan ready to be brought into use in the immediate future, which will fall into the above described situation. The Russian Administration has the same situation.

[13] A "beam" in this context is a single elliptical beam, a composite beam or a group of beams forming a satellite system (e.g. two beams of HISPASAT-1 (analogue 27 MHz), four beams of RST-1).

6.4.3 AGTE study

The Asia Pacific Telecommunity Group of Technical Experts (AGTE) reported that it had conducted ongoing studies to investigate the feasibility of replanning under Resolution 532. An example of a trial downlink and feeder-link Plan for Region 3 assumed analogue modulation was conducted. In considering the results of the example exercise, AGTE indicated that the task of Resolution 532 may be feasible, on the basis of providing at least 12 national assignments to all administrations in Region 3. AGTE therefore asked GTE to conduct a similar study based on this point.

6.4.4 Study related to the request made by Region 3

With reference to the 12 channels for each country of Region 3, this resulted from a study on the effect of adding two channels (i.e. 10 + 2) to the beams of Region 3 countries was requested by Region 3 countries in order to more efficiently use the 500 MHz BSS allocation in that Region at 12 GHz. The results of the study show that it is possible to add two channels (i.e. 10 + 2) for each Region 3 country for both feeder link and downlink if the orbital positions and channel blocks and polarization of some beams are properly adjusted.

The Administration of Japan requested GTE to study the impact of including a 34.5 MHz bandwidth for the Japanese national beam. The results of studies found that only a relatively slight degradation in EPM occurs to neighbouring beams. IRG decided to include the request in the replanning exercises.

6.4.5 Multinational beam study for Germany, Austria, Switzerland and Liechtenstein

A study was conducted by GTE to determine the impact of a proposal from the Administrations of Germany, Austria, Switzerland and Liechtenstein to include a new multinational beam covering their territories with ten channels per country in the replanning studies in place of their national beams. The results of the study found that it was possible to accommodate the proposed multinational beam for Germany, Austria, Switzerland and Liechtenstein with ten channels per country into the draft plan without negative EPM.

The IRG decided to include in the planning exercise a beam replacing the national beams of these four administrations with ten channels for each of the administrations concerned. That inclusion was adopted with the understanding that, if the above common beam is found to be compatible with the Plan and is finally included in the Plan by the conference, other similar combined beams compatible with the Plan will also be included in it, and that future modifications of the Plan for a similar purpose are permitted.

6.4.6 Feeder-link studies of national preferences related to the use of the 14 GHz and/or 17 GHz frequency bands

At GTE-4, participants from the Republic of India, the Islamic Republic of Iran and the Republic of Korea indicated their wishes to use for their feeder-link assignments the 14 GHz frequency band alternatively and/or in addition to the 17 GHz frequency band.

These national preferences were examined at the end of the basic study described in Document IRG99-5/16 in which, in accordance with the IRG-4 decision, the 17 GHz frequency band was primarily considered in order to provide each country with the required number of channels in accordance with Resolution 532 (WRC-97). Other technical assumptions used in the above studies are described in Document IRG99-5/13.

For the Islamic Republic of Iran and the Republic of Korea, the required number of channels can be assigned to these countries in the draft new 14 GHz feeder-link Plan without causing any excess interference to any other beam in that draft new Plan.

In the case of the Republic of India, only one of its two beams at 56° E and two of its three beams at 68° E (±0.2°) can be assigned the required number of channels in the draft new 14 GHz feeder-link Plan without causing any excess interference to any other beam in that draft new Plan.

The Republic of Korea indicated that the 17 GHz band is primarily for use as the feeder link for beam KOR11200 as described in Document IRG99-5/16.

6.4.7 Multinational beam for CZE, HNG, HRV and SVK

The Administrations of Croatia, Hungary, Slovak Republic and Czech Republic requested IRG-5 to investigate the inclusion of a new multinational beam covering their territories with ten channels per country in the replanning studies replacing their national beams. The Administrations of Croatia, Hungary, Slovak Republic and Czech Republic requested that their current national beams (HRV14800, HNG10600, SVK14400, CZE14400) continue to be taken into account in the ongoing planning study until the final clarification of the acceptability of inclusion of the proposed multinational beam. IRG-5 agreed to investigate the proposal and include the results in its report to be submitted to WRC-2000. The same evaluation process will be followed as was used in studying the request in section 6.4.5 above, i.e.:

1) Continue the planning exercises based on national coverages with ten channels (principles 1 and 2 of Annex 1 of Resolution 532) at the same orbital position.
2) At the end of this exercise, four identical multinational beams covering the territory of Croatia, Hungary, Slovak Republic and Czech Republic, each with ten channels will be substituted to the national beams of Croatia, Hungary, Slovak Republic and Czech Republic and the e.i.r.p. of this multinational beam be reduced if necessary to a level which does not create more interference than the previous situation (i.e. the four national beams with ten channels). The result of this modification i.e. the level of e.i.r.p. and the EPM associated to this new multinational beam is proposed to the Administrations of Croatia, Hungary, Slovak Republic and Czech Republic for agreement or otherwise.

These administrations shall provide to BR new test points before 31 December 1999 if needed.

6.4.8 Multinational beam for Syria and Lebanon

The Administrations of Syria and Lebanon requested IRG-5 to investigate the inclusion of the multinational beam SYR33900 covering their territories with ten channels per country in the replanning studies replacing their national beams, with possible extension to two additional neighbouring countries if so requested by them. The Administrations of Syria and Lebanon requested that their current national beams continue to be taken into account in the ongoing planning study until the final clarification of the acceptability of inclusion of the proposed multinational beam. IRG-5 agreed to investigate the proposal and include the results in its report to be submitted to WRC-2000. The same evaluation process will be followed as was used in studying the request in sections 6.4.5, and described in section 6.4.7. These two administrations shall provide to BR new test points before 31 December 1999 if needed.

6.4.9 New requests agreed by IRG-5

A number of new requests were put to IRG-5 for its consideration as follows.

Malaysia requested a change in orbital position from 86º E to 91.5º E for its composite beam.

China requested a change in orbital position from 79.8º E to 134º E for its elliptical and composite beams. It also requested that the WRC-97 large feeder-link beams be used at 62º E, 92º E and 134º E.

Iran requested a change in orbital position from 34º E to 54º E for its beam.

Portugal requested the inclusion of a new minimum sized spot beam to cover the territory of Macao, preferably at 122º E.

Australia requested that 10 (12) channels be provided to all Australian test points including its offshore territories for both the downlink and feeder link.

American Samoa requested to split the composite beam between PLM and SMA to have two individual (non-composite) beams. The same request is made for MRA and GUM.

Morocco requested IRG-5 to investigate the use of the 17 GHz band in place of the 14 GHz band for its feeder-link assignments. Should the results indicate that both frequency bands are possible, the administration, once informed, should make its choice of the use of either the 14 or 17 GHz frequency bands.

Seychelles requested IRG-5 to investigate the use of the 14 GHz band in addition to the 17 GHz band for its feeder-link assignments. Should the results indicate that both frequency bands are possible, the administration, once informed, should make its choice of the use of either the 14 or 17 GHz frequency bands.

Bulgaria requested IRG-5 to also study the feeder link with its beam at 1º W with the same beam ellipse and orientation of the downlink beam.

Japan requested IRG-5 to study 12 channels at 109.85º E in addition to and grouped with its assignments at 110º E.

Lao P.D.R. requested IRG-5 to move its national orbital location from 122º E to another orbital position with a 33 MHz bandwidth for the channels.

A group of countries requested the IRG to consider in the replanning exercises a new beam covering the East Timor territory. The orbital position is to be chosen within its service arc in a way that does not put undue constraints on the replanning exercises. The administrative procedures to implement this request have yet to be determined.

BR shall include in the replanning exercises any systems which become existing in the meaning of principle 3 of Annex 1 to Resolution 532 (WRC-97), as time permits. Systems that could not be entered in replanning exercises shall be reported to the Conference.

IRG-5 agreed to investigate the proposals and include the results in its report to be submitted to WRC-2000. For any new beam, the corresponding test points shall be communicated to BR by the responsible/requesting administrations before 31 December 1999.

6.5 Studies of compatibility with other services and the Region 2 Plan

In addition to the Regions 1 and 3 BSS-BSS compatibility analysis, planning Principles 7 and 8 of Annex 1 to Resolution 532 (WRC-97) require a compatibility examination to ensure protection of the Region 2 Plan and not to require more protection from assignments in Region 2. Moreover, it is also necessary to ensure the compatibility between the draft Regions 1 and 3 Plan and those services sharing the same frequency bands (FSS and terrestrial services) in all three Regions.

This section provides the result of compatibility analyses for proposed BSS assignments for Regions 1 and 3 except assignments which are considered as "existing" systems as per Resolution 532.

The analyses comprise both:

- compatibility studies from the proposed Regions 1 and 3 BSS Plan assignments into other services or into Region 2 BSS; and
- compatibility studies into the proposed Regions 1 and 3 BSS Plan assignments from other services or from Region 2 BSS.

Both feeder-link and downlink conditions have been investigated.

The input data used for the compatibility analyses was obtained from the "feasibility study" as described in the previous section.

The satellite systems data that were contained in the SNS database as of [1 February 2000, i.e. all networks which have been received by BR before 19/1/98 have been taken into account and networks for which the complete information has been received between 19/1/98 and 19/8/99 have also been taken into account] were used in the calculation. It is to be noted that those satellite networks not yet processed by the Bureau have not been taken into account in these compatibility analyses.

Compatibility analysis between the draft Regions 1 and 3 BSS Plan and the Region 2 BSS Plan has been based on the present Region 2 BSS Plan assignments and the modifications of the Region 2 Plan that successfully applied the Article 4 procedure.

Two important points should be taken into account in interpreting the results contained in this section.

1) The results of the compatibility analyses will change if the list of satellite systems contained in the SNS database is modified, i.e. new satellite systems/assignments (FSS in Regions 2 and 3 and BSS of Region 2) are included in the list or cancelled as a result of application of relevant provisions of Article S11.

2) The tables of identified administrations show cases where there is a possibility of harmful interference if various additional circumstances apply. Such tables do not imply that harmful interference will actually occur, they merely provide a warning flag that further investigation of the necessity of actual coordination may be required.

The Bureau was requested to also provide the result of compatibility analyses with respect to assignments contained in the WRC-97 Plan using the same criteria and method mentioned below.

6.5.1 Methodology

Sharing criteria and methodologies for the compatibility analyses have been developed by IRG based on those in Appendices S30 or S30A and their associated Rules of Procedure. The criteria that have been applied are summarized in Table 1 below. The details of the calculation basis for each compatibility condition are explained in **Attachment 3**.

TABLE 1

Criteria for assessing compatibility between Plans and services

Interference source: Feeder-link assignments in the draft Regions 1 and 3 BSS Plan

Protected assignments/service	RR provision	Criteria/methodology
Region 2 Plan assignments	4.2.1.4 of Article 4 of APS30A	APS8 (section 5 of Annex 1 of APS30A)
Terrestrial service	4.2.1.3 of Article 4 of APS30A	APS7 (section 2 of Annex 1 of APS30A)/ list of "existing" stations
Receiving FSS specific earth station	4.2.1.2 of Article 4 of APS30A	Annex 4 of APS30A (section 1 of Annex 1 of APS30A)/list of existing stations

Interference source: Downlink assignments in the draft Regions 1 and 3 BSS Plan

Protected assignments/service	**RR provision**	**Criteria/methodology**
Region 2 Plan assignments	4.3.1.2 of Article 4 of APS30	Pfd (section 3 of Annex 1 of APS30)
Terrestrial service	4.3.1.4 of Article 4 of APS30	Pfd (sections 4, 8 of Annex 1 of APS30)
FSS space station associated with a receiving FSS earth station that may suffer interference	4.3.1.5 of Article 4 of APS30	Pfd (section 6 of Annex 1 of APS30)

Protected assignments: Feeder-link assignments in the draft Regions 1 and 3 BSS Plan

Interference source	**RR provision**	**Criteria/methodology**
Region 2 Plan assignments	4.2.3.4 of Article 4 of APS30A	APS8 (section 5 of Annex 1 of APS30A)
Space station of FSS (Regions 1 and 3)	7.1 of Article 7 of APS30A	Annex 4 of APS30A with modification of satellite system noise temperature 600 K and ΔTs/Ts 6%
Space station of unplanned BSS (Region 2)	7.1 of Article 7 of APS30A	Annex 4 of AP30A with modification of satellite system noise temperature 600 K and ΔTs/Ts 6%

Protected assignments: Downlink assignments in the draft Regions 1 and 3 BSS Plan

Interference source	**RR provision**	**Criteria/methodology**
Region 2 Plan assignments	4.3.3.2 of Article 4 of APS30	Pfd (section 3 of Annex 1 of APS30)
Terrestrial service	6.1.1 of Article 6 of APS30	Frequency overlap and Annex 3 of APS30
Space station of FSS	7.2.1 of Article 7 of APS30	Frequency overlap and Annex 4 of APS30

6.5.2 Summary of results

A summary of compatibility analysis results obtained are included in Table 2. Further details of the results are contained in **Attachment 5**.

TABLE 2

Compatibility analyses

The results below apply to the assignments in "the draft Regions 1 and 3 BSS Plan" except assignments which are considered as "existing" as per Resolution 532.

6.5.2.1 Compatibility with respect to the draft Regions 1 and 3 Plan assignments causing interference

6.5.2.1.1 Feeder link

Protected assignments/service	Number of administrations receiving interference from the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan causing interference to the subject assignments/service
Region 2 Plan assignments	2	3

Protected assignments/service	Number of existing stations sharing the same frequency bands with the draft Regions 1 and 3 Plan assignments
Terrestrial service (all three Regions)	1 142 (14 GHz)* 489 (17 GHz)*
Earth station of FSS (all three Regions)	35
* In addition, there are transmitting terrestrial stations which do not have corresponding receiving terrestrial stations recorded in MIFR (e.g. Typical stations).	

6.5.2.1.2 Downlink

Protected assignments/service	Number of administrations/organizations receiving interference from the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan causing interference to the subject assignments/service
Region 2 Plan assignments	0	0
Terrestrial service (all three Regions)	95	63
FSS space station associated with a receiving FSS earth station that may suffer interference (Region 2 11.7-12.2 GHz) (Region 3 12.2-12.5 GHz)	25	112

6.5.2.2 Compatibility with respect to the draft Regions 1 and 3 Plan assignments receiving interference

6.5.2.2.1 Feeder link

Assignment/service causing interference to draft Regions 1 and 3 Plan assignments	Number of administrations/organizations causing interference to the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan receiving interference from the subject assignments/service
Region 2 Plan assignments	3	4
Space station of FSS (all three Regions)	13	88
Space station of unplanned BSS (Region 2)	0	0

6.5.2.2.2 Downlink

Assignment/service causing interference to draft Regions 1 and 3 Plan assignments	Number of administrations/organizations causing interference to the draft Regions 1 and 3 Plan assignments	Number of administrations in the draft Regions 1 and 3 Plan receiving interference from the subject assignments/service
Region 2 Plan assignments	0	0
Terrestrial service (all three Regions)	1	1
Space station of FSS (Region 2 11.7-12.2 GHz) (Region 3 12.2-12.5 GHz)	18	125

6.5.3 Possible solution to incompatibility problems

Possible technical and regulatory measures were discussed to overcome some of the incompatibilities.

For the FSS, there are MIFR systems (usually in operation), or FSS systems coordinated, or in coordination with an actual Plan to be operational soon.

BR was requested to identify the administration as well as the concerned FSS networks that are involved in these incompatibilities upon request. Administrations may request the assistance of BR in recommending actions for resolution of incompatibilities.

7 Conclusions

When considering possible recommendations to WRC-2000, the following statements were made:

1 The annex to this Report contains a proposal by the countries listed in it, requesting WRC-2000:

- to adopt a new Plan for the broadcasting-satellite service in Regions 1 and 3 with appropriate procedures;
- to use to that effect the planning exercise developed by the GTE and IRG;
- to retain the IRG with the task to study any remaining unresolved cases and report to the subsequent WRC.

2 The Administrations of Luxembourg, Sweden, Poland, Germany, Spain, France, Bulgaria, Turkey, Denmark, Austria, Portugal, Finland, New Zealand, Norway, United Kingdom, Russia and Switzerland were of the view that many of the items proposed in Annex 1 are beyond the mandate of the IRG as specified in Resolution 532 (WRC-97).

3 A group of administrations were of the view that, as the task of the IRG was to study the feasibility of increasing the capacity of the assignments to Regions 1/3, the results of the GTE as presented to the IRG have demonstrated that there may be a potential of increasing the capacity based on the data and requirements that were used by the GTE at its meeting in September 1999. However, the results presented to the IRG have not yet fully demonstrated this feasibility for the following reasons:

- the existing systems that will be in accordance with the principle 3 of Annex 1 of Resolution 532 as of the date to be decided by WRC-2000 have not yet been taken into account (principle 3);
- those BSS assignments that were included in the Plans by WRC-97, and referred to in the reports of the analysis presented to IRG-5 but not yet brought into use, have not yet been analysed to show their impact on the results of the analysis (principle 5);
- a number of feeder-link incompatibilities have not been resolved;
- the detailed results of the downlink and feeder-link analysis have not been studied by the IRG;
- all FSS network coordination requests communicated to BR prior to the GTE but not yet processed have not been taken into consideration and there has been no method identified for resolving these potential incompatibilities (principle 8);
- many incompatibilities have been identified with terrestrial services and there is no means yet to resolve these incompatibilities (principle 8);
- most of the multinational beams that were in the Plans since WARC-77 and confirmed by WRC-97 could not be included;
- some administrations' preferences with respect to orbital positions and channels assignments have not been accommodated in the feasibility studies;
- some of the new preferences of administrations for orbital positions have not yet been analysed (see paragraph 6.4.8 of the report);
- some of the technical parameters adopted by the GTE required further consideration.

1) The administrations are: AUT, D, DNK, E, FIN, F, LUX, NOR, HOL, NZL, POL, POR, G, RUS, S, SUI and TUR

4 The delegations of Syria, Indonesia, Morocco, Eritrea, Chad, Tunisia, Seychelles, Iran, Viet Nam, Algeria, Mali and Kenya express their concern in regard to the manner in which some European delegations intending to protect their subregional existing systems created, practically in all IRG meetings, a number of false reasons for avoiding the replanning of the broadcasting-satellite service and, in so doing, attempted to acquire a monopolization of the spectrum/orbit in contravention with the basic principles of the ITU Constitution.

5 One Region 2 administration, the United States of America, also expressed concern about the compatibility of the feasibility studies with other services sharing these bands, as required by principles 7 and 8 of Annex 1 to Resolution 532 (WRC-97), considering the results of the compatibility analyses provided in section 6.5.

8 Review of Annex 7 of Appendix S30

8.1 Introduction

8.1.1 Provisions and original intent of Annex 7

Annex 7 to Appendix S30 of the Radio Regulations was adopted at WARC-77 and maintained without change at WRC-97. It specifies two types of constraints on the development of Plans for the BSS. Part A contains limitations on the nominal orbital positions that may be used in modifying the BSS Plans for the three ITU Regions. Part B deals with the concept of clustering i.e. "the grouping of space stations in nominal orbital positions of +0.2º and -0.2º from the centre of the cluster of satellites".

The limitations most relevant to the replanning studies of the IRG and GTE and for consideration at WRC-2000 are:

> Section A1: "No broadcasting satellite serving an area in Region 1 and using a frequency in the band 11.7-12.2 GHz shall occupy a nominal position further west than 37º W or further east than 146º E."; and
>
> Section A3: "Any new orbital position in the Regions 1 and 3 Plan in the range of the orbital arc between 37° W and 10° E associated with a new assignment, or resulting from a modification of an assignment in the Plan, shall be coincident with, or within 1° to the east of, a nominal orbital position in the Regions 1 and 3 Plan at the date of entry into force of the Final Acts of the 1977 Conference (in force on 1 January 1979).
>
> In the event of a modification to an assignment in the Regions 1 and 3 Plan, the use of a new nominal orbital position not coincident with any nominal orbital position in the Plan at the date of entry into force of the Final Acts of the 1977 Conference (in force on 1 January 1979) shall involve an 8 dB reduction in the e.i.r.p. compared to that appearing in the Regions 1 and 3 Plan for the assignment before modification."

The orbital position limitations in the first paragraph of section A3 were intended to ensure equitable sharing of the frequency band 11.7-12.2 GHz and the orbital arc 37º W to 10º E between Region 2 FSS networks and Region 1 BSS Plan assignments. In particular, they require that a minimum separation of 5º be maintained between adjacent BSS nominal orbital positions. This permits a Region 2 FSS space station to operate at a separation of up to 2.5º from the nearest Region 1 BSS space station, which is sufficient to avoid mutual interference and the need for coordination.

With regard to the equity of sharing between Region 1 BSS and Region 2 FSS, the view was expressed during the fifth meeting of the IRG that the need for orbital position limitations of the type contained in section A3 of Annex 7 had changed since WARC-77. In particular, it was observed that the 1977 BSS Plan provided for a rather dense utilization of the geostationary orbit to the east of 37^{o} W at a time when very few orbital positions were in use for the FSS serving Region 2 countries. In contrast, the utilization of orbital positions for Region 1 assignments in the WRC-97 BSS Plan is quite similar to that of WARC-77, whereas the utilization of orbital positions for the Region 2 FSS has increased substantially. With comparable density of orbital position utilization in the two services, it was considered that the burden of sharing the band in the orbital arc of common interest should be balanced and equitable.

In this connection, however, it may also be observed that, although the countries of North America have indeed made heavy use of orbital positions west of about 60^{o} W for FSS networks providing national coverage, this is not true for the countries of South America. In the orbital arc cited in section A3 of Annex 7, the only existing or planned FSS systems are networks providing trans-Atlantic communications between Regions 1 and 2. It can therefore be argued that due to their geographical situation, some countries in Region 2 continue to need provisions similar to those of Annex 7 to facilitate the development of their FSS systems. Therefore, such provisions need to be included in the revision of Appendices S30 and S30A.

8.1.2 Application of Annex 7 to the WRC-97 Plan

As noted above, Annex 7 was maintained without change at WRC-97. However, in developing the Plan for Regions 1 and 3, WRC-97 did introduce an exception to the orbital position limitations specified in that Annex. Specifically, the nominal orbital position at 31^{o} W from the original WARC-77 Plan was replaced by new positions at 30^{o} W and 33.5^{o} W. The Radio Regulations Board views these two new positions as "nominal orbital positions in the Plan" for the application of the Annex 7 orbital limitations on modifications to the WRC-97 Plan.

8.2 Consideration of Annex 7 in IRG/GTE replanning studies

8.2.1 WRC-97 request for studies of Annex 7

Annex 2 of Resolution 532 (WRC-97) requested the IRG to:

- "examine Annex 7 in the light of its studies for possible revision of the BSS Plans and with respect to the decisions taken by WRC-97, such as the reduction of downlink e.i.r.p.";
- provide to WRC-2000 "its advice on the relevance of that annex in providing protection to all services sharing the Plan bands, and particularly the Region 2 BSS Plan".

8.2.2 Results of ITU-R studies on Annexes 7, 1, and 4

In response to these requests from WRC-97, IRG invited the GTE to carry out the desired examination of Annex 7 in collaboration with elements of ITU-R.

During the course of this examination of Annex 7, the question arose as to whether the sharing criteria of Annexes 1 and 4 of Appendix S30 (which are associated respectively with the Plan modification procedures of Article 4 of Appendix S30 and the coordination procedures of Article 7 of Appendix S30) might make the orbit position limitations of Annex 7 unnecessary. Accordingly, IRG-3 suggested that subsequent studies of Annex 7 be expanded to include this question.

On the basis of these studies and taking account of contributions from administrations, the following conclusions were drawn by the ITU-R:

- The 8 dB e.i.r.p. reduction of section A3 of Annex 7 can be removed insofar as the protection of fixed service systems and current mobile service systems is concerned.
- No conclusion was drawn on the impact that relaxing or removing the 8 dB e.i.r.p. requirement would have on the fixed-satellite service since the pertinent studies are pending.
- With regard to the orbital position limitations of section A3, the first comprehensive technical studies indicated that an orbital separation of at least 2.5° is required to ensure adequate protection of a Region 1 BSS Plan assignment against interference from a Region 2 FSS network. It follows that Region 2 FSS access to the arc 37° W to 10° E is contingent on the maintenance of at least a 5° orbital separation between adjacent nominal BSS positions in this arc.
- The technical studies also concluded that the present Annexes 1 and 4 pfd limits are not, in themselves, sufficient to ensure either access of Region 2 FSS networks or appropriate interference protection to both BSS and FSS in the orbital arc 37° W to 10° E.
- Further studies of Annexes 7, 1 and 4 shed additional light on the Region 2 FSS - Region 1 BSS orbital separation required to avoid mutual interference, as well as on the relevance of the Annexes 1 and 4 limits to Region 2 FSS access to the orbital arc segment in question. In particular, these studies utilized three separate technical approaches for determining the minimum orbital separation between an FSS satellite serving Region 2 and a BSS satellite serving Region 1 with characteristics similar to those in the WRC-97 BSS Plan. The studies concluded that, in the absence of agreement on further technical means for constraining the emissions of Region 1 BSS and Region 2 FSS satellites, besides those currently recommended by ITU-R, orbital position limitations on Region 1 BSS similar to those in section A3 of Annex 7 will continue to be required to ensure a balanced access to the arc from 37° W to 10° E by the BSS and the FSS. The studies also confirmed the previous conclusions regarding the inadequacy of the existing criteria of Annexes 1 and 4 as substitutes for the orbital position limitations of Annex 7.

8.2.3 IRG guidance for the replanning studies

Based on the early results of the studies just described, the Report of the second meeting of the IRG provided the following guidance in selecting orbital positions relative to the "prohibited arc", 37° W to 10° E cited in Annex 7.

> "In selecting orbit positions during the replanning studies, the following priority sequence should be observed:
>
> a) take to the extent possible the existing nominal orbital positions of the WRC-97 Plans;
>
> b) if necessary, create new orbital positions outside the prohibited arc of Annex 7;
>
> c) then if unavoidable and further positions are still required, next try orbital positions within the prohibited arc of Annex 7 to Appendix 30/S30 taking into account Principle 8 of Annex 1 to Resolution 532 (WRC-97)".

The Report of the third meeting of the IRG provided the following additional guidance to the GTE with regard to the use of the Annex 7 limits in its replanning studies.

> "The specific requests of administrations [regarding the orbital positions to be used in planning] will be taken into account. However, in selecting orbit positions, the orbit segmentation limitations contained in Appendix S30 shall be respected.

NOTE 1 - It was understood by the United States that the "orbit segmentations limitations" are those contained in both sections A1 and A3 of Annex 7.

NOTE 2 - A group of APT members have the opinion that selection of orbital positions during the planning process shall be in conformity with Annex 7 of Appendix S30".

Using additional guidance from IRG-4, the Bureau presented the results of new planning exercises to GTE-4 and IRG-5. These exercises included only one orbital position that was not in conformity with the present Annex 7 orbital position limitations. This position was included to satisfy the orbital position preference of one administration and does not pose any constraints on the orbital positions available to the FSS of Region 2. It follows that the Annex 7 limitations need not impose undue constraints on the Regions 1 and 3 replanning exercises.

8.3 Applicability of Annex 7 and Annexes 1 and 4 in the modification procedures associated with a future Regions 1 and 3 Plan

The provisions of Annexes 1 and 7 are associated with the Plan modification procedures of Article 4 of Appendix S30. Likewise the provisions of Annex 4 are associated with the coordination and notification procedures of Article 7 of Appendix S30. The applicability of these Annexes in any revision of the Article 4 and Article 7 procedures at WRC-2000, was discussed in the light the results of the studies summarized in section 2.2 above and a proposal described in Document IRG99-5/26. This discussion led to the identification of three options, as discussed below.

8.3.1 Option 1 - Retention of Annexes 7 and 4 with a minor update of section 6 of Annex 1

In this option, the orbital position limitations of section A3 of Annex 7 would be retained without change, as would the Annex 4 pfd limits for the protection of the BSS systems in the Plans against interference from FSS space stations.

This option is based on the results of three independent analyses conducted within WP 10-11S which demonstrated that the orbital position limitations of Annex 7 continue to be needed, even with the change of BSS and FSS parameters that have occurred since the original development of the Annex. One of these studies, using currently published INTELSAT FSS carrier parameters and BSS planning parameters demonstrated that the current 2.5 degree separation continues to be required, when the respective beams are pointed to the north eastern part of Brazil and West Africa. Although this was a worst-case analysis, it meant that, in order to fulfil the objectives of the original Annex 7 (namely, that modifications to the BSS Plan should not inhibit the growth of the FSS in Region 2) continued applicability of the orbit position limitations of Annex 7 are required.

The only necessary change under this option would be to update the first paragraph of section 6 of Annex 1. Specifically, the condition for determining whether an administration is affected by a proposed Plan modification would refer the 0.25 dB (or greater) increase in pfd to the pfd resulting from the assignments in the WRC-97 Plan rather than the WARC-77 Plan.

Advantages: This option would continue the existing guarantee of access to the arc 37^{o} W to 10^{o} E for a limited number of future Region 2 FSS networks, especially those serving the countries of South America, Central America and the Caribbean. At the same time, it would allow Region 1 countries the opportunity to modify the Regions 1 and 3 Plan by the addition of up to eleven new orbital positions as listed in the RRB rule of procedure for Annex 7. Under this option, the number of Region 2 FSS systems that can be accommodated without major constraints on their system characteristics is about nine.

Disadvantages: Many Region 1 countries feel that, as an unplanned service, the Region 2 FSS is not entitled to guaranteed orbital access and that a "vast orbital arc" is available for Region 2 FSS at positions to the west of the Annex 7 arc. The view was also expressed that, to achieve balanced sharing, more of the burden should be borne by the Region 2 FSS.

8.3.2 Option 2: Revision of Annex 7 with retention of Annex 4 and an update of section 6 of Annex 1

Following the guidelines of the IRG and the GTE, the study cited is section 3.1 above also considered whether the provisions of Annex 1 might be used to replace or modify Annex 7. It was found that using the Annex 1 criterion of -138 dB(W/m^2/27 MHz) as a coordination trigger, the orbital separation requirements could be reduced from 2.5 to 1.5 degrees. This meant that, although Annex 7 type provisions continue to be needed, some measure of relief could be afforded by allowing Region 1 BSS use of positions 1.5 degrees east of the nominal orbital position, as against the original 1 degree. However, the e.i.r.p. reduction specified in section A3 of Annex 7 (8 dB compared with 1977 values, or 3 dB compared with 1997 values) would still be required, and between 1 and 1.5 degrees, the pfd limit of -138 dB(W/m^2/27 MHz) would need to be observed.

The study also examined the reverse situation, namely the application of Annex 4 for interference from the FSS into the BSS in application of Article 7. No changes were found necessary.

Advantages: Continued protection of present and future Region 2 FSS systems as envisioned at WARC-77 and WRC-97. Increased flexibility for Region 1 BSS orbital positions.

Disadvantages: Limits new orbital positions for Region 1 BSS systems to within 1 to 1.5º east of nominal orbital positions.

8.3.3 Option 3: Deletion of section A3 of Annex 7 with revision of section 6 of Annex 1 and retention of Annex 4

The first paragraph of section 6 of Annex 1 to Appendix S30 specifies an increase in power flux-density on the territory of Region 2 countries caused by a proposed modification to the Regions 1 and 3 Plan which acts as a "trigger" for the coordination of that modification with the FSS in those countries. The third paragraph of section 6 specifies a threshold pfd value below which coordination is not required. This threshold was established during WARC-77 and derived from the following expression with θ, the orbital separation between FSS and BSS space stations, set equal to 2.5°:

$$pfd_{limit} = -148 + 25 \log \theta \text{ dBW/m}^2\text{/27 MHz}$$

Under option 3 the first paragraph of section 6 of Annex 1 would be updated as in option 1, and this formula would be used to replace the present orbital and e.i.r.p. limitations of section A3 of Annex 7 to Appendix 30. In particular for the orbital arc 37º W to 10º E, the formula to trigger coordination would specify new limits on the power flux-density of BSS assignments in the Regions 1 and 3 Plan expressed as a function of the orbital separation between these assignments and the nearest nominal orbital positions of the Regions 1 and 3 Plan (i.e. the further these BSS assignments are away from nominal orbital positions of the Plan, the more constraining is the sharing criteria).

The modification of the criteria of section 6 of Annex 1 would be to insert the following new paragraph after the first paragraph of section 6 of Annex 1:

However, in the range of the orbital arc between 37° W and 10° E, where an assignment in the Regions 1 and 3 Plan or its subsequent modification gives a power flux-density which exceeds the value derived from the expression given hereafter anywhere in the territory of an administration of Region 2, that administration shall be considered as affected.

$$-148 + 25 \, Log \, (2.5 - \sigma) \, dBW/m^2/27 \, MHz \text{ for } 0° \leq \sigma \leq 2.06°$$

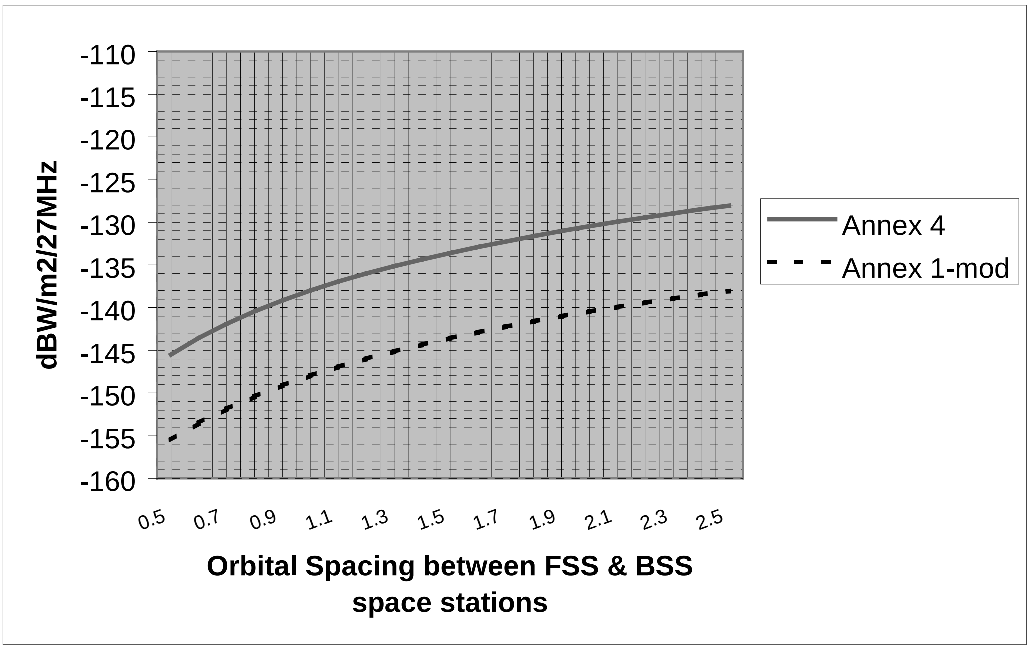
$$-157 \, dBW/m^2/27 \, MHz \text{ for } 2.06 < \sigma \leq 3°$$

Where σ is the separation between the orbital position of the BSS assignment considered and the nearest nominal orbital position of the Regions 1 and 3 Plan.

The existing second paragraph would remain without change, but the first line of the existing third paragraph would be amended so that the paragraph reads:

However, except for the orbital arc between 37º W and 10º E, where an assignment in the Regions 1 and 3 Plan or its subsequent modification gives a power flux-density of less than -138 dB(W/m^2/27 MHz) anywhere in the territory of an administration of Region 2, that administration shall be considered as not being affected; where an assignment in the Region 2 Plan or its subsequent modification gives a power flux-density of less than -160 dB(W/m^2/4 kHz) anywhere in the territory of an administration of Region 1 or 3, that administration shall be considered as not being affected.

The following figure shows a comparison of the proposed new criterion for section 6 of Annex 1 and the existing criterion of Annex 4 to Appendix S30.



Advantages: The two conditions for triggering coordination provided in this option offer the BSS of Region 1 the opportunity to access the entire range of orbital positions in the arc 37^o W to 10^o E on a first-come, first-served basis, while still protecting Region 2 FSS systems already in coordination from unacceptable interference

Disadvantages: The fact that access to the arc in question would be on a first-come, first-served basis could lead to the submission to the BR of a significant number of "paper" satellites for both BSS and FSS networks, leading to lengthy delays.

NOTE - Option 3 has not been studied by Working Party 4A or Joint Working Party 10-11S. In particular, the equation for the pfd limit proposed for the orbital arc between 37º W and 10º E requires further study for the range 2.5º < σ ≤ 3º. In addition, this equation needs a general review of the way it protects both narrow-band and broadband FSS systems. For example, to protect narrow-band systems, a pfd trigger limit per 4 kHz may also be required. Such a general review may also be required for the other pfd limits in Annexes 1 and 4 to Appendix S30.

9 Monopolization of the BSS resource

Annex 2 of Resolution 532 (WRC-97) requested IRG to examine concerns raised at WRC-97 regarding the modification of the Plans for additional requirements or subregional systems which should not lead to monopolization of the use of the bands by a country or a group of countries.

IRG considered one contribution from the United States on this issue. It cited a dictionary definition of the term "monopolization", and observed that based on this definition, monopolization should not be an issue, since the Plans provide access for each Member State of the Union to the BSS orbit/spectrum resource. Some administrations were of the view that the definition provided did not adequately cover their concerns on the issue.

Some administrations believed that action in relation to the avoidance of monopolization of the BSS resources may require appropriate procedures to be adopted by the Conference.

10 Direct-to-home transmission/broadcasting-satellite service

The minutes of the final Plenary Meeting of WRC-97 requested the Inter-conference Representative Group (IRG):

> *"to review the possibility of combining the direct-to-home transmission services by satellite and satellite broadcasting services in the planned and non-planned bands and its implication on the relevant Articles of the Radio Regulations."*

Initial discussions on this subject were held by GTE-1. However, although no contributions were available for consideration at GTE-1, it was noted that Question 247/11[14] is directly relevant to this subject. This Question is assigned to JWP 10-11S. GTE-1 requested that Special Rapporteur Group JWP 10-11S/SRG-1 carry out the studies described in the Question and report its conclusions to GTE. The Special Rapporteur for 10-11S/SRG-1A received no contributions in response to the requested studies but JWP 10-11S did review one contribution which considered the fundamental question cited in Question 247/11:

> "*What are the technical differences between the BSS and the FSS as a function of frequency and use, and should these differences continue to require differences in the methods of treatment of the two services in the RR?*"

On the basis of its review of this Question, JWP 10-11S drew the following conclusions in its comments to IRG:

> *"After a careful review of the current definitions of the BSS and FSS as provided in the Radio Regulations and of the various types of satellite applications that have been implemented in these two services, the following conclusions were drawn.*
>
> *As presently defined, one particular application, TV programme distribution directly to the home or via a cable system, can be implemented in either service. But many other applications are unique to only one of the services. For example, unlike the FSS, the BSS includes transmission of digital radio programmes to portable and mobile receivers. And the FSS includes many applications, including VSATs, in which the transmissions are clearly not intended for the general public, and hence are not in the BSS.*

---

[14] Syria opposed the adoption of Question 247/11 based on the assumption that DTH transmissions should not cover broadcasting and if it will do so, provision S23.13 should be applied.

In view of these distinctions and the continuing major differences in the regulatory constraints governing access to the orbit and spectrum in the two services, it is concluded that no useful purpose would be served by abandoning the present distinction between the FSS and the BSS and the methods of treatment of the two services in the Radio Regulations."

IRG did not provide any more information on this subject.

11 Acknowledgements

The Chairperson thanks all those participants who contributed to the successful conclusions of all five IRG meetings. The Chairperson also thanks the management of the BR, particularly Mr K. Arasteh for his efficient organization and management of the whole replanning process, and the Bureau staff (planning, administrative, translation and software development) for their efforts associated with the replanning studies and in assisting with the preparation of many of the meeting's documents and for organizing the meetings. The Bureau staff always delivered even under the most extreme time pressures.

The original document was modified to include in it slight modifications requested by APT. It was endorsed by:

The participants in the Arab States meeting of September 1999 in Damascus.

The participants in the APT meeting of October 1999 in Australia.

The participants in the ABU meeting of November 1999 in Australia.

The participants in the 35th ASBU meeting of October 1999 in Tunisia.

PROPOSED STRATEGY FOR PLANNING

Since the very first allocation of bands to the broadcasting-satellite service, planning was considered as the only means to allow for the equitable access to the frequency bands and spectrum. Planning was generally considered by those who have the means to launch and operate satellite systems as an inefficient use of the spectrum. The principles adopted by WRC-95 and WRC-97 recognized the need to provide each ITU Member State to dispose of an amount of spectrum wide enough to permit economical development of satellite systems. They also recognized the need for other systems to develop by avoiding to fulfil the bands by national requirements.

It is now more than four years since the question was discussed in conferences and meetings, making negotiations more and more difficult within the framework of IRG. Some countries asked for at least a spectrum of 400 MHz per coverage area in Region 1 and 500 MHz in Region 3, others considered that that amount of spectrum could not be available and would overload the bands, making the development of other systems difficult. IRG decided in its third meeting to develop the plan on the basis of 10 channels per country in Region 1 corresponding to a total spectrum of 400 MHz and 12 channels in Region 3 corresponding to a total spectrum of 500 MHz.

Exercises carried out by BR indicate that a plan based on 10 channels per coverage area in Region 1 and 12 channels in Region 3 is feasible. The results appearing in Document IRG-5/18 demonstrate that all the cases were resolved. The planning exercise contained in the above document and its improvements was based on an analogue-analogue configuration with a co-channel protection ratio of 24 dB. The revised Appendix 30 will be based on a digital-digital configuration with a co-channel protection ratio of 20 dB. One can easily deduce from this that a digital-digital plan will be in position to satisfy a number of additional systems.

On the basis of this positive result the question is to know what other systems should be included in the planning exercise and what planning strategy should be adopted in order to avoid multiplication of Article 4 systems to be considered or even non-coordinated systems already in operation. Considering that systems defined in principle 3 of Resolution 532 are already included in the planning exercise, the remaining candidates for inclusion in the planning exercise are:

- Part B systems, i.e. systems for which the procedure of Article 4 was successfully implemented; and
- systems being coordinated and having been brought into use.

At this stage in the evolution of the work within IRG, it becomes necessary to consider the extent to which the work already done and the work to be done will remain valid if Part B systems are not included in the planning exercise and if the number of such systems vary by the addition of new systems and deletion of some of them. What action can ITU adopt in respect to systems not fully coordinated and brought into use? What would be the situation of a Member State which entry in the plan is incompatible with a system which is operated without being coordinated and without appearing in the plan? The more the planning is delayed the more systems, such as those described above, will exist making it practically impossible to prepare a plan.

In order to avoid these difficulties, a compromise package is proposed intended to prepare a plan as early as possible, taking account of as many of those systems coordinated or in operation as possible and to set up a system for the resolution of any unresolved case. In this package a distinction is to be made between the technical preparation of a plan and the status of the entries in the plan such as the application or not of due diligence. Components of the package may be refined, however, the acceptance by the Administrations sponsoring this document of any of them is subject to adoption of the whole package.

The package is proposed to have the following components:

1) BR shall prepare a draft plan that includes 10 channels per coverage area in Region 1, 12 channels in Region 3, and the existing systems as defined in principle 3 of Resolution 532.

2) The draft plan will also include those systems appearing in Part B which have provided due diligence information in accordance with Resolution 49 (WRC-97) up to a cut-off date to be decided by WRC-2000; the draft plan shall take account of the protection to be afforded to the FSS systems in Regions 2 and 3.

3) The draft plan shall be communicated to administrations some weeks before WRC-2000 to permit them to examine it.

4) WRC-2000 shall be recommended to decide, in conformity with its agenda, to consider itself as the conference entitled to adopt a plan.

5) The conference will review the draft plan and adopt it together with any modification that could be agreed upon during the conference.

6) Cases which could not be resolved at the conference will be entered in the plan with appropriate indication of the means to resolve them.

7) IRG should be continued after WRC-2000, as a single group, GTE becoming part of it, if required, with the following mandate:
   - to consider unresolved cases as well as any modification to the plan adopted by WRC-2000 that may facilitate their resolution;
   - to consider means permitting further amendments to that plan and development of subregional systems avoiding monopolization of the spectrum/orbit by a country or a group of countries;
   - in respect of unresolved cases any amendments proposed to the revised plan, which have the potential to cause interference to assignments of other administrations, should be subject to endorsement by a conference.

In case this approach is accepted, ITU will avoid convening a conference within an overloaded programme of conferences and meetings. Part of the resulting saving should be used by the Director of BR to make available the required resources for the preparation of software and the draft plan.

To evaluate the difficulties associated with the convening of ITU conferences, the programme of meetings adopted by the Plenipotentiary Conference (Minneapolis, 1998) in its Resolution PLEN/9 is attached. Considering the programme of meetings for the years 2002 and 2003, the only possible date for convening a planning conference would be 2004, i.e. nearly five years from now, which cannot be accepted.

ATTACHMENT

(to the Annex)

RESOLUTION PLEN/9

Future conferences and assemblies of the Union

The Plenipotentiary Conference of the International Telecommunication Union (Minneapolis, 1998),

having considered

a) Document 28 submitted by the Secretary-General on planned conferences and assemblies;

b) the proposals submitted by several Member States;

c) the necessary preparatory work to be carried out by Member States, Sector Members and the Sectors of the Union before each session of a conference or assembly,

resolves

1 that the schedule of future conferences and assemblies shall be as follows:

1.1 Regional Telecommunication Development Conference (RTDC): fourth quarter of 1999 or first quarter of 2000[1][2];

1.2 Radiocommunication Assembly (RA-2000): Turkey, 1-5 May 2000;

1.3 World Radiocommunication Conference (WRC-2000): Turkey, 8 May - 2 June 2000;

1.4 World Telecommunication Standardization Assembly (WTSA-2000): Canada, 27 September - 6 October 2000;

1.5 Regional Telecommunication Development Conference (RTDC): first quarter of 2001;

1.6 World Telecommunication Development Conference (WTDC-02): first quarter of 2002;

1.7 Plenipotentiary Conference (PP-02): Morocco, latter part of 2002;

1.8 World Radiocommunication Conference (WRC-02/03): place and date to be determined;

2 that the Council shall take a decision on the need for a radiocommunication assembly in 2002-2003;

3 that the agenda of the above conferences shall be established by the Council, taking into account the resolutions and recommendations of the relevant conferences and assemblies;

4 that the conferences and assemblies shall be held within the periods indicated in *resolves* 1, the precise dates and places, where not already decided, being set by the Council after consultation of the Member States, and leaving sufficient time between the various conferences. However, in cases where precise dates are specified, they shall not be changed except as provided for in the Convention. The durations indicated in *resolves* 1 for conferences and assemblies for which agendas have already been established shall not be changed; the precise duration of the other conferences and assemblies shall be decided by the Council after their agendas have been established, within the time periods indicated in *resolves* 1.

---

[1] Place and dates to be decided by the Council at its November 1998 session.

[2] Place and dates to be decided by the Council at its 1999 session.

METHODOLOGY TO IMPLEMENT THE PLANNING APPROACH

1 Preliminary studies

The Bureau conducted a preliminary theoretical study to assess whether the four channel rasters defined by GTE-2 could be implemented or not in the sequence they were defined (see Document GTE99-3/7).

This study showed that it would be more appropriate to start with channel raster b).

GTE-4 agreed to develop the methodology, which is provided below, based on the use of channel raster b).

2 Step 1 implementation: Definition of *a priori* selected orbital position

As a result of IRG-3 conclusions, the Radiocommunication Bureau sent a Circular Letter, CR/117 dated 1 March 1999, to all administrations requesting them to kindly inform the Bureau of their preferred orbital position(s) for their beam(s) as an alternative to existing one(s) in order for GTE to start its replanning studies.

If in response to CR/117, an administration requested to move its assignments to an orbital position different from that mentioned in Appendices S30/S30A, which is the orbital position proposed by default, then the Bureau recalculates the beam parameters (antenna gain and ellipse parameters) associated with those assignments by using the WRC-97 ellipse software.

At the request of the APT Group of Technical Experts (AGTE) from Region 3, GTE will use the default orbital positions proposed by AGTE in Document GTE99-4/9, 24 September 1999, as default orbital positions for Region 3 in the GTE replanning studies, unless a different preferred orbital position had been requested by an administration in that region in response to CR/117. The Region 3 administrations for which a default orbital position was proposed by AGTE which is different from that of Appendices S30 and S30A, will be consulted by the Bureau in order to confirm or otherwise this course of action, noting that absence of reply will mean agreement with the choice of orbital position indicated in Document GTE99-4/9. A Circular Letter will then be issued by the Bureau in order to inform all administrations of the orbital positions used in the GTE replanning studies.

3 Step 2 implementation: Creation of composite beams

In accordance with IRG-3 instructions, the Bureau consulted with all relevant administrations subject to use a composite beam.

Following this consultation, the Bureau created a set of composite beams to be used in replanning studies (see Addenda 1 and 2 to Document GTE99-4/5, 24 September 1999).

4 Step 3 implementation

4.1 Introduction

As concluded by GTE-2, Step 3 is described by a list of general criteria to be implemented to define the order list of the downlink "existing"[1] and "planned"[2] beams to be introduced in the revised Plan (see section A6.4.3 of Attachment 6 to Document GTE99-2/20).

---

[1] Whenever the term "existing" is used in this document, it refers to notified assignments that are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

[2] Whenever the term "planned" is used in this document, it refers to assignments/beams other than those of "existing" systems.

In order to implement these criteria, further considerations were needed and are presented in the following sections. A flow chart in Annex 2 summarizes the algorithm used to implement Step 3.

Once the "Step 3 Starting Point Plan" (downlink only) has been defined as indicated under section 4.2 below, the first Step 3 beam to consider is analysed with respect to this "Step 3 Starting Point Plan". Then, if the results of the analysis meet the criteria, the first Step 3 beam is included in that "Step 3 Starting Point Plan" which is then called the "Draft Step 3 Plan" (downlink only). The "Draft Step 3 Plan" is thus updated after each inclusion into it of a Step 3 beam which passed successfully the Step 3 analysis and met the criteria. This "Draft Step 3 Plan" as it evolves is then used to analyse the subsequent Step 3 beams.

4.2 Implementation of the 1st criterion: downlink "existing" beams

In order to define the "Step 3 Starting Point Plan", all the "existing" assignments of all the downlink "existing" beams are included in the "Step 3 Starting Point Plan".

For each Plan downlink "planned" beam falling in this category, ten "new" channels with new parameters are added in the sub-frequency band already assigned to "existing" assignments as contained in Appendices S30 and S30A of the corresponding downlink "existing" beam. An MSPACE "group" is created between the new channels and their corresponding "existing" assignments, so as not to exceed a total number of ten channels per country or the number of channels of an "existing system" which is greater than ten.[3]

A BSS-BSS compatibility analysis is then conducted in order to check if these ten "new" channels are acceptable or not, i.e.: these ten "new" channels are acceptable if their EPM is positive and if they do not degrade[4] by more than 0.45 dB the EPM, if already negative, of the other "existing" assignments (see also Annex 1).

In the case where there are many beams falling in this category, the order of treatment of the beams is defined on the basis of:

I beam with minimum service-arc size (high latitude countries with low elevation angles);

II maximum beam size.

However, in the case where there are only few beams falling in this category and if these beams are likely to be mutually compatible, they are treated simultaneously.

If a beam cannot get ten "new" channels in the sub-frequency band already assigned to its corresponding downlink "existing" beam, it is then not included in the "Draft Step 3 Plan" at that stage and will be considered together with other beams under section 4.3 below.

After a successful introduction of one or all beams into the "Draft Step 3 Plan", according to the case of treatment, all the positive reference situations of the "Draft Step 3 Plan" are updated in order to prepare for the treatment of the next beam or the implementation of section 4.3 below, according to the case.

4.3 Implementation of national single or composite downlink "planned" beams

Taking into account the preferred orbital positions expressed by **administrations** in response to Circular Letter CR/117, the downlink "planned" beams in the new Planning Approach are considered as follows.

---

[3] Sweden and Norway reserve their position on this paragraph.

[4] It is to be noted that during the implementation of all steps, such degradations do not accumulate.

The first action to be done is to define the order of treatment of the downlink "planned" beams. This order is defined on the basis of:

I beam with minimum service-arc size (high latitude countries with low elevation angles);

II composite beams;

III maximum beam size.

Then, for each downlink "planned" beam falling in this category, a Victim Study and a Culprit Study (see Annex 1) are conducted in order to assign the most suitable sub-frequency band.

The selection of the sub-frequency band is based on the same criterion which was used for Approach 1 Step 4, i.e. select the sub-frequency band which has the highest EPM sum of all the channels at the worst test point.

In cases where a single criterion could not be enough to select between two sub-frequency bands, a second criterion will be introduced in the future, i.e. select the sub-frequency band which has the smallest (mathematical) standard deviation of EPM.

If one downlink "planned" beam cannot be included in the "Draft Step 3 Plan", it will be considered under section 4.3.1 or section 5 (Step 4) below.

After a successful introduction of one downlink "planned" beam into the "Draft Step 3 Plan", all the positive reference situations of the "Draft Step 3 Plan" are updated in order to prepare for the treatment of the next downlink "planned" beam or the implementation of section 4.3.14 or section 5 (Step 4) below, according to the case.

In order to reduce the excess of interference with the same and other services sharing the same frequency band, an alternative implementation is carried out where the first criterion to select the most appropriate sub-frequency band is to reuse to the extent possible the same sub-frequency band where corresponding assignments were assigned by WRC-97.

This alternative implementation is then selected if it allows the introduction of more downlink "planned" beams in the "Draft Step 3 Plan".

However, for orbital positions specifically requested, this order of treatment may be different. administrations are free to choose orbital positions and channels, subject to not putting undue constraints on the replanning process.

4.3.1 Treatment of downlink "planned" beams not included in the "Draft Step 3 Plan" but for which at least one specific orbital position was requested

In order to implement paragraph 4.3 above (to accommodate as much as possible the preferred orbital position(s) specifically requested by administrations), the following steps are to be implemented in sequence as listed below. These steps are to be applied to all those downlink "planned" beams not included in the "Draft Step 3 Plan" but for which at least one specific orbital position was requested.

A Change the order of treatment

Partly repeat Step 3 with a different order of treatment in order to process the downlink "planned" beam under consideration (e.g. beam A) before other downlink "planned" beams (e.g. beams B1, B2, B3, B4) for which a specific orbital position was **not** requested and which, because of their treatment before beam "A" as done in section 4.3 above, were included successfully in the "Draft Step 3 Plan". The identification of beams "B1, B2, B3, B4" is done on the basis that beam "A" together with beams "B1, B2, B3, B4" are likely to be incompatible around the orbital position preferred for beam "A" (generally, beams "B1, B2, B3, B4" are located at the orbital position preferred for beam "A" or at a next adjacent orbital position).

B Use the ITU/EBU program to generate a smaller ellipse

Considering that, in the worst situation, the downlink "planned" beam under consideration would have to move to another orbital position (i.e. if considered at step 4), where it would get a recalculated ellipse which would be generally smaller than that generated at WARC-77, GTE-4 agreed to check whether or not a new ellipse recalculated at the preferred orbital position can ease the inclusion of this downlink "planned" beam in the "Draft Step 3 Plan".

C Use of fast roll-off antenna

GTE-4 agreed to check whether the use of a fast roll-off space station antenna for the downlink "planned" beam under consideration would allow for its inclusion in the "Draft Step 3 Plan" at its preferred orbital position.

D Power adjustment

Considering that most of the "existing systems" use higher or lower power levels than that of the "planned" assignments, GTE-4 agreed to check whether some increase or reduction in the power level of the downlink "planned" beam under consideration would allow for its inclusion in the "Draft Step 3 Plan" at its preferred orbital position, noting that the adjustment of the power level should be considered on a case-by-case basis and should not put any unacceptable constraints on the possible operation of that beam.

E Use of fast roll-off antenna and/or apply power adjustment to the beams which are putting undue constraints because of their national preference, noting that the adjustment of the power level should be considered on a case-by-case basis and should not put any undue constraints on the possible operation of that beam.

If all means described above do not resolve the situation, the downlink "planned" beam under consideration has to be assessed at another preferred orbital position specifically requested by the responsible administration, if any, or has to be processed at Step 4 below where it would have to move to another orbital position.

After a successful inclusion in the "Draft Step 3 Plan" of one downlink "planned" beam, for which a specific orbital position was requested, all positive reference situations of the "Draft Step 3 Plan" are updated in order to process the next downlink "planned" beam, for which a specific orbital position was requested, or for the implementation of section 5 (Step 4) below, according to the case.

4.4 Implementation of multinational beams[5]

4.4.1 "Existing" multinational beams from those appearing in the WARC-77 Plan are to be treated under section 4.2.

4.4.2 Other multinational beams from those appearing in the WARC-77 Plan are to be treated after Step 5 (see Step 6 described in section 7 below). See also section 2.12.7 of Document IRG99-4/19.

4.5 Verification if required of any undue constraints on the replanning process

The purpose of this action is to check whether there is any downlink "planned" beam, among those which were not included in the Plan after Step 3, which is subject to undue constraints imposed by

[5] Syria reserves its position regarding this section.

other beams which were included successfully in the Plan under Step 3 before it. Administrations are free to choose orbital positions and channels, subject to not putting undue constraints on the replanning process.

If it is the case for a given beam, the undue constraints (e.g. request for multiple overlapping beams instead of a composite beam and/or request for multiple orbital positions instead of one) will then be removed (e.g. use of a composite beam instead of multiple overlapping beams and/or use one position instead of multiple orbital positions) and another Step 3 study will be conducted.

5 Step 4 implementation

5.1 Introduction

The methodology defined below is to be applied to each single or composite downlink "planned" beam not entered in the "Draft Step 3 Plan". The "Draft Step 3 Plan" at the end of Step 3 is thus used as the "Step 4 Starting Point Plan" (downlink only). The first Step 4 beam to consider is analysed with respect to this "Step 4 Starting Point Plan". If the results of the analysis meet the criteria, the first Step 4 beam is included in that "Step 4 Starting Point Plan" which is then called the "Draft Step 4 Plan" (downlink only). The "Draft Step 4 Plan" is thus updated after each inclusion into it of a Step 4 beam which passed successfully the Step 4 analysis and met the criteria. This "Draft Step 4 Plan" as it evolves is then used to analyse the subsequent Step 4 beams.

A flow-chart in Annex 3 summarizes the draft algorithm used to implement Step 4.

5.2 Definition of the beam order list

The order of treatment of the downlink "planned" beams which were not included in the plan at Step 3 is defined on the basis of:

I national beam co-located with "existing" beam, if any (rest of section 4.2 above);

II beam with minimum service-arc size;

III composite beams;

IV maximum beam size.

NOTE - An administration with an "existing" system that ceased or is about to cease operation may request the Bureau to change the orbit position of its "existing" system. In this case, the system will no longer be considered as an existing system. It will receive a new orbital position and would have the new parameters used for replanning studies.[6]

5.3 Step 4 methodology description

For each downlink "planned" beam under consideration at Step 4, apply the following sub-steps.

5.3.1 Step 4 Culprit study

Perform a Culprit study (see Annex 1) against the "Draft Step 4 Plan" of the selected beam at its orbital position used at Step 3 in order to obtain the level of the Single Entry C/I values between this beam and the "Draft Step 4 Plan" beams/assignments.

[6] Syria reserves its position on this note.

5.3.2 Step 4 Orbital spacing study

Determine the required increase in the orbital spacing(s) in order to be compatible with respect to the "Draft Step 4 Plan" beams/assignments.

A For each possible sub-frequency band (eight in Region 1, four in Region 3) for the selected beam, perform the three following actions:

A.1 For each "Draft Step 4 Plan" beam for which there is at least one Single Entry C/I value below the associated C/I limit [*], convert this Single Entry C/I excess in terms of a required eastward or westward increase of the orbital spacing between the "Draft Step 4 Plan" beam and Step 4 beam under consideration, using for that purpose the discrimination provided by the Equivalent Antenna Gain which is generally dominated by the receiving earth station antenna off-axis discrimination.

A.2[**] For each "Draft Step 4 Plan" beam convert its Single Entry C/I margins, i.e. Single Entry C/I value above the associated C/I limit [*], in terms of a required eastward or westward minimum orbital separation between the "Draft Step 4 Plan" beam and Step 4 beam under consideration, using for that purpose the discrimination provided by the Equivalent Antenna Gain which is generally dominated by the receiving earth station antenna off-axis discrimination.

A.3[***] Check whether the downlink single entry C/I limits of 25 dB (co-channel) and 20 dB (adjacent channel) to protect the Step 4 beam under consideration are met, to the extent possible, if time and resources permit.

A.4 Considering the required orbital spacing increases and minimum orbital separations calculated under A.1, A.2 and A.3 above, define the nearest eastern and the nearest western suitable orbital positions for this sub-frequency band within the service arc.

NOTE - Annex 4 to this document provides an example of the Equivalent Antenna Gain functions (as defined in Recommendation ITU-R BO.1212, which combine the effects of transmitting and receiving antenna co-polar and cross-polar patterns as per section 2.3 of the "assumptions" document).

B Move the selected beam to a suitable orbital position considering eastern and western suitable orbital positions of all sub-frequency bands as identified under A above, and considering the guidelines of IRG-2 under B.1 below, and then recalculate the beam parameters accordingly.

B.1 In selecting orbit positions during the replanning studies the following priority sequence should be observed:

a) take to the extent possible the existing nominal orbital positions of the WRC-97 Plans;

b) if necessary, create new orbital positions outside the prohibited arc of Annex 7.

c) then, if unavoidable and further positions are still required, next try orbital positions within the prohibited arc of Annex 7 to Appendix S30 taking into account Principle 8 of Annex 1 to Resolution 532 (WRC-97).

---

[*] Each Single Entry C/I limit is increased by up to 1 dB in order to take into account the conversion imprecision due to approximations (e.g. no recalculation of the elliptical beam at the new orbital position).

[**] Action not yet implemented.

C Perform a new Culprit study (see Annex 1) against the "Draft Step 4 Plan" with for the Step 4 beam under consideration, the suitable orbital position selected under B above and all sub-frequency bands. This analysis is necessary in order to ensure that all Single Entry C/I limits of the "Draft Step 4 Plan" beams/assignments are met[***].

D Repeat A, B and C above until a position is found within the service arc, or until the service arc boundaries are reached.

If for a given beam no suitable orbital position can be found under the studies above, i.e. the service arc boundaries have been reached, it means that this beam cannot be included in the "Draft Step 4 Plan", and thus it will be considered under Step 5 below.

5.3.3 Step 4 Victim study

Perform a Victim study (see Annex 1) of the Step 4 beam under consideration from the "Draft Step 4 Plan" at the orbital position selected under section 5.3.3 above in order to check whether the reference situation of this Step 4 beam is positive or not.

If it is not the case, some adjustments to the orbital position are needed. For that purpose, the "Draft Step 4 Plan" beams which produce the lowest co-channel and/or adjacent channel C/I values have to be identified and the EPM excess, plus 1 dB margin to compensate the aggregate effect, has to be converted in terms of a required increase of the orbital spacing between the "Draft Step 4 Plan" beams thus identified and the Step 4 beam under consideration. Then actions described in section 5.3.2 have to be repeated.

However, if for the Step 4 beam under consideration all the EPM values are positive, then this beam is added to the "Draft Step 4 Plan", and all the positive reference situations are updated in order to prepare for the treatment of the next Step 4 beam.

In cases where more than one sub-frequency band at a new orbital position passed both the Culprit and the Victim studies and all have positive EPM values, then the selection of the sub-frequency band will be based on the same criterion which was used for Approach 1, Step 4 and in section 4.3 above, i.e. select the sub-frequency band which has the highest EPM sum of all the channels at the worst test-point.

In cases where a single criterion would not be enough to select between two sub-frequency bands, a second criterion will be introduced in the future, i.e. select the sub-frequency band which has the (mathematical) smallest standard deviation of EPM.

After a successful introduction of one Step 4 beam into the "Draft Step 4 Plan", all the positive reference situations of the "Draft Step 4 Plan" are updated in order to prepare for the treatment of the next beam.

6 Step 5 implementation

6.1 Definition of the beam order list

The order of treatment of the downlink "planned" beams which were not included in the Plan at Steps 3 and 4 is defined on the basis of:

I national beam co-located with "existing" beam, if any (rest of section 4.2 and Step 4 above);

II beam with minimum service-arc size;

[***] In particular since action A2 is not yet implemented.

III composite beams;

IV maximum beam size.

6.2 Description of the Step 5 methodology

Two situations might occur after implementation of both Step 3 and Step 4:

i) only a few beams remain not included in the "Draft Step 4 Plan" at the end of Step 4;

ii) a significantly high number of beams remain not included in the "Draft Step 4 Plan" at the end of Step 4.

Under situation i) above, it is proposed to apply one of the three following practical methods, either:

a) to modify manually the blocks and/or orbital positions assigned to the beams causing difficulties to introduce in the Plan the Step 5 beam under consideration; or

b) to repeat the implementation of Step 3 and to try to find a solution to each beam by applying when necessary the Step 4 methodology, and then to continue Step 3 with other remaining Step 3 beams; or

c) to repeat the implementation of both Step 3 and Step 4 but with a different order of treatment of the beams, where the beam under consideration at Step 5 will be treated before the beams causing difficulties to introduce it in the "Draft Step 3 Plan".

As an optional measure to resolve particular specific cases of remaining incompatibilities in Region 1, and on an exceptional basis, the use of different channel repartition may be envisaged (e.g. spreading the ten channels over the 800 MHz instead of 400 MHz in one polarization). In such a case, the concerned administration(s) should be informed.

If at the end the study, there remains excess interference into "existing" systems, the Bureau will request the responsible administration(s) of that "existing" system(s) if they were prepared to either accept a small e.i.r.p. increase in the order of a maximum of 1 dB, or alternatively to accept the respective EPM degradation. In the absence of a reply within 15 days from the date of the Bureau's Telefax, it will be understood that this administration agrees with either the e.i.r.p. increase or the EPM degradation. Such e.i.r.p. increase is only for the purpose of replanning exercises and should be understood as not having any impact on the status of coordination already undertaken by the responsible administration(s) of such "existing" system(s).

Under situation ii) above, it is proposed to repeat the implementation of both Step 3 and Step 4 with a reduced number of channels.

It might also be required, if necessary, to adjust appropriately other beam parameters such as e.i.r.p. on a case-by-case basis.

In both situations, when test points with very low EPM (less than about -10 dB) receive excess interference, such test points can be ignored for the purpose of the replanning exercises, if necessary, on a case-by-case basis. In such cases, the concerned administration(s) are informed accordingly, and the issue will be reported to IRG-5.

NOTE - See also the conclusions of IRG regarding alternative Region 3 channel arrangements in section 2.4.2 of Document IRG99-4/19-E.

7 Step 6: Implementation of multinational downlink "planned" beams

The order of treatment of the multinational downlink "planned" beams is defined on the following bases:

i) beam with minimum service-arc size (high latitude countries with low elevation angles);

ii) maximum beam size.

Step 6 includes elements of Steps 3, 4 and 5 described respectively in sections 4, 5 and 6 above for application to multinational downlink "planned" beams. However, for these multinational beams, the selection of channels is limited to the maximum number of channels already assigned to these multinational beams contained in the WRC-97 Plans.

8 Establishment and compatibility analysis of the feeder-link Plan

8.1 Introduction

IRG-4 suggested that initial studies relating to the feeder-link replanning exercises should primarily consider the 17 GHz band. GTE-4 concluded from preliminary feeder-link replanning studies undertaken by the Bureau at 17 GHz, that limitation to the 17 GHz frequency band may not provide all assignments with the required number of channels and protection.

As a consequence, the feeder-link replanning studies should consider both the 14 GHz and 17 GHz frequency bands. Furthermore, some administrations expressed their specific preferences to use the 14 GHz frequency band in addition or alternatively to the 17 GHz frequency band.

8.2 Action 1: Establishment of the "draft new feeder-link Plan" at both 14 GHz and 17 GHz

The first action is to create the "draft new feeder-link Plan" by using the "existing" feeder-link systems with their "existing assignment(s)" which were notified, which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

All feeder-link "planned" beams are included in the "draft new feeder-link Plan" at the same time.

In order to simplify the establishment of the "draft new feeder-link Plan", GTE-4 agreed to start with assigning to each of the feeder-link "planned" beams the block of channels selected for their corresponding downlink "planned" beam at the end of the implementation of the "draft new downlink Plan" (i.e. result of Steps 3, 4, 5 and 6 above).

In the 14 GHz frequency band, only 14 channels are available (seven channels per circular polarization). GTE-4 decided to assign channels in the 14 GHz frequency band in case an administration already has assignments for their feeder-links in this band. The assignment of channels should start from the top of the band (i.e. from channel 14 downwards on both bands of polarization).

For the implementation of this course of action, it is also required to move to a new orbital position each feeder-link "planned" beam for which the corresponding downlink "planned" beam has been moved at that new orbital position. The ellipse parameters of the moved feeder-link "planned" beam are then recalculated with the ITU/EBU program.

8.3 Action 2: Analysis of the interference situation

Once the "draft new feeder-link Plan" has been established, as described in section 8.2 above, a first MSPACE run is performed in order to assess the interference situation of this "draft new feeder-link Plan".

EPM degradations are identified as follows:

a) in the case of "existing" systems, identifying positive reference EPM degraded below -0.45 dB or negative reference EPM degraded by more than 0.45 dB. The reference EPMs are those of the WRC-97 reference situation as it evolves;

b) in the case of "planned assignments", identifying negative EPMs below -0.45 dB.

For each feeder-link "planned" beam having an EPM degradation, identify its major interfering beam(s) based on the level of the corresponding Single Entry C/I value (generally, the other beams located at the same orbital position are major interfering beams).

In order to resolve this situation, GTE-4 agreed to apply the following measures in any appropriate order:

- reverse the polarization direction;
- assign different channels in the same or the alternative frequency band if allocated;
- apply fast roll-off receiving space station antenna patterns (e.g. as described in Annex 3 to Appendix S30A).

As a last resort, a shift of ±0.2 degrees around the nominal orbital position, in both the feeder-link and downlink plans, can be envisaged between the beams involved in the incompatibility situation. Such orbital shifts will necessarily imply reassessment of the downlink plan.

However, none of the above-mentioned measures are applied to the "existing" feeder-link systems. In addition, every effort will be made to accommodate a national "planned" beam at the orbital position of the "existing" system.

8.4 Action 3: Second run of interference calculation

In order to confirm that the measures described in section 8.3 above have been effective, a second MSPACE run is performed.

Any remaining incompatibilities which could not be resolved by iterations of Action 2 measures will be reported for further appropriate action.

Annexes: 4

ANNEX 1

(to Attachment 1)

Detailed description of Victim and Culprit studies

A1.1 "Victim" (Receiving interference) study

This study involves evaluating levels of interference from assignments in the "starting point Plan" (i.e. assignments previously successfully included in the draft new plan) to new channels which could possibly be added for a given beam(s) under consideration.

In addition to the "starting point Plan", for each beam that will receive additional channel(s) a complete set of possible candidate channels (40 for Region 1, 24 for Region 3) for each polarization (Circular Right-hand, Circular Left-hand) is generated. These sets of candidate channels are then treated as "Victims" in an MSPACE study that runs all of these candidate channels as a grouped addition to the "starting point Plan". This provides information about which candidate channels/beams would receive an excess of interference (negative EPM) from the "starting point Plan".

The result of this step is a table which lists the channels/blocks, for all beam and polarization combinations, that would not receive negative EPM values from the "starting point Plan". It should be noted that in the case of composite beams, the only channels that would be considered as valid candidate channels would be those that were available for all subsidiary beams of a given composite beam. (Candidate channels that are not available for all subsidiary beams should be removed from the table.)

A1.2 "Culprit" (causing interference) study

This study involves evaluating levels of interference from new channels which could possibly be added to assignments in the "starting point Plan".

This study can be implemented by many MSPACE runs for each candidate channel. However, in order to shorten the MSPACE calculation time the following method was developed.

In addition to the "starting point Plan", potential new channels determined after a Victim study are included as "additions" in an MSPACE study. Then values of single entry C/I are calculated for each beam/polarization/channel/test point of the "starting point Plan" with respect to potential new channels.

By comparing the Single Entry C/I Criterion/Limit for each beam/polarization/channel/test point of the "starting point Plan" with calculated Single Entry C/I, potential new channels that cause unacceptable interference to assignments of the "starting point Plan" are removed from the list of candidate channels.

The definition of the Single Entry C/I Criterion/Limit, denoted as C2Ilimit, is as follows:

$$\text{C2ILimt} = \text{PR} - 10 \text{ Log}\left(10^{\left(\min\left(0,\text{Ref.EPM}\right)/-10\right)} \text{ x } 10^{0.045} - 10^{\left(\text{Ref.EPM}/-10\right)}\right)$$

where:

PR is the co-channel or the adjacent channel protection ratio associated with the wanted assignment in the case of a co-channel or adjacent channel interfering assignment, respectively; and

Ref.EPM is the Reference EPM associated with the wanted assignment.

This definition means that a separate Single Entry C/I Criterion/Limit needs to be associated with each Reference EPM of the "starting point Plan".

A1.2.1 Definition of artificial Reference EPM for Culprit study purposes

In order to provide appropriate protection of the Plan assignments during the Culprit study (i.e. no more than what was provided by any starting point Plan), the reference situation of these Plan assignments should be updated as follows:

Assumptions:

- R is the Reference EPM of the starting point Plan as contained in the MSPACEG scenario/input file (e.g. could be calculated after the successful addition of each beam during Step 3 implementation);
- E is the new and last calculated EPM as contained in the MSPACEG reference situation/output file;
- NR is the New Reference EPM to be used to update the R value.

The definition of NR is done according to the following criteria:

If R < 0

if $E < -10 \text{ Log}[1-10^{0.045}(1-10^{(-R/10)})]$

$NR = -10 \text{ Log}[10^{0.045}(1-10^{(-R/10)})+10^{(-E/10)}]$

else

$NR = -10 \text{ Log}[10^{(-R/10)}10^{0.045}-10^{(-E/10)}] + 10 \text{ Log}(10^{0.045}-1)$

end if

else

NR = E

end if

A1.3 Interference calculation in both "Victim" and "Culprit" studies

As a practical measure to better simulate the real situation, the GTE-4 concluded not to take into account interference generated by assignments located at orbital position distances greater than **S** degrees from the nominal orbital position of the wanted assignment, where **S** is defined in order to provide an orbital position discrimination at the receiving earth station antenna greater than 35 dB. The formula for **S** takes into account the difference in e.i.r.p. between interfering and wanted signals and allows for correction if the receiving earth station antenna diameter of the wanted assignment is not in conformity with Recommendation ITU-R BO.1213 (60 cm). Provisionally[7], **S** is defined as follows:

$S = 15 + 10^{((|\Delta e.i.r.p.| + 20*\text{Log}(d/60) - 29)/25)}$ degrees in a co-polar situation

$S = 9 + 10^{((|\Delta e.i.r.p.| + 20*\text{Log}(d/60) - 29)/25)}$ degrees in a cross-polar situation

---

[7] It will be up to the Bureau to implement the formulae in a simplified form provided that it serves the same purpose.

where

Δe.i.r.p. is the difference in dB between the maximum e.i.r.p. of the interfering signal and the maximum e.i.r.p. of the wanted signal

d is the receiving earth station antenna diameter of the wanted assignment.

This GTE-4 conclusion was included as a practical measure to improve the replanning exercises. Considering that the configuration of the BSS Plan is rather homogeneous, it is understood that the plateau effects of the receiving earth station antenna patterns are negligible compared to the other sources of interference. Indeed, interference received from BSS satellites beyond a certain orbital distance is in practice negligible.

If such interference was taken into account, it could result in an unrealistically high level of interference in the replanning exercises.

As indicated in Annex 4 to this document, all receiving earth station antennas include in their patterns a slope (29 - 25 log φ) and a plateau as a mask for the high-order side lobes. It is considered that interference levels below -35 dB correspond to this negligible area. As can be seen from Annex 4, and to be on the safe side, the co-polar and cross-polar distances of 15 and 9 degrees respectively, which were chosen, provide almost 40 dB of discrimination. This value is further qualified by taking into account differences in e.i.r.p.s and receiving earth station antenna diameters as defined above.

Source: Documents IRG99-5/13, IRG99-5/13(Add.1), IRG99-5/13(Add.2), IRG99-5/19 and IRG99-5/19(Add.1)

BASIC TECHNICAL ASSUMPTIONS FOR THE PLANNING APPROACH

1 Introduction

During the third meeting of IRG (IRG-3), a study approach referred to as the "Planning Approach" was defined. The second meeting of GTE (GTE-2) then developed the technical assumptions and methodology associated with this new approach. Initial replanning studies commenced in accordance with Resolution 532. The results were presented to GTE-3. Based on a review of these results, IRG-4 made further refinements to the technical assumptions.

GTE-4 made further amendments to the technical assumptions in order to:

- include IRG-4 decisions on other issues as contained in Attachment D to the IRG-4 Report;
- update previous assumptions (e.g. list of "existing" systems);
- define new assumptions to carry out replanning studies of the feeder-link Plan.

2 Technical assumptions to carry out studies on the Planning Approach

2.1 MSPACE input file assumptions

MSPACE interference calculations are performed with the following default values:

- 0.1° for the station-keeping error;
- 1.0° for the rotation error; and
- 0.1° for the mis-pointing error,

except for:

- assignments, notified with specific values, which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

2.2 Emission type and channel bandwidth

So far, studies have been carried out with analogue emissions, except for notified digital assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau.

However, future studies are to be based on digital emissions with a reference bandwidth of 27 MHz using the protection ratios described in paragraph 7. However, other bandwidths such as 33 MHz have to be considered before final adoption of the Plan (e.g. 34.5 MHz as suggested by Japan at GTE-4 (Document GTE99-4/2, 20 September 1999) for their assignments).

Japan requested to use 34.5 MHz of bandwidth for their assignments in the replanning exercises. This request will be studied at the end of the basic study as is the case for other national preferences, provided that all necessary elements for such a study (e.g. protection ratios) are available in draft revised Recommendation ITU-R BO.1293 or in any other draft new Recommendation from JWP 10-11S.

NOTE - For notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau, the parameters notified are used.

2.3 Antenna types

Except for notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the

Bureau and which use antenna types different from those described below, the following default antenna types are to be used:

- downlink receiving earth station antenna according to Figure 7*bis* of Annex 5 of Appendix S30 (Recommendation ITU-R BO.1213);
- downlink space station transmitting antenna according to Figure 9 of Annex 5 of Appendix S30 (i.e. the R13TSS pattern)[1];
- uplink transmitting earth station antenna according to Curves A' and B' of Figure A of Annex 3 of Appendix S30A (Recommendation ITU-R BO.1295); and
- uplink receiving space station antenna according to Curves A' and B' of Figure B of Annex 3 of Appendix S30A (Recommendation ITU-R BO.1296)[2] .

In the initial studies conducted by GTE-3, there were two cases where downlink BSS-BSS compatibility problems arose from downlink test points located outside the -3 dB contour. GTE-3 reported that receive antenna diameters larger than 60 cm in accordance with Recommendation ITU-R BO.1213 may be used in order to compensate for the lower gain of the satellite antenna in that direction, as follows:

Beam ID	Adm.	Test point location (downlink)	Contour where test points are located	Compatibility problem at Step 3 (beam not included)	Ant. Diameter used
MCO11600	MCO	46N00 5E60	-7.4 dB	One beam	0.99 m
RSTRSA11 RSTRSA12 RSTRSD11 RSTRSD12	RUS	54N33 22E88 55N07 22E74 55N11 20E78 54N44 20E00 41N20 47E82 46N40 48E90	-8.1 dB	Two beams	1.09 m

Alternatively, GTE-3 determined the following options that could be applied for the purposes of the replanning studies:

For MCO:

a) do not consider the downlink test point located outside the -3 dB contour; or

b) increase the size of the downlink beam provided that it remains in the territory of the Administration or include a minimum sized downlink spot beam so that it includes the test point within the -3 dB contour.

IRG-4 decided to apply the approach described in a) above in the MCO case.

---

[1] The improved fast roll-off space station transmitting antenna characteristics as defined by JWP 10-11/S (see Document GTE99-3/14) or other types of antennas contained in ITU-R Recommendations may be used in special circumstances to solve compatibility problems. In such cases the Administration for which the fast roll-off antenna is to be applied should be consulted.

[2] Improved space station receiving antenna characteristics may be used in special circumstances to solve compatibility problems (e.g. fast roll-off antenna described in Annex 3 to Appendix S30A). In such cases the Administration for which the improved antenna is to be applied should be consulted.

For RUS:

a) increase the size of the downlink beam or include a minimum sized spot beam so that it includes the test points within the -3 dB contour.

IRG-4 decided that this is a technical issue that can be solved between Russia and GTE.

After IRG-4, the Administration of Russia requested to use a receiving earth station antenna diameter of 0.9 m at the following downlink test-points: 41.20° N-47.82° E, 46.40° N-48.90° E, 54.33° N-22.88° E, 55.07° N-22.74° E, 55.11° N-20.78° E and 54.44° N-20.00° E. This request was implemented in the replanning studies. For that purpose, these six test points were removed from WRC-97 downlink beams RSTRSD11 and RSTRSD12 and added to new downlink beams RSTRSD13 and RSTRSD14, with the same coverage and the same channels as beams RSTRSD11 and RSTRSD12, at the orbital position 36° E.

2.4 Polarization and channel spacing

Circular polarization, CR or CL, will be used except for cases where assignments have linear polarization and are:

> "notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau".

2.4.1 Possible Regions 1 and 3 channel arrangements

Following IRG-3 conclusions, GTE-3 derived four channel arrangements utilizing a continuous band of 400 MHz:

a) ten defined channels, with 38.36 MHz frequency spacing, grouped in a continuous band of 400 MHz with one predetermined type of polarization. The channel scheme is based on co-channels only;

b) ten defined channels, with 38.36 MHz frequency spacing, grouped in a continuous band of 400 MHz with one predetermined type of polarization. The channel scheme assumes adjacent-channels;

c) ten defined channels, with 38.36 MHz frequency spacing between co-polarized channels, grouped in a continuous band of 200 MHz with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be co-channels). The channel scheme is based on co-channels only; and

d) ten defined channels, with 38.36 MHz spacing between co-polarized channels, grouped in a continuous band of 200 MHz with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be adjacent channels with a frequency spacing of 19.18 MHz).

The four corresponding channel rasters are shown in Figure 1.1 below.

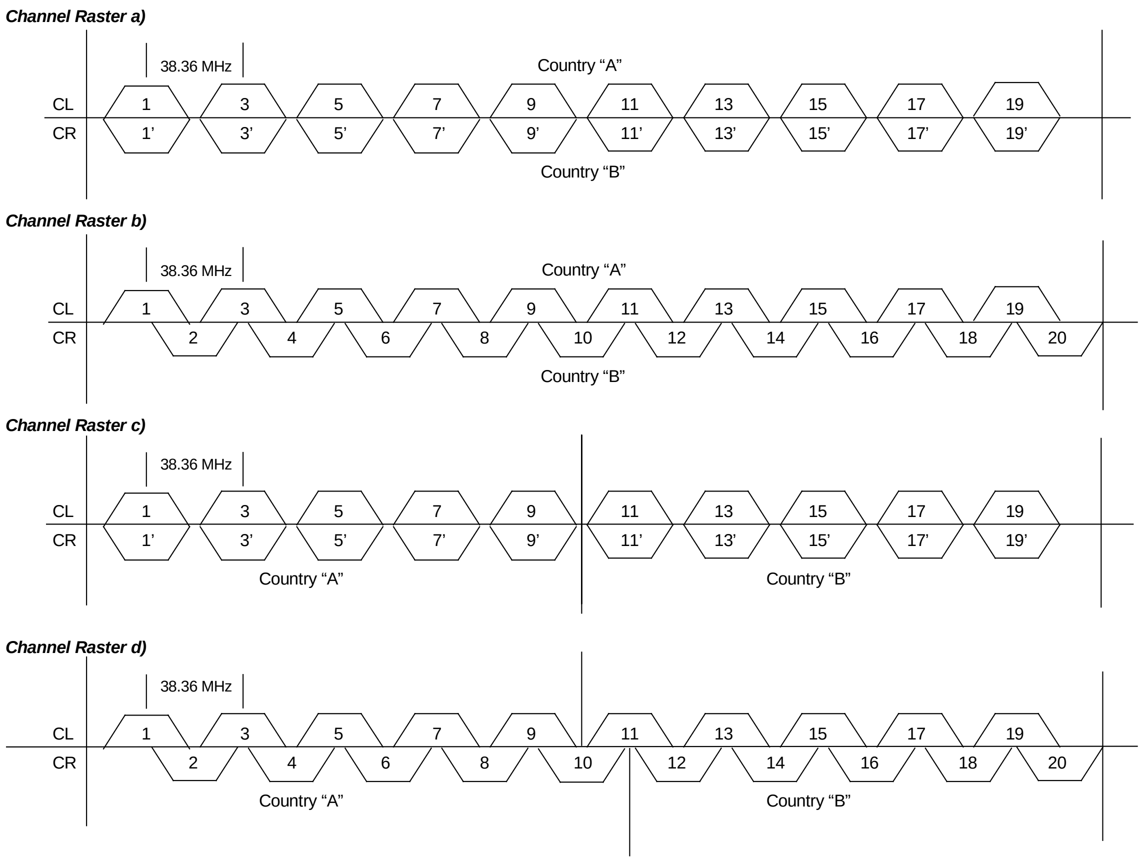

FIGURE 1.1

Studies (see Document GTE99-3/18) were generally based upon raster b) of Figure 1.1.

GTE-4 decided to assume both the 14 GHz and the 17 GHz frequency bands in the feeder-link replanning studies in order to provide all assignments with the required number of channels and protection and also in order to cope with specific preferences expressed by some Administrations.

With respect to the 14 GHz feeder-link band, it was concluded to use the WRC-97 channel raster, i.e.: similar to raster d) above, but reduced to the 14 available channels in that band (7 channels per circular polarization). It was also concluded, that, to begin with, to assign channels from the top of the band whilst not taking into account the internal adjacent channel interference effect.

2.4.2 Alternative Region 3 channel arrangements

Following IRG-3 conclusions, GTE-3 derived four channel arrangements utilizing a continuous band of 500 MHz:

a) 12 defined channels, with 38.36 MHz frequency spacing, grouped in a continuous band of 500 MHz with one predetermined type of polarization. The channel scheme is based on co-channels only;

b) 12 defined channels, with 38.36 MHz frequency spacing, grouped in a continuous band of 500 MHz with one predetermined type of polarization. The channel scheme assumes adjacent channels;

c) 12 defined channels, with 38.36 MHz frequency spacing between co-polarized channels, grouped in a continuous band of 250 MHz with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be co-channels). The channel scheme is based on co-channels only; and

d) 12 defined channels, with 38.36 MHz spacing between co-polarized channels, grouped in a continuous band of 250 MHz with two predetermined types of polarization (i.e. cross-polarized channels assigned to the same beam will be adjacent channels with a frequency spacing of 19.18 MHz).

The four corresponding channel rasters are shown in Figure 1.2 below.

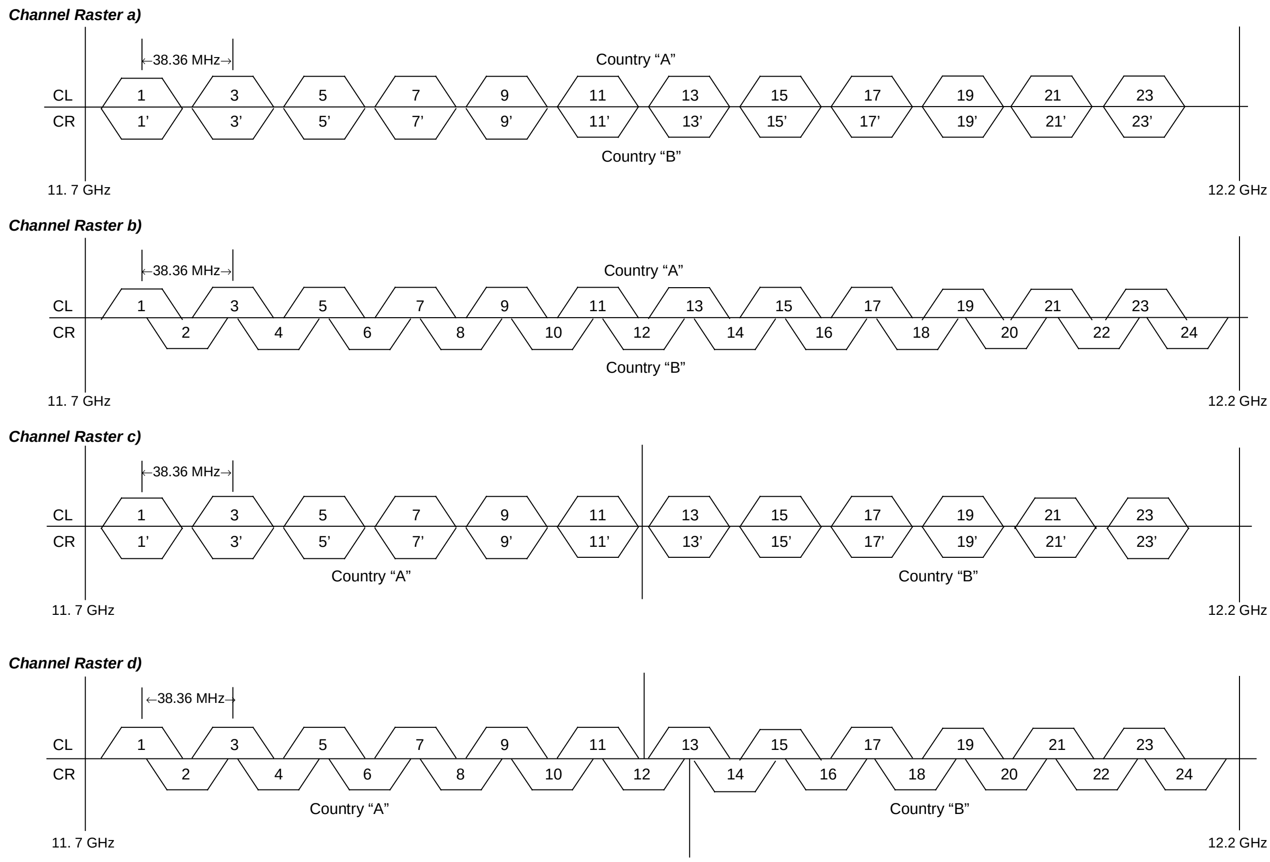

FIGURE 1.2

Another initial study (see Document GTE99-3/17) was generally based upon raster b) of Figure 1.2 for Region 3 and raster b) of Figure 1.1 for Region 1. The results of this initial study indicate that it is possible to conduct a satisfactory replanning exercise on this basis.

In regards to the number of channels to be used in Region 3, APT members have discussed the issue. It is very important to Region 3 countries to achieve an efficient usage of the 500 MHz of BSS spectrum. As a compromise to advance the work of the meeting, Region 3 Administrations agreed with the general approach outlined by the distinguished delegate of the Kingdom of Morocco described below:

Stage 1: Further replanning should be conducted on the basis of ten channels for each country in Regions 1 and 3, as described in the report of the IRG-3 meeting.

Stage 2: At the end of Step 4 (see Document IRG99-4/[11]), GTE will attempt to add two additional channels for each Region 3 country at the orbital positions determined at the end of Step 4. In determining the feasibility of these additional two channels, GTE will also perform studies to identify any undue constraints on Region 1 BSS resulting in the border area between Regions 1 and 3.

2.4.3 Preferred channel rasters

Raster b) is considered to better accommodate "existing" assignments compared with raster d) and is, for the parameters (frequency spacing, channel bandwidth, protection ratios etc.), more efficient than rasters a) and c). Considering that emphasis should be placed on channel raster(s) that give the greatest chance of achieving a successful result, IRG determined that raster b) should be used (see Document GTE99-3/7). Channel raster d) may be used in certain circumstances on a case-by-case basis.

2.4.4 Agreement on channels specifically preferred by Administrations

2.4.4.1 Channels preferred by AUS

The Administration of Australia requested that the beam and channels arrangement of the current WRC-97 Plans should be used (see also Documents GTE99-3/11 and GTE99-3/12).

Downlink channels introduced from the WRC-97 Plan for AUS

Orb.	Beam	Channel	Pol	Emission
152° E	AUS00600	2, 6, 10, 14, 18, 22	CL	digital
	AUS00400	3, 7, 11, 15, 19, 23	CR	digital
	AUS0040A	3, 7, 11, 15, 19, 23	CR	digital
	AUS0040B	3, 7, 11, 15, 19, 23	CR	digital
	AUS0040C	3, 7, 11, 15, 19, 23	CR	digital
	AUS00500	4, 8, 12, 16, 20, 24	CL	digital
164° E	AUS00900	1, 5, 9, 13, 17, 21	CR	digital
	AUS0090A	1, 5, 9, 13, 17, 21	CR	digital
	AUS0090B	1, 5, 9, 13, 17, 21	CR	digital
	AUS00800	2, 6, 10, 14, 18, 22	CL	digital
	AUS00700	3, 7, 11, 15, 19, 23	CR	digital
	AUS0070A	3, 7, 11, 15, 19, 23	CR	digital

Feeder-link channels introduced from the WRC-97 Plan for AUS

Orb.	Beam	Channel	Pol	Emission
152° E	AUS00600	28, 32, 36, 40, 26, 30	CR	digital
	AUS00400	3, 7, 11, 15, 19, 23	CL	digital
	AUS0040A	3, 7, 11, 15, 19, 23	CL	digital
	AUS0040B	3, 7, 11, 15, 19, 23	CL	digital
	AUS0040C	3, 7, 11, 15, 19, 23	CL	digital
	AUS00500	4, 8, 12, 16, 20, 24	CR	digital
164° E	AUS00900	27, 31, 35, 39, 25, 29	CR	digital
	AUS0090A	27, 31, 35, 39, 25, 29	CR	digital
	AUS0090B	27, 31, 35, 39, 25, 29	CR	digital
	AUS00800	2, 6, 10, 14, 18, 22	CL	digital
	AUS00700	3, 7, 11, 15, 19, 23	CR	digital
	AUS0070A	3, 7, 11, 15, 19, 23	CR	digital

The Administration of Australia also requested that extra capacity should be provided for that Administration by an additional national coverage beam at two orbital positions (152° E and 164° E) with two channels per beam (see also Documents GTE99-3/11 and GTE99-3/12). This involves beams at multiple orbital positions covering the same area in the replanning studies.

IRG decided to pursue these requests of Australia in the further replanning studies.

2.4.4.2 Channels preferred by RUS[3]

Channels in the WRC-97 Plan for RUS at orbital positions 36° E, 56° E, 86° E and 140° E

Orb.	Beam	Channel	Feeder Link Pol	Downlink Pol	Emission
36° E	RST-1	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital & analogue
		26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital & analogue
56° E	RST-2	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital & analogue
		26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital & analogue
86° E	RST-3	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital & analogue
		26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital & analogue
140° E	RST-5	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital & analogue
		26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital & analogue

The Administration of Russia requested that the beam and channels arrangement of the current WRC-97 Plan be used at orbital positions 36° E, 56° E, 86° E and 140° E, as referred to in paragraph 2.12.5 and paragraph 4.4 of Documents GTE99-3/12 and 11, respectively. IRG decided to pursue this request of Russia in the further replanning studies.

Further to IRG-4, the Administration of Russia notified with analogue and digital modulations eight channels (27, 28, 31, 32, 35, 36, 39, 40) of the RST-1 network asking not to group odd and even channels.

Considering also the IRG decision to use only digital modulation for the "planned" assignments introduced in the draft new Plan during the replanning studies, GTE-4 agreed to assume the following channels for Russia in doing the replanning studies:

[3] The Administrations of Morocco and Syria consider that the total number of channels per coverage area shall not exceed either ten channels or the number of channels of an "existing system" which is greater than 10. This is with the understanding that the planning conference will decide on the status of those channels of "existing systems" that exceed the number 10.

Channels assumed in the replanning studies for RUS

Orb.	Beams (Network)	Channel	Feeder Link Pol	Downlink Pol	Emission
36° E	RSTREA11 (RST-1)	27, 31, 35, 39	CR	CL	analogue
	RSTREA12 (RST-1)	28, 32, 36, 40	CL	CR	analogue
	RSTRED11 (RST-1)	27, 31, 35, 39	CR	CL	digital
	RSTRED12 (RST-1)	28, 32, 36, 40	CL	CR	digital
	RSTRSD11 RSTRSD13*	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital
	RSTRSD12 RSTRSD14*	26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital
56° E	RSTRSD21	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital
	RSTRSD22	26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital
86° E	RSTRSD31	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital
	RSTRSD32	26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital
140° E	RSTRSD51	25, 27, 29, 31, 33, 35, 37, 39	CR	CL	digital
	RSTRSD52	26, 28, 30, 32, 34, 36, 38, 40	CL	CR	digital
* downlink only (see section 2.3 above)					

Where MSPACE grouped have been created between the following beams:

– RSTREA11, RSTRED11, RSTRSD11 and RSTRSD13 (downlink only)

– RSTREA12, RSTRED12, RSTRSD12 and RSTRSD14 (downlink only)

– RSTRSD21, RSTRSD22

– RSTRSD31, RSTRSD32

– RSTRSD51, RSTRSD52

After IRG-4, the request of the Administration of Russia to use for its beam at 110° E downlink channels 25, 27, 29, 31, 33, 35, 37, 39 CL and 26, 28 CR and feeder-link channels 25, 27, 29, 31, 33, 35, 37, 39 CR and 26, 28 CL was implemented. In addition, these channels were grouped in order not to take into account the internal adjacent channel interference effect.

2.4.4.3 Channels preferred by IND

(See section 2.10.2.3 below.)

2.4.4.4 Channels preferred by IRN

The Islamic Republic of Iran requested to study their feeder links at both the 14 GHz and 17 GHz frequency bands. The 17 GHz frequency band will be assumed in the basic study, whereas the 14 GHz frequency band will be studied at the end of the basic study as is the case for other national preferences.

2.4.4.5 Channels preferred by KOR

The Republic of Korea requested to study their feeder links at both the 14 GHz and 17 GHz frequency bands. The 17 GHz frequency band will be assumed in the basic study, whereas the 14 GHz frequency band will be studied at the end of the basic study as is the case for other national preferences.

2.5 Test points

By default, the test points of the WRC-97 Regions 1 and 3 Plan shall be used (see also paragraph 2.10.2).

2.5.1 Revised downlink test points for MRC

The Administration of Morocco requested the following new downlink test points to be used for the creation of the elliptical beam for Morocco (see also Document GTE99-3/11). This request would align the downlink beam of Morocco with its WARC Orb-88 feeder-link beam. IRG decided to pursue this request from Morocco in the further replanning studies.

Latitude (° N)	Longitude (° W)
20.40	17.00
23.50	12.80
23.70	15.90
26.40	9.60
27.20	13.20
29.90	5.80
30.40	9.60
32.30	1.30
34.90	2.10
35.80	5.90

The new downlink test points of Morocco were implemented in the replanning studies and used for the recalculation of its downlink beam.

2.5.2 Revised downlink test points for MCO

For the reason mentioned in section 2.3 above, IRG-4 decided to remove from the downlink Plan one test point of Monaco located at 46N00 5E60.

2.5.3 Revised downlink test-points for RUS

The Administration of Russia requested two new downlink test points (42.42° N, 130.62° E and 46.02° N, 143.42° E) to be added to its beam RUS-4 in order to cover its territory (Primorsky) more properly (see also Document GTE99-3/11). IRG agreed that this proposal should remain in the replanning studies. Japan, China and Korea agreed with this proposal under the following conditions:

1) no unacceptable interference to Japanese FSS, Chinese FSS, and Korean FSS;

2) simulated shaped beam or other means should be used for reducing, to the maximum, the radiation over the territory of other countries.

After IRG-4, the Administration of Russia confirmed its request which was implemented in the replanning studies. The elliptical beam RUS00400 was thus recalculated.

2.6 Ellipse calculations

Ellipses are recalculated only if orbital positions change or if test points are changed. If there are no changes to orbital positions or test points, ellipses of the WRC-97 Plan are used.

The ITU/EBU computer program will be used for any necessary calculations including the maximum co-polar antenna gain and, in accordance with WRC-97 practice, a satellite antenna pointing accuracy of 0.1° will only be used in calculating ellipses and a minimum half-power beamwidth of 0.6° is assumed as specified in Appendices S30 and S30A.

2.6.1 Calculation of ellipse parameters for the Monaco downlink beam

The Administration of Monaco requested the new orbital position (13° W) for the study. In order not to change the beam dramatically, one of the downlink test points (5.60° E, 46.0° N) which is located outside the beam area of the downlink beam in the WRC-97 Plan (i.e. close to the -9 dB gain contour) was not taken into account when new ellipse parameters were calculated as described in paragraph 2.6.

This course of action is in line with the IRG-4 decision to delete this downlink test point (5.60° E, 46.0° N) as indicated in section 2.5.2 .

2.7 Protection ratios

Studies which were performed up to GTE-3 used the following assumptions concerning protection ratios (identical to those used in the Article 4 procedure after WRC-97):

a) separate uplink and downlink replanning (i.e. EPM approach).

Except for notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau before 27 October 1997, the following protection ratios will apply:

b) downlink co-channel protection ratio: 24 dB;

c) downlink upper and lower adjacent channel protection ratio: 16 dB;

d) uplink co-channel protection ratio: 30 dB;

e) uplink upper and lower adjacent channel protection ratio: 22 dB.

For notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use was confirmed to the Bureau before 27 October 1997, the following protection ratios apply:

f) downlink co-channel protection ratio: 31 dB;

g) downlink upper and lower adjacent channel protection ratio: 15 dB;

h) uplink co-channel protection ratio: 40 dB;

i) uplink upper and lower adjacent channel protection ratio: 21 dB.

The interference calculations were performed according to the calculation methods adopted by the RRB, as described in Document GTE99-2/3.

IRG determined that further studies using 27 MHz all-digital emissions (except for notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use was confirmed to the Bureau before 27 October 1997) should be performed using the advice of JWP10-11S (see Document GTE99-3/6) i.e.:

- an overall co-channel protection ratio between digital emissions of 20 dB (i.e. 21 dB for the downlink and 27 dB for the feeder link) except for "existing" assignments mentioned above,
- an overall co-channel protection ratio for digital emissions with respect to "existing" analogue emissions of 23 dB (i.e. 24 dB for the downlink and 30 dB for the feeder link) and an adjacent protection ratio of 15 dB (i.e. 16 dB for the downlink and 22 dB for the feeder link) using the worst-case approach (see paragraph 2.2.2.1 of Attachment 1 of Document GTE99-2/2).

The protection ratios to be applied to "existing" systems (i.e., notified assignments that are in conformance with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau) are provided in Annex A. This in no way prejudices a decision of the Conference related to use of this criteria for future systems intended to replace these existing systems.

2.7.1 Negative Equivalent Protection Margin for "existing" systems in the WRC-97 Plan

Negative Equivalent Protection Margins of WRC-97 Plans for "existing" systems were kept because it is considered that those negative EPM were accepted together with the protection margins at that time when those assignments were successfully included in the plans or were brought into use.

2.8 Downlink e.i.r.p. levels and power density

Except for notified assignments which are in conformity with Appendices S30 and S30A, which have been brought into use and for which the date of bringing into use has been confirmed to the Bureau, the downlink e.i.r.p. to be used for each channel of a beam will be the minimum downlink e.i.r.p. of any channel of that same beam which existed in the WRC-97 Plan. For composite beams, the downlink e.i.r.p. in the direction of the test points relating to the envelope of such a beam should be that or close to that of the corresponding subsidiary beam[4].

For additional channels which are added in the course of the replanning exercise to the downlink beams whose national plan assignments (J) and modified national plan assignments (KOR) have been notified and brought into use and for which the date of bringing into use has been confirmed to the Bureau before 27 October 1997 (KOR11201, KO11201D and J 11100), the downlink e.i.r.p. level will be the level of the nearest channel of the WRC-97 Plan reduced by 5 dB (see paragraph 2.3 of Attachment C of the IRG-2 report).

This measure is taken in order to avoid having inconsistent values of e.i.r.p. for different channels and to facilitate the replanning studies. The minimum e.i.r.p. is chosen in order to ensure compatibility with other services.

The power density value is determined assuming a uniform power density over a 27 MHz bandwidth.

2.9 Minimum elevation angle

As defined in Section 3.12 of Annex 5 of Appendix S30.

[4] subsidiary beam = individual elliptical beam component of a composite beam.

The minimum elevation angle to be met within the downlink service area is assumed to be 20° in the replanning studies. In cases where a country has a lower elevation angle in the WRC-97 Plan, the actual elevation is taken and the possible service arc for the purposes of the replanning exercise is determined by any positive increase in elevation angle. A minimum elevation angle of 40° should be assumed for those downlink test points located in areas subject to high precipitation (rain-climatic zones M, N, P and Q).

2.10 Composite beams in replanning studies

Based on the conclusions of IRG-2 and IRG-3, in general, composite beams are created for Administrations which have more than one beam at a given orbital position in the current WRC-97 Regions 1 and 3 BSS Plan. According to the conclusions of IRG-3 and IRG-4, Administrations' preferences were generally taken into account in the studies for Australia[5], China, India, Saudi Arabia, the United States/American Samoa, and France/New Caledonia and Wallis and Futuna Islands. Annex C to this document contains the diagrams illustrating the -3 dB beam areas for Administrations which had downlink composite beams created for the initial studies. Annex D provides the diagrams of the feeder-link composite beams created for the feeder-link studies.

In order to evaluate whether or not these national preferences impose undue constraints on the replanning process, a comparison with respect to the Bureau's original suggestion was conducted. In regards to composite beams, IRG decided to proceed with the requests of Administrations, and to evaluate the results on a case-by-case basis, where required.

2.10.1 General definition of composite beams

Composite beams ("simulated shaped beams") have been formed by combining the existing elliptical beams of the relevant Administration at the orbit position in question.[6]

The orbital positions which were requested by Administrations or the default orbital positions of the WRC-97 Plan were used for the ellipses that make up the composite beam.

Because a "composite beam" is a *de facto* single beam ("simulated shaped beam"), the same set of channels will be used throughout the area covered by the composite beam.

For the downlink C/I calculation, the highest downlink e.i.r.p. of the composite beam will be assumed in the direction of each visible receiving earth station. In the feeder-link Plan, the highest receiving space station antenna gain value of the composite beam will be assumed in the direction of each visible transmitting earth station.

2.10.2 Specific considerations concerning composite beams

2.10.2.1 Downlink situation of AUS

Taking into account a request from Australia, the beam and channel arrangement (6 channels per beam) in the WRC-97 Plan were included in the initial studies. In addition, Australia requested that its additional channels should be provided in national coverage beams.

---

[5] See also section 2.10.2.1.

[6] The United States reserves its position regarding the composite beams for its territories.

However, this request has been referred to IRG for its consideration. In the studies performed before GTE-3, two composite beams were derived from the WRC-97 beams (as shown in Attachment 1 of Document GTE99-3/12), one at each of the two orbital positions, with four channels per beam were included (see paragraph 3.3 of Document GTE99-3/11).

In line with the IRG-4 decision referred to in section 2.4.4.1 above, and after further clarifications from Australia, two new composite beams with national coverage are created for Australia, one at 152° E using feeder-link beam AUS0040A and downlink beams AUS0040A, AUS0040B, AUS0040C, AUS0070A, AUS0090A and AUS0090B, and one at 164° E using feeder-link beam AUS0070A and downlink beams AUS0040A, AUS0040B, AUS0040C, AUS0070A, AUS0090A and AUS0090B (see Attachment 1).

2.10.2.2 Downlink situation of CHN

Taking into account a request from China, the composite beams and elliptical beams as shown in Attachment 1 were used in the initial studies. There is one composite and one elliptical beam at orbital position 62° E, one composite and one elliptical beam at orbital position 79.8° E, and two composite beams at orbital position 92° E (see paragraph 3.4 of Documents GTE99-3/11 and GTE99-4/13).

In order to reduce excessive overlaps between the different composite beams at each of the different orbital positions and to cover the Chinese territory appropriately, some of the test points of a number of beams (CHN15400, CHN15500, CHN15600, CHN15700, CHN15800, CHN15900 and CHN16100) have been modified and the orbital position of one beam (CHN15700) was changed from 62° E to 79.8° E.

- Test points at 42.8° N and 96.3° E, 34.3° N and 79° E, and 36.3° N and 90° E of beam CHN15400 were replaced with those at 44.29° N and 95.36° E, 35.3° N and 79° E, and 36.5° N and 89° E, respectively.
- A test point at 36.3° N and 90° E of beam CHN15500 was replaced with a test point at 35.3° N and 90° E and a new test point at 33.5° N and 79.5° E was added to that beam.
- Test points at 35.4° N and 108.5° E, 32.6° N and 105.2° E, and 31.7° N and 95.9° E of beam CHN15600 were replaced with those at 35.4° N and 105.5° E, 32.6° N and 100.2° E, and 34.7° N and 95° E, respectively.
- A test point at 33° N and 105.8° E of beam CHN15700 was replaced with a test point at 30° N and 105.8° E. Test points at 32.9° N and 105.8° E, and 31.5° N and 115.3° E of beam CHN15800 were replaced with those at 34.9° N and 105.8° E, and 33.5° N and 115.3° E, respectively.
- Test points at 31.5° N and 115.3° E, and 33.1° N and 109.5° E of beam CHN15900 were replaced with those at 29.5° N and 115.3° E, and 30.1° N and 109.5° E, respectively.
- Test points at 39.6° N and 120.2° E, 36° N and 115.4° E, and 37.4° N and 122.6° E of beam CHN16100 were replaced with those at 36.6° N and 120.2° E, 35.5° N and 115.4° E, and 35.4° N and 122.6° E, respectively.

The Administration of the People's Republic of China requested that a feeder-link beam covering the Chinese Mainland should be provided from three orbital positions. China then accepted BR's proposal as conveyed to them by correspondence (see resulting composite beams in Attachment 2).

2.10.2.3 Feeder-link and downlink situation of IND

Taking into account a request from India, the composite beams and elliptical beams as shown in Attachment 1 were used in the initial studies. There are two composite beams at orbital position 56° E and one composite beam and two elliptical beams at orbital position 68° E (see paragraph 3.6 of Document GTE99-3/11).

In order to reduce excessive overlaps between the different composite beams at each of the different orbital positions and to cover the Indian territory appropriately, some test points of a limited number of beams have been modified (IND04100, IND04200, IND04500 and IND04600). The orbital positions of beams IND04200, IND04600 and IND4800 were changed from 68° E to 56° E and those of beams IND03800 and IND04000 were changed from 56° E to 68° E.

- A test point at 19.0° N and 84.9° E of beam IND04100 was replaced with a test point at 17.8° N and 81.4° E of beam IND04600.
- A test point at 29.9° N and 74.5° E of IND04200 was replaced with a test point at 31.2° N and 79.0° E of beam IND03800.
- A test point at 21.6° N and 80° E of beam IND4500 was deleted from that beam and added to beam IND04600.

GTE-4 concurred with India's request to use for the above described beams both the 14 GHz and 17 GHz frequency bands, either alternatively or in combination for their feeder links.

[h]2.10.2.4 Downlink situation of the United States

According to a request from the United States, one downlink composite beam was modified by adding a downlink spot beam for American Samoa in order to reduce the sensitivity derived from a downlink test point outside the downlink beam area (i.e. 14 dB gain contour) (see paragraph 3.11 of Document GTE99-3/11).

IRG agreed that this arrangement would be used in the further replanning studies.

2.10.2.5 Downlink situation of F

According to a request from France, two downlink elliptical beams (WAL10200 and NCL10000) in the WRC-97 Plan were included without being grouped in the initial studies instead of the downlink composite beam.

The IRG agreed that this arrangement will be used in the further replanning studies.

With respect to the feeder-link situation, in both the study presented at GTE-4 and the study presented at IRG-5, a similar situation was assumed at the request of France, i.e.: to define one feeder-link composite beam for WAL (composed of WRC-97 beams WAL10200 and WAL10201), and another feeder-link composite beam, not grouped with the first one, for NCL (composed of WRC-97 beams NCL10000 and NCL10001). See the corresponding 3 dB contours in Attachment 2.

IRG-5 is invited to confirm or otherwise this course of action which was not presented at IRG-4.

[h] Editorial Note - Deleted since now in line with general principles.

2.11 Orbital positions[7]

Based on the responses received from Administrations with respect to Circular Letter CR/117 of 1 March 1999, and/or the reminder of 15 March 1999, the orbital positions shown in Document GTE99-3/11 were used for Steps 1 to 3. Orbital positions of some beams were modified during initial Step 4 studies in order to accommodate these beams in the Plan.

Some Administrations strongly disagreed with the results after Step 4 and requested that their preferred orbital positions be maintained. All Administrations whose specific requests cannot be met in the replanning exercise will be contacted by the Bureau individually. If the request is maintained, every effort will be undertaken in order to satisfy the requirements of the Administration concerned.

This course of action was implemented in the replanning studies prior to GTE-4.

At the request of the APT Group of Technical Experts (AGTE) from Region 3, GTE will use the default orbital positions proposed by AGTE in Document GTE99-4/9, 24 September 1999, as default orbital positions for Region 3 in the GTE replanning studies, unless a different preferred orbital position had been requested by an Administration in that Region in response to CR/117. The Region 3 Administrations for which a default orbital position was proposed by the AGTE which is different from that of Appendices S30 and S30A, will be consulted by the Bureau in order to confirm or otherwise this course of action, noting that absence of reply will mean agreement with the choice of orbital position indicated in Document GTE99-4/9. A Circular Letter will then be issued by the Bureau in order to inform all Administrations of the orbital positions used in the GTE replanning studies.

2.11.1 Countries/administrative regions covered by channels from two orbital positions in the WRC-97 Plan

Some countries/administrative regions (CHN/HKG, D, NZL, PNG) are covered by channels from two orbital positions in the WRC-97 Plan. In accordance with the IRG-3 conclusion, a separate beam for Hong Kong at 122° with 10 channels was included in the initial studies to determine if this beam causes any difficulties for the replanning. In case of Germany, New Zealand and Papua New Guinea, an ellipse and associated test points at one of their orbital positions were taken (D: 19° W, NZL: 158° E, and PNG: 128° E using test-points of PNG at 110° E).

2.11.2 Case of CHN/HKG

IRG-4 considered the report of GTE on this issue, and advised GTE to continue to take account of the request of China together with other requests from this Administration under the various steps of the replanning process. If there are any problems, GTE should consult the Administration concerned.

---

[7] NOTE - During the GTE-3 meeting, the Syrian Administration emphasized the importance for each Administration to enjoy full freedom to select its existing nominal orbital position or to modify it to meet its requirements during the exercise. This should not necessarily be a nominal orbital position. It could be any angular value between nominal orbital positions.

2.11.3 New multinational beam and multiple orbital positions for D[8]

The Administrations of Germany, Austria, Switzerland and Liechtenstein requested to include ten channels per country with four new identical multinational beams covering their territories while deleting their national beams (see also Document GTE99-3/11). The Administration of Germany requested that in addition to the beam D 08700 at 19° W, the beam D2-216000 at 1° W continue to be taken into account in the replanning study until the final clarification of the inclusion of the multinational beams proposed by the Administrations of Germany, Austria, Switzerland and Liechtenstein.

IRG reviewed this request, and decided to continue with the existing planning approach. In addition, before the next meeting of IRG, IRG requested that GTE perform the study outlined in Annex B to determine the impact of the request from Germany, Austria, Switzerland and Liechtenstein on the replanning process. This study in no way should prejudice the decision of IRG that it may take at its next meeting. IRG will review the results of this study at its next meeting and determine how to proceed. IRG also agreed that any process within ITU should be open, transparent and non-discriminatory.

As for the multiple orbital positions for Germany under the existing planning approach, IRG decided that the basic study will be carried out using one orbital position for Germany with ten channels covering its national territory.

2.11.4 Request for collocation of orbital positions

In response to Circular Letter CR/117, some Administrations expressed their wishes to collocate their beams with the beams of certain other Administrations. If it is necessary to move one of these Administrations to another orbital location, the other Administrations who wish to be co-located should also be moved to the new location.

If a given number of Administrations insist on a given orbital position in which they are incompatible with one another, this shall in no way impose constraints on the replanning process or limit the capacity of other countries. The concerned countries have to accept any resulting interference or reduction in capacity.

2.11.5 Requested new beam(s)

The Bureau reported at GTE-4 that it had received a request from the Republic of Seychelles for the inclusion of a beam in the replanning studies under Resolution 532 (see Document GTE99-4/10). GTE considered the request and had no objections with it.

IRG-5 is invited to confirm or otherwise this course of action which was not presented at IRG-4.

---

[8] The German Administration has agreed to the conclusions of IRG-4. However, it reserves its right to reiterate the request for including, into the planning exercises, both national beams of Germany as contained in Appendices S30 and S30A at two orbital positions when the results of the studies described in this section and their further treatment within the IRG are known.

2.12 "Existing systems"[9, 3]

Where an Administration has an "existing system" in the Plan and the Administration wishes to collocate its national beam with the "existing system", a new national beam with ten channels is created and grouped with the "existing system".

2.12.1 Case of E

New national downlink beam arrangements for Spain, E 12900 and CNR13000, with ten channels (ch. 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CL) with WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type, were created at orbital position 30° W. In order not to exceed a total of ten channels and to be compatible with the "existing" beams HISPASA4 and HISPA27D (ch. 23, 27, 31, 35, 39 CL) all Spanish beams were grouped.

A similar course of action was taken with respect to the feeder-link beam arrangements for Spain, E 12900 and CNR13000, which were created at orbital position 30° W with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CR), with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

2.12.2 Case of J

A new national downlink beam for Japan, J 11100, with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CR) with reduced e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type, was created at orbital position 110° E. In order not to exceed a total of ten channels and to be compatible with the "existing" beam J 11100, now renamed J 1110E, at 110° E (ch. 1, 3, 5, 7, 9, 11, 13, 15 CR) and with "existing" beam 000BS-3N at 109.85° E, all Japanese beams were grouped.

A similar course of action was taken with respect to the feeder-link beam for Japan, J 11100, which was created at orbital position 110° E with ten channels (ch. 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 CR), with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

2.12.3 Case of KOR

A new national downlink beam for the Republic of Korea, KOR11200, with ten channels (ch. 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 CL) with reduced e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type, was created at orbital position 116° E (see also section 2.8 above). In order not to exceed a total of ten channels and to be compatible with the "existing" beams KO11201D and KOR11201 (ch. 2, 4, 6, 8, 10, 12 CL) all beams were grouped. Because the orbital position of the national beam was changed from 110° E to 116° E, new ellipse parameters were calculated as described in section 2.6 above.

Despite the fact that the feeder-link parts of the KOREASAT-1 system are using the 14 GHz frequency band, a similar course of action was taken with respect to the feeder-link beam for the

---

[9] See definition in section 2.2. Currently there are eleven systems which fall into this category (see Annex A).

[3] The Administrations of Morocco and Syria consider that the total number of channels per coverage area shall not exceed either ten channels or the number of channels of an "existing system" which is greater than 10. This is with the understanding that the planning conference will decide on the status of those channels of "existing systems" that exceed the number 10.

Republic of Korea, KOR11200, which was created at orbital position 116° E with ten channels (ch. 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 CL at 17 GHz), with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type (see also section 2.4.4.5 above).

2.12.4 Case of S

As the "existing" downlink beam S 13902 (ch. 40 CL) is a multinational beam and the orbital position 5.2° E of "existing" downlink beams SIRIUS01 (ch 4, 8 CR) and SIRIUS02 (ch. 12, 16, 20 CR) is different from that preferred by the Administration of Sweden (5° E), the national downlink beam S 13800 of Sweden at 5° E is treated together with national beams of other Administrations with WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type.[10]

A similar course of action was taken with respect to the feeder-link beam for Sweden, S 13800, which was treated at 5° E, with ten channels, with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

The e.i.r.p. of the "existing" downlink beam S 13902 (ch. 40 CL) was reduced from 68.2 dBW to 63.2 dBW which is the value notified by the Administration of Sweden.

2.12.5 Case of NOR

Downlink beam NOR12102 is no longer considered as "existing" orbital position 5° E as agreed by the Administration of Norway.

According to the request from the Administration of Norway, a new national beam NOR12000 was created at orbital position 0.8° W. This beam has been assigned ten channels (ch. 22, 24, 26, 28, 30, 32, 34, 36, 38, 40 CR) with WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type. In order not to exceed a total of ten channels within a sub-frequency band of 400 MHz, and in order to be compatible with some channels (ch. 24, 28, 32, 36, 40 CR) of the "existing" system BIFROST-2 at 0.8° W, beam of BIFROS22 of BIFROST-2 and beam NOR12000 were grouped. Because the orbital position of the national beam NOR12000 was changed from 5° E to 0.8° W, new ellipse parameters were calculated as described in section 2.6 above.

A similar course of action was taken with respect to the feeder-link beam for Norway, NOR12000, which was created at orbital position 0.8° W with ten channels (ch. 22, 24, 26, 28, 30, 32, 34, 36, 38, 40 CL) with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

2.12.6 Case of F

Beam F 09300 is no longer considered as an "existing" orbital position 19.0° W as agreed by the Administration of France. According to the request from that Administration, a new national beam F 09300 was created at orbital position 7.0° W and was treated together with national beams of other Administrations with reduced e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type. Because the orbital position of the national beam F 09300 was changed from 19.0° W to 7.0° W, new ellipse parameters were calculated as described in section 2.6 above.

---

[10] Sweden reserves its position on the grouping of beams and on the selection of channels.

A similar course of action was taken with respect to the feeder-link beam for France, F 09300, which was created at orbital position 7.0° W with ten channels, with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

2.12.7 Case of LUX

Although the Administration of Luxembourg has not requested to move beam LUX11400 from orbital position 19.0° W to orbital position 19.2° E where its "existing" system DBL is located, for the replanning studies, beam LUX11400 has been moved to orbital position 19.2° E in order to be included successfully in the draft new Plan with ten channels (ch. 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CL), WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type. In order to be compatible with the same channels used by the "existing" system DBL, all beams of DBL and beam LUX11400 were grouped. Because the orbital position of the national beam LUX11400 was changed from 19.0° W to 19.2° E, new ellipse parameters were calculated as described in section 2.6 above.

Desipte the fact that the feeder-link part of the DBL system is not yet considered as an "existing" feeder-link system, a similar course of action was taken with respect to the feeder-link beam for Luxembourg, LUX11400, which was created at orbital position 19.2° E with ten channels (ch. 21, 23, 25, 27, 29, 31, 33, 35, 37, 39 CL) with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

2.12.8 Case of RUS

New national downlink beams for Russia, RSTRSD11, RSTRSD12, with eight channels each (ch. 25, 27, 29, 31, 33, 35, 37, 39 CL and 26, 28, 30, 32, 34, 36, 38, 40 CR respectively) and with WRC-97 e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type, were created at orbital position 36° E. In order to be compatible with beams RSTRSA11 and RSTRSD11 (ch. 27, 31, 35, 39 CL), RSTRSA12 and RSTRSD12 (ch. 28, 32, 36, 40 CR) of the "existing" system RST-1, now renamed RSTREA11, RSTREA12, RSTRED11 and RSTRED12 respectively, all Russian beams at 36° E were grouped (see section 2.4.4.2 above).

A similar course of action was taken with respect to the feeder-link beams for Russia, RSTRSD11, RSTRSD12, which were created at orbital position 36.0° E with eight channels each (ch. 25, 27, 29, 31, 33, 35, 37, 39 CR and 26, 28, 30, 32, 34, 36, 38, 40 CL respectively) with new protection ratios, digital modulation and with MODRSS receiving space station antenna type and MODTES transmitting earth station antenna type.

The Russian Administration has requested to create beams RSTRSD11 and RSTRSD12, with only four channels each (ch. 25, 29, 33, 37 and 26, 30, 34, 38 respectively) and with reduced e.i.r.p., new protection ratios, digital modulation and MODRES receiving earth station antenna type.

GTE-4 agreed with the first assumption mentioned above.

2.12.9 National beams collocated with assignments that are included in the Appendix S30/S30A Plan resulting from the successful completion of the Article 4 procedures[3]

According to the request from the Administrations of France and Norway, new national beams F 09300 and NOR12000 were created at orbital positions 7° W and 0.8° W, respectively. The channels and polarization that were the same as those in the collocated assignments (those included in the Appendix S30/S30A Plan resulting from the successful completion of the Article 4 procedures) are considered first as candidate channels[11]. However, IRG concluded that in the follow-up studies, these requests for co-location should no longer be pursued.

2.13 Multinational beams[12]

In accordance with the conclusion of IRG-3, multinational beams for the following Administrations are maintained in the studies with the following number of channels. The "existing" (as defined in section 4.2 of Document IRG99-4/18) multinational beams will be treated in Step 3. The other multinational beams in the WRC-97 Plan will be treated in Step 4, or later steps.[13]

---

[3] Administrations of Morocco and Syria consider that the total number of channels per coverage area shall not exceed either ten channels or the number of channels of an "existing system" which is greater than 10. This is with the understanding that the planning conference will decide on the status of those channels of "existing systems" that exceed the number 10.

[11] Norway reserves its position on the selection of channels.

[12] Sweden and Norway reserve their position on this section.

[13] In so doing, Morocco does not accept in any way that protection of these "existing" multinational beams places any undue constraints on the replanning process. In addition, Lao P.D.R. expressed its view that under no conditions the number of channels in a multinational beam shall exceed the number of channels assigned to these beams in the 1997 Plans.

2.14 Application to feeder-link studies

In the absence of further guidance, technical assumptions and methodologies adopted for the downlink replanning exercises should be applied in a similar way and as far as practical to the subsequent feeder-link replanning exercises. Initial studies relating to the feeder-link replanning exercises will consider primarily the 17 GHz band.

GTE-4 concluded from preliminary feeder-link replanning studies undertaken by the Bureau at 17 GHz, that limitation to the 17 GHz frequency band may not provide all assignments with the required number of channels and protection.

As a consequence, GTE-4 concluded that the feeder-link replanning studies should consider both the 14 GHz and 17 GHz frequency bands. Furthermore, some Administrations expressed their specific preferences to use the 14 GHz frequency band in addition or alternatively to the 17 GHz frequency band.

Unless otherwise specified in the other sections of this document, the technical assumptions assumed are valid for both the feeder-link and the downlink studies.

Several beams have the same ellipse characteristics in the WRC-97 Plan. In order to simplify the replanning studies, only one version of them has been kept and renamed in order to avoid confusion, as shown in the following table (see also Attachment 3):

Name of WRC-97 Beams	Corresponding proposed new name
AFG24500 and AFG24600	AFG24546

[4] RST-1, BIFROST-2

[5] RST-1, DBL (downlink only), HISPASAT-1 (27 MHz bandwidth, digital modulation).

ANNEX B

(to Attachment 2)

The Administrations of Germany, Austria, Switzerland and Liechtenstein requested to include ten channels per country with four new identical multinational beams covering their territories while deleting their national beams (see also Document GTE99-3/11).

IRG agreed that these new multinational beams be included in the studies if this inclusion does not have any impact on the replanning itself, i.e. if this inclusion will not create more interference nor request more protection than the four national beams with ten channels.

In order to determine if the inclusion of these beams impact replanning, GTE was requested by IRG to perform the following studies:

1) continue the replanning exercises based on national coverages with ten channels (Principles 1 and 2 of Annex 1 of Resolution 532) at the same orbital position;

2) at the end of this exercise, four identical multinational beams covering the territory of Germany, Austria, Switzerland and Liechtenstein, each with ten channels will be substituted to the national beams of Germany, Austria, Switzerland and Liechtenstein and the e.i.r.p. of these multinational beams may be reduced if necessary to a level which does not create more interference than the previous situation (i.e. the four national beams with ten channels). The result of this modification i.e. the level of e.i.r.p. and the EPM associated with these new multinational beams is proposed to the Administrations of Germany, Austria, Switzerland and Liechtenstein for agreement or otherwise.

ANNEX C

(to Attachment 2)

The ellipses provided in this document with respect to composite beams in the draft new downlink Plan at 12 GHz are based on the default or preferred orbital positions, according to the case. When posting the information on the Web, the updated orbital positions and beam parameters will be provided.

METHODOLOGY FOR COMPATIBILITY STUDIES WITH OTHER SERVICES AND THE REGION 2 PLAN

1 Feeder link causing interference

1.1 Compatibility analysis for BSS feeder link into FSS (space-to-Earth) (paragraph 4.2.1.2 of Article 4 of Appendix S30A)

1.1.1 Provision

1.1.1.1 Article 4 of Appendix S30A

"4.2.1.2 having a frequency assignment in the band 17.7-18.1 GHz to an earth station in the fixed-satellite service (space-to-Earth), which is recorded in the Master Register or which has been coordinated or is being coordinated under the provisions of No. **S9.7** and which is located within the coordination area of the feeder-link fixed-satellite earth station."

1.1.1.2 Annex 1 to Appendix S30A

"**1 Limits applicable to protect a frequency assignment in the band 17.7-18.1 GHz to an earth station in the fixed-satellite service (space-to-Earth) (see §§ 4.2.1.2 and 4.2.3.2 of Article 4 of Appendix S30A)**

An administration shall be considered as being affected if, upon application of the procedures of Section 3 of Annex 4, that administration is included in the coordination area of the frequency assignment to a transmitting feeder-link earth station.

For the purpose of this calculation, the feeder-link transmitting earth station parameters notified by the administration, which may differ from those given in Annex 3, are used."

1.1.1.3 Rules of Procedure

"4.2.1.2

In determining those administrations affected in accordance with this paragraph, the limits of Annex 1 (§ 1) and Annex 4 (§ 3) will be used for those specific earth stations in the fixed-satellite service (space-to-Earth) which are either recorded in the MIFR or notified at the time of examination under Nos. **S11.2** to **S11.9**."

1.1.2 Methodology

Because this analysis is based on the worst case (i.e. horizontal elevation angle is 0 degree, feeder-link earth stations are located on the test points which are situated near the border), the coordination contours are bigger than those which will be created at the stage of implementation of the system. Therefore, for this study practical way would be not to produce coordination contours but to list all of the specific earth stations in the fixed-satellite service (space-to-Earth) in the band 17.7-18.1 GHz, which are recorded in the MIFR at the time of examination.

It should be noted that the WRC-97 concluded that:

"Before an administration notifies to the Bureau or brings into use this frequency assignment to a transmitting feeder-link earth station in the band 17.7-18.1 GHz, it shall effect coordination of this assignment, using the method described in Annex 4, in respect of a specific earth station in the fixed-satellite service (space-to-Earth) in the band 17.7-18.1 GHz:

a) either recorded in the Master Register prior to 27 October 1997 with a favourable finding; or

b) for which a notice is received by the Bureau prior to 27 October 1997 for recording in the Master Register and which subsequently receives a favourable finding based on the Plan as it existed on 27 October 1997."

1.2 Compatibility analysis for BSS feeder link into terrestrial service (paragraph 4.2.1.3 of Article 4 of Appendix S30A)

1.2.1 Provision

1.2.1.1 Article 4 of Appendix S30A

"4.2.1.3 having a frequency assignment in the bands 14.5-14.8 GHz or 17.7-18.1 GHz to a terrestrial station in use or intended to be brought into use within three years of the projected date of bringing the feeder-link modification into use, and which is located within the coordination area of the feeder-link fixed-satellite earth station"

1.2.1.2 Annex 1 to Appendix S30A

"**2 Limits applicable to protect a terrestrial station in the bands 14.5-14.8 GHz and 17.7-18.1 GHz (see §§ 4.2.1.3 and 4.2.3.3 of Article 4 of Appendix S30A)**

An administration shall be considered as being affected if, upon application of the procedures of Appendix **S7**, that administration is included in the coordination area of the frequency assignment to a transmitting feeder-link earth station[9].

For the purpose of this calculation, the feeder-link transmitting earth station parameters notified by the administration, which may differ from those given in Annex 3, are used."

1.2.1.3 Rules of Procedure

"4.2.1.3

In determining those administrations affected in accordance with this paragraph, the limits of Annex 1 (§ 2) shall be applied. Paragraphs 4.2.1.2 and 4.2.1.3 refer to "the coordination area of the feeder link fixed-satellite earth station", implying that any modification to the Plan should be limited to feeder links with fixed earth stations. The Board noted that few entries in the Plan contain fixed feeder-link earth stations. It may be concluded from this situation that nothing prevents an administration from applying the Article 4 procedure to a typical feeder link earth station the coordination area of which should be calculated as indicated in § 7 of Appendix **S7**."

1.2.2 Methodology

This analysis identifies the large number of administrations likely to be affected which are situated closed to the service area of the examined feeder link because this analysis is based on the worst case (i.e. horizontal elevation angle is 0 degree, feeder-link earth stations are located on the test points which are situated near the border). At the implementation stage the network coordination contours might be much smaller because the location of a feeder-link earth station is decided.

Therefore, for this study a practical way would be not to produce coordination contours but to list all terrestrial stations (space-to-Earth) in the bands 14.5-14.8 GHz and 17.7-18.1 GHz, which are recorded in MIFR at the time of examination.

It should be noted that WRC-97 concluded that:

"Before an administration notifies to the Bureau or brings into use this frequency assignment to a transmitting feeder-link earth station in the bands 14.5-14.8 GHz and 17.7-18.1 GHz, it shall effect coordination of this assignment with each administration whose territory lies wholly or partly within

---

[9] In Regions 1 and 3, for the application of the procedures of Appendix **S7**, the e.i.r.p. for the feeder-link earth station is the sum of the values specified in columns 13 and 14 of the Plan.

the coordination area of the feeder-link earth station, using the method described in Appendix **S7**, in respect of stations of the fixed and mobile services in the bands 14.5-14.8 GHz and 17.7-18.1 GHz:

a) either recorded in the Master Register prior to 27 October 1997 with a favourable finding; or

b) for which a notice is received by the Bureau prior to 27 October 1997 for recording in the Master Register and which subsequently receives a favourable finding based on the Plan as it existed on 27 October 1997"

1.3 Compatibility analysis for BSS feeder link into Region 2 BSS Plan (paragraph 4.2.1.4 of Article 4 of Appendix S30A)

1.3.1 Provision

1.3.1.1 Article 4 of Appendix S30A

"4.2.1.4 having an assignment for feeder links in the fixed-satellite service (Earth-to-space) with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is in conformity with the Region 2 feeder-link Plan, or in respect of which proposed modifications to the Plan have already been published by the Board in accordance with the provisions of paragraphs 4.2.6.1 and 4.2.7 of this Article"

1.3.1.2 Annex 1 to Appendix S30A

"5 Limits applicable to protect a frequency assignment in the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.3-17.8 GHz (Region 2) to a receiving space station in the fixed-satellite service (Earth-to-space)

An administration in Region 1 or 3 shall be considered affected by a proposed modification in Region 2 or vice versa when the power flux-density arriving at the receiving space station of a broadcasting-satellite feeder-link station would cause an increase in the noise temperature of the feeder-link space station which exceeds the threshold value of $\Delta T/T$ corresponding to 3%, where $\Delta T/T$ is calculated in accordance with the method given in Appendix **S8**, except that the maximum power densities per Hertz averaged over the worst 1 MHz are replaced by power densities per Hertz averaged over the total RF bandwidth of the feeder-link carriers (24 MHz for Region 2 and 27 MHz for Regions 1 and 3).

Interim systems of Region 2 in accordance with Resolution **42 (Rev.Orb-88)** shall not be taken into consideration when applying this provision to proposed modifications to the Regions 1 and 3 Plan. However, this provision shall be applied to Region 2 interim systems with respect to the Regions 1 and 3 Plan."

1.3.1.3 Rules of Procedure

"4.2.1.4

In determining those administrations of Region 2 that may be affected, the proposed modification of the Regions 1 and 3 Plan is examined with respect to the Region 2 Plan as it exists at the date of receipt of the proposal for modification including the proposed modifications received before that date (whether the procedure of Article 4 is complete or not). The examination will consider only those administrations having assignments whose necessary bandwidth overlaps the necessary bandwidth of the proposed modification. The Region 2 administration is identified as having services which are considered to be affected when the limits specified in § 5 of Annex 1 to Appendix **S30A** are exceeded."

1.3.2 Methodology

With the criteria and the methodology prescribed in Annex 1 and the above-mentioned Rule of Procedure, the administrations likely to be affected should be identified by running the Appendix AP29 Program using the following assumptions from Annex 3 of Appendix S30A:

– Power density per Hertz averaged over the total RF bandwidth:

  For Regions 1 and 3 assignments: Power -10 log (27 MHz) = Power -74.31 dB(W/Hz)

– Satellite system noise temperature for Region 2 assignments = 1 500 K

2 Downlink causing interference

2.1 Compatibility analysis for BSS downlink into Region 2 Plan (paragraph 4.3.1.2 of Article 4 of Appendix S30)

2.1.1 Provision

2.1.1.1 Article 4 of Appendix S30

"4.3.1.2 of Region 2 having a frequency assignment to a space station in the broadcasting-satellite service with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is in conformity with the Region 2 Plan, or in respect of which proposed modifications to that Plan have already been published by the Bureau in accordance with the provisions of §§ 4.3.5.1 or 4.3.6 of this Article"

2.1.1.2 Annex 1 to Appendix S30

"3 Limits to the change in the power flux-density to protect the broadcasting-satellite service in Regions 1 and 2 in the band 12.2-12.5 GHz and in Region 3 in the band 12.5-12.7 GHz

With respect to § 4.3.1.2 of Article 4, an administration in Region 2 shall be considered as being affected if the proposed modification to the Regions 1 and 3 Plan would result in exceeding the power flux-densities given below, at any point in the service area affected.

With respect to §§ 4.3.3.2 or 4.3.3.6 of Article 4, as appropriate, an administration in Region 1 or 3 shall be considered as being affected if the proposed modification to the Region 2 Plan would result in exceeding the power flux-densities given below, at any point in the service area affected.

-147 dB(W/m^2/27 MHz)	for $0° \leq \theta < 0.44°$;
$-138 + 25 \log \theta$ dB(W/m^2/27 MHz)	for $0.44° \leq \theta < 19.1°$;
-106 dB(W/m^2/27 MHz)	for $\theta \geq 19.1°$;

where θ is:

– the difference in degrees between the longitudes of the broadcasting-satellite space station in Region 1 or 3 and the broadcasting-satellite space station affected in Region 2, *or*

– the difference in degrees between the longitudes of the broadcasting-satellite space station in Region 2 and the broadcasting-satellite space station affected in Region 1 or 3."

2.1.1.3 Rules of Procedure

"**4.3.1.2**

In determining those administrations of Region 2 that might be affected, the proposed modification of the Regions 1 and 3 Plan is examined with respect to the Region 2 Plan as it exists at the date of receipt of the proposal for modification including the proposed modifications received before that date (whether the procedure of Article 4 is complete or not). The examination will consider only those administrations having assignments whose necessary bandwidth overlaps the necessary bandwidth of the proposed modification. The Region 2 administration is identified as having services which are considered to be affected when the power flux-density over any part of its territory which lies within the service area of the Region 2 assignment under examination exceeds the limits specified in § 3 of Annex 1 to Appendix **S30**. In the absence of a defined service area contour, the area on the surface of the Earth within the −3 dB contour shall be considered as the service area of that Region 2 assignment in this examination."

2.1.2 Methodology

With the criteria and the methodology prescribed in Annex 1 and the above-mentioned Rule of Procedure, the administrations likely to be affected should be identified.

2.2 Compatibility analysis for BSS downlink into terrestrial service (paragraph 4.3.1.4 of Article 4 of Appendix S30)

2.2.1 Provision

2.2.1.1 Article 4 of Appendix S30

"4.3.1.4 having no frequency assignment in the broadcasting-satellite service in the channel concerned but in whose territory the power flux-density value exceeds the prescribed limit as a result of the proposed modification or having an assignment whose associated service area does not cover the whole of the territory of the administration, and in whose territory outside that service area the power flux-density from the broadcasting-satellite space station subject to this modification exceeds the prescribed limit as a result of the proposed modification"

2.2.1.2 Annex 1 to Appendix S30

"**8 Limits to the change in the power flux-density to protect the terrestrial services of other administrations**

a) In Region 1 or 3:

With respect to § 4.3.1.4 of Article 4, an administration in Region 1 or 3 shall be considered as being affected if the consequence of the proposed modification of an existing assignment in the Regions 1 and 3 Plan is to increase the power flux-density arriving on any part of the territory of that administration by more than 0.25 dB over that resulting from that frequency assignment in the Regions 1 and 3 Plan at the time of entry into force of the Final Acts (1977 Conference, in force on 1 January 1979). The same administration shall be considered as not being affected if the value of the power flux-density anywhere in its territory does not exceed the limits expressed in §§ 5 *a)* and 5 *b)* of this Annex applied to the frequency range 11.7-12.5 GHz.

With respect to § 4.3.1.4 of Article 4, in the case of an addition of a new assignment to the Regions 1 and 3 Plan, an administration in Region 1 or 3 is considered as being affected if the power flux-density on any part of its territory exceeds the limit expressed in § 5 *a)* and 5 *b)* of this Annex applied to the frequency range 11.7-12.5 GHz.

5 Limits to the change in the power flux-density to protect the terrestrial services of administrations in Regions 1 and 3[16]

With respect to § 4.3.3.4 of Article 4, an administration in Region 1 or 3 shall be considered as being affected if the proposed modification to the Region 2 Plan would result in the following power flux-density limits being exceeded:

a) in the frequency band 12.2-12.7 GHz for all the territories of administrations in Regions 1[17] and 3 and for any arrival angle γ:

-125 dB(W/m^2/4 kHz) for broadcasting-satellite space stations using circular polarization;

-128 dB(W/m^2/4 kHz) for broadcasting-satellite space stations using linear polarization;

b) in the frequency band 12.2-12.5 GHz for territories of administrations in Region 3 and those in the western part of Region 1, west of longitude 30° E[18]:

-132 dB(W/m^2/5 MHz)	for $0° \leq \gamma < 10°$;
$-132 + 4.2 (\gamma - 10)$ dB(W/m^2/5 MHz)	for $10° \leq \gamma < 15°$;
-111 dB(W/m^2/5 MHz)	for $15° \leq \gamma < 90°$;

4 Limits to the change in the power flux-density to protect the terrestrial services of administrations in Region 2

With respect to § 4.3.1.4 of Article 4, an administration in Region 2 shall be considered as being affected if the proposed modification to the Regions 1 and 3 Plan would result in exceeding a power flux-density, for any angle of arrival, at any point on its territories, of:

-125 dB(W/m^2/4 kHz)	when the broadcasting-satellite station uses circular polarization, *and,*
-128 dB(W/m^2/4 kHz)	when the broadcasting-satellite station uses linear polarization."

2.2.1.3 Rules of Procedure

"4.3.1.4

This paragraph is understood by the Board as being intended to protect terrestrial services in any territory or part of a territory in the three Regions where this territory or part of a territory is not covered by a broadcasting-satellite assignment in a given channel. Therefore the modification to the Regions 1 and 3 Plan should take account of:

– terrestrial stations in Regions 1 and 3; and

– terrestrial stations in Region 2.

---

[16] See § 3.18 of Annex 5.

[17] In the band 12.5-12.7 GHz in Region 1, these limits are applicable only to the territory of administrations mentioned in Nos. **S5.494** and **S5.496**.

[18] See Resolution **34**.

In the case of terrestrial stations in Regions 1 and 3 the limit for the power flux-density not to be exceeded by a broadcasting-satellite space station in the same Regions is specified in section 8 *a)* of Annex 1. In the case of terrestrial stations in Region 2, the limit for the power flux-density not to be exceeded by a broadcasting-satellite space station in Regions 1 and 3 is that specified in § 4 of Annex 1 to Appendix **S30**. The agreement of an administration is required when a pfd excess exists over some part of its territory, unless the assigned bandwidth of the examined assignment is completely within the assigned bandwidth(s) of one or more assignments[1] of the potentially affected administration in the Appendix **S30** Plan and the area of pfd excess is inside the service area(s) of those Appendix **S30** assignments. In the absence of a defined service area contour, the area on the surface of the Earth within the -3 dB contour shall be considered as the service area of those Appendix **S30** assignments in this examination."

2.2.2 Methodology

With the criteria and the methodology prescribed in Annex 1 and the above-mentioned Rule of Procedure, the administrations likely to be affected should be identified.

Comparison between a corresponding former assignment (on the same channel) of the WRC-97 Plan is made (see Annex A to this Attachment). The pending coordination from WRC-97 Plan is incorporated in the list of the identification.

It is checked whether or not the administrations identified have frequency assignments in the broadcasting-satellite service for the channel concerned.

2.3 Compatibility analysis for BSS downlink into FSS (space-to-Earth) (paragraph 4.3.1.5 of Article 4 of Appendix S30)

2.3.1 Provision

2.3.1.1 Article 4 of Appendix S30

"4.3.1.5 having a frequency assignment in the band 11.7-12.2 GHz in Region 2 or 12.2-12.5 GHz in Region 3 to a space station in the fixed-satellite service which is recorded in the Master International Frequency Register (Master Register) or which has been coordinated or is being coordinated under the provisions of No. **S9.7**, or those of § 7.2.1 of this Appendix"

2.3.1.2 Annex 1 to Appendix S30

"**6 Limits to the change in the power flux-density of assignments in the Regions 1 and 3 Plan to protect the fixed-satellite service (space-to-Earth) in the band 11.7-12.2 GHz in Region 2, and of assignments in the Region 2 Plan to protect the fixed-satellite service (space-to-Earth) in the band 12.5-12.7 GHz in Region 1 and in the band 12.2-12.7 GHz in Region 3**

With respect to § 4.3.1.5 of Article 4, an administration in Region 2 shall be considered as being affected if the proposed modification to the Regions 1 and 3 Plan would result in an increase in the power flux-density on its territory of 0.25 dB or more above that resulting from the frequency assignments in the Regions 1 and 3 Plan at the time of entry into force of the Final Acts (1977 Conference, in force on 1 January 1979).

---

[1] Assignments to satellite networks of international organizations should not be considered as being national assignments of administrations which notify them on behalf of international satellite organizations.

With respect to § 4.3.3.5 of Article 4, an administration in Region 1 or 3 shall be considered as being affected if the proposed modification to the Region 2 Plan would result in an increase in the power flux-density on its territory of 0.25 dB or more above that resulting from the frequency assignments in the Region 2 Plan at the time of entry into force of the Final Acts (1985 Conference).

However, where an assignment in the Regions 1 and 3 Plan or its subsequent modification gives a power flux-density of less than -138 dB(W/m^2/27 MHz) anywhere in the territory of an administration of Region 2, that administration shall be considered as not being affected; where an assignment in the Region 2 Plan or its subsequent modification gives a power flux-density of less than -160 dB(W/m^2/4 kHz) anywhere in the territory of an administration of Region 1 or 3, that administration shall be considered as not being affected."

2.3.1.3 Rules of Procedure

"4.3.1.5

1 The bands 11.7-12.2 GHz in Region 2 and 12.2-12.5 GHz in Region 3 are allocated to the fixed-satellite service (FSS). See comments made under the Rules of Procedure concerning Nos. **S5.488** and **S5.491**.

2 An administration in Region 2 is identified among those whose agreement is required under this paragraph when the following conditions are fulfilled:

a) it has assignment to fixed-satellite service space stations in the band 11.7-12.2 GHz whose assigned bandwidth overlaps the necessary bandwidth of the proposed assignment and which is:

– recorded in the MIFR, with a favourable Finding under No. **S11.31**; or

– published or received for publication for coordination under provision **S9.7**; or

– published or received for publication under § 7.2.1 of Article 7 of Appendix **S30/No. S9.8**; and

b) the power flux-density over any portion of the service area of the above-mentioned Region 2 FSS assignment resulting from the proposed Regions 1 and 3 BSS assignment exceeds the limits prescribed in §§ 1 and 3 of section 6 of Annex 1 to Appendix **S30**.

c) See also the comments made under the Rules of Procedure concerning Annex 7.

3 An administration of Region 3 is identified among those whose agreement is required under this paragraph when the following conditions are fulfilled:

a) it has assignment to fixed-satellite service space stations in the band 12.2-12.5 GHz whose assigned bandwidth overlaps the necessary bandwidth of the proposed assignment and which is:

– recorded in the MIFR, with a favourable Finding under No. **S11.31**; or

– published or received for publication for coordination under provision **S9.7**; or

– published or received for publication under § 7.2.1 of Article 7 of Appendix **S30/No. S9.8**; and

b) the power flux-density over any portion of the service area of the above-mentioned Region 3 FSS assignment resulting from the proposed Region 1 BSS assignment exceeds the limits prescribed in §§ 1 and 3 of section 6 of Annex 1 to Appendix **S30**.

c) See also the comments made under the Rules of Procedure concerning § 6 of Annex 1.

In the case of inclusion of a new assignment to the Regions 1 and 3 Plan, the limit prescribed in § 3 of section 6 of Annex 1 shall be applied with the same conditions as those mentioned in §§ 2 and 3 above (see also Rules relating to §§ 4.1 *a)* and 4.1 *b)* above)."

2.3.2 Methodology

With the criteria and the methodology prescribed in Annex 1[1] and the above-mentioned Rule of Procedure, the administrations likely to be affected should be identified.

Comparison between a corresponding former assignment (on the same channel) of the WRC-97 Plan is made (see Annex A to this Attachment). The pending coordination from WRC-97 Plan is incorporated in the list of the identification.

3 Feeder link receiving interference

3.1 Compatibility analysis for Region 2 Plan into BSS feeder link (paragraph 4.2.3.4 of Article 4 of Appendix S30)

3.1.1 Provision

3.1.1.1 Article 4 of Appendix S30A

"4.2.3.4 having an assignment for feeder-links in the fixed-satellite service (Earth-to-space) with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is in conformity with the Regions 1 and 3 feeder-link Plan, or in respect of which proposed modifications to the Plan have already been published by the Bureau in accordance with the provisions of §§ 4.2.6.1 and 4.2.7 of this Article"

3.1.1.2 Annex 1 to Appendix S30A

"5 Limits applicable to protect a frequency assignment in the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.3-17.8 GHz (Region 2) to a receiving space station in the fixed-satellite service (Earth-to-space)

An administration in Region 1 or 3 shall be considered affected by a proposed modification in Region 2 or vice versa when the power flux-density arriving at the receiving space station of a broadcasting-satellite feeder-link station would cause an increase in the noise temperature of the feeder-link space station which exceeds the threshold value of $\Delta T/T$ corresponding to 3%, where $\Delta T/T$ is calculated in accordance with the method given in Appendix **S8**, except that the maximum power densities per Hertz averaged over the worst 1 MHz are replaced by power densities per Hertz averaged over the total RF bandwidth of the feeder-link carriers (24 MHz for Region 2 and 27 MHz for Regions 1 and 3).

Interim systems of Region 2 in accordance with Resolution **42 (Rev.Orb-88)** shall not be taken into consideration when applying this provision to proposed modifications to the Regions 1 and 3 Plan. However, this provision shall be applied to Region 2 interim systems with respect to the Regions 1 and 3 Plan."

[1] This pfd limit will be applied in conjunction with Annex 7 to Appendix S30.

3.1.1.3 Rules of Procedure

"4.2.3.4

In determining the administrations of Regions 1 and 3 that might be affected, the proposed modification of the Region 2 Plan is examined with respect to the Regions 1 and 3 Plan as it exists at the date of receipt of the modification including all proposed modifications received before that date (whether the procedure of Article 4 is complete or not). The examination will identify only those administrations having assignments whose necessary bandwidth overlaps the necessary bandwidth of the proposed modification. An administration is identified as having services which may be affected when the limits specified in § 5 of Annex 1 to Appendix **S30A** are exceeded."

3.1.2 Methodology

With the criteria and the methodology prescribed in Annex 1 and the above-mentioned Rule of Procedure, the administrations likely to be affected should be identified by running the Appendix AP29 Program using the following assumptions:

– Power density per Hertz averaged over the total RF bandwidth:

For Region 2 assignments: Power -10 log (24 MHz) = Power -73.80 dB(W/Hz)

– Satellite system noise temperature for "existing" Regions 1 and 3 assignments before 27 October 1997 (These are default values unless other values were notified.)

= 1 800 K (for 17 GHz)

– Satellite system noise temperature for other Regions 1 and 3 assignments

= 600 K (for 17 GHz)

3.2 Compatibility analysis for FSS (space-to-Earth) into BSS feeder link (paragraph 7.1 of Article 7 of Appendix S30A)

3.2.1 Provision

3.2.1.1 Article 7 of Appendix S30A

"7.1 The provisions of Articles **S9** and **S11** and Appendix **S8** are applicable to transmitting space stations in the fixed-satellite service in the band 17.7-18.1 GHz, and the provisions of Resolution **33** are applicable to space stations in the broadcasting-satellite service in Region 2 in the band 17.3-17.8 GHz together with the provisions of Annex 4, except that in relation to feeder-link stations, the relevant criteria mentioned in Appendix **S8** are replaced by those given in Section 1 of Annex 4"

3.2.1.2 Annex 4 to Appendix S30A

"**1 Threshold values for determining when coordination is required between transmitting space stations in the fixed-satellite service or the broadcasting-satellite service and a receiving space station in the feeder-link Plans in the frequency bands 17.3-18.1 GHz (Regions 1 and 3) and 17.3-17.8 GHz (Region 2)**

With respect to § 7.1, Article 7 of this Appendix, coordination of a transmitting space station in the fixed-satellite service or in the broadcasting-satellite service with a receiving space station in a broadcasting-satellite feeder link in the Regions 1 and 3 Plan or the Region 2 Plan is required, for inter-satellite geocentric angular separations of less than 3° or greater than 150°, when the power flux-density arriving at the receiving space station of a broadcasting-satellite feeder-link station of another administration would cause an increase in the noise temperature of the feeder-link space station which exceeds a threshold value of $\Delta T_S/T_S$ corresponding to 4%. $\Delta T_S/T_S$ is calculated in accordance with Case II of the method given in Appendix **S8**.

The above provision does not apply when the geocentric angular separation between a transmitting space station in the fixed-satellite service or in the broadcasting-satellite service and a receiving space station in the feeder-link Plan, exceeds 150° of arc and the free-space power flux-density of the transmitting space station in the fixed-satellite service does not exceed a value of -137 dB(W/m^2/MHz) on the Earth's surface at the equatorial Earth limb."

3.2.2 Methodology

The fixed-satellite service networks which have transmitting space stations in the frequency band 17.7-18.1 GHz should be identified.

Then for each identified network, the AP29 program will be run with a threshold value of $\Delta T_S/T_S$ corresponding to 6% and the following assumptions.

– Power density per Hertz averaged over the total RF bandwidth:

  For Region 2 assignments: Power -10 log (24 MHz) = Power -73.80 dB(W/Hz)

– Satellite system noise temperature for "existing" Regions 1 and 3 assignments before 27 October 1997 (These are default values unless other values were notified.)

  = 1 800 K (for 17 GHz)

– Satellite system noise temperature for other Regions 1 and 3 assignments

  = 600 K (for 17 GHz)

3.3 Compatibility analysis for Region 2 unplanned BSS into BSS feeder link (paragraph 7.1 of Article 7 of Appendix S30A)

3.3.1 Provision

3.3.1.1 Article 7 of Appendix S30A

"7.1 The provisions of Articles **S9** and **S11** and Appendix **S8** are applicable to transmitting space stations in the fixed-satellite service in the band 17.7-18.1 GHz, and the provisions of Resolution **33** are applicable to space stations in the broadcasting-satellite service in Region 2 in the band 17.3-17.8 GHz together with the provisions of Annex 4, except that in relation to feeder-link stations, the relevant criteria mentioned in Appendix **S8** are replaced by those given in Section 1 of Annex 4"

3.3.1.2 Annex 4 to Appendix S30A

"**1 Threshold values for determining when coordination is required between transmitting space stations in the fixed-satellite service or the broadcasting-satellite service and a receiving space station in the feeder-link Plans in the frequency bands 17.3-18.1 GHz (Regions 1 and 3) and 17.3-17.8 GHz (Region 2)**

With respect to § 7.1, Article 7 of this Appendix, coordination of a transmitting space station in the fixed-satellite service or in the broadcasting-satellite service with a receiving space station in a broadcasting-satellite feeder link in the Regions 1 and 3 Plan or the Region 2 Plan is required, for inter-satellite geocentric angular separations of less than 3° or greater than 150°, when the power flux-density arriving at the receiving space station of a broadcasting-satellite feeder-link station of another administration would cause an increase in the noise temperature of the feeder-link space station which exceeds a threshold value of $\Delta T_S/T_S$ corresponding to 4%. $\Delta T_S/T_S$ is calculated in accordance with Case II of the method given in Appendix **S8**.

The above provision does not apply when the geocentric angular separation between a transmitting space station in the fixed-satellite service or in the broadcasting-satellite service and a receiving space station in the feeder-link Plan, exceeds 150° of arc and the free-space power flux-density of the transmitting space station in the fixed-satellite service does not exceed a value of -137 dB(W/m^2/MHz) on the Earth's surface at the equatorial Earth limb."

3.3.1.3 Resolution 33 (Rev.WRC-97)

See *resolves* 1 and 2 and Section B

"Section B. Coordination Procedure Between Space Stations in the Broadcasting-Satellite Service and Space Systems of Other Administrations

3. An administration intending to bring into use a space station in the broadcasting-satellite service shall, for the purpose of coordination with space systems of other administrations, apply the following provisions of Article **11** of the Radio Regulations:

3.1 Nos. **1041** to **1058** inclusive.

3.2.1 Nos. **1060** to **1065**[1].

3.2.2 No coordination under paragraph 3.2.1 is required when an administration proposes to change the characteristics of an existing assignment in such a way as not to increase the probability of harmful interference to stations in the space radiocommunication service of other administrations.

3.2.3 Nos. **1074** to **1105** inclusive."

3.3.2 Methodology

The Region 2 unplanned BSS networks which have transmitting space stations in the frequency band 17.3-17.8 GHz should be identified.

Then for each identified network, the AP29 program will be run with a threshold value of $\Delta T_S/T_S$ corresponding to 6% and the following assumptions.

– Power density per Hertz averaged over the total RF bandwidth:

For Region 2 assignments: Power -10 log (24 MHz) = Power -73.80 dB(W/Hz)

– Satellite system noise temperature for "existing" Regions 1 and 3 assignments before 27 October 1997 (These are default values unless other values were notified.)

= 1 800 K (for 17 GHz)

– Satellite system noise temperature for other Regions 1 and 3 assignments

= 600 K (for 17 GHz)

4 Downlink receiving interference

4.1 Compatibility analysis for Region 2 Plan into BSS downlink (paragraph 4.3.3.2 of Article 4 of Appendix S30)

4.1.1 Provision

[1] The calculation methods and the interference criteria to be employed in evaluating the interference should be based upon relevant CCIR Recommendations agreed by the administrations concerned either as a result of Resolution **703** or otherwise. In the event of disagreement on a CCIR Recommendation or in the absence of such Recommendations, the methods and criteria shall be agreed between the administrations concerned. Such agreements shall be concluded without prejudice to other administrations.

4.1.1.1 Article 4 of Appendix S30

"4.3.3.2 of Regions 1 and 3 having a frequency assignment to a space station in the broadcasting-satellite service with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is in conformity with the Regions 1 and 3 Plan, or in respect of which proposed modifications to that Plan have already been published by the Bureau in accordance with the provisions of §§ 4.3.5.1 or 4.3.6 of this Article"

4.1.1.2 Annex 1 to Appendix S30

"**3 Limits to the change in the power flux-density to protect the broadcasting-satellite service in Regions 1 and 2 in the band 12.2-12.5 GHz and in Region 3 in the band 12.5-12.7 GHz**

With respect to § 4.3.1.2 of Article 4, an administration in Region 2 shall be considered as being affected if the proposed modification to the Regions 1 and 3 Plan would result in exceeding the power flux-densities given below, at any point in the service area affected.

With respect to §§ 4.3.3.2 or 4.3.3.6 of Article 4, as appropriate, an administration in Region 1 or 3 shall be considered as being affected if the proposed modification to the Region 2 Plan would result in exceeding the power flux-densities given below, at any point in the service area affected.

-147 dB(W/m^2/27 MHz)	for 0° ≤ θ < 0.44°;
-138 + 25 log θ dB(W/m^2/27 MHz)	for 0.44° ≤ θ < 19.1°;
-106 dB(W/m^2/27 MHz)	for θ ≥ 19.1°;

where θ is:

– the difference in degrees between the longitudes of the broadcasting-satellite space station in Region 1 or 3 and the broadcasting-satellite space station affected in Region 2, *or*

– the difference in degrees between the longitudes of the broadcasting-satellite space station in Region 2 and the broadcasting-satellite space station affected in Region 1 or 3"

4.1.1.3 Rules of Procedure

"4.3.3.2

In determining the administrations of Region 1 that might be affected, the proposed modification of the Region 2 Plan is examined with respect to the Regions 1 and 3 Plan as it exists at the date of receipt of the modification including all proposed modifications received before that date (whether the procedure of Article 4 is complete or not). The examination will identify only those administrations having assignments whose necessary bandwidth overlaps the necessary bandwidth of the proposed modification. An administration of Region 1 is identified as having services which might be affected when the power flux-density over any part of its territory which lies within the service area of the Region 1 assignment under examination exceeds the limits specified in § 3 of Annex 1 to Appendix **S30**. In the absence of a defined service area contour, the area on the surface of the Earth within the -3 dB contour shall be considered as the service area of that Region 1 assignment in this examination."

4.1.2 Methodology

With the criteria and the methodology prescribed in Annex 1 and the above-mentioned Rule of Procedure, the administrations likely to be affected should be identified.

The frequency overlap and the geographical overlap (on the basis of BSS test points) between the BSS service area and the pfd excess area will be checked.

4.2 Compatibility analysis for terrestrial stations into BSS downlink (paragraph 6.1.1 of Article 6 of Appendix S30)

4.2.1 Provision

4.2.1.1 Article 6 of Appendix S30

"6.1.1 Before notifying to the Bureau a frequency assignment to a terrestrial transmitting station, an administration shall initiate coordination with any other administration having a frequency assignment to a broadcasting-satellite station in conformity with the appropriate Regional Plan if:

– the necessary bandwidths of the two transmissions overlap; *and*

– the power flux-density which would be produced by the proposed terrestrial transmitting station exceeds the value derived in accordance with Annex 3 at one or more points on the edge of the service area which is within the coverage area of the broadcasting-satellite station of that administration."

4.2.1.2 Annex 3 to Appendix S30

"2.3 Protection ratio (R)

2.3.1 The single entry protection ratio against all types of terrestrial transmissions, with the exception of amplitude-modulation multichannel television systems, is 35 dB for carrier frequency differences between the wanted and interfering signals of up to ±10 MHz, decreasing linearly from 35 dB to 0 dB for carrier frequency differences between 10 MHz and 35 MHz, and is 0 dB for frequency differences in excess of 35 MHz (see Figure 1).

2.3.2 The carrier frequency difference should be determined by reference to the frequency assignments in the broadcasting-satellite Plan or, in the case of assignments not contained within a plan, by reference to the characteristics of the proposed or operational system. For amplitude-modulation multichannel television systems which produce high peaks of power flux-density spread over a wide range of their necessary bandwidth, the protection ratio *R* is 35 dB and is independent of the carrier frequency difference.

2.3.3 A signal from a terrestrial station should be considered only if its necessary bandwidth overlaps the necessary bandwidth of the broadcasting-satellite assignment."

4.2.2 Methodology

The transmitting terrestrial stations in the frequency band 11.7-12.5 GHz should be identified.

Then C/I with the criteria of Annex 3 with respect to BSS frequency assignments (in the bands 11.7-12.5 GHz in Region 1 and 11.7-12.2 GHz in Region 3) will be calculated.

4.3 Compatibility analysis for FSS (space-to-Earth) into BSS downlink (paragraph 7.2.1 of Article 7 of Appendix S30)

4.3.1 Provision

4.3.1.1 Article 7 of Appendix S30

"7.2.1 Before an administration notifies to the Bureau or brings into use any frequency assignment to a space station in the fixed-satellite service, it shall seek the agreement of any other administration having a frequency assignment in conformity with the appropriate Regional Plan, if:

a) any portion of the necessary bandwidth proposed for the space station in the fixed-satellite service falls within the necessary bandwidth associated with the frequency assignment to the broadcasting-satellite station; *and*

b) the power flux-density which would be produced by the proposed fixed-satellite assignment exceeds the value specified in Annex 4.

For this purpose, the administration seeking agreement shall send to any other such administration the information listed in Appendix **S4**, Annexes 2A and 2B."

4.3.1.2 Annex 4 to Appendix S30

"With respect to paragraph 7.2.1 of Article 7 of this Appendix, coordination of a space station in the fixed-satellite service of Region 2 is required when, under assumed free-space propagation conditions, the power flux-density on the territory of an administration in Region 1 or Region 3 exceeds the value derived from the expressions given below.

With respect to paragraph 7.2.1 of Article 7 of this Appendix, coordination of a space station in the fixed-satellite service in Region 1 or 3 is required when, under assumed free-space propagation conditions, the power flux-density on the territory of an administration in Region 2 exceeds the value derived from the same expressions:

-147 dB(W/m^2/27 MHz)	for $0° \le \theta < 0.44°$
$-138 + 25 \log \theta$ dB(W/m^2/27 MHz)	for $0.44° \le \theta < 19.1°$
-106 dB(W/m^2/27 MHz)	for $\theta \ge 19.1°$

where θ is:

– the difference in degrees between the longitude of the interfering fixed-satellite space station in Region 2 and the longitude of the affected broadcasting-satellite space station in Regions 1 and 3, *or*

– the difference in degrees between the longitude of the interfering fixed-satellite space station in Region 1 or 3 and the longitude of the affected broadcasting-satellite space station in Region 2."

4.3.2 Methodology

The administrations likely to be affected having the fixed-satellite service transmitting space station in the frequency bands 11.7-12.2 GHz (Region 2) and 12.2-12.5 GHz (Region 3) should be identified with the criteria specified in Annex 4.

The frequency overlap and the geographical overlap (on the basis of BSS test points) between the BSS service area and the pfd excess area will be checked.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Addendum 16 to Document 35-E*
22 May 2000
Original: English

COMMITTEE 4

Brazil (Federative Republic of)

PROPOSAL FOR THE WORK OF THE CONFERENCE

The Brazilian Administration makes the following proposal for the work of the World Radiocommunication Conference (WRC-2000) under agenda item 1.1:

MOD B/35/96

S5.481 *Additional allocation:* in Germany, Angola, Brazil, China, Ecuador, Spain, Japan, Morocco, Nigeria, Oman, Democratic People's Republic of Korea, Sweden, Tanzania and Thailand, the band 10.45-10.5 GHz is also allocated to the fixed and mobile services on a primary basis.

____

* Pursuant to Resolution 26 (Rev.WRC-97) the secretariat notes that this contribution was received on 22 May 2000.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Addendum 15 to Document 35-E
8 May 2000
Original: English

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 6 - to identify those items requiring urgent action by the radiocommunication study groups in preparation for the next world radiocommunication conference

The Brazilian Administration proposes that the following item be included by WRC-2000 in the WRC-03 agenda:

ADD B/35/95

"to consider regulatory provisions and possibly identify additional spectrum allocation in bands above 17.8 GHz for high density systems in the fixed-satellite service (HDFSS), taking full account of its future requirements".

Reasons: Studies related to frequency sharing between FS and FSS systems have indicated that the conditions for sharing between these services are greatly affected by the number of terminals in each service. Experience has shown that a low terminal density in both services characterizes a manageable sharing situation. However, situations involving a large number of terminals in one or both services (high-density systems) can be critical.

The fixed service and the fixed-satellite service currently share many frequency bands. Many of them are being identified for HDFS use. It is expected that, as the number of HDFS systems operating in these bands increases, the sharing of these bands with FSS systems, in particular with HDFSS systems, will become increasingly difficult.

The increasing number of high-density fixed service (HDFS) applications, has motivated WRC-2000 to consider aspects related to HDFS systems, including regulatory aspects, technical and operational criteria, and methods to facilitate sharing between HDFS and other services in the bands available for high-density FS applications. It is important that WRC-03 consider the possible identification of additional spectrum in the bands above 17.8 GHz for use by HDFSS, guaranteeing a sufficiently wide allocation for HDFSS use on a global basis.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Addendum 14 to
Document 35-E
8 May 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 4 - in accordance with Resolution 95 (WRC-97), to review the resolutions and recommendations of previous conferences with a view to their possible revision, replacement or abrogation

1 Introduction

WRC-97 has revised the limiting date for bringing into use an assignment of a satellite network, reducing the maximum period of six years plus a three-year extension referred to in No. 1550 to a maximum period of five years plus a possible extension of two years, as indicated in S11.44. Transitional arrangements related to this revision are contained in Resolution 51 (WRC-97). *Resolves* 3 of Resolution 51 establishes that for satellite networks with API received by the Bureau prior to 22 November 1997 this maximum period corresponds to a six-year period from the date of the receipt of the API plus a three-year extension pursuant to No. 1550. However, No. 1550 refers to a maximum of six years plus a three-year extension period from the date of the publication of the Special Section of the Weekly Circular (referred to in No. 1044). The Brazilian Administration proposes that the text in *resolves* 3 of Resolution 51 be made compatible to the text in No. 1550, so that the six plus three-year period be from the date of publication of the API.

2 Proposals

Modifications to Resolution 51

RESOLUTION 51 (WRC-97)

Provisional application of certain provisions of the Radio Regulations as modified by WRC-97 and transitional arrangements

NOC B/35/91

considering a), b) and *c)*

NOC B/35/92

resolves 1 and 2

MOD B/35/93

3 that, for satellite networks for which the API has been received by the Bureau prior to 22 November 1997, the maximum allowed time period from the date of publication of the Special Section of the Weekly Circular referred to in **S9.2B**~~receipt of the API~~ to bring the relevant frequency assignments into use shall be six years plus the extension pursuant to No. **1550** (see also Resolution **49 (WRC-97)**);

NOC B/35/94

resolves 4 and 5

Reasons: To make the period of six years plus the three-year extension referred to in *resolves* 3 of Resolution 51 compatible with the period of six plus three years in No. 1550, taking into account *inter alia* that this provision of the Radio Regulations is explicitly referred to in *resolves* 3.

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

MODIFICATIONS TO ARTICLE S9 AND TO APPENDIX S5

Introduction

At present, Appendices S30 and S30A are self contained insofar as the procedures for coordinating assignments to other services with those in the BSS Plans are concerned. For example, Article 6 of Appendices S30 and S30A covers the coordination, notification and recording of terrestrial stations in the BSS and feeder-link bands subject to a Plan, respectively, and Article 7 plays a similar role for FSS assignments. The purpose of agenda item 1.20 is to reopen the WRC-97 issue of whether it would be simpler to use the general coordination procedure of Article S9 and the notification and recording procedures of Article S11 (after appropriate additions) in place of Articles 6 and 7 of Appendices S30 and S30A.

The fundamental issue of WRC-2000 agenda item 1.20 is whether or not to suppress Articles 6 and 7 of Appendices S30 and S30A. Upon careful review of the SC Report, it is apparent that suppressing Articles 6 and 7 (or effectively suppressing these articles by simply using them to refer to provisions of Article S9) would result in significant changes to how coordination is conducted between the planned and unplanned services.

We remain unconvinced that suppression of Articles 6 and 7, with the associated complex and significant changes, improves on the current situation. The existing procedures have been used for 20 years and no problems have arisen that cannot be corrected within the Appendices. Further, such significant revisions lead to the risk of unintended consequences associated with revising the still evolving procedures of Articles S9 and S11 to make them applicable to the other services with allocations in the Appendices S30 and S30A bands, in respect of the Plans.

Considering all this, Approach “A” of the CPM-99 Report (retention of Articles 6 and 7 of Appendices S30 and S30A and corresponding suppression or modification, as appropriate, of provisions in Article S9 and Appendix S5) is the best solution. In addition, Approach “A” includes updating of Appendices S30 and S30A to cover the sharing situations that are not currently addressed in these two Appendices.

We can support changes to the procedures of Article 4 that would facilitate modification of the Plans, and there may be consequential changes to Article 4 under Approach “A”.

The Brazilian Administration proposes to suppress the provisions Nos. S9.8 and S9.9 and retain Articles 6 and 7 of Appendices S30 and S30A (Approach “A”).

TABLE S5-1 (*continued*)

Reference of Article S9	**Case**	**Frequency bands (and Region) of the service for which coordination is sought**	**Threshold/condition**	**Calculation method**	**Remarks**
No. **S9.17A** GSO, non-GSO/ GSO, non-GSO	A specific earth station in respect of other earth stations operating in the opposite direction of transmission in frequency bands allocated with equal rights to space radiocommunication services in both directions of transmission, where the coordination area of the earth station includes the territory of another country or the earth station is located within the coordination area of a coordinated earth station, with the exception of ~~the frequency bands subject to the Plans in~~coordination under Article 6 of Appendix **S30**, Article 7 of Appendix **S30A** and No. **S9.19**	Any frequency band allocated to a space service	The coordination area of the earth station covers the territory of another administration or the earth station is located within the coordination area of an earth station	i) For bands in Table S5-2, see § 2 of Annex 1 of this Appendix ii) See Recommendations ITU-R IS.847, ITU-R IS.848 and ITU-R IS.849	
No. **S9.18** Terrestrial/ GSO, non-GSO	Any transmitting station of a terrestrial service in the bands referred to in No. **S9.17** within the coordination area of an earth station, in respect of this earth station, with the exception of the coordination under Nos. **S9.16** ~~and~~, **S9.19** and Article 6 of Appendix **S30**	Any frequency band allocated to a space service.	Transmitting terrestrial station is situated within the coordination area of a receiving earth station	See Remarks column	The coordination area of the affected earth station has already been determined using the calculation method of No. **S9.17**

TABLE S5-1 (*continued*)

Reference of Article S9	**Case**	**Frequency bands (and Region) of the service for which coordination is sought**	**Threshold/condition**	**Calculation method**	**Remarks**
No. **S9.19** Terrestrial/ GSO	A transmitting station in a terrestrial service or a transmitting earth station in the fixed-satellite service (Earth-to-space) in a frequency band shared on an equal primary basis with the BSS, with respect to an earth station of the broadcasting-satellite service, except where the service is subject to the Plans in Appendix **S30**	Bands listed in No. **S9.11**	i) Necessary bandwidths overlap; and ii) the pfd of the terrestrial station at the edge of the BSS service area exceeds the permissible level	Check by using the assigned frequencies and bandwidths	

Reasons: To support Approach "A" of the CPM-99 Report taking into account that some modifications in Appendices S30 and S30A are required in order to solve their inconsistencies.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Addendum 12 to
Document 35-E
14 March 2000
Original: English

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

SECTION 5 OF ANNEX 1 OF APPENDIX S30

Introduction

Annex 1 to Appendix S30 of the Radio Regulations specifies limits for determining whether a service is affected by a proposed modification to the Plan and therefore it is necessary to seek the agreement of any other administration. Section 5 of Annex 1 specifies limits to the change in the power flux-density to protect the terrestrial services from modifications to the Region 2 BSS Plan.

ITU-R studied possible modification to the pfd limits in sections 5 *b)* and 5 *c)* of Annex 1. Section 5 *c)* specifies limits for determining whether terrestrial services of administrations in Region 1 east of longitude 30° E in the 12.2-12.7 GHz band may be affected by modifications to the Region 2 BSS Plan.

Relaxation of the pfd limits in section 5 *c)* would facilitate BSS to certain geographical areas in Region 2. BSS transmit power to certain portions of Region 2 immediately adjacent to portions of Region 1 must be significantly reduced in order to meet the specified levels in the section 5 *c)* pfd limit. These lower power levels necessitate the use of much larger BSS receive antennas than other Region 2 areas.

The pfd limits in section 5 *b)* determine if terrestrial services in Region 1 west of 30º E and all of Region 3 may be affected by modifications to the Region 2 BSS Plan.

The Brazilian Administration proposes to change sections 5 *b)* and 5 *c)* of Annex 1 of Appendix S30 as follows:

MOD B/35/79

5 Limits to the change in the power flux-density to protect the terrestrial services of administrations in Regions 1 and 3[16]

With respect to § 4.3.3.4 of Article 4, an administration in Region 1 or 3 shall be considered as being affected if the proposed modification to the Region 2 Plan would result in the following power flux-density limits being exceeded:

a) in the frequency band 12.2-12.7 GHz for all the territories of administrations in Regions 1[17] and 3 and for any arrival angle γ:

–125 dB(W/m^2/4 kHz)	for broadcasting-satellite space stations using circular polarization;
–128 dB(W/m^2/4 kHz)	for broadcasting-satellite space stations using linear polarization;

b) in the frequency band 12.2-12.~~5~~7 GHz for territories of administrations in Regions 1[17] and 3~~ and those in the western part of Region 1, west of longitude 30° E~~[18]:

–~~132~~148 dB(W/m^2/~~5 M~~4 kHz)	for 0° ≤ γ < ~~10~~5°;
–~~132~~148 + ~~4.2~~0.5 (γ – ~~10~~5) dB(W/m^2/~~5 M~~4 kHz)	for ~~10~~5° ≤ γ < ~~15~~25°;
–~~111~~138 dB(W/m^2/~~5 M~~4 kHz)	for ~~15~~25° ≤ γ < 90°;

~~*c)* in the frequency band 12.2-12.7 GHz for territories of administrations in Region 1[17], east of longitude 30° E:~~

~~–134 dB(W/m²/5 MHz)~~	~~for γ = 0°;~~
~~–134 + 4.6975 γ² dB(W/m²/5 MHz)~~	~~for 0° < γ ≤ 0.8°;~~
~~–128.5 + 25 log γ dB(W/m²/5 MHz)~~	~~for γ > 0.8°;~~

~~d~~c) in the frequency band 12.5-12.7 GHz for all the territories of administrations of Regions 1[17] and 3:

–148 dB(W/m^2/4 kHz)	for $\gamma = 0°$;
–148 + 4.6975 γ^2 dB(W/m^2/4 kHz)	for $0° < \gamma \leq 0.8°$;
–142.5 + 25 log γ dB(W/m^2/4 kHz)	for $\gamma > 0.8°$;

where γ is the angle of arrival of the incident wave above the horizontal plane, in degrees.

---

[16] See § 3.18 of Annex 5.

[17] In the band 12.5-12.7 GHz in Region 1, these limits are applicable only to the territory of administrations mentioned in Nos. **S5.494** and **S5.496**.

[18] See Resolution **34**.

The Brazilian Administration reminds that consequential updates in Table 3 of Article 10 of Appendix S30 would be required.

Reasons: These pfd limits are currently contained in Table S21-4 of Article S21 for the protection of the FS from the FSS in the 12 GHz bands. These limits are more relaxed than the current limits in sections 5 *b)* and 5 *c)* at low arrival angles and thus meet the expressed concerns of the BSS community. On the other hand, they are more stringent at higher arrival angles than section 5 *c)* thus providing greater protection to the terrestrial services. Therefore these limits represent a compromise between the various requirements in the band. Furthermore the Article S21 limits have been successfully applied for a long time to protect terrestrial services from the FSS.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Addendum 11 to Document 35-E
14 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

SCOPE OF FOOTNOTES S5.487 AND S5.490

Introduction

Footnotes S5.487 and S5.490 state:

S5.487 In the band 11.7-12.5 GHz in Regions 1 and 3, the fixed, fixed-satellite, mobile, except aeronautical mobile, and broadcasting services, in accordance with their respective allocations, shall not cause harmful interference to broadcasting-satellite stations operating in accordance with the provisions of Appendix **S30**.

S5.490 In Region 2, in the band 12.2-12.7 GHz, existing and future terrestrial radiocommunication services shall not cause harmful interference to the space services operating in conformity with the broadcasting-satellite Plan for Region 2 contained in Appendix **S30**.

At the Special Committee meeting, in July 1999, there were discussions on the applicability of S5.487 and S5.490 to modifications to the Appendix S30 Plans. Some views were expressed that these provisions provide a super-primary status to the BSS over other co-primary services in the band, in that it requires the other services not to cause harmful interference to the broadcasting-satellite stations operating in accordance with the provisions of Appendix S30. From this some expressed the view that these footnotes should not apply to modifications to the Plans. However, § 4.3.17 of Appendix S30, Article 4 states:

4.3.17 The Bureau shall publish in a special section of its weekly circular the information received under § 4.3.14 together with the names of any administrations with which the provisions of this Article have been successfully applied. The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan.

In addition the vast majority of administrations who have brought into use, or are planning to bring into use, their BSS assignment in the Plan have submitted modifications to the ITU. This is certainly true in Region 2 where all the deployed BSS systems are the result of modifications to the Plans.

B/35/78

Considering that assignments that successfully enter the Plan through the modification procedure should continue to enjoy the same status as the original assignments, the Brazilian Administration proposes that the footnotes S5.487 and S5.490 should continue to apply to modifications as well.

Reasons: To be in accordance with § 4.3.17 of Appendix S30.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Addendum 10 to Document 35-E
14 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.19*bis* - in accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board's Rules of Procedure relating to the application of RR 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference

Introduction

No. S23.13/2674 states:

"S23.13 § 4 In devising the characteristics of a space station in the broadcasting-satellite service, all technical means available shall be used to reduce, to the maximum, the radiation over the territory of other countries unless an agreement has been previously reached with such countries."

No. S23.13 (RR 2674) was adopted at WARC-71. It was intended as a statement of good engineering practice to reduce BSS interference with the terrestrial services outside of the intended service area.

At WRC-95, however, some countries sought to have the interpretation of No. S23.13 revised to require, as a condition for registration, the approval of other countries within the service area of a BSS system proposed as a plan modification. After thorough debate, WRC-95 instructed the RRB to revise its Rules of Procedure to reflect the results of its debate. The RRB made the revisions, but further concerns were raised at WRC-97. These concerns led WRC-97 to adopt Resolution 536 (WRC-97) which resolves "that, in addition to observing No. **S23.13/2674**, and before providing satellite broadcasting services to other administrations, administrations originating the services should obtain the agreement of those other administrations."

Some administrations considering that this Rule of Procedure should be applied retroactively to BSS filings received by the BR for the application of Article 4 of Appendix S30 or under Resolution 33/Article S9 before 18 November 1995, persuaded the 1998 meeting of the ITU Council to adopt new agenda item 1.19*bis*.

B/35/77

The Brazilian Administration is of the opinion that there is no need to repeat the work and discussion of WRC-95 and WRC-97, and that Resolution 536 (WRC-97) and S23.13 are sufficient.

Additionally, the Brazilian Administration considers that WRC-2000 shall not revise the Rule of Procedure modified in 1998 to apply it retroactively to BSS filings received by the BR for the application of Article 4 of Appendix S30 or under Resolution 33/Article S9 before 18 November 1995.

Brazil also supports the existing separation of Article 4 of Appendix S30 and the Rule of Procedure for RR S23.13/2674.

Reasons: This proposal is self explanatory.

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.19 - to consider the report of the inter-conference representative group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

Introduction

Resolution 532 (WRC-97) deals with the review and possible revision of the 1997 broadcasting-satellite service Plans for Regions 1 and 3. Annex 1 to this Resolution presents eight principles to be used in the planning studies.

These guiding principles include those intended to preserve the integrity of Region 2 Plan:

7 Ensure that the integrity of the Region 2 Plan and its associated provisions is preserved, by providing the same protection to the assignments contained in those Plans as is now received under the relevant provisions of the Radio Regulations, and by not requiring more protection from assignments in the Region 2 Plan than that currently provided under the Radio Regulations.

8 Ensure compatibility between the BSS in Regions 1 and 3 and services having allocations in the planned bands in all three Regions.

The resultant broadcast issues for Region 2 include:

a) ensuring the protection of the BSS and other radiocommunication services in Region 2 against interference from any revisions to the Regions 1 and 3 Plan;

b) not requiring Region 2 services to provide greater protection to Regions 1 and 3 BSS than at present;

c) maintaining a guarantee for access by FSS system serving Region 2 to the orbital arc used by BSS satellites serving Region 1 equivalent to that now provided by Annex 7 to Appendix S30; and

d) protecting Plan modifications that have entered the Article 4 procedures of Appendices S30 and S30A.

B/35/76

The Brazilian Administration is of the opinion that any possible replanning must protect Region 2 services in accordance with the current criteria of Appendices S30 and S30A, and must not introduce additional constraints upon those services, in accordance with principles 7 and 8 of Annex 1 to Resolution 532 (WRC-97). Region 2 BSS and FSS systems that have initiated the coordination procedure, or Plan modification procedure, as appropriate, should be protected by any revisions of the Regions 1 and 3 Plans. Similarly, in the other direction, Region 2 FSS and BSS systems that have initiated the coordination procedure, or Plan modification procedure, as appropriate, should not have to protect any revisions of the Regions 1 and 3 Plans. As envisioned by principles 7 and 8 of Resolution 532 (WRC-97), these other services that are currently undergoing coordination under the Radio Regulations should not be subject to new retroactive requirements.

Similarly, Brazil is of the view that, at WRC-2000, the orbital position limitations of Sections A1 and A3 of Annex 7 shall be maintained. In particular, no BSS assignments serving Region 1 should be located to the west of 37º W and, within the Annex 7 restricted portion of the arc (37º W to 10º E), all assignments must use positions at, or at most, one degree to the east of existing positions in the WRC-97 Plan. However, in the case of positions within one degree to the east of existing positions the Annex 7 requirement for an 8 dB reduction in e.i.r.p. compared to that appearing in the WARC-77 Plan, should be replaced by a 3 dB reduction compared with e.i.r.p. in the WRC-97 Plan, as a result of technical studies.

Reasons: To be in conformity with principles 7 and 8 of Resolution 532 (WRC-97).

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.13 - on the basis of the results of the studies in accordance with Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97)

1.13.1 to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

1.13.2 to consider the inclusion in other frequency bands of similar limits in Articles S21 and S22, or other regulatory approaches to be applied in relation to sharing situations

Introduction

Resolutions 130 (WRC-97) and 538 (WRC-97) have requested the ITU-R to conduct a) “appropriate technical, operational and regulatory studies” to review the regulatory conditions relating to the coexistence of non-GSO FSS and GSO FSS and GSO BSS systems, in order to ensure that undue constraints are not placed on the development of non-GSO FSS, GSO FSS and GSO BSS systems, and b) the development of a methodology for calculating the power levels produced by non-GSO FSS systems and the compliance of these levels with the applicable limits established pursuant to Resolutions 130 (WRC-97) and 538 (WRC-97).

The Brazilian Administration has participated in several technical groups where topics related to WRC-2000 agenda item 1.13 have been discussed. These groups include Joint Task Group 4-9-11, Working Parties 4A, 4-9S and 10-11S and the 1999 Conference Preparatory Meeting. Specific contributions were submitted by the Brazilian Administration mainly on issues related to sharing studies between non-GSO FSS networks and FS systems and on the functional description of the validation software to be used by BR, where an original analytical method was proposed. An extensive analysis of the points that have been discussed has produced the basis for the Brazilian Administration proposals for WRC-2000. Some views and comments of the Brazilian Administration are presented in Section 2. Section 3 contains specific proposals of the Brazilian Administration for WRC-2000.

The following paragraphs present some views and comments of the Brazilian Administration on issues related to WRC-2000 agenda item 1.13.

Power flux-density limits for non-GSO satellites in the band 17.7-19.3 GHz

CPM-99 agreed on a general form for the per satellite pfd that would guarantee protection to FS receivers from the aggregate interference produced by multiple (assumed non-homogeneous) non-GSO satellite networks operating in the 17.7-19.3 GHz band. This mask is presented in section 3.1.4.1.2 of the CPM-99 Report, and was developed based on results that were obtained by direct simulation under the conservative assumption that every visible satellite in a non-GSO constellation produces the maximum allowed pfd level at the FS receiving station. It was understood that this mask would remain adequate to protect FS receivers if the number of co-frequency non-GSO networks were as many as five. Further studies, including one made by the Brazilian Administration, have considered a more realistic model in which the pfd entries reaching a given FS receiver location are characterized by statistically independent random variables having probability density functions that depend on the operational characteristics of the non-GSO network. They have shown that the aggregate interference levels obtained under the above-mentioned conservative approach are higher than those obtained using a more realistic modelling of the pfd entries. The Brazilian Administration agrees that the per satellite pfd limits contained in section 3.1.4.1.2 of the CPM Report are certainly adequate to protect the fixed service from aggregate interference generated by the satellites of multiple, co-frequency non-GSO FSS networks operating in the 17.7-19.3 GHz band. It is understood that the extensive studies, performed under the assumption of a more realistic interference model, have indicated that in many cases, because of the operational characteristics of the non-GSO networks, positive interference margins will be present.

Power flux-density limits for non-GSO satellites in the band 10.7-12.75 GHz

Joint Task Group 4-9-11 agreed on a general form for the per satellite pfd masks that would guarantee protection to FS receivers from the aggregate interference produced by multiple (three to five), assumed non-homogeneous, non-GSO satellite networks operating in the 10.7-11.7 GHz and 11.7-12.75 GHz bands. These pfd masks were also supported at CPM-99 and are presented in section 3.1.4.1.1 of the CPM-99 Report. The Brazilian Administration agrees that these per satellite pfd masks are certainly adequate to protect the fixed service from aggregate interference generated by the satellites of multiple, co-frequency non-GSO FSS networks operating in the 10.7-12.75 GHz band.

Sharing between non-GSO FSS earth stations and the fixed service

The conditions for sharing between non-GSO FSS and FS services are greatly affected by the deployment characteristics of each service. It is expected that the low-density deployment of both services would facilitate sharing while the high-density deployment of both services would greatly increase the sharing difficulties. More specifically, the Brazilian Administration believes that the sharing between non-ubiquitous FS terminals and non-ubiquitous non-GSO FSS earth stations can be handled by the usual case-by-case coordination procedures. It also believes that the use of mitigation techniques would only be helpful in the already difficult sharing cases where only one of the services (FS or FSS) is characterized by a ubiquitous deployment of terminals. If the sharing situation involves the high-density deployment of terminals in both services, the Brazilian Administration believes that the effectiveness of these mitigation techniques would be greatly decreased and the set of possible solutions would be reduced. Possible solutions in this case would be, for example, frequency separation or the constraining of one or both services to low-density non-ubiquitous applications. In summary, the Brazilian Administration believes that situations involving the ubiquitous deployment of a large number of terminals in one or both services (FS and FSS) are the most critical ones and that, in such cases, frequency sharing in the same geographic area is very difficult. The Brazilian Administration further believes that, except near international borders where coordination may be required, this sharing problem constitutes a national issue.

Single-entry epfd limits

Limits to the $epfd_{down}$ radiated by non-GSO FSS systems in the bands 17.8-18.6 GHz and 19.7-20.2 GHz were agreed upon during the discussions that took place within Joint Task Group 4-9-11 and are reflected in the CPM-99 Report. During CPM-99, a compromise agreement was also reached concerning limits to the $epfd_{down}$ radiated by non-GSO FSS systems in the 10.7-12.75 GHz band. The resulting agreed points include:

– *Limits* (validation limits) to the $epfd_{down}$ radiated by non-GSO FSS systems in the band 10.7-12.75 GHz (for antenna diameters of 0.6 m, 1.2 m, 3 m and 10 m), including limits corresponding to special cases of high latitudes to be satisfied during 100% of the time (for antenna diameters greater than 0.6 m).

– *Operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the bands 10.7-12.75 GHz, to be satisfied during 100% of the time (for antenna diameters between 3 and 18 metres).

– *Additional operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems into 3 and 10 metre GSO FSS earth station antennas in the bands 10.7-12.75 GHz.

– *Limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the band 17.8-18.6 GHz (for antenna diameters of 1 m, 2 m and 5 m).

– *Operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the bands 17.8-18.6 GHz, to be satisfied during 100% of the time.

– *Limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the band 19.7-20.2 GHz (for antenna diameters of 0.7 m, 0.9 m, 2.5 m and 5 m).

– *Operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the bands 19.7-20.2 GHz, to be satisfied during 100% of the time.

Concerning the protection of GSO BSS systems, a compromise was reached at CPM-99. The compromise includes *limits* (validation) to the $epfd_{down}$ radiated by non-GSO FSS systems in the 11.7-12.7 GHz band (for antenna diameters of 0.3 m, 0.45 m, 0.6 m, 0.9 m, 1.2 m, 1.8 m, 2.4 m and 3 m) and *limits* corresponding to special cases of high latitudes to be satisfied during 100% of the time (for antenna diameters of 1.8 m, 2.4 m and 3 m). An *operational limit* (100% of the time, single entry) for 2.4 m BSS antenna diameters in a certain northern high latitude area of Region 2 was also included.

During the discussion within JTG 4-9-11 there was also agreement on *limits* to the $epfd_{up}$ radiated by non-GSO FSS systems in certain bands within the 12.5-30.0 GHz range and on *limits* to the $epfd_{is}$ radiated by non-GSO FSS systems in certain bands within the 10.7-18.4 GHz range. These agreements are reflected in the CPM-99 Report.

The Brazilian Administration supports the above-mentioned agreements and calls the attention of WRC-2000 to the following points:

– With regard to the $epfd_{down}$ *operational limits*, there is a need for regulatory procedures to implement them. These procedures should identify non-GSO systems exceeding the *operational limits* and also ensure immediate reduction of the interference level to the allowed limits by any non-GSO system exceeding the *operational limits*. There is also a need for a WRC-2000 Resolution calling for the ITU-R to develop, as a matter of urgency, Recommendations to permit administrations to check compliance with the *operational limits*.

– Concerning the $epfd_{down}$ *additional operational limits* ($epfd_{down}$ radiated into 3 m and 10 m GSO FSS earth station antennas in the 10.7-12.75 GHz band), there is a need for regulatory procedures to implement them. There is also a need for a WRC-2000 Resolution calling for ITU-R to develop, as a matter of urgency, studies aiming at the assessment of the statistical behaviour (time distribution) of the actual $epfd_{down}$ levels radiated by a non-GSO FSS system. These studies should also contemplate methodologies to consider intermediate antenna sizes. Recommendations to permit administrations to check compliance with the *additional operational limits* should also be developed.

Off-axis e.i.r.p. density limits

The Brazilian Administration supports the application of off-axis e.i.r.p. density limits to earth stations operating with GSO satellites in the bands 12.75-13.25 GHz, 13.75-14.5 GHz and 29.5-30.0 GHz. However, the Brazilian Administration do not favour the application of off-axis e.i.r.p. density limits to earth stations operating with non-GSO satellites, since it believes that if such limits are applied to the earth stations of a given non-GSO network, it would possibly be helpful only in decreasing the amount of interference affecting its own satellites (internal interference) and not in facilitating sharing with other non-GSO (or GSO) FSS systems. The Brazilian Administration also supports the idea of a grandfathering clause to protect existing earth stations that operate with systems for which complete coordination or notification information has been received by ITU before 2 June 2000.

Resolutions 130 (WRC-97) and 538 (WRC-97)

The Brazilian Administration believes that *resolves* 6 in Resolution 130 (WRC-97), concerning non-GSO FSS systems not claiming protection from GSO networks in the FSS, and *resolves* 8 in Resolution 130 (WRC-97) and 1.7 in Resolution 538 (WRC-97), both related to coordination under No. S9.12, are important and needed. The Brazilian Administration is of the opinion that *resolves* 6 and 8 of Resolution 130 (WRC-97) and *resolves* 1.7 of Resolution 538 (WRC-97) should be reflected in the pertinent footnotes of the Radio Regulations.

Use of the band 17.3-17.8 GHz (in Region 2)

The Brazilian Administration is of the opinion that the use of the band 17.3-17.8 GHz in Region 2 by FSS systems (Earth-to-space) operating with non-GSO satellites should be restricted to earth stations having antennas greater than 4.5 metres that are located in non-urban areas and that do not cause harmful interference to BSS terminals located anywhere outside the 500 m radius circle centred at the FSS earth station location.

17.7-19.3 GHz[7, 8]	Fixed-satellite (space-to-Earth) Meteorological-satellite (space-to-Earth)	–115[aa] or ~~–125 12~~ –115 – X[12]	–115 + 0.5(δ – 5)[aa] or ~~–125 + (δ – 5) 12~~ –115 – X + ((10 + X)/20) (δ – 5)[12]	–105[aa] or –105 [12]	1 MHz
19.3-19.7 GHz 22.55-23.55 GHz 24.45-24.75 GHz 25.25-27.5 GHz	Fixed-satellite (space-to-Earth) Earth exploration-satellite (space-to-Earth) Inter-satellite	–115	–115 + 0.5(δ – 5)	–105	1 MHz

Reasons: To add per satellite power flux-density masks that would protect fixed service receivers from interference generated by multiple (three to five) non-GSO satellite constellations. These new masks were developed based on the aggregate interference generated by a non-GSO constellation under the assumption that every visible satellite in the constellation produces the maximum allowed pfd level at the fixed service receiver location. In the particular case of the 17.7-19.3 GHz band, studies that have used a more realistic interference model have indicated that, because of the operational characteristics of the non-GSO networks, these new masks in Table S21-4 will probably protect the FS receivers with some positive margin.

TABLE **S21-4** *(end)*

NOC

S21.16.1 to **S21.16.5**

MOD B/35/28

---

[12] **S21.16.6** ~~These values shall apply provisionally only to emissions of space stations on non-geostationary satellites in networks operating with a large number of satellites, that is systems operating with more than 100 satellites (see Resolution **131 (WRC-97)**).~~The function X is defined as a function of the number, N, of satellites in the non-GSO FSS constellation as follows:

– for N ≤ 50 $X = 0$ (dB)

– for 50 < N ≤ 288 $X = \frac{5}{119}(N - 50)$ (dB)

– for N > 288 $X = \frac{1}{69}(N + 402)$ (dB)

In the band 18.8-19.3 GHz, these limits apply to emissions of a space station on a non-geostationary FSS satellite for which complete coordination or notification information, as appropriate, has been received by the Radiocommunication Bureau after 17 November 1995, and which was not operational by that date.

ADD B/35/29

[12*bis*] **S21.16.6*bis*** These limits apply to emissions of a space station on a meteorological-satellite and on a geostationary FSS satellite. These limits also apply to emissions of a space station on a non-geostationary FSS satellite in the bands 18.8-19.3 GHz for which complete coordination or notification information has been received by the Radiocommunication Bureau by 17 November 1995, or are in operation by that date.

Reasons: The above regulatory text reflects the date-specific provisions currently in Resolution 131 (WRC-97). It maintains the original limits for non-GSO FSS systems in the band 18.8-19.3 GHz that were notified or operational prior to the end of WRC-95 per the decision in Resolution 131 (WRC-97). In the band 17.7-18.8 GHz, the new limits would apply to all non-GSO systems irrespective of the date of receipt of information or date of bringing into operation.

[1] **A.S22.1**

MOD B/35/34

---

[2] **S22.5C.1, D.1, F.1** The equivalent power flux-density is defined as the sum of the power flux-densities produced at a ~~point~~GSO receive station on the Earth's surface or in the geostationary orbit, as appropriate, by all ~~space~~the transmit stations within a non-geostationary-satellite system, taking into account the off-axis discrimination of a reference receiving antenna assumed to be pointing ~~towards the geostationary-satellite orbit~~in its nominal direction. The equivalent power flux-density is calculated using the following formula:

$$\cancel{epfd = 10 \cdot \log_{10}\left[\sum_{i=1}^{N_s} 10^{pfd_i/10} \cdot \frac{G_r(\theta_i)}{G_{max}}\right]}$$

$$epfd = 10 \log_{10}\left[\sum_{i=1}^{N_a} 10^{\frac{P_i}{10}} . \frac{G_t(\theta_i)}{4\pi d_i^2} . \frac{G_r(\varphi_i)}{G_{r,\max}}\right]$$

where:

N_a: number of transmit stations in the non-geostationary-satellite system that are visible from the GSO receive station considered on the Earth's surface or in the geostationary orbit, as appropriate;

i: index of the transmit station considered in the non-geostationary-satellite system;

P_i RF power at the input of the antenna of the transmit station, considered in the non-geostationary-satellite system in dBW in the reference bandwidth;

θ_i: off-axis angle between the boresight of the transmit station considered in the non-geostationary-satellite system and the direction of the GSO receive station;

$G_t(\theta_i)$: transmit antenna gain (as a ratio) of the station considered in the non-geostationary-satellite system in the direction of the GSO receive station;

d_i: distance in metres between the transmit station considered in the non-geostationary-satellite system and the GSO receive station;

φ_i: off-axis angle between the boresight of the antenna of the GSO receive station and the direction of the ith transmit station considered in the non-geostationary-satellite system;

$G_r(\varphi_i)$: receive antenna gain (as a ratio) of the GSO receive station in the direction of the ith transmit station considered in the non-geostationary-satellite system;

$G_{r,max}$: maximum gain (as a ratio) of the antenna of the GSO receive station;

epfd: is the computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.

~~N_s: number of non-geostationary space stations visible from the point considered at the Earth's surface, within an elevation angle greater than or equal to 0°;~~

~~i: index of the non-geostationary space station considered;~~

~~pfd_i: power flux-density produced at the point considered on the Earth's surface in dB(W/m^2) in the reference bandwidth;~~

~~θ_i: angle between the direction considered towards the geostationary-satellite orbit and the direction of the interfering space station in the non-geostationary-satellite system;~~

~~$G_r(\theta_i)$: gain (as a ratio) of the receive reference antenna to be considered as part of a geostationary-satellite network;~~

~~G_{max}: maximum gain (as a ratio) of the above receive reference antenna;~~

~~*epfd*: computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.~~

3 For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

4 Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO FSS systems.

5 In addition to the limits shown in Table **S22-1A**, the following single-entry $epfd_{down}$ limits apply to all antenna sizes greater than 60 cm in the frequency bands listed in Table **S22-1A**.

100% of the time $epfd_{down}$ (dB(W/(m^2 · 40 kHz)))	**Latitude (North or South) (degrees)**
–160	0 < |Latitude| ≤ 57.5
–160 + 3.4(57.5 – |Latitude|)/4	57.5 < |Latitude| ≤ 63.75
–165.3	63.75 ≤ |Latitude|

Reasons: During CPM-99, a compromise agreement was also reached concerning limits to the $epfd_{down}$ radiated by non-GSO FSS systems in the 10.7-12.75 GHz band. The resulting agreed points include:

– *Limits* (validation limits) to the $epfd_{down}$ radiated by non-GSO FSS systems in the band 10.7-12.75 GHz (for antenna diameters of 0.6 m, 1.2 m, 3 m and 10 m), including limits corresponding to special cases of high latitudes to be satisfied during 100% of the time (for antenna diameters greater than 0.6 m).

– *Operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the bands 10.7-12.75 GHz, to be satisfied during 100% of the time (for antenna diameters between 3 and 18 metres).

– *Additional operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems into 3 and 10 metre GSO FSS earth station antennas in the bands 10.7-12.75 GHz.

ADD B/35/37

[10] Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO BSS systems.

[11] For BSS antenna diameters 180 cm, 240 cm and 300 cm, in addition to the single-entry limits shown in Table **S22-1D**, the following single-entry 100% of the time $epfd_{down}$ limit also applies in the frequency bands listed in Table **S22-1D**:

100% of the time $epfd_{down}$ dB(W/(m^2 · 40 kHz))	**Latitude (North or South) (degrees)**
–160.0	0 ≤ |Latitude| ≤ 57.5
–160.0 + 3.4(57.5 – |Latitude|)/4	57.5 ≤ |Latitude| ≤ 63.75
–165.3	63.75 ≤ |Latitude|

[12] For BSS antenna diameter 240 cm, in addition to the single-entry 100% of the time $epfd_{down}$ limit specified in footnote 11 of this table, a –167 dB(W/(m^2 · 40 kHz)) single-entry 100% of the time operational $epfd_{down}$ limit also applies to receive antennas located in Region 2, west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.][*]

Reasons: Concerning the protection of GSO BSS systems, a compromise was reached at CPM-99. The compromise includes *limits* (validation) to the $epfd_{down}$ radiated by non-GSO FSS systems in the 11.7-12.7 GHz band (for antenna diameters of 0.3 m, 0.45 m, 0.6 m, 0.9 m, 1.2 m, 1.8 m, 2.4 m and 3 m) and *limits* corresponding to special cases of high latitudes to be satisfied during 100% of the time (for antenna diameters of 1.8 m, 2.4 m and 3 m). An *operational limit* (100% of the time, single entry) for 2.4 m BSS antenna diameters in a certain northern high latitude area of Region 2 was also included in the compromise.

MOD B/35/40

S22.5D 2) The ~~aggregate~~equivalent power flux-density[32], $epfd_{up}$, produced at any point in the geostationary-satellite orbit by emissions from all the earth stations in a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Table **S22-2**, for all conditions and for all methods of modulation, shall not exceed the limits given in Table **S22-2** for the specified percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Table **S22-2**, for all pointing directions towards the Earth's surface visible from any given location in the geostationary-satellite orbit.

[*] This transitional regime would be applicable only if the pfd limits in section 5 *c)* of Annex 1 to Appendix **S30** are sufficiently relaxed.

SUP B/35/41

____

~~[3] **S22.5D.1** The aggregate power flux-density is defined as the sum of the power flux- densities produced at a point in the geostationary-satellite orbit by all the earth stations of a non-geostationary-satellite system. The aggregate power flux-density is computed by means of the following formula~~:

$$\cancel{apfd = 10 \cdot \log_{10} \left[\sum_{i=1}^{N_e} 10^{P_i/10} \cdot \frac{G_t(\theta_i)}{4 \pi d_i^2} \right]}$$

~~where:~~

~~N_e: number of earth stations in the non-geostationary-satellite system with an elevation angle greater than or equal to 0°, from which the point considered in the geostationary-satellite orbit is visible;~~

~~i: index of the earth station considered in the non-geostationary-satellite system;~~

~~P_i: RF power at the input of the transmitting antenna of the earth station considered in the non-geostationary-satellite system in dBW in the reference bandwidth;~~

~~θ_i: off-axis angle between the boresight of the earth station considered in the non-geostationary-satellite system and the direction of the point considered in the geostationary-satellite orbit;~~

~~$G_t(\theta_i)$: transmit antenna gain (as a ratio) of the earth station considered in the non-geostationary-satellite system in the direction of the point considered in the geostationary-satellite orbit;~~

~~d_i: distance in metres between the earth station considered in the non-geostationary-satellite system and the point considered in the geostationary-satellite orbit;~~

~~*apfd*: aggregate power flux-density in dB(W/m^2) in the reference bandwidth.~~

~~NOTE – Tables **S22-1** to **S22-4** and Nos. **S22.26** to **S22.29** contain provisional limits corresponding to an interference level caused by one non-geostationary fixed-satellite service system in the frequency bands to be applied in accordance with Resolutions **130 (WRC-97)** and **538 (WRC-97)**. These provisional limits are subject to review by ITU-R and are subject to confirmation by WRC-99.~~

MOD B/35/51

S22.5G The limits given in Tables **S22-1A to S22-1D**~~and **S22-3**~~ may be exceeded on the territory of any country whose administration has so agreed.

ADD B/35/52

S22.5H The limits specified in Nos. **S22.5C, S22.5D** and **S22.5F** apply to non-GSO FSS systems for which complete coordination or notification information, as appropriate, has been received after 22 November 1997.

Reasons: Reflects the "*instructs the Radiocommunication Bureau*" in Resolutions 130 (WRC-97) and 538 (WRC-97), and *resolves* 2 of Resolution 130 (WRC-97). Review of the findings by the Bureau under "*instructs the Radiocommunication Bureau*" in Resolution 130 (WRC-97) and Resolution 538 (WRC-97) should be kept in an updated version of these resolutions to cover transitional aspects. It was noted that no notification was received prior to 22 November 1997 for non-GSO FSS systems (Earth-to-space) in the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.8-18.1 GHz (Region 2).

ADD B/35/53

S22.5I An administration operating a non-GSO FSS system which is in compliance with the limits in Nos. **S22.5C**, **S22.5D** and **S22.5F** (see also Resolution **WWW**) shall be considered as having fulfilled its obligations under No. **S22.2** with respect to any GSO network, irrespective of the dates of receipt by the Bureau of the complete coordination or notification information, as appropriate, for the non-GSO system and of the complete coordination information for the GSO network, provided that the $epfd_{down}$ radiated by the non-GSO FSS system into any operating GSO FSS earth station does not exceed the operational limits given in footnote 3 of Table **S22-1D** or the operational limits given in Tables **S22-4A** and **S22-4B**, when the diameter of the earth station is equal to the values given in Table **S22-4A** or the gain of the earth station is equal to or greater than the values given in Table **S22-4B** for the corresponding orbital inclination of the GSO FSS satellite. Except as otherwise agreed between concerned administrations, an administration operating a non-GSO FSS system that is subject to the limits in Nos. **S22.5C**, **S22.5D** and **S22.5F** and which radiates $epfd_{down}$ into any operating GSO FSS earth station at levels in excess of the operational limits given in footnote 3 of Table **S22-1D** or the operational limits given in Tables **S22-4A** and **S22-4B**, when the diameter of the earth station is equal to the values given in Table **S22-4A** or the gain of the earth station is equal to or greater than the values given in Table **S22-4B** for the corresponding orbital inclination of the GSO FSS satellite, shall be considered in violation of its obligations under No. **S22.2**.

Reasons: Reflects *resolves* 4 and 1.4 of Resolutions 130 (WRC-97) and 538 (WRC-97), respectively, and the principles provided in section 3.1.2.1.4.2 *c)*. Other additions to the provision correct the language, and make explicit the intention that any non-GSO FSS system that exceeds the validation, operational or additional operational limits, as applicable, shall, except otherwise agreed between concerned administrations be deemed to be in violation of its obligations under No. S22.2.

ADD B/35/54

TABLE **S22-4A**[16, 18]

Operational limits to the epfd$_{down}$ radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	**epfd$_{down}$ (dB(W/m^2))**	**Percentage of time during which epfd$_{down}$ may not be exceeded**	**Reference bandwidth (kHz)**	**Receive GSO earth station antenna diameter[17] (m)**	**Orbital inclination of GSO satellite (degrees)**
10.7-11.7 in all Regions; 11.7-12.2 in Region 2; 12.2-12.5 in Region 3; 12.5-12.75 in Regions 1 and 3 (prior to 31 December 2005)	–163 –166 –167.5 –169.5	100	40	3 6 9 ≥ 18	≤ 2.5
	–160 –163 –164.5 –166.5	100	40	3 6 9 ≥ 18	≤ 4.5
10.7-11.7 in all Regions; 11.7-12.2 in Region 2; 12.2-12.5 in Region 3; 12.5-12.75 in Regions 1 and 3 (after 31 December 2005)	–161.25 –164 –165.5 –167.5	100	40	3 6 9 ≥ 18	≤ 2.5
	–158.25 –161 –162.5 –164.5	100	40	3 6 9 ≥ 18	≤ 4.5

16 For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

17 Linear interpolation of epfd levels in decibels should be performed for other intermediate antenna diameters using a logarithmic scale for the antenna diameter.

18 In addition to the operational limits shown in Table **S22-4A**, the following additional operational limits apply to certain GSO FSS earth station antenna sizes in the frequency bands listed in Table **S22-4A**. A method of assessing interference levels for intermediate antenna sizes should also be developed within ITU-R.

ADD B/35/54*bis*

TABLE **S22-4A1**

Additional operational limits to the $epfd_{down}$ radiated by non-GSO FSS systems into 3 and 10 metre GSO FSS earth station antennas

$epfd_{down}$ (dB(W/(m^2/40 kHz)))	Percentage of time during which $epfd_{down}$ may be exceeded	Receive GSO earth station antenna diameter[17] (m)
–182	0.1	3
–179	0.06	
–176	0.03	
–171	0.02	
–168	0.016	
–165	0.007

–185	0.03	10
–183	0.02	
–179	0.01	
–175	0.004	
–171	0.002	
–168	0.001	
–166	0.0002	
–166	0	

Reasons: During CPM-99, a compromised agreement was also reached concerning limits to the $epfd_{down}$ radiated by non-GSO FSS systems in the 10.7-12.75 GHz band. The resulting agreed points include:

– *Limits* (validation limits) to the $epfd_{down}$ radiated by non-GSO FSS systems in the band 10.7-12.75 GHz (for antenna diameters of 0.6 m, 1.2 m, 3 m and 10 m), including limits corresponding to special cases of high latitudes to be satisfied during 100% of the time (for antenna diameters greater than 0.6 m).

– *Operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems in the bands 10.7-12.75 GHz, to be satisfied during 100% of the time (for antenna diameters between 3 m and 18 m).

– *Additional operational limits* to the $epfd_{down}$ radiated by non-GSO FSS systems into 3 m and 10 m GSO FSS earth station antennas in the bands 10.7-12.75 GHz.

With regard to the $epfd_{down}$ *operational limits,* there is a need for regulatory procedures to implement them. There is also a need for a WRC-2000 Resolution calling for ITU-R to develop, as a matter of urgency, Recommendations to permit administrations to check compliance with the *operational limits*.

Concerning the epfd_{down} *additional operational limits* (epfd_{down} radiated into 3 m and 10 m GSO FSS earth station antennas in the 10.7-12.75 GHz band), there is a need for regulatory procedures to implement them. These procedures should identify non-GSO systems exceeding the *additional operational limits* and also ensure immediate reduction of the interference level to the allowed limits by any non-GSO system exceeding the *additional operational limits*. There is also a need for a WRC-2000 Resolution calling for ITU-R to develop, as a matter of urgency, studies aiming the assessment of the statistical behaviour (time distribution) of the actual epfd_{down} levels radiated by a non-GSO FSS system. These studies should also contemplate methodologies to consider intermediate antenna sizes. Recommendations to permit administrations to check compliance with the *additional operational limits* should also be developed.

ADD B/35/55

TABLE **S22-4B**[19]

Operational limits to the epfd_{down} radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	epfd_{down} (dB(W/m^2))	Percentage of time during which epfd_{down} may not be exceeded	Reference bandwidth (kHz)	Receive GSO earth station antenna Gain (dBi)	Orbital inclination of GSO satellite (degrees)
19.7-20.2	–157 –157 –155	100 100 100	40 40 40	≥ 49 ≥ 43[20] ≥ 49	≤ 2.5 ≤ 2.5 > 2.5 and ≤ 4.5
19.7-20.2	–143 –143 –141	100 100 100	1 000 1 000 1 000	≥ 49 ≥ 43[20] ≥ 49	≤ 2.5 ≤ 2.5 > 2.5 and ≤ 4.5
17.8-18.6	–164 –162	100 100	40 40	≥ 49 ≥ 49	≤ 2.5 > 2.5 and ≤ 4.5
17.8-18.6	–150 –148	100 100	1 000 1 000	≥ 49 ≥ 49	≤ 2.5 > 2.5 and ≤ 4.5

[19] For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

[20] The operational limit applies to non-GSO systems operating at altitudes of 7 000 km or above in order to protect GSO FSS systems employing adaptive coding.

Reasons: Limits to the epfd_{down} radiated by non-GSO FSS systems in the bands 17.8-18.6 GHz and 19.7-20.2 GHz were agreed upon during the discussions that took place within Joint Task Group 4-9-11 and are reflected in the CPM-99 Report.

– *Limits* to the epfd_{down} radiated by non-GSO FSS systems in the band 17.8-18.6 GHz (for antenna diameters of 1 m, 2 m and 5 m).

– *Operational limits* to the epfd_{down} radiated by non-GSO FSS systems in the bands 17.8-18.6 GHz, to be satisfied during 100% of the time.

– *Limits* to the epfd_{down} radiated by non-GSO FSS systems in the band 19.7-20.2 GHz (for antenna diameters of 0.7 m, 0.9 m, 2.5 m and 5 m).

– *Operational limits* to the epfd_{down} radiated by non-GSO FSS systems in the bands 19.7-20.2 GHz, to be satisfied during 100% of the time.

With regard to the $epfd_{down}$ *operational limits*, there is a need for regulatory procedures to implement them. These procedures should identify non-GSO systems exceeding the *operational limits* and also ensure immediate reduction of the interference level to the allowed limits by any non-GSO system exceeding the *operational limits*. There is also a need for a WRC-2000 Resolution calling for ITU-R to develop, as a matter of urgency, Recommendations to permit administrations to check compliance with the *operational limits*.

The operational limits proposed for antennas with a gain equal to or greater than 49 dBi represent a compromise agreed upon at the CPM-99 meeting. CPM-99 agreed that the “operational” limits contained in Table S22-4B above in conjunction with $epfd_{down}$ “validation” masks would adequately protect GSO FSS systems with an antenna gain equal to or greater than 49 dBi.

ADD B/35/56

S22.5J In case of *force majeure*, telecommand and ranging carriers transmitted to non-geostationary satellites in the fixed-satellite service are not subject to the limits given in Table **S22-2**.

Reasons: Specific provision needed to cover emergency situations.

MODIFICATIONS TO SECTION VI OF ARTICLE S22

MOD B/35/57

Section VI – GSO ~~E~~earth station off-axis power limitations in the fixed-satellite service[11]

MOD B/35/58

S22.26 § 9 The level of equivalent isotropically radiated power (e.i.r.p.) emitted by an earth station within a geostationary-satellite network shall not exceed the following values for any off-axis angle φ which is ~~2.5~~3° or more off the main-lobe axis of an earth station antenna:

Off-axis angle	*Maximum e.i.r.p.*
~~2.5~~3° ≤ φ ≤ 7°	(~~39~~42 – 25 log φ) dB(W/40 kHz)
7° < φ ≤ 9.2°	~~18~~21 dB(W/40 kHz)
9.2° < φ ≤ 48°	(~~42~~45 – 25 log φ) dB(W/40 kHz)
48° < φ ≤ 180°	~~0~~3 dB(W/40 kHz)

MOD B/35/59

S22.27 For FM-TV emissions with energy dispersal, the limits in No. **S22.26** above may be exceeded by up to 3 dB provided that the off-axis total e.i.r.p. of the transmitted FM-TV carrier does not exceed the following values:

Off-axis angle	*Maximum e.i.r.p.*
~~2.5~~3° ≤ φ ≤ 7°	(~~53~~56 – 25 log φ) dBW
7° < φ ≤ 9.2°	~~32~~35 dBW
9.2° < φ ≤ 48°	(~~56~~59 – 25 log φ) dBW
48° < φ ≤ 180°	~~14~~17 dBW

MOD B/35/60

S22.28 FM-TV carriers which operate without energy dispersal should be modulated at all times with programme material or appropriate test patterns. In this case, the off-axis total e.i.r.p. of the emitted FM-TV carrier shall not exceed the following values:

Off-axis angle	*Maximum e.i.r.p.*
~~2.5~~3° ≤ φ ≤ 7°	(~~53~~56 – 25 log φ) dBW
7° < φ ≤ 9.2°	~~32~~35 dBW
9.2° < φ ≤ 48°	(~~56~~59 – 25 log φ) dBW
48° < φ ≤ 180°	~~14~~17 dBW

NOC

S22.29 The e.i.r.p. limits given in Nos. **S22.26**, **S22.27** and **S22.28** are applicable in the following frequency bands allocated to the fixed-satellite service (Earth-to-space):

12.75-13.25 GHz

13.75-14 GHz

14-14.5 GHz.

ADD B/35/61

S22.30 The e.i.r.p. limits given in Nos. **S22.26, S22.27** and **S22.28** do not apply to earth station antennas ready to be in service[12] prior to 2 June 2000 nor to earth stations associated with a satellite network in the fixed-satellite service for which complete coordination or notification information has been received before 2 June 2000.

ADD B/35/62

[12] **S22.30.1** "Ready to be in service" relates to the case where antennas have been installed but the start of service has been delayed due to *force majeure*.

ADD B/35/63

S22.31 Telecommand and ranging carriers transmitted to geostationary satellites in the fixed-satellite service in normal mode of operation (i.e. earth station transmitting telecommand and ranging carriers to a directive receiving antenna on the space station) may exceed the levels given in No. **S22.26** by no more than 16 dB in the frequency bands 12.75-13.25 GHz and 13.75-14.5 GHz. In all other modes of operation, and in case of *force majeure,* telecommand and ranging carriers transmitted to geostationary satellites in the fixed-satellite service are exempted from the levels given in No. **S22.26**.

ADD B/35/64

S22.32 § 10 The level of equivalent isotropically radiated power (e.i.r.p.) density emitted by an earth station within a geostationary-satellite network in the 29.5-30.0 GHz frequency band shall not exceed the following values for any off-axis angle φ which is 3° or more off the main-lobe axis of an earth station antenna:

Off-axis angle	*Maximum e.i.r.p. density*[12]
3° ≤ φ ≤ 7°	(28 – 25 log φ) dB(W/40 kHz)
7° < φ ≤ 9.2°	7 dB(W/40 kHz)
9.2° < φ ≤ 48°	(31 – 25 log φ) dB(W/40 kHz)
48° < φ ≤ 180°	1 dB(W/40 kHz)

ADD B/35/64*bis*

[12] **S22.32.1** The above values are 6 dB higher than the corresponding values in Recommendation ITU-R S.524-5.

ADD B/35/65

S22.33 The e.i.r.p. limits given in No. **S22.32** do not apply to earth station antennas ready to be in service prior to [XXXX] nor to earth stations associated with satellite networks in the fixed-satellite service which have been brought into use before 2 June 2000.

ADD B/35/66

S22.34 Telecommand and ranging[13] carriers transmitted to geostationary satellites in the fixed-satellite service in normal mode of operation (i.e. earth station transmitting telecommand and ranging carriers to a directive receiving antenna on the space station) may exceed the levels given in **S22.32** by no more than 10 dB[14] in the frequency band 29.5-30 GHz.

In all other modes of operation, and in case of *force majeure,* telecommand and ranging carriers transmitted to geostationary satellites in the fixed-satellite service are exempted from the levels given in No. **S22.32**.

ADD B/35/66*bis*

[13] **S22.34.1** Measurement of the distance to the satellite.

ADD B/35/66*ter*

[14] **S22.34.2** Further studies are required to confirm the value of 10 dB.

ADD B/35/67

S22.35 For GSO systems in which the earth stations are expected to transmit simultaneously in the same 40 kHz band, e.g. for the GSO systems employing CDMA, the maximum e.i.r.p., values in No. **S22.32** should be decreased by 10 log(N) dB, where N is the number of earth stations which are in the receive satellite beam of the satellite to which these earth stations are communicating and which are expected to transmit simultaneously on the same frequency.

ADD B/35/68

S22.36 Earth stations operating in the 29.5-30 GHz frequency band should be designed in such a manner that 90% of the their peak off-axis e.i.r.p. density levels do not exceed the values given in No. **S22.32**. Further study is needed to determine the off-axis angular range over which these exceedances would be permitted, taking into account the interference level into adjacent satellites. The statistical processing of the off-axis e.i.r.p. density peaks should be dealt with using the method given in Recommendation ITU-R S.732.

ADD B/35/69

S22.37 The values given in No. **S22.32** are maximal values under clear-sky conditions. In case of systems employing uplink power control, these levels include any additional margins above the minimum clear-sky level necessary for the implementation of uplink power control. During rain faded conditions, the levels in No. **S22.32** may be exceeded by earth stations when implementing uplink power control.

ADD B/35/70

S22.38 FSS earth stations operating in the 29.5-30 GHz band, which have lower elevation angles to the GSO will require higher e.i.r.p. levels relative to the same terminals at higher elevation angles to achieve the same power flux-densities at the GSO due to the combined effect of increased distance and atmospheric absorption. Earth stations with low elevation angles may exceed the levels given in **S22.32** by the following amount:

Elevation angle to GSO (ε)	*Increase in e.i.r.p. density (dB)*
$\varepsilon \leq 5°$	2.5
$5 < \varepsilon \leq 30°$	$0.1(25 - \varepsilon) + 0.5$

ADD B/35/71

S22.39 The values in No. **S22.32** applicable to the off-axis angle range from 48° to 180° is intended to account for spillover effects.

Reasons: The application of off-axis e.i.r.p. density limits to earth stations operating in the bands 12.75-13.25 GHz, 13.75-14.5 GHz and 29.5-30 GHz should be restricted to earth stations that operate with GSO satellites. Off-axis e.i.r.p. density limits need not be applied to earth stations that operate with non-GSO satellites since imposing off-axis e.i.r.p. density to the earth stations of a given non-GSO network would possibly help only in decreasing the amount of interference affecting its own satellites (internal interference) and not in facilitating sharing with other non-GSO (or GSO) FSS systems.

It is important to have a grandfathering clause to protect existing earth stations that operate with systems for which complete coordination or notification information has been received by ITU before 2 June 2000.

MODIFICATIONS TO FOOTNOTES OF ARTICLE S5

MOD B/35/72

S5.441 The use of the bands 4 500-4 800 MHz (space-to-Earth), 6 725-7 025 MHz (Earth-to-space) by the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by geostationary-satellite systems in the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by a non-geostationary-satellite system~~s~~ in the fixed-satellite service ~~shall be in accordance with the provisions of Resolution **130 (WRC-97)**~~is subject to the application of the provisions of No. **S9.12** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations. The provisions of Resolution **130 (Rev.WRC-2000)** apply.

MOD B/35/73

S5.484A The use of the bands 10.95-11.2 GHz (space-to-Earth), 11.45-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 13.75-14.5 GHz (Earth-to-space), 17.8-18.6 GHz (space-to-Earth), 19.7-20.2 GHz (space-to-Earth), 27.5-28.6 GHz (Earth-to-space), 29.5-30 GHz (Earth-to-space) by a non-geostationary~~- and geostationary-~~satellite system~~s~~ in the fixed-satellite service is subject to application of the provisions of ~~Resolution **130** (WRC-97). The use of the band 17.8-18.1 GHz (space-to-Earth) by non-geostationary fixed-satellite service systems is also subject to the provisions of Resolution **538 (WRC-97)**~~ No. **S9.12** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations. The provisions of Resolutions **130 (Rev.WRC-2000)** and **538 (Rev.WRC-2000)** apply.

MOD B/35/74

S5.487A *Additional allocation:* in Region 1, the band 11.7-12.5 GHz, in Region 2, the band 12.2-12.7 GHz and, in Region 3, the band 11.7-12.2 GHz, are also allocated to the fixed-satellite service (space-to-Earth) on a primary basis, limited to non-geostationary systems and subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~No. **S9.12** for coordination between non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from GSO networks in the broadcasting-satellite service operating in accordance with the Radio Regulations. The provisions of Resolution **538 (Rev.WRC-2000)** apply.

Reasons: *Resolves* 8 in Resolution 130 (WRC-97) and 1.7 in Resolution 538 (WRC-97) (both related to coordination under No. S9.12) and *resolves* 6 in Resolution 130 (WRC-97) (concerning non-GSO FSS systems not claiming protection from GSO networks in the FSS) are important and needed. They should be reflected in the pertinent footnotes of the Radio Regulations.

MOD B/35/75

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) in Regions 1 and 3 and 17.8-18.1 GHz (Earth-to-space) in Region 2 by non-geostationary-satellite systems in the fixed-satellite service is subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~No. **S9.12** for coordination between non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations. The use of the band 17.3-17.8 GHz in Region 2 by FSS systems (Earth-to-space) operating with non-GSO satellites is restricted to earth stations having antennas greater than 4.5 m that are located in non-urban areas and that do not cause harmful interference to BSS terminals located anywhere outside the 500 m radius circle centered at the FSS earth station location. The provisions of Resolution **538 (Rev.WRC-2000)** apply.

Reasons: *Resolves* 8 in Resolution 130 (WRC-97) and 1.7 in Resolution 538 (WRC-97) (both related to coordination under No. S9.12) and *resolves* 6 in Resolution 130 (WRC-97) (concerning non-GSO FSS systems not claiming protection from GSO networks in the FSS) are important and needed. They should be reflected in footnote S5.16 of the Radio Regulations.

In Region 2, in the frequency band 17.3-17.8 GHz, BSS systems are expected to have a high density of ubiquitous deployed terminals. To allow for the frequency sharing between such BSS systems and non-GSO systems (Earth-to-space) operating in the band, it is necessary to limit the number and the interfering potential of earth stations operating with non-GSO systems, since frequency sharing between two services is very difficult when one or both services have a high density of ubiquitous deployed terminals.

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.10 - to consider results of ITU-R studies carried out in accordance with Resolution 218 (WRC-97) and take appropriate action on this subject

Introduction

Resolution 218 (WRC-97) requests ITU-R to determine the future spectrum requirements for the provision of distress, urgency and safety communications in the GMDSS by the mobile-satellite and AMS(R)S. It also requests to study the feasibility of priorization, real-time pre-emptive access and, if necessary, interoperability between different mobile-satellite systems for GMDSS and AMS(R)S.

Presently, the ICAO CNS/ATM system, which will require up to 10.8 MHz of spectrum by 2010 according to ICAO and IATA, is being implemented. Therefore, it is necessary to guarantee that the systems operating in the mobile-satellite service (MSS) will not impose restrictions on the implementation of new systems of AMS(R)S.

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Addendum 6 to Document 35-E
14 March 2000
Original: English

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.9 - take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions 213 (Rev.WRC-95) and 220 (WRC-97)

Introduction

Resolution 220 (WRC-97) calls, *inter alia*, for ITU-R to study, as a matter of urgency, the technical criteria as well as operational and safety requirements to determine if sharing between the aeronautical radionavigation and radionavigation-satellite services (ARNS/RNSS) operating or planned to operate in the band 1 559-1 610 MHz, and the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, is feasible, taking into account the essential need to protect these services, the requirements to provide additional spectrum to the MSS and Resolution 213 (Rev.WRC-95). The latter Resolution calls, *inter alia*, for ITU-R to investigate a potentially suitable downlink band that may assist in meeting the spectrum requirements of the MSS.

So far, all discussions on the subject have centred on the feasibility of sharing between ARNS/RNSS (space-to-Earth) and the MSS (space-to-Earth) in the referred band. Only few, or none at all, have attempted to address Resolution 213 (Rev.WRC-95).

Examination of studies carried out in ITU-R, on the feasibility of sharing between ARNS/RNSS and MSS in the space-to-Earth direction in the concerned band, has indicated the incompatibility between these services. The frequency band 1 559-1 610 MHz is allocated to the ARNS and RNSS (space-to-Earth) on a primary basis. Today the GPS, which is an element of the global navigation satellite system (GNSS) of the International Civil Aviation Organization (ICAO), is the only system in operation near or in the band 1 559-1 567 MHz. Studies have, however, considered the GPS augmentations which are planned to be implemented to include, e.g. pseudolites. Pseudolites (from pseudo satellites) are ground-based radio transmitters that transmit signals to those from RNSS satellites and are intended to provide additional facilities to the system. These studies have also considered ARNS/RNSS systems from other administrations, such as the E-NSS-1 and LSATNAV, that are planned to be implemented. All this will make this portion of the spectrum extremely crowded and populated by systems recognized by the Radio Regulations as safety-of-life related services, leading to the conclusion that sharing is not feasible.

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.8 - to consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Introduction

This proposal presents regulatory and technical provisions for operation of earth stations on board vessels (ESVs) using frequencies allocated to the fixed-satellite service and for protection of the terrestrial stations operating at the same band. More than protecting the stations in the fixed service, this service must be assured of its growth without any constraint from the ESVs.

ESVs operating in the fixed-satellite service beyond a certain distance do not present a potential for interference to stations in the fixed service operating in accordance with the RR the 6 GHz FS allocation, and therefore need not be coordinated. Operations while these earth stations are stationary at predetermined points can be coordinated bilaterally with fixed service systems. Technical and regulatory issues concern the potential for interference between in-motion operations by these ESVs operating close to shore and stations in the fixed service both on and offshore.

ADD B/35/20

S5.ESV In the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz, transponders on space stations in the fixed-satellite service may be used, additionally, by earth stations on board vessels. Such use is subject to the provisions specified in the procedures of Resolution **ZZZ (WRC-2000)**.

Reasons: To establish regulatory and technical provisions for operations of earth stations on board vessels in the fixed-satellite service and protection for the terrestrial stations operating in the FS in the same band.

ADD B/35/21

RESOLUTION ZZZ (WRC-2000)

Provisions to enable earth stations located on board vessels to operate in fixed-satellite service networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that there is a demand for global wideband satellite communication services on vessels;

b) that the technology exists that would permit the use of fixed-satellite services (FSS) networks by earth stations on board vessels (ESVs) operating in the 3 700-4 200 MHz and 5 925-6 425 MHz bands;

c) that ESVs have the potential to cause unacceptable interference to the fixed service (FS) systems in the band 5 925-6 425 MHz;

d) that FS systems have the potential to cause interference to ESVs in the 3 700-4 200 MHz band;

e) that ESVs operating in these bands require considerably less than the full bandwidth in this FSS allocation and only a portion of the visible geostationary arc;

f) that there are a limited number of geostationary FSS systems that have global coverage;

g) that in order to ensure the protection and future growth of the FS, the ESV must operate with certain technical and operational constraints;

h) that administrations may authorize radiocommunication stations on offshore structures and platforms for which they are responsible;

i) that based on appropriate assumptions a minimum distance can be calculated beyond which the ESV will not have the potential to cause unacceptable interference to the fixed service in this band,

noting

a) that operation within the territorial sea is at the discretion of the administration with territorial authority, in which case the relevant procedures of that administration will apply;

b) that operation of earth stations on vessels from specified fixed points at locations outside the territorial sea but for which an administration has territorial jurisdiction is fully within the FSS,

resolves

1 that the administration that issues the radio licence for the use of ESVs in these bands (licensing administration) shall ensure that such stations do not cause unacceptable interference to stations in the fixed service;

2 that licensing administrations shall ensure that ESVs are capable of operating in compliance with the requirements of this Resolution;

3 that operators of ESVs shall comply with the conditions established by the licensing administration(s);

4 that ESVs shall not claim protection from fixed service station transmissions;

5 that any transmissions from ESVs within a distance of 200 km off any given coast shall be based upon the prior agreement of that coastal administration;

6 that the ESV system shall include means of identification and an automatic mechanism to terminate transmissions whenever the station operates outside its pre-authorized geographic (see *resolves* 5) or operational limits;

7 that ESVs shall be equipped so as to enable the licensing administration under the provisions of Article **S18** to verify earth station performance and to accomplish the switch off of the ESV transmission immediately upon request by an administration whose services may be affected;

8 that when ESVs operating beyond the territorial sea but within 200 km of the coast of an administration fail to comply with the terms required by that administration pursuant to *resolves* 3 and 5, then that administration may:

– request the ESV to comply with such terms or cease operation immediately; or

– request the licensing administration to require such compliance or immediate cessation of the operation;

9 that any licensing authority that licenses ESVs shall agree to maintain at all times a point of contact, which shall be published in a circular of ITU, that may be contacted by an affected administration seeking assistance pursuant to *resolves* 3 and 5 above,

instructs ITU-R

to study and develop Recommendations on methods for coordination between terrestrial stations and ESVs while in motion at less than the minimum coordination distance from the shore.

Reasons: To establish regulatory and technical provisions for operations of earth stations on board vessels in the fixed-satellite service and protection for the terrestrial stations operating in the FS in the same band.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.4 - to consider issues concerning allocations and regulatory aspects related to Resolutions 126 (WRC-97), 128 (WRC-97), 129 (WRC-97), 133 (WRC-97), 134 (WRC-97) and 726 (WRC-97)

Proposal addressing the use of the frequency range 37-40 GHz by the fixed service (Resolution 133 (WRC-97))

Introduction

Resolution 133 deals with sharing of the FS with other services in the range 37-40 GHz. Point-to-point FS systems are already deployed on a large scale and their use is growing in the 37-40 GHz range which is allocated to the FS on a primary basis. The initial large-scale deployment of P-P systems in this band was in mobile and competitive market networks with a concentration mainly in and around urban and industrial areas. A more recent large-scale FS application of this band represents a new variety of FWA using P-P and P-MP systems that terminate directly on subscriber premises. While the current major use of the 38 GHz band is the application of P-P systems with smaller capacities, there is an accelerating trend toward higher capacities up to *n* x 155 Mbit/s, using higher level modulation methods (e.g. 256-QAM). Deployment levels and further details can be found in draft new Recommendation ITU-R F.[Doc. 9/1015].

In recent years, Brazil has experienced a tremendous growth in the deployment of point-to-point digital radio systems, mainly with transmission capacity ranging from 2 to 34 Mbit/s, for mobile telecommunication system back-haul connections, as well as for corporate wireless access applications, at frequency bands higher than 15 GHz. Currently, in the metropolitan areas, due to the saturation at the lower frequency bands, the 38 GHz band has been authorized for the above applications. A huge deployment rate of radio hops at 38 GHz is taking place in urban areas, gaining characteristics of high density deployments.

Rain outage events are the primary cause of unavailability in frequency bands above 30 GHz. These characteristics are more pronounced in tropical regions of the world, with high rain precipitation rates, like ITU-R rain zones N and P, as is the case of the most populated urban areas of Brazil. In such high rain precipitation regions, HDFS systems operating above 40 GHz will have severe limitations on allowable hop lengths, making difficult its deployment in many applications envisaged. Thus, it is important to tropical region countries that choose the lower frequency bands for HDFS deployments.

Sharing between the HDFS and FSS has been shown to be technically feasible, particularly where the FS and/or the FSS would not rely on the ubiquitous deployment of terminals.

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.4 - to consider issues concerning allocations and regulatory aspects related to Resolutions 126 (WRC-97), 128 (WRC-97), 129 (WRC-97), 133 (WRC-97), 134 (WRC-97) and 726 (WRC-97)

Proposal for the confirmation of the fixed service allocation in the 31.8-33.4 GHz frequency range (Resolutions 126 (WRC-97) and 726 (WRC-97))

Introduction

Resolutions 126 (WRC-97) and 726 (WRC-97) invite ITU-R to address, among other issues, sharing between high-density fixed systems (HDFS) and other radiocommunication services sharing spectrum in the bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz bands.

At WRC-97, a number of frequency bands above 30 GHz were identified through Resolution 726 (WRC-97) as available for the deployment of high-density fixed systems. Included in Resolution 726 (WRC-97) is the frequency range 31.8-33.4 GHz. WRC-97 amended the Table of Frequency Allocations to include the fixed service on a primary basis in the 31.8-33.4 GHz range subject to conditions found in Resolution 126 (WRC-97). The first condition stipulated that this allocation to the fixed service would not go into force until 1 January 2001. Secondly, this allocation would be reviewed at WRC-2000 taking into account the results of sharing studies and the future requirements of the other allocated services. The frequency range 31.8-33.4 GHz also has primary allocations to the radionavigation, space research (space-to-Earth) (deep space) and the inter-satellite services.

ITU-R, through various working parties, has studied the sharing potential between the fixed service (high-density applications) and the other primary services. With regard to sharing between the fixed and radionavigation service, studies indicate that sharing may be possible through the use of appropriate mitigation and operational measures, recognizing that fixed systems may receive emissions from airborne radionavigation systems. However, actual interference events are expected to be rare. The CPM Report recommended that sharing between the fixed and radionavigation services could be addressed through the development of appropriate ITU-R Recommendations. Sharing between the fixed service and the deep-space facilities is considered practical as there are only a few deep-space sites in the world and coordination with the fixed stations is feasible. It would be appropriate to adopt a suitable free-space spectral pfd limit at the surface of the Earth in order to provide adequate protection to HDFS systems from SRS satellites in a temporary near-Earth orbit phase. Studies have also concluded that interference levels from high-density fixed stations into inter-satellite receivers are well within acceptable limits.

S5.547 The bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz are available for high-density applications in the fixed service ~~(see Resolution **726 (WRC-97)**)~~.

SUP B/35/10

RESOLUTION 126 (WRC-97)

Use of the frequency band 31.8-33.4 GHz for high density systems in the fixed service

MOD B/35/11

S5.547A ~~Use of the band 31.8-33.4 GHz by the fixed service shall be in accordance with Resolution **126 (WRC-97)**.~~ Due to the operational nature of the radionavigation service, systems in the fixed service operating in the 31.8-33.4 GHz band may be subject to emissions from airborne radionavigation systems. Interference into fixed systems is expected to be rare, however, administrations are encouraged to take practical measures to minimize potential interference, taking into account **S4.10**.

MOD B/35/12

TABLE **S21-4** *(end)*

Frequency band	**Service***	**Limit in dB(W/m²) for angle of arrival (δ) above the horizontal plane**			**Reference bandwidth**
		0°-5°	**5°-25°**	**25°-90°**	
31.8-32.3 GHz	Space research	–120	–120 + 0.75(δ – 5)	–105	1 MHz
32-33 GHz	Inter-satellite	–135	–135 + (δ – 5)	–115	1 MHz

Reasons: Sharing studies have concluded that reasonable measures can be taken by the various services using this band to ensure practical coexistence. As a result, it is possible to confirm the fixed allocations in the band 31.8-33.4 GHz, and to identify this band as being available for HDFS applications. Consequently, Resolution 126 (WRC-97) can be suppressed. In addition, the draft CPM Report to WRC-2000 provides suitable pfd limits to protect the fixed service. With regard to the band 31.8-33.4 GHz, Resolution 726 (WRC-97) can be suppressed since the necessary ITU-R studies required to confirm the fixed service allocation have been completed.

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.2 - to finalize remaining issues in the review of Appendix S3 to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation 66 (Rev.WRC-97) and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services

Introduction

Recommendation 66 (Rev.WRC-97) directs ITU-R to submit a report to WRC-2000 with a view to finalizing the space services spurious emissions limits in Appendix S3 of the Radio Regulations. Appendix S3 contains tables of maximum permitted spurious emission power levels. Table I contains the values applicable to transmitters installed on or before 1 January 2003 (valid until 1 January 2012), while Table II applies to the transmitters installed after 1 January 2003 and to all transmitters after 1 January 2012. Note 14 of Table II identifies the spurious emissions limits for space services as “design objectives” until after WRC-2000.

ITU-R concluded that there is no further need for the “design objectives” qualification for space services limits and that at this time, they believe that no changes to the attenuation values or the reference bandwidth for space services are applicable. This reflects its view to transform these “design objectives” into a regulatory limit.

The Brazilian Administration proposes text that would remove the “design objectives” designation from the space services spurious emissions limits and make related appropriate modifications applicable to deep-space systems. Also the Brazilian Administration proposes to correct an oversight in Appendix S3 regarding limits for the radiodetermination service, and specify that spurious emission levels for radar systems be determined from radiated emissions.

APPENDIX S3

Section I – Spurious emission limits for transmitters installed on or before 1 January 2003 (valid until 1 January 2012)

MOD B/35/3

6 Radar systems are exempt from spurious emission limits under this section.~~The measurement methods for radar systems should be guided by Recommendation ITU-R M.1177. For those radar systems for which acceptable methods of measurement do not exist, t~~The lowest practicable power of spurious emission should be achieved.

Section II – Spurious emission limits for transmitters installed after 1 January 2003 and for all transmitters after 1 January 2012

Application of these limits

MOD B/35/4

8 Guidance regarding the methods of measuring spurious emissions is given in the most recent version of Recommendation ITU-R SM.329. The e.i.r.p. method specified in that Recommendation should be used when it is not possible to measure the power supplied to the antenna transmission line~~.~~, or for specific applications, such as radars, where the antenna is designed to provide significant attenuation at the spurious frequencies. Additionally, the e.i.r.p. method may need some modification for special cases, e.g. beam-forming radars.

MOD B/35/5

TABLE II

Attenuation values used to calculate maximum permitted spurious emission power levels for use with radio equipment

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
Space services (earth stations) [10~~, 14~~]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Space services (space stations) [10~~, 14~~]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Radiodetermination [14]	43 + 10 log (*PEP*), or 60 dB, whichever is less stringent
Amateur services operating below 30 MHz (including with SSB) [12, 16]	43 + 10 log (*PEP*), or 50 dB, whichever is less stringent

Notes to Table II

MOD B/35/6

14 ~~These values are "design objectives". This note will not be applicable after WRC-99.~~ Radiodetermination (Radar) system spurious emission (dB) attenuation shall be determined for radiated emission levels, not at the antenna transmission line. The measurement methods for determining the radiated spurious emission levels from the radar systems should be guided by Recommendation ITU-R M.1177.

Reasons: Clarify the exemption of radar systems from the Section I limits, in order to correct an oversight in Appendix S3 regarding limits for the radiodetermination service that may lead incorrectly to the application of the Section I limits to radars. Clarify the application of the e.i.r.p. measurement method to radars particularly, but also to other systems where antenna line measurements may not be appropriate. Confirm the values in Table II and "clean up" the table by removing the "design objectives" designation from the space services spurious emissions limits.

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.1 - requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

Introduction

Resolution 26 (Rev.WRC-97) urges administrations to review footnotes periodically and to propose the deletion of their country footnotes or of their country names from footnotes, as appropriate. Also, Recommendation 34 (WRC-95) has a long-term objective to harmonize the use of frequencies throughout the world as showed in *considering c)* and *recommends* 2.

In Regions 1 and 3 the band 10-10.45 GHz is allocated to the fixed and mobile services on a primary basis, and in Region 2 this allocation is restricted to a few countries according to footnote S5.480: Brazil, Costa Rica, Ecuador, Guatemala, Honduras and Mexico. In addition to this, there are some countries working on the planning of the band 10 to 10.45 GHz for fixed services, including FWA systems, in Region 2.

MOD B/35/1

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Brazil (Federative Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Introduction

The Brazilian Administration has pleasure to submit its proposals covering several items of the agenda of WRC-2000.

The following addenda are, thus, herein included:

Addendum 1: agenda item 1.1;

Addendum 2: agenda item 1.2;

Addendum 3: agenda item 1.4a;

Addendum 4: agenda item 1.4b;

Addendum 5: agenda item 1.8;

Addendum 6: agenda item 1.9;

Addendum 7: agenda item 1.10;

Addendum 8: agenda item 1.13;

Addendum 9: agenda item 1.19;

Addendum 10: agenda item 1.19*bis*;

Addendum 11: agenda item 1.20a;

Addendum 12: agenda item 1.20b;

Addendum 13: agenda item 1.20c.

The Brazilian Administration is also submitting additional proposals jointly with other CITEL administrations. These will appear as separate documents.

PLENARY MEETING

Note by the Secretary-General

PREPARATION OF RADIO REGULATIONS AND RELATED ISSUES

ADDITIONAL INFORMATION

Additional information on the subjects referred to in Document 36 is brought to the attention of the Conference at the request of the Director of the Radiocommunication Bureau.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

Director, Radiocommunication Bureau

Information related to the preparation of the Radio Regulations

1 Introduction

Document 36 contains background information on the preparation of the 1998 edition of the Radio Regulations, as well as an indication of errors, inconsistencies and obsolete parts. In that document, the Bureau announced that additional information might be submitted, pending the review of other subjects related to the texts appearing in the Radio Regulations.

This document deals with issues that were identified in such a review and are drawn to the attention of the Conference for such action as may be deemed appropriate.

2 Discrepancies between Annex 2A to Appendix S4 and Annex 2 to Appendices S30 and S30A

WRC-97, in revising Appendix S4, integrated the Annex 2 information of Appendices S30, S30A and S30B into Annexes 2A and 2B to that Appendix.

Annex 2 to Appendices S30 and S30A was also revised at the same Conference. However, some of the revised data items of Annex 2 to Appendices S30 and S30A have not been incorporated into Annex 2A to Appendix S4.

The Conference may wish to consider aligning Annex 2 to Appendices S30 and S30A with Annex 2A to Appendix S4, as follows:

- Replace description of item B.3 *g)* 1) of Annex 2A to Appendix S4 with that of item 12 *a)* of Annex 2 to Appendix S30 and item 3.4 *a)* of Annex 2 to Appendix S30A in order to include cross-polar maximum antenna gain in the case of a beam in other than elliptical shape.
- Delete item B.3 *g)* 7) (ΔG) which had been removed from Annex 2 to Appendix S30 at WRC-97.
- Align item C.8 *h)* of Annex 2A to Appendix S4 with item 11 of Annex 2 to Appendix S30.
- Align item C.11 *b)* of Annex 2A to Appendix S4 with item 2.3 of Annex 2 to Appendix S30A.
- Introduce two new data items C.9 *b)* 9) and C.15 to Annex 2A to Appendix S4 extracted from items 14 *i)* and 23 of Annex 2 to Appendix S30 respectively (items 1.6 *i)* and 5 of Annex 2 to Appendix S30A respectively).

A possible revision to the above-mentioned data items is included in Attachment 1 to this document.

3 Issues referred in Resolution 30 (WRC-97)

Resolution 30, in paragraph 8 ("*further instructs the Director of the Radiocommunication Bureau*"), instructed the Director, BR, to report to the next world radiocommunication conference on the experience gained in the introduction of the CD-ROM format, with a view to making any necessary consequential amendments to the Radio Regulations. The same Resolution, in paragraph 7, instructed the Director to consider an alternative name, if appropriate, for the Weekly Circular.

As indicated in Document 41 (Activity Report), the Bureau has implemented Resolution 30 (WRC-97) and the new publication, the "International Frequency Information Circular (IFIC)" is being published every two weeks, in CD-ROM format, as from 11 January 2000. Therefore, an **appropriate change of the reference (from Weekly Circular to IFIC) might be required in various provisions of the Radio Regulations**.

The following provisions of the Radio Regulations make reference to the "Weekly Circular" or to "Circular" in the meaning of "Weekly Circular":

- Article S9: provisions Nos. S9.1, S9.2B, S9.3 (twice), S9.5B, S9.5D, S9.38, S9.40. S9.41 (twice), S9.51, S9.52, S9.52A, S9.55, and S9.64;
- Article S11: Nos. S11.28 and S11.43;
- Appendix S4: In section A.13;
- Appendix S7: § 1;
- Appendix S25: Nos. S25/1.2, 1.6, 1.8, 1.9, 1.11.1, 1.11.2, 1.22, Table of Added Allotments (Notes 3.1, 10 and footnote 2);
- Appendix S30: Nos. 4.3.5.1, 4.3.6, 4.3.7, 4.3.12, 4.3.17, 4.4, 5.1.6 (twice), 5.1.7, 6.3.4 (three times), 6.3.5, 7.1.3 (twice), 7.1.4, 7.1.7 (twice), 7.1.8, 7.2.3 (three times), 7.2.5 (twice), 7.2.6a, 7.2.6b, 7.4.2 (twice), 7.4.3, Article 10 (Notes 11 and 12);
- Appendix S30A: Nos. 4.2.6.1, 4.2.7, 4.2.8, 4.2.13, 4.2.18, 4.3, 5.1.10 (twice), 5.1.11;
- Appendix S30B: Nos. 5.6, 6.2.6, 6.33, 6.34, 6.49, 6.50 and 6.54 a);

It is to be noted that some of the references (e.g. those in Notes 11 and 12 of Article 10 in Appendix S30) are of a historical nature and need not be changed.

The term "Weekly Circular" or "Circular" is also used in several Resolutions and Recommendations, notably:

- Resolution 4: in *resolves* 1.2;
- Resolution 8: in Annex B (§ 4) and in Annex C (§ 6);
- Resolution 33: section A (§ 2.2 - twice, § 2.3);
- Resolution 42: in the Annex (§§ 6, 8, 10, 11);
- Resolution 46: in Annex 1 (§ 1.3 - twice, §§ 1.4, 1.6, 2.7.2, 2.9, 2.17, 5.1.6);
- Resolution 49: in *resolves* 5 and 6; in Annex 1 (§§ 8, 11);
- Resolution 312: in the Annex (footnote 1);
- Resolution 500: in *requests the Bureau*;
- Resolution 533: in *resolves* 5 (twice);

- Recommendation 35: in the Annex (Nos. T10.12, T10.13, T10.14, T10.17, T10.24).

In addition, as the International Frequency List is now systematically published with every issue of the IFIC, an appropriate amendment might be required to the relevant provisions in Article S20 (Nos. S20.2 to S20.6).

4 Numbering of the provisions of the Radio Regulations

The 1998 edition of the Radio Regulations systematically applies the prefix S in front of every provision of the Radio Regulations (e.g. Article S5, No. S19.28, Appendix S7, etc.). The prefix S was introduced to distinguish the provisions of the new, simplified Radio Regulations, that were adopted by WRC-95 and WRC-97, from the provisions of the former Radio Regulations, often referred to with the prefix RR (e.g. RR1107), in the application of the relevant procedures.

In view of the fact that the 1997 revision of the Radio Regulations resulted in a consistent set of provisions that are referred to with the prefix S in the 1998 edition of the Radio Regulations, whose provisional application commenced on 1 January 1999 with respect to the frequency assignment notices received after 31 December 1998, and that the Bureau is about to complete the examinations of the frequency assignment notices received prior to 1 January 1999 whose treatment was governed by the former provisions of the Radio Regulations that were in force, **the Conference may wish to consider the abolition or otherwise of the prefix S in front of the provisions of the Radio Regulations in the forthcoming editions of the Radio Regulations**.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 36-E
14 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

The attached document is brought to the attention of the Conference at the request of the Director, Radiocommunication Bureau and summarizes those errors, inconsistencies and obsolete parts of the Radio Regulations that were discovered by the Bureau's staff and/or were drawn to the attention of the Bureau with a view to presenting them appropriately to WRC-2000.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

Director, Radiocommunication Bureau

Preparation of the Radio Regulations

1 Introduction

The preparation of the Radio Regulations deserves special attention as they, as an integral part of the Constitution and Convention of ITU, represent an internationally binding instrument.

The 1998 edition of the Radio Regulations was prepared on the basis of the consolidated text of the Simplified Radio Regulations (Document 2 of WRC-97) and the Final Acts of WRC-97.

Document 2 already contained, in almost all cases, references to the Simplified Radio Regulations, based on the table of correspondence between the provisions of the Radio Regulations (1994 edition) and the provisions of the Simplified Radio Regulations (as adopted by WRC-95) that was established by the VGE and further completed by the ITU Secretariat. However, in some cases, where it was not possible to establish an unambiguous mapping between the old and new references, because of the modified scope of some provisions in the new Articles **S9** and **S11**, WRC-97 was requested to take an appropriate decision as to the correct reference for the new set of provisions. Although WRC-97 took such decisions in many cases, some provisions (e.g. those of Appendix **S30**) were not reviewed by the Conference.

In addition to the substantive changes adopted by WRC-97, which are reflected in the Final Acts of WRC-97, the Conference introduced editorial changes to several texts of the Simplified Radio Regulations that were not reflected in the Final Acts. Moreover, WRC-97 instructed the Bureau to introduce further editorial changes, where appropriate, in the remaining part of the Radio Regulations, to reflect:

1) ITU structural changes (world administrative radio conferences to world radiocommunication conferences, CCIR to ITU-R, IFRB to the Radiocommunication Bureau, Administrative Council to Council, etc.);

2) the replacement of ex-CCIR Reports by ITU-R Recommendations;

3) the renumbering of RR provisions resulting from the simplification of the RR.

The Bureau also replaced the term “Member(s)” with “Member State(s)” to correspond to the terminology subsequently approved by the Plenipotentiary Conference (Minneapolis, 1998).

2 Summary of experiences

The general guidelines, as indicated in the introduction, were not sufficient for the Bureau to arrive at unambiguous formulations. For instance, the term “IFRB” was used in the former Radio Regulations with two meanings: one referring to the former IFRB Secretariat (whose functions are now undertaken by the Radiocommunication Bureau) and the other to the former Board (whose functions are now undertaken by the Radio Regulations Board). In other places, the term “Board” was used in the generic sense meaning IFRB. In this context, where the differentiation was not always clear, the Bureau was faced with a problem as to the use of the proper replacement term. For instance, Article 8 of Appendix **S30**, at several places, makes reference to the “Board”. Although some of the actions referred to in this regard are now under the responsibilities of the Bureau, the term “Board” was nevertheless maintained (in all provisions of Article 8 of Appendix **S30**, as well as in all provisions of Article 8 of Appendix **S30A**).

Similar difficulties were experienced with respect to those provisions that make reference to an abrogated Resolution or Recommendation. The most illustrative example in this regard is No. **S5.120**: the only function of this provision is the cross-referencing of Resolution **640**; as Resolution **640** was abrogated by WRC-97, provision No. **S5.120** became useless. Despite the fact that provision No. **S5.120** does not serve any useful purpose, the Bureau maintained it (with an appropriate Note), as the suppression of a provision remains within the prerogatives of a Conference.

Further difficulties were experienced in identifying relevant ITU-R Recommendations as replacements for the former CCIR Reports. Such identification was particularly difficult in the context of some very old WARC Resolutions and Recommendations (e.g. Recommendations **705** and **706**), where the quoted CCIR texts are no longer in force and several new texts now make reference to the subject referred to in the quoted CCIR texts. In such cases, the Bureau maintained the historical references to the relevant CCIR texts, indicating, through appropriate notes, the obsolete status of these texts.

This document summarizes those errors, inconsistencies and obsolete parts of the Radio Regulations that were discovered by the Bureau’s staff and/or were drawn to the attention of the Bureau with a view to presenting them appropriately to WRC-2000. The document does not deal with other issues related to the application of the Radio Regulations (e.g. imprecise formulations, etc.); some of these issues are covered in another document of the Bureau concerning its experiences with the application of the Radio Regulations (Document 16), as well as in various proposals from administrations (e.g. those relating to the revision of Appendix **S5**).

3 Errors, inconsistencies and obsolete parts

Despite very careful preparation of the 1998 edition of the Radio Regulations, it contains several errors, inconsistencies and obsolete parts.

3.1 Typographical errors

Several typographical errors were noticed in the 1998 edition. These errors, as summarized in Table 1, will be corrected in the forthcoming edition of the RR.

TABLE 1

List of typographical errors

Volume, page	Incorrect text	Correct text
1, p. 34, No. S5.2, in E/F/S	The map does not agree with the definition in No. **S5.9**

3, p. 276, Resolution 533, *recognizing b)*, in E	position	positions

3.2 Inconsistencies

Several inconsistencies were found in the 1998 edition. These inconsistencies, as summarized in Table 2, are brought to the attention of WRC-2000 which may wish to propose corrective action.

TABLE 2

Inconsistencies in the RR

Volume, page	Nature of inconsistency	Possible corrective action
1, p. 38, text of No. S5.50	The current text is inconsistent with the overall approach (see box 117.6-126 kHz, R3, and the relationship between fixed, maritime mobile and No. **S5.64**)	Redraft No. **S5.50** to read: “The footnote references which appear in the Table below the allocated service or services apply to more than one of the allocated service, or to the whole frequency band.”
1, p. 187	The course of action referred to in the last sentence of No. **S14.4** may also occur after the course of action referred to in Nos. **S14.5** and **S14.6**. However, No. **S14.6** does not foresee a course of action as indicated in No. **S14.4**	Add the whole text of the last sentence of No. **S14.4** as a penultimate sentence of No. **S14.6**
2, p. 13	Paragraph 6 is placed under Section I, but this is a general text which should be placed before the title of Section I	Place § 6 before the title of Section I NOTE - This matter is on the WRC-2000 agenda (item 1.2)
2, p. 46-48	Annex 2 of Appendix **S30/S30A** was updated by WRC-97 but these changes are not reflected in Annex 2B of Appendix **S4**	Update Annex 2B as indicated in the addendum to this document
2, p. 60, row dealing with No. S9.21, fourth and fifth columns	Reference to Appendix **S30B**	Delete the reference to Appendix **S30B** (frequency bands of Appendix **S30B** are not subject to the procedure of No. **S9.21**)
2, p. 168, § 11	This paragraph calls for publication of the same information in two different lists (List IV and List VI). In view of the different periodicity of publication of these lists, the information may not be compatible	Delete all text after the word “stations” in the third line NOTE - No. **S20.15** specifies the course of action with respect to the content of service documents
2, p. 718	§ 8.3 and § 8.4 are contradictory to some extent. This is a consequence of the fact that § 8.3 now makes reference to No. **S11.32** (which encompasses both the former RR1504 and 1505), whereas the original § 8.3 made reference only to RR1504	§ 8.3 could be amended to read "... except with respect to the coordination requirements vis-à-vis space radiocommunication stations of other administrations, under No. **S11.32** and related provisions."

3.3 Obsolete parts

Several obsolete texts were found in the 1998 edition. These texts, as summarized in Table 3, are brought to the attention of WRC-2000 which may wish to propose corrective action. Another document (Document 15), which deals with a general review of the Resolutions and Recommendations from WARCs/WRCs, indicates which Resolutions and Recommendations are obsolete.

TABLE 3

Obsolete parts in the RR

Volume, page	Obsolete text	Possible course of action
1, p. 43: boxes 435-495 kHz (R1) and 415-495 kHz (R2 and R3) 1, p. 44, text of No. S5.81	Provision No. **S5.81** is obsolete as from 1 February 1999	Delete No. **S5.81** and the appropriate footnote reference in the relevant boxes
1, p. 53, No. S5.120	No. **S5.120**	Delete No. **S5.120**
2, pages 29-32	Table in Annex 1B makes reference to notice types AP1/A1, AP1/B, AP1/C, AP1/A2, AP1/A4, AP1/A5, AP1/A6, AP1/A7, AP2, AP5 that were replaced by notice types T01, T02, T11-T17	Make appropriate changes Annexes 1A and 1B, as indicated in Attachments 1 and 2 to this document
2, p. 73	Last paragraph in § 2.1 Last paragraph in § 2.3	Delete these two paragraphs as the subject matter was considered by WRC-97

ATTACHMENT 1

Proposed modifications to Annex 1A of Appendix S4

ANNEX 1A

List of characteristics of stations in the terrestrial services[1]

ITEM B – Notifying administration

~~Country s~~Symbol of the notifying administration.

ITEM SYNC – Synchronized network

Symbol followed by the identification ~~number~~ of the network, if the station concerned by the assignment pertains to a synchronized network.

ITEM 1A – Assigned frequency

The assigned frequency as defined in Article **S1**.

ITEM 1AA – Usable frequency range

The difference between the maximum and minimum assignable frequencies of a distinct frequency band.

ITEM 1B – Reference frequency

The reference frequency as defined in Article **S1**.

ITEM 1C – Preferred band (MHz)

For notifications under No. **S7.6** and for HF broadcasting stations in their exclusive bands.

ITEM 1D – Vision carrier frequency

The vision carrier frequency of a television broadcasting assignment.

ITEM 1E – Frequency offset, line frequency

The carrier frequency offset expressed as a multiple of 1/12 of the line frequency of the television system concerned, expressed by a number (positive or negative)~~and a symbol (P or M)~~.

ITEM 1E1 – Frequency offset, kHz

The carrier frequency offset, in kHz, expressed by a number (positive or negative).

ITEM 1G – Alternative frequency

For HF broadcasting stations in their exclusive bands.

[1] The Radiocommunication Bureau shall develop and keep up-to-date forms of notice to meet fully the statutory provisions of this Appendix and related decisions of future conferences. Additional information on the items listed in this Annex together with an explanation of the symbols is to be found in the Preface to the International Frequency List.

~~*ITEM 1H – Other frequencies used*~~

~~For HF broadcasting stations in their exclusive bands.~~

ITEM 1X – Channel number proposed or allotted channel

For HF coast radiotelephone stations.

ITEM 1Y – Channel number of the alternative proposed channel

For HF coast radiotelephone stations.

ITEM 1Z – Channel number of channel to be replaced

For HF coast radiotelephone stations.

ITEM 2C – Date of bringing into use

The date (actual or foreseen, as appropriate) of bringing the frequency assignment (new or modified) into use.

ITEM 3A – Call sign or station identification

The call sign or other identification used in accordance with Article **S19**.

ITEM 4A – Name of the location of the transmitting station

The name of the locality by which the transmitting station is known or in which it is situated.

ITEM 4B – Country or geographical area

~~The country or~~ Symbol of the geographical area in which the station is located.

ITEM 4C – Geographical coordinates

The geographical coordinates (longitude and latitude in degrees and minutes) of the transmitter site. In some cases, seconds are also indicated.

ITEM 4D – Radius of the circular area

The nominal radius (km) of the circular area in which the mobile transmitting stations are operating.

ITEM 4E – Country symbol or standard defined area

A country symbol or a standard defined area described by the symbols contained in standard references.

~~*ITEM 4F – B1 character (transmitter coverage area identifier)*~~

~~For a coast station assignment in the international NAVTEX system.~~

ITEM 4G – Ground conductivity

For assignments to stations of the broadcasting service covered by the LF/MF Broadcasting Agreement (Regions 1 and 3) (Geneva, 1975).

ITEM 5A – Name of the location of the receiving station

The name of the locality by which the receiving station is known or in which it is situated.

ITEM 5B – Country or geographical area

~~The country or~~ Symbol of the geographical area in which the receiving station is located.

ITEM 5C – Geographical coordinates

The geographical coordinates (longitude and latitude in degrees and minutes) of the site of the receiving station.

ITEM 5D – Area of the receiving station(s)

The standard defined area of reception of the transmitting station.

ITEM 5E – Longitude and latitude of the centre of the circular receiving area

The geographical coordinates (in degrees and minutes).

ITEM 5F – Nominal radius of the circular receiving area

The radius (km) of the circular receiving area.

ITEM 5G – Maximum length of circuit

The maximum length of the circuit (in km) for receiving areas other than circular.

ITEM 6A – Class of station

The class of station described by a symbol.

ITEM 6B – Nature of service

The nature of service described by a symbol.

ITEM 7A – Class of emission, necessary bandwidth and description of transmission

The class of emission, necessary bandwidth and description of transmission, in accordance with Article **S2** and Appendix **S1**.

ITEM 7A1 – Frequency stability

Frequency stability RELAXED, NORMAL or PRECISION for analogue television

ITEM 7AA – Type of modulation

~~The choice of modulation is needed in order to specify if the requirement is to~~ For HF broadcasting stations in their exclusive bands, a symbol which specifies the use of DSB, SSB or any new broadcasting techniques recommended by ITU-R.

ITEM 7B – Class of operation of the assignment

The class of operation of the assignment.

ITEM 7B1 – Adjacent channel protection ratio

For assignments to stations of the broadcasting service covered by the LF/MF Broadcasting Agreement (Regions 1 and 3) (Geneva, 1975), the protection ratio (dB) to be used for adjacent channel interference calculations.

ITEM 7C1 – Television system

Symbol corresponding to the television system.

ITEM 7C2 – Colour system

Symbol corresponding to the colour system.

ITEM 7D – Transmission system

Symbol corresponding to the transmission system for an assignment to a VHF sound broadcasting station.

ITEM 7E – Frequency deviation

For any type of modulation, as applicable: the peak-to-peak frequency deviation (MHz).

ITEM 7F – Energy dispersal

For any type of modulation, as applicable: the sweep frequency (kHz) of the energy dispersal waveform.

ITEM 8 – Power (dBW)

Symbol X, Y or Z describing, as appropriate, the type of power corresponding to the class of emission.

ITEM 8A – Power delivered to the antenna ~~(dBW)~~

The power delivered to the antenna transmission line expressed in dBW with the exception of LF/MF sound broadcasting for which the power delivered to the antenna shall be expressed in kW.

ITEM 8AB – Maximum power density (dB(W/Hz))

The maximum power density (dB(W/Hz)) for each carrier type averaged over the worst 4 kHz band for carriers below 15 GHz, or averaged over the worst 1 MHz band for carriers above 15 GHz, supplied to the antenna transmission line.

ITEM 8B – Radiated power (dBW)

The radiated power expressed in dBW in one of the forms described in Nos. **S1.161** to **S1.163**. ~~In the ce of systems where automatic power control is applied, indicate the range of power control, expressed in dB relative to the transmitted power indicated above.~~

ITEM 8BA – Range of power control

In the case of systems where automatic power control is applied, the range of power control (dB) above the nominal power indicated in 8B.

ITEM 8BH – Maximum ~~E~~effective radiated power (dBW) – horizontal

The maximum effective radiated power of the horizontally ~~polarization~~ polarized component (for VHF sound broadcasting (BC) and VHF/UHF television broadcasting (BT) assignments).

ITEM 8BV – Maximum ~~E~~effective radiated power (dBW) – vertical

The maximum effective radiated power of the vertically ~~polarization~~ polarized component (for VHF sound broadcasting (BC) and VHF/UHF television broadcasting (BT) assignments).

ITEM 8D – Vision/sound power ratio

Vision/sound carrier power ratio for VHF/UHF analogue television broadcasting (BT) assignments.

ITEM 9 – Directivity of the antenna

Directional (D) or non-directional (ND) antenna.

ITEM 9A – Azimuth of maximum radiation

For a directional transmitting antenna, the azimuth of maximum radiation of the transmitting antenna in degrees (clockwise) from True North~~, or the symbol "ND" for a non-directional antenna~~.

ITEM 9AA – Central azimuth of augmentation

The central azimuth of the augmentation (centre of the span) in degrees for an assignment to an MF broadcasting station in Region 2.

ITEM 9AB – Azimuthal sector for rotating antenna

Two azimuths in degrees (clockwise from True North) defining the sector in which the antenna rotates.

ITEM 9B – Elevation angle of maximum directivity

The angle of maximum directivity in degrees with one decimal position.

ITEM 9C – Angular width of radiation main lobe (beamwidth)

The total angle measured horizontally in a plane containing the direction of maximum radiation, in degrees, within which the power radiated in any direction does not fall more than 3 dB below the power radiated in the direction of maximum radiation.

ITEM 9CA – Total span of augmentation

The total span of the augmentation in degrees for an assignment to an MF broadcasting station in Region 2.

ITEM 9D – Polarization

Information on polarization.

ITEM 9E – Height of antenna

Information on height above ground level, in metres.

ITEM 9EA – Altitude of site above sea level

Information on the altitude of the site above mean sea level, in metres (for VHF sound broadcasting (BC) and VHF/UHF television broadcasting (BT) assignments, and for all terrestrial stations in the frequency bands above 1 GHz that are shared between space radiocommunication and terrestrial radiocommunication services).

ITEM 9EB – Maximum effective antenna height

The maximum effective height of the antenna, in metres (for VHF sound broadcasting (BC) and VHF/UHF television broadcasting (BT) assignments).

ITEM 9EC – Effective antenna height at different azimuths

The effective height of the antenna at different azimuths, in metres, for every 10° interval (for VHF sound broadcasting (BC) and VHF/UHF television broadcasting (BT) assignments).

ITEM 9F – Electrical height or maximum height of the antenna

The electrical height of the antenna in degrees or metres.

ITEM 9G – Maximum antenna gain (isotropic, relative to a short vertical antenna or relative to a half-wave dipole, as appropriate)

The maximum gain of the antenna in the direction of maximum radiation (see No. **S1.160**).

ITEM 9GH – Antenna gain for different azimuths in the horizontal plane

The antenna gain in the horizontal plane for different azimuths (dB).

ITEM 9GV – Antenna gain for different azimuths in the vertical plane

The antenna gain in the vertical plane for different azimuths (dB).

~~*ITEM 9H – Azimuths defining the sectors of limited radiation in degrees (clockwise) from True North*~~

~~The azimuth or azimuthal sectors of limited radiation, in degrees (clockwise) from True North.~~

ITEM 9I – Maximum ~~agreed~~ radiation ~~in the sectors~~or r.m.s. value of radiation

The maximum ~~agreed~~ radiation ~~in the sector~~, in dB relative to a cymomotive force (c.m.f.) of 300 V or an effective monopole radiated power (e.m.r.p.) of 1 kW, determined from the nominal power of the transmitter and the theoretical gain of the antenna without allowing for miscellaneous losses.

For assignments to stations of the broadcasting service covered by the MF Broadcasting Agreement (Region 2) (Rio de Janeiro, 1981), the product of the r.m.s. characteristic field strength, calculated in the horizontal plane, and the square root of the power.

ITEM 9IA – Radiation at central azimuth of augmentation

The value of the radiation at the central azimuth of the augmentation, expressed in mV/m at 1 km.

ITEM 9J – Reference antenna

The measured radiation pattern of the antenna, the reference radiation pattern or the symbols in standard references to be used for coordination.

ITEM 9K – Receiving system noise temperature

The lowest total receiving system noise temperature, in Kelvin.

ITEM 9L – Maximum effective radiated power (dB(kW))

The maximum effective radiated power , expressed in dB relative to an e.r.p. of 1 kW on a short vertical antenna.

ITEM 9N – Attenuation in a sector (dB)

The value in dB of the attenuation in a defined sector.

ITEM 9NA – Augmentation number

The serial numbers of the augmentations as described in items 9IA, 9AA and 9CA.

ITEM 9NH – Attenuation (dB) ~~in~~ of the horizontally polarized component ~~plane~~ at different azimuths

The value of attenuation ~~in dB~~ of the horizontally polarized component in the horizontal plane at different azimuths, with respect to the maximum e.r.p. of this component, expressed in dB~~in the horizontal plane at different azimuths~~.

ITEM 9NV – Attenuation (dB) ~~in~~ of the vertically polarized component ~~plane~~ at different azimuths

The value of attenuation ~~in dB~~ of the vertically polarized component in the horizontal plane at different azimuths, with respect to the maximum e.r.p. of this component, expressed in dB~~in the vertical plane at different azimuths~~.

ITEM 9O – Type of pattern

The type of antenna radiation pattern, represented by a symbol.

ITEM 9P – Special quadrature factor

The value of the special quadrature factor, in mV/m at 1 km (to replace the normal expanded quadrature factor when special precautions are taken to ensure pattern stability).

ITEM 9Q – Type of antenna

Symbol designating a ~~S~~simple vertical antenna or ~~directional~~ any other antenna.

ITEM 9R – Slew angle

For HF broadcasting stations in their exclusive bands, ~~T~~the slew angle represents the difference between the azimuth of maximum radiation and the direction of unslewed radiation.

ITEM 9T1 – Tower number

The serial number of each of the towers whose characteristics are described in items 9T2 to 9T8.

ITEM 9T2 – Tower field ratio

The ratio of the tower field to the field of the reference tower.

ITEM 9T3 – Phase difference of the field

The positive or negative phase difference in the tower field with respect to the field of the reference tower, in degrees.

ITEM 9T4 – Electrical tower spacing

The electrical spacing of the tower from the reference point, in degrees.

ITEM 9T5 – Angular tower orientation

The angular orientation of the tower from the reference point, in degrees (clockwise) from True North.

~~*ITEM 9T6 – Reference point indicator*~~

~~The reference point.~~

ITEM 9T7 – Electrical height of tower

The electrical height of the tower, in degrees.

ITEM 9T8 – Tower structure

Symbol corresponding to the tower structure.

ITEMS 9T9A to 9T9D – Description of top-loaded or sectionalized tower

Description of top-loaded or sectionalized towers, in ~~degrees~~ accordance with RJ81 Agreement.

~~*ITEM 10A – Maximum hours (UTC) of operation of the circuit to each locality or area*~~

~~The maximum hours of operation, expressed in hours and minutes (UTC) or by symbols.~~

ITEM 10B – Regular hours (UTC) of operation of the frequency assignment

The regular hours of operation (in hours and minutes from ... to ...) of the frequency assignment, in UTC.

ITEM 10CA – Start date

For HF broadcasting stations in their exclusive bands, ~~U~~used in the case that the requirement starts after the start of the schedule.

ITEM 10CB – Stop date

For HF broadcasting stations in their exclusive bands, ~~U~~used in the case that the requirement stops before the end of the schedule.

ITEM 10CC – Days of operation

For HF broadcasting stations in their exclusive bands, ~~U~~used when the station does not transmit every day of the week.

ITEM 10D – Estimated peak hours of traffic

For HF coast radiotelephone stations.

ITEM 10E – Estimated daily volume of traffic

For HF coast radiotelephone stations.

~~*ITEM 10F – Duration of transmissions*~~

~~For coast stations in the International NAVTEX system, the duration of transmission in hours and minutes.~~

ITEM 11 – Coordination with other administrations

~~Country or geographical area~~ Symbol of the administration with which coordination ~~is to be~~ has been effected and the provision (No. of the Radio Regulations, regional agreement, or other arrangement) requiring such coordination.

ITEM 12A – Operating administration or agency

The symbol for the operating agency.

ITEM 12B – Postal and telegraphic addresses of the administration responsible for the station

Symbol for the address of the administration responsible for the station and to which communication should be sent on urgent matters regarding interference, quality of emissions and questions referring to the technical operation of the circuit (see Article **S15**).

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

France

PROPOSALS FOR THE WORK OF THE CONFERENCE

PROPOSED UPDATED SHARING CRITERIA BETWEEN FSS, BSS AND TERRESTRIAL SERVICES IN THE 11.7-12.7 GHz BAND

(Agenda item 1.19)

Introduction

Under its agenda item 1.19, WRC-2000 will have to determine the basis for the revision of Appendices S30 and S30A on the basis of the review of the studies undertaken in response to Resolution 532 (WRC-97).

Among the principles adopted by WRC-97 in this Resolution, are the following:

> 4 In order to avoid obsolescence of the Plans, caused by technical assumptions becoming out of date, ensure that the Plans are established with a view to achieving long-term flexibility.
>
> 5 Leaving capacity for future additional requirements.

The sharing criteria between the broadcasting-satellite service (BSS), the fixed-satellite service (FSS) and the terrestrial services in the bands covered by Appendix S30 are key in determining the capability of the revised Plan to satisfy these two principles.

The bands covered by Appendix S30 are also allocated to various space and terrestrial services (see Attachment 1). Due to the conflicts between the protection requirements of these various services and the necessity for each of them to respond to the growing needs of the market, it is clear that establishing the appropriate trade-offs between them can only be done by a conference decision.

This contribution reviews the existing sharing conditions in these bands, which are set forth by Annexes 1, 3, 4 and 7 of Appendix S30, and proposes that WRC-2000 take action on updating these criteria in order for the new Plan and its future evolution to satisfy principles 4 and 5 of Resolution 532 (WRC-97).

1 Criteria to protect terrestrial services

Sections 4, 5 and 8 of Annex 1 to Appendix S30 currently contain a number of different limits to trigger coordination between a proposed modification of the BSS Plan and terrestrial services. There is a need to harmonize these values and bring them in line with the current usage of these bands by terrestrial services.

F/37/1

The following pfd limits are proposed in lieu of the current Sections 4, 5 and 8 of Annex 1 to Appendix S30 to protect terrestrial services in the band 11.7-12.7 GHz, over the territory of those countries in the three Regions where these services are allocated on a primary basis, from interference caused by the BSS in the bands subject to Appendix S30:

-148 dB(W/m^2/4 kHz) for $\theta \leq 5°$;

$-148 + 0.5 (\theta - 5)$ dB(W/m^2/4 kHz) for $5° < \theta \leq 25°$;

-138 dB(W/m^2/4 kHz) for $25° < \theta \leq 90°$;

where θ is the angle of arrival.

Reasons: These limits are consistent with the currently recognized protection requirement of the terrestrial services in this band. Assuming digital BSS transmissions, they are also consistent with a practically unconstrained development of BSS in these bands.

2 Criteria to protect the broadcasting-satellite service

Protection of the BSS Plan from interference caused by FSS or non-planned BSS is currently ensured by the application of the procedure of Article 7 of Appendix S30, associated with the criterion in Annex 4 of that Appendix:

-147 dB(W/m^2/27 MHz) for $0° \leq \theta < 0.44°$;

$-138 + 25 \log \theta$ dB(W/m^2/27 MHz) for $0.44° \leq \theta < 19.1°$;

-106 dB(W/m^2/27 MHz) for $\theta \geq 19.1°$;

where θ is the orbital separation between the wanted and interfering space stations.

Noting that the current pfd levels in Annex 4 of Appendix S30 have not been modified since WARC SAT-77, although the technical parameters for the Plans in the three Regions are now substantially different, there is clearly scope to relax these criteria. A proposed alternative to the current levels in Annex 4 of Appendix S30 is provided below, for the protection of the BSS Plan in the three Regions, from interference caused by the FSS or non-planned BSS.

The following pfd limits, defined as a function of the orbital separation θ between the wanted and interfering space stations, have been studied in conjunction with a 9° coordination arc, to protect the BSS reception against FSS or non-planned BSS transmit space stations in the bands covered by Appendix S30.

-146 dB(W/m^2/27 MHz) for $\theta < 0.225°$;

$-134 + 18.5 \log \theta$ dB(W/m^2/27 MHz) for $0.225° \leq \theta < 1.8°$;

$-137 + 30 \log \theta$ dB(W/m^2/27 MHz) for $1.8 \leq \theta < 9°$;

where θ is the orbital separation in degrees between the wanted and interfering space stations.

Figure 1 provides a comparison between the alternative criterion studied and that currently applicable in Annex 4 of Appendix S30 for this interference situation.

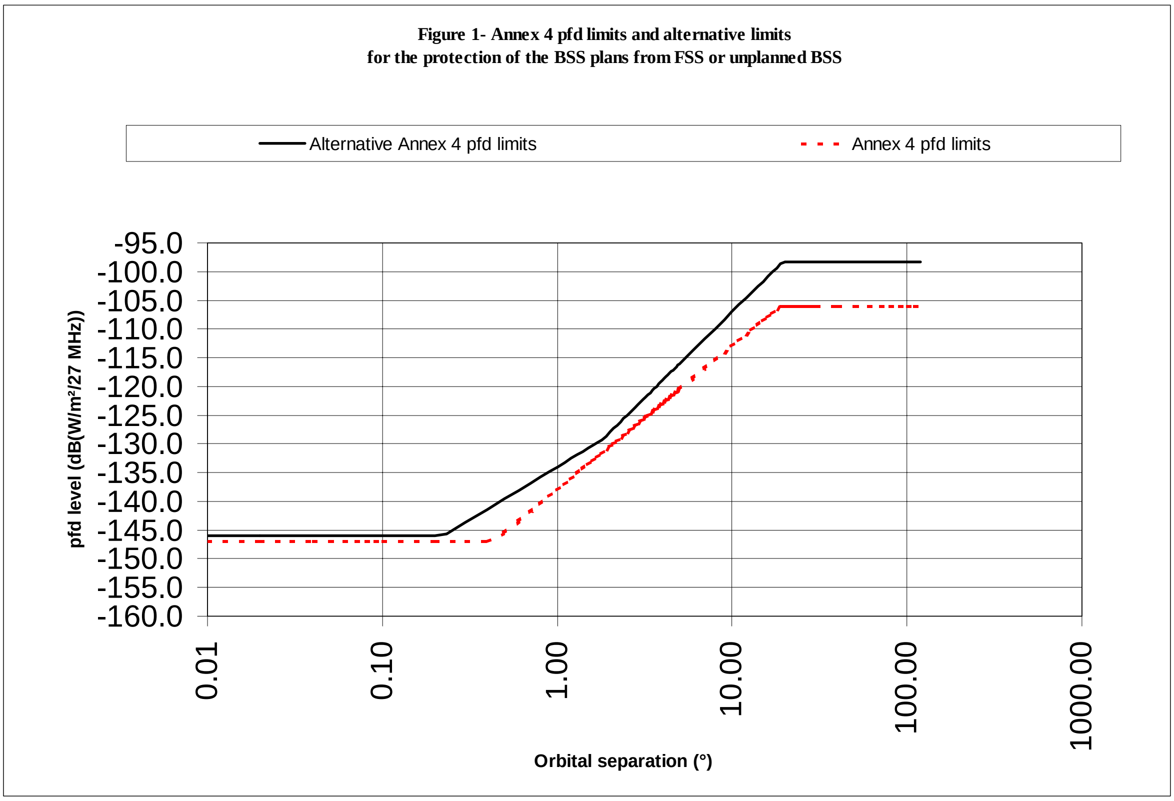

Figure 2 provides a comparison between the pfd level that would be required to achieve the protection requirements defined in Appendix S30 and the pfd limit applicable in Annex 4 for the same orbital separation, based on the following assumptions:

For Regions 1 and 3

- BSS antenna diagram in compliance with Figure 7*bis* of Annex 5 of Appendix S30;
- wanted pfd level required for 99% of the worst month into a 60 cm receive BSS antenna: –108 dB(W/m^2/27 MHz);
- wanted C/I aggregate for the downlink: 24 dB;
- required protection ratio = C/I wanted + 5 dB = 29 dB (as per Annex 6 of Appendix S30).

For Region 2

- BSS antenna diagram in compliance with Figure 8 of Annex 5 of Appendix S30;
- wanted pfd level required for 99% of the worst month into a 100 cm receive BSS antenna: –107 dB(W/m^2/24 MHz);
- wanted C/I aggregate for the overall link: 28 dB;
- required protection ratio = C/I wanted + 5 dB = 33 dB (as per Annex 6 of Appendix S30).

From Figure 2, it can be seen that apart from the 2.4 m antenna, the 30 cm and the 45 cm antenna in Regions 1 and 3, the current pfd limits in Annex 4 provide more protection than required to the Plan for all orbital separations. Also, it can be seen that there is significant margin against the Plan protection requirement for different ranges of orbital separations, for all antenna diameters. This suggests that some relaxation may be sought for these ranges of orbital separations. In addition, to take into account the increasing widespread use of digital techniques in the BSS, a 3 dB relaxation is proposed on the protection ratios, consistent with the IRG conclusions (i.e. 26 dB C/I single entry for Regions 1 and 3 protection and 30 dB for Region 2 protection).

Figure 2- Difference between the pfd required by Annex 6 of Appendix S30 for various antennas and current Annex 4 pfd limits

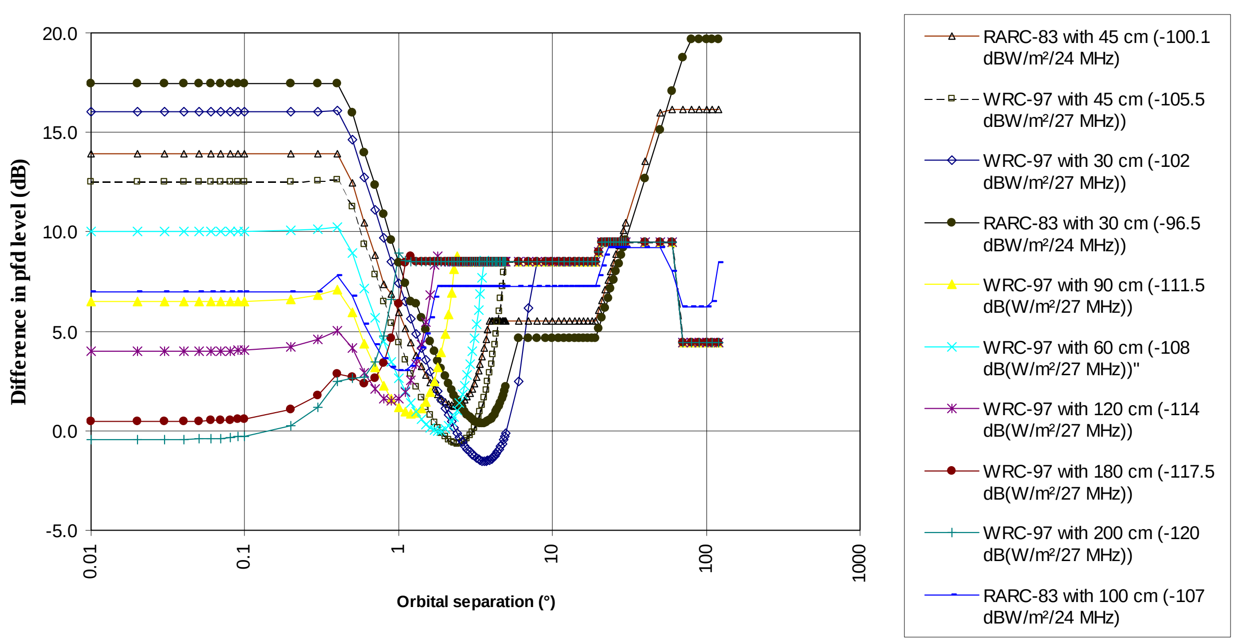

Figure 3 provides a similar comparison against the candidate alternative pfd limits. It shows that the margin in excess has been essentially eliminated, while providing satisfactory protection to all diameters in the range between 60 cm and 240 cm in Regions 1 and 3, as well as to all diameters above 45 cm diameter in Region 2.

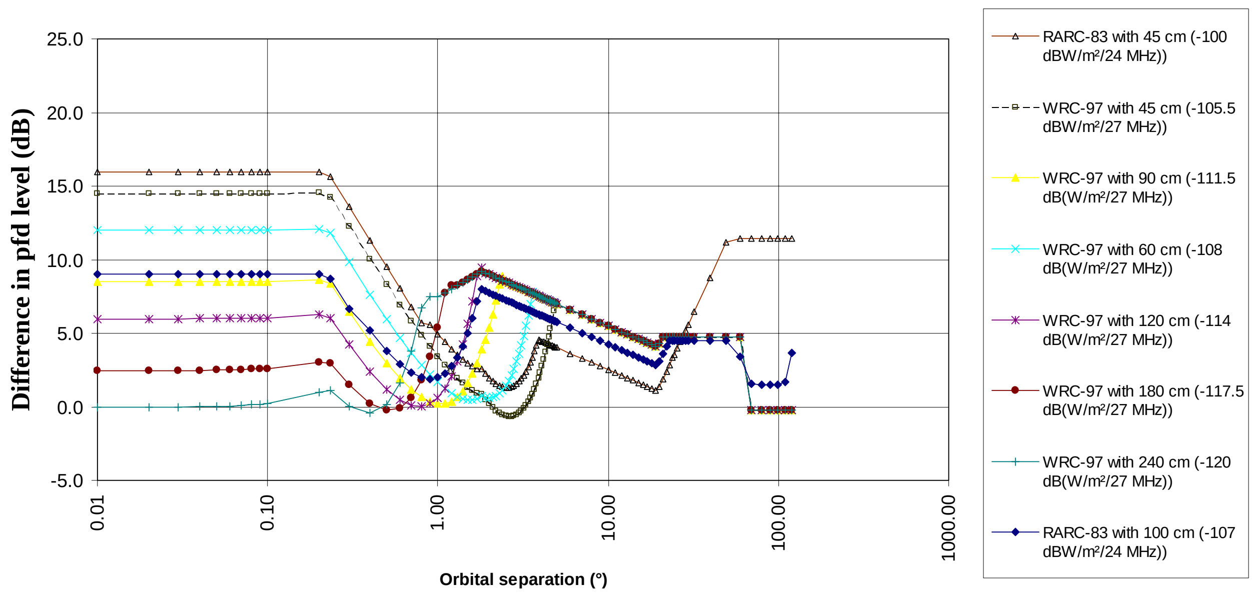
The philosophy of the current Annex 4 limits was to protect the nominal transmissions in the Plan (90 cm/–103 dB(W/m^2/27 MHz) for individual reception and 180 cm/–111 dB(W/m^2/27 MHz) for community reception in the 1977 Plan). Since WRC-97, the nominal transmission in the Regions 1 and 3 Plan corresponds to a 60 cm antenna associated to a pfd of –108 dB(W/m^2/27 MHz). In Region 2, it corresponds to a 1 m antenna associated to a pfd of –107 dB(W/m^2/24 MHz).

From the above, it can be seen that the alternative candidate pfd mask in Figure 1 would protect a range of antenna diameters between 30 cm and 240 cm. This would in fact protect both the nominal characteristics of the Plans and any modifications. If the nominal Plan and its modifications were to be treated separately, there would be a need to split this mask into two masks: one applicable to the protection of the nominal Plan, and one applicable to the protection of the Plan modifications. As can be seen from Figure 3, the mask to protect the nominal Plan could be derived from the candidate mask by a relaxation of 9 dB for the smaller orbital separations (i.e. –137 dB(W/m^2/27 MHz) for θ < 0.69°.

Concerning the additional proposed criterion of a 9° coordination arc, this proposal is in line with the results of the most recent studies carried out in ITU-R, which indicate that identification of affected administrations in the case of S9.7 should be based on a 9° coordination arc in the 10-12 GHz band. For the particular case of the BSS protection, a 9° orbital nominal separation corresponds, taking into account a ±0.05° station-keeping accuracy for both the wanted and interfering space stations, to an off-axis angle of (9-2*0.05)*1.1 = 9.7°. Assuming that the side-lobe characteristics for the BSS receive antenna are compliant with Figure 7*bis* of Annex 5 to Appendix S30, this corresponds to an off-axis earth station discrimination of 31.2 dB. Taking into account the fact that modifications to the Plans or FSS should have lower satellite e.i.r.p. levels that the ones in the new Plan, this value is considered more than adequate to protect the BSS in all situations. In all cases, it is proposed that BR identifies the affected administrations based on the use of this criterion only.

Figure 3- Difference between the pfd required by Annex 6 of Appendix S30 for various antennas and alternative Annex 4 pfd limits



Proposals

Based on the above analysis, the following proposals are made:

a) Limits to protect the nominal characteristics of the Plans

F/37/2

The following pfd limits, defined as a function of the orbital separation θ between the wanted and interfering space stations, are proposed (in conjunction with a 9° coordination arc) to protect the nominal transmissions in the BSS Plan against FSS or non-planned BSS transmit space stations in the bands covered by Appendix S30. They would replace the current limits in Section 3 of Annex 1 of Appendix S30 and in Annex 4 of Appendix S30.

–137 dB(W/m^2/27 MHz) for $\theta < 0.69°$;

–134 + 18.5 log θ dB(W/m^2/27 MHz) for $0.69° \leq \theta < 1.8°$;

–137 + 30 log θ dB(W/m^2/27 MHz) for $1.8 \leq \theta < 9°$;

where θ is the orbital separation in degrees between the wanted and interfering space stations.

NOTE - In EUR/13/200, 217, 218, it is proposed to suppress Article 7 and Annex 4 of Appendix S30, and to move the limits of Annex 4 of Appendix S30 to Appendix S5 (EUR/13/208). If this approach were decided by WRC-2000, the limits proposed above would replace those proposed in EUR/13/208.

b) Limits to protect BSS transmissions other than nominal Plan transmissions in the bands covered by Appendix S30

F/37/3

The following pfd limits, defined as a function of the orbital separation θ between the wanted and interfering space stations, are proposed (in conjunction with a 9° coordination arc) to protect BSS transmissions other than nominal transmissions in the BSS Plan against FSS or non-planned BSS transmit space stations in the bands covered by Appendix S30. They would replace the current limits in Section 3 of Annex 1 of Appendix S30 and in Annex 4 of Appendix S30.

–146 dB(W/m^2/27 MHz) for $\theta < 0.225°$;

–134 + 18.5 log θ dB(W/m^2/27 MHz) for $0.225° \leq \theta < 1.8°$;

–137 + 30 log θ dB(W/m^2/27 MHz) for $1.8 \leq \theta < 9°$;

where θ is the orbital separation in degrees between the wanted and interfering space stations.

3 Criteria to protect the fixed-satellite service

The fixed-satellite service (FSS) is currently protected from a modification to one of the BSS Plans by the application of the procedure of Article 4 of Appendix S30, Sections 4.3.1.5 or 4.3.3.5. Sections 6 and 7 of Annex 1 to Appendix S30 and Section A3 of Annex 7 to Appendix S30 are associated with this procedure.

3.1 Threshold limits in Annex 1 of Appendix S30

The coordination criteria to determine whether an administration is affected by a proposed modification to one of the BSS Plans are contained in Sections 6 and 7 of Annex 1 to Appendix S30.

Section 7 of Annex 1 to Appendix S30 contains a ΔT/T criterion of four per cent, which applies to protect the FSS receive space station from the BSS transmit space station (operation in opposite directions of transmission).

Section 6 of Annex 1 to Appendix S30 contains two criteria applicable in the case of operation in the same direction of transmission:

- a pfd increase of 0.25 dB, applicable to modifications to an existing assignment in the Plan;

- an absolute pfd limit of –138 dB(W/m^2/27 MHz), which is independent from the real characteristics of the FSS network which is the subject of the coordination, in particular, independent from the orbital location of this network. Application of this criterion may lead to the situation where a modification to one of the BSS Plans (in all three Regions) may have to coordinate with an administration having an FSS network 70° away simply because these pfd limits are exceeded on the territory of this administration.

3.2 Discussion

Whilst the above criteria very significantly restrict the possibility of modifying the plans in the three Regions, none of them adequately protects the FSS. For example, the first criterion (0.25 dB increase in pfd) being independent of the orbital separation, the modification of an assignment in the Plan may lead to reduce the orbital separation while keeping the pfd level unchanged, hence possibly increase the interference by several orders of magnitude. The second criterion, which corresponds to a reduction in BSS pfd of 30 dB relative to the edge of service area, falls short of the FSS protection requirement by 8 dB in the case of collocated operation of the FSS and BSS space stations and use of a 2.4 m receive antenna in the FSS, as shown below.

The possibility of using a simple 6% relative noise increase criterion in lieu of pfd limits was investigated, which would have had the advantage of reducing the coordination requirements to what is strictly needed to protect the actual characteristics of the affected FSS network. However, this approach was found to have two major drawbacks: a) it would allow, by submitting especially sensitive carriers, one FSS network to block a large number of BSS Plan modifications; b) it would significantly increase the time required by the Bureau to determine the affected administrations.

Another approach was therefore investigated, by determining the pfd level required to provide a maximum 6% relative noise increase into a range of representative FSS earth station antennas. The total system receive noise temperature has been calculated from the receiver noise temperature, adding 3 dB for all other sources of noise (0.6 dB for uplink noise, 0.4 dB for terrestrial interference, 1 dB for GSO interference, 1 dB for cross polarization isolation and frequency reuse interference).

FSS receive earth station antenna diameter (m)	0.45	0.60	0.80	1.20	3.0	5.0	6.0	8.0
FSS receiver temperature	110	110	125	150	150	200	230	250
Total FSS link receive noise temperature	220	220	250	300	300	400	460	500

Based on these assumptions, and on the use of FSS earth station antenna diagrams compliant with Recommendation ITU-R S.580, Figure 4 shows the pfd mask required for the protection of each of these transmissions to obtain a 6% increase in overall link noise temperature and the envelope of all these masks.

Figure 5 provides a comparison of the above envelope pfd mask with the current Section 6 of Annex 1 pfd limit and with the alternative pfd mask proposed in Section 2 above for the replacement of the Annex 4 pfd mask for the protection of BSS transmissions other than nominal Plan transmissions.

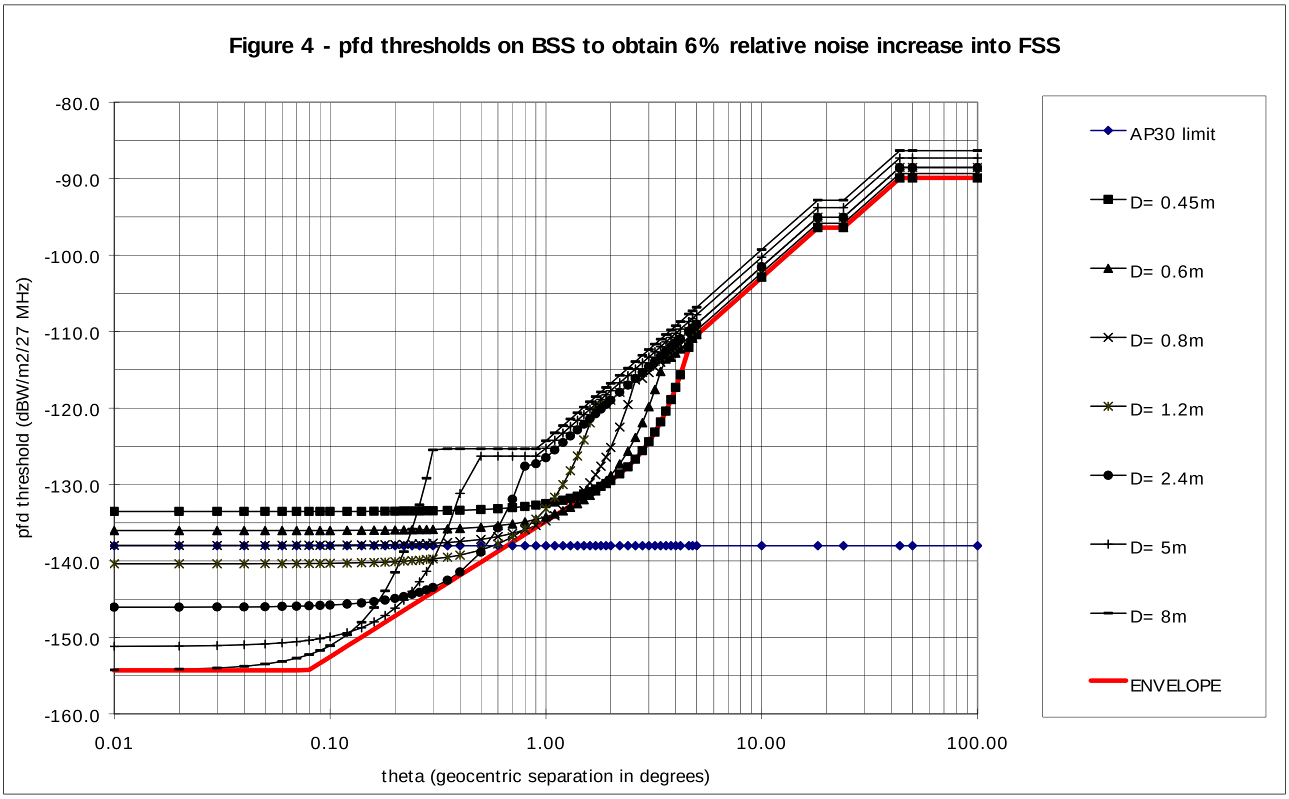


Figure 5- Current Annexes 1 and 4 pfd limits and alternative limits

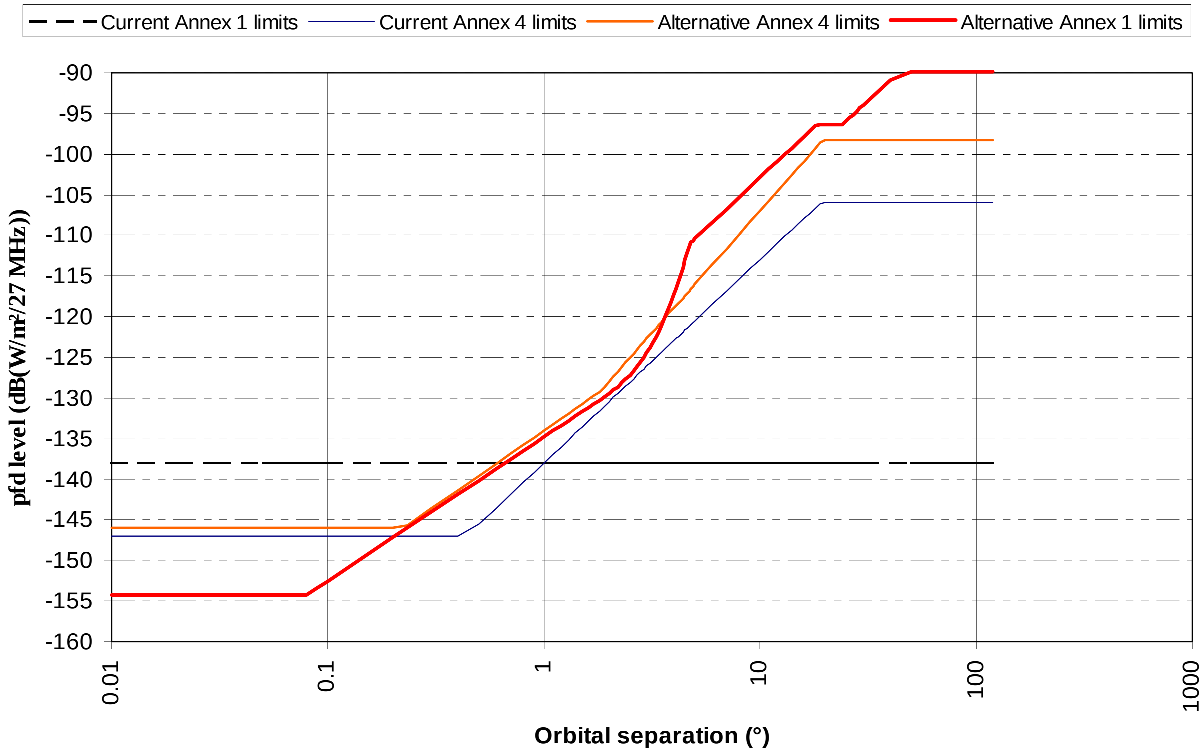

As can be seen from Figure 5, except for very small and very large separations, there is no significant difference between the envelope mask of Figure 4 and the pfd mask proposed in Section 2 above as an alternative to the current Annex 4 mask.

For very large orbital separations, the pfd mask proposed in Section 2 leads to more constraints on the BSS than the envelope mask of Figure 4. For very small orbital separations, it leads to less constraints on the BSS than the envelope mask of Figure 4.

Given that the mask proposed in Section 2 already provides 8 dB better protection for the FSS at smaller orbital separation, it is concluded that an acceptable compromise to improve the protection of FSS compared to the current situation, without undue constraints on BSS, is to adopt, for the protection of FSS, the same pfd mask as the one proposed for the protection of BSS. This would also ensure an equitable access to spectrum/orbit resources to both services in all three Regions.

One important improvement afforded by the proposed pfd mask is that, for large orbital separation, up to 40 dB relaxation is obtained. Adoption of this criterion would therefore allow to avoid the current situation, where modifications to the Plan trigger coordination with virtually all FSS networks. In addition, for very small orbital separations (less than 0.7°), up to 8 dB strengthening of the mask is proposed compared to the current situation, in order to protect FSS earth stations up to 2.4 m in diameter, a lesser protection being offered for large diameters. These new criteria would allow coexistence of both services with very small orbital separations, which is not currently possible in spite of the very stringent orbital position limitations included in Annex 7 of Appendix S30.

3.3 Proposals for the protection of FSS

F/37/4

The following limits are therefore as a replacement to those appearing in Section 6 of Annex 1 to Appendix S30 to protect FSS from modifications of the Appendix S30 Plans, in conjunction with a 9° coordination arc:

-146 dB(W/m^2/27 MHz)	for $\theta < 0.225°$;
$-134+18.5 \log \theta$ dB(W/m^2/27 MHz)	for $0.225° \leq \theta < 1.8°$;
$-137 + 30 \log \theta$ dB(W/m^2/27 MHz)	for $1.8 \leq \theta < 9°$;

where θ is the orbital separation in degrees between the wanted and interfering space stations.

F/37/5

Concerning the case of operation of BSS and FSS in opposite directions of transmission, the current criterion in Section 7 of Annex 1 of Appendix S30, which is associated to paragraph 4.3.3.5 of Article 4 of Appendix S30 to cover the cases where the proposed new BSS space stations may affect receive FSS space stations, could be relaxed from a $\Delta T/T$ of 4% to 6%, which is in line with the standard protection requirement for the FSS.

3.4 Limits in Annex 7 of Appendix S30

The limits included in Annex 7 are hard limits, in the sense that if they are not met, the proposed modification to the Plan is rejected by BR. Two types of limits apply in this Annex:

– BSS satellite orbital limitations. For example, in the orbital arc 37° W-10° E, the only positions that can be used are those within 1° to the East of the nominal orbital locations in the Plan.

– BSS satellite e.i.r.p reduction. In the case of the above example, the use of an orbital location different from one of the nominal locations of the Plan leads to the obligation of an 8 dB e.i.r.p. reduction. Taking the Regions 1 and 3 Plan standard satellite e.i.r.p. as a reference, this 8 dB reduction corresponds to a pfd level of –108 –8 dB = –116 dB(W/m^2/27 MHz). Taking the minimum mandatory energy dispersal of 600 kHz, this corresponds to a maximum pfd per 4 kHz allowed of:

$$-116 - 10 \log(600/4) = -138 \text{ dB(W/m}^2\text{/4 kHz)}$$

which is exactly the pfd limit proposed for the protection of terrestrial services (see Section 1).

It would therefore appear that the satellite e.i.r.p. limitations currently included in Annex 7 of Appendix S30 could be met (in the analogue case) by the application of the proposals contained in Section 1.

Concerning the orbital position limitations, it appears that these limitations have been included in the Radio Regulations in order to enable equitable access between the FSS and the BSS, noting that the BSS already has access to a significant portion of the orbit/spectrum resources as a result of the assignments included in the Plans by the Conference. These limitations were therefore intended to maintain a global balance between the FSS use (through Article 7 of Appendix S30) and the BSS use (original Plan + modifications to the Plans through Article 4 of Appendix S30).

Attachment 2 provides a summary of the current use of the orbit/spectrum resources common to Regions 1 and 2 (in the band 11.7-12.2 GHz) and to Regions 1 and 3 (in the band 12.2-12.5 GHz).

It shows that the currently planned use by the BSS Plan and its proposed additions is comparable if not lower to the currently planned use of these resources by the FSS.

It is therefore concluded that, if suitable updated criteria such as those proposed in Sections 1, 2 and 3.3 above were applied, the balance achieved through the application of these criteria may not require maintaining the current limitations in Section A3 of Annex 7 of Appendix S30.

It is also concluded that the application of the current criteria in Appendix S30 may have resulted in BSS in Regions 1 and 3 and FSS in Regions 2 and 3 mutually preventing each other to access resources as a result of too stringent, yet inadequate, criteria. The criteria proposed in this document are expected to contribute to a more satisfactory development of the services in this band.

Proposal

F/37/6

It is proposed to suppress Section A3 of Annex 7 to Appendix S30 and to have no additional limitations in this Annex**.**

4 Example of coexistence of BSS, FSS and terrestrial systems using the proposed criteria

In the following example, an analysis is provided of the interference situation between a BSS and an FSS system located with 1° separation on the orbital arc between 47° W and 20° E (10° margin around the current Annex 7 arc between Regions 1 and 2).

4.1 Minimum angular discrimination between Regions 1 and 2

A key element in determining the level of constraints imposed by the sharing requirements between FSS in Region 2 and BSS in Region 1 is the minimum angular discrimination that can be provided in the direction of one Region by a space station serving the other Region.

In the orbital arc of interest (47° W to 20° E), the minimum angle seen from the GSO between the two Regions is 3.2°. Taking into account the pointing accuracy currently achieved by satellites of ±0.15°, this leads to a minimum requirement of 2.9° in angular distance between the two Regions.

Based on Recommendation ITU-R S.672-4, and the use of 3° wide FSS coverage area, FSS spacecraft antennas can provide a discrimination of 22 dB between the edge of FSS coverage area and a direction separated from this coverage area by 2.9°. Concerning BSS spacecraft antennas, and also based on the use of 3° wide BSS coverage areas, the use of fast roll-off antennas, in line with Figure 11B of Appendix S30, allows the provision of 29 dB discrimination between the edge of the BSS coverage area and a direction separated from this coverage area by 2.9°. Attachment 3 provides the references for the derivation of these numbers.

These values have been taken as the basis for the following analysis.

4.2 Protection of a BSS planned and non-planned use

Assuming a new FSS system is planned, it will have to protect the BSS Plan and its modifications previously received by the Bureau in the bands subject to Appendix S30.

In line with the proposal made in Section 2, a BSS system located 1° away from the planned FSS system (0.9° taking into account station keeping accuracy) would tolerate a maximum pfd from the FSS system of –135.6 dB(W/m^2/27 MHz). This corresponds to a satellite e.i.r.p. density of –135.6 + 162.7 = 27.1 dB(W/27 MHz). Taking into account the 22 dB achievable interregional discrimination, this corresponds to a maximum satellite of 49.1 dBW e.i.r.p. at the edge of the FSS service area, or 52.1 dBW boresight e.i.r.p. This is in line with most of the FSS transmissions currently planned. Using a somewhat larger satellite antenna (e.g. 2 m) would allow another 5 dB improvement if required (L_s = –30 dB) in order to protect the BSS system while implementing a 57.1 dBW maximum e.i.r.p in the FSS, or 54.1 dBW at the edge of the FSS service area.

4.3 Protection of an FSS system

The FSS system located 1° away from a BSS system would have to accept interference from this BSS system if the latter has been communicated to the Bureau previously.

In line with the proposal made in Section 3.1, an FSS system located 1° away from the BSS system (0.9° taking into account station keeping accuracy) would tolerate a maximum BSS interfering pfd of –135.6 dB(W/m^2/27 MHz). Taking into account the 29 dB achievable interregional discrimination, this corresponds to a maximum BSS satellite pfd at the edge of the BSS service area of –106.6 dB(W/m^2/27 MHz). This allows BSS satellite e.i.r.p. levels of 56.1 dBW at edge of coverage, which is in line with the maximum level currently appearing in Regions 1 and 3 Plan.

In the case where the interference comes from an assignment in the original Plan, it would correspond to a 56 dBW BSS edge of coverage e.i.r.p. Although the assignments in the original Plan do not use fast roll-off antennas, they correspond, in the worst cases involving Region 1-Region 2 separation, to half-power beamwidth of about or less than 1°. In this case, this would correspond to values of the ratio φ/φo of 7 or greater. As can be seen in Attachment 3, this would lead to a minimum 35 dB off-coverage geographic discrimination, which is 6 dB higher that the one assumed above.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Italy

PROPOSALS FOR THE WORK OF THE CONFERENCE

PROPOSAL FOR THE DELETION OF ITALY IN RADIO REGULATIONS NOS. S5.112, S5.114 AND S5.117 IN ACCORDANCE WITH WRC-2000 AGENDA ITEM 1.1

Agenda item 1.1 - requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

1 Introduction

WRC-2000 agenda item 1.1 requests administrations to review the footnotes to the Table of Frequency Allocations with the view to delete their country footnotes or to have their country name deleted from footnotes, if no longer required.

2 Background

On request of a group of countries, WARC-79 adopted some “Alternative Allocations” footnotes in order to permit the planning of the mobile maritime service in Region 1 in the MF band. With these footnotes, a primary allocation to the mobile maritime service and an allocation on a permitted basis to the fixed and land mobile services were established, in the concerned bands.

3 Proposal

Taking into account that the subsequent competent Regional Administrative Radio Conference of 1985 established an assignment plan for the mobile maritime service up to 2 160 kHz and the status of permitted service no longer exists, the Italian Administration proposes the deletion of its name in footnotes Nos. S5.112, S5.114 and S5.117 (see Annex).

Annex: 1

ANNEX

MOD I/38/1

S5.112 *Alternative allocation:* in Bosnia and Herzegovina, Cyprus, Denmark, France, Greece, Iceland,~~ Italy,~~ Malta, Norway, Sri Lanka, Turkey and Yugoslavia, the band 2 194-2 300 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

MOD I/38/2

S5.114 *Alternative allocation:* in Bosnia and Herzegovina, Cyprus, Denmark, France, Greece, Iraq,~~ Italy,~~ Malta, Norway, Turkey and Yugoslavia, the band 2 502-2 625 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

MOD I/38/3

S5.117 *Alternative allocation:* in Bosnia and Herzegovina, Cyprus, Côte d'Ivoire, Denmark, Egypt, France, Greece, Iceland,~~ Italy,~~ Liberia, Malta, Norway, Sri Lanka, Togo, Turkey and Yugoslavia, the band 3 155-3 200 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

PLENARY MEETING

Note by the Secretary-General

REPORT OF THE RADIOCOMMUNICATION BUREAU
ON THE IMPLEMENTATION OF RESOLUTION 53 (WRC-97)

Attached is the report of the Director of the Radiocommunication Bureau which was prepared in response to Resolution 53 (WRC-97) for consideration and subsequent action by the Conference.

Yoshio UTSUMI
Secretary-General

Attachment: Report of the Radiocommunication Bureau to WRC-2000 on the implementation of Resolution 53 (WRC-97), Updating of the "Remarks" columns in the Tables of Article 9A of Appendix S30A and Article 11 of Appendix S30 to the Radio Regulations

Director, Radiocomunication Bureau

REPORT OF THE RADIOCOMMUNICATION BUREAU TO WRC-2000 ON THE IMPLEMENTATION OF RESOLUTION 53 (WRC-97), UPDATING OF THE "REMARKS" COLUMNS IN THE TABLES OF ARTICLE 9A OF APPENDIX S30A AND ARTICLE 11 OF APPENDIX S30 TO THE RADIO REGULATIONS

1 WRC-97, in revising the BSS and feeder-link Plans for Regions 1 and 3, adopted new texts relating to the symbols in the "Remarks" columns of Article 9A of Appendix S30A and Article 11 of Appendix S30 to the Radio Regulations. It also adopted new entries in the "Remarks" columns of the above-mentioned Articles, on the understanding that, based on the report of the Bureau, the lists of identified administrations will be reviewed and revised, as appropriate, by WRC-2000.

2 During WRC-97, studies of compatibility between the revised Regions 1 and 3 broadcasting-satellite service (downlink and feeder-link) Plans, and other services having allocations in the planned bands in all three Regions, with equal rights and between the revised Regions 1 and 3 Plans and the Region 2 Plans, were performed using data which had been received and processed by the Radiocommunication Bureau at the time of the Conference under relevant provisions of the Radio Regulations.

3 It was not possible, however, during the Conference, to analyse fully the effect of all assignments which were received before 27 October 1997 but which had not been processed at that time. It was therefore decided that, in order to analyse fully the effect of assignments that have not been processed, it was necessary that the Bureau process the assignments for other services which were received prior to WRC-97.

4 The Bureau was therefore instructed to complete the required analyses based on the new Notes 3 to 7 in Section 9A.2 of Article 9A of Appendix S30A and Notes 5 to 7 in Section 11.2 of Article 11 of Appendix S30 added during the Conference.

5 The Bureau was also instructed to publish the results of its revised compatibility calculations after WRC-97, together with a modified "Remarks" column of Article 9A of Appendix S30A and Article 11 of Appendix S30, in the form of a Circular Letter. Within a period of 60 days from the date of that Circular Letter, administrations concerned were to decide whether or not they wish to continue appearing as "affected administrations" in the relevant Table of the above-mentioned Articles. If no reply was received from administrations within that period, it would be taken that there was no need to make any change.

6 Some software packages which were used before and during WRC-97 were enhanced after the Conference to provide better precision in the compatibility analysis. In some cases, the list of affected administrations was also revised due to the increase of precision in the compatibility analysis.

7 As mentioned in paragraph 5 above and in accordance with *resolves* 2 of Resolution 53 (WRC-97), the results of the revised compatibility calculations, together with a modified "Remarks" column of Article 9A of Appendix S30A and Article 11 of Appendix S30 were included in the annexes to Circular Letter CR/135 which was sent to all administrations on 7 January 2000. The contents of these annexes, which are reproduced in this document, are summarized as follows:

- Annex 1 contains an extract of Article 11 of Appendix S30 including the entirely revised Tables 2 and 3 together with a list of Plan assignments for which the “Remarks” column was modified.
- Annex 2 contains an extract of Article 9A of Appendix S30A including the entirely revised Tables 1A and 1B together with a list of Plan assignments for which the “Remarks” column was modified.

In accordance with *resolves* 3 of Resolution 53 (WRC-97), the concerned administrations were requested to examine their respective situation in the relevant Tables within a period of 60 days from the date of that Circular Letter.

8 The Bureau has received comments from four administrations (D, FIN, J and MLA) within the 60 days time limit specified in the Resolution to the above-mentioned Circular Letter, as follows:

The Administration of the Federal Republic of Germany agreed with the updating of the “Remarks” columns in the Tables of Article 9A of Appendix S30A and Article 11 of Appendix S30 to the Radio Regulations.

The Administration of Finland stated that "all occurrences of FIN can be removed from Table 2 of Annex 1 to Circular Letter CR/135".

The Administrations of Japan and Malaysia indicated to the Bureau that they wish to continue appearing as affected or affecting administrations, according to the case, in the relevant Tables of Article 9A of Appendix S30A and Article 11 of Appendix S30 to the Radio Regulations, i.e. retention of the results of the provisional analysis in lieu of those of the revised compatibility calculations published in CR/135 which represent the complete, updated and definitive (with increased precision) results.

The Bureau replied to the Administrations of Japan and Malaysia that their request was not in line with the objectives of *resolves* 3 of Resolution 53 (WRC-97).

This report is therefore submitted to WRC-2000 for its consideration and subsequent action taking into account the information contained in the annexes to this document.

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Document 40-E
23 March 2000
Original: English

PLENARY MEETING

Note by the Secretary-General

WORLD RADIOCOMMUNICATION CONFERENCE PROCESS

Attached is a report by the Director of the Radiocommunication Bureau pursuant to Resolution 80 (Minneapolis, 1998).

The Conference is invited to consider the issues covered in the attached report.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

Director, Radiocommunication Bureau

WORLD RADIOCOMMUNICATION CONFERENCE PROCESS

Resolution 80 (Minneapolis, 1998)

1 Resolution 80 (Minneapolis, 1998) covered issues relating to the World Radiocommunication Conference process and included *resolves* in respect of methods for preparation and planning, support for regional harmonization of common proposals (with reference to Resolution 72 (WRC-97)) and encouragement for both formal and informal collaboration in the interval between conferences. Comments on these aspects are included in the Report of the Director on activities of the Bureau (Document 41).

2 Resolution 80, also included an instruction to the Director of the Radiocommunication Bureau "to study, with advice from the Radiocommunication Advisory Group, ways of improving the preparations for, and the structure and organization of, world radiocommunication conferences, for consideration by the conference".

3 Pursuant to the above *instructs the Director of the Radiocommunication Bureau*, the issues have been considered by the Radiocommunication Advisory Group at its seventh and eighth meetings (22-26 February 1999 and 17-20 January 2000 respectively). The following comments incorporate the advice from RAG.

4 Agenda setting

4.1 Recent WRCs have had extensive agendas which, in view of the time available, has meant that resources have been stretched both during preparations and at the conference. As a consequence, it has not been possible to reach clear conclusions on some agenda items and they have had to be referred to the next WRC, thereby compounding the problem. Although the decision of PP-98 to allow some increase in the interval between WRCs might help, every effort should be made to exert discipline on the preparation of draft agendas, concentrating on priority items and those for which adequate preparations can be assured.

4.2 Although it may not be possible to identify in advance of the next WRC which agenda items will be particularly complex, consideration should be given to estimating the extent of preparatory work associated with each item, the appropriate forum for conducting that work, and the amount of effort that might be needed at WRC. This would help to identify whether the draft agenda is realistic given the resources likely to be available at the next WRC. It would also help to deal with items that would only be included if Council committed additional resources to the WRC.

4.3 The requirement to identify and take into account the financial implications of potential decisions under each agenda item should be respected.

4.4 At recent conferences, the draft agenda of the future conference has been finalized very late in the conference by a Working Group of the Plenary. Although it will still be necessary to bring together all of the proposals in one group, more emphasis should be placed on the role of committees in identifying agenda items and their urgency, preferably as early in the conference as possible. This would also somewhat alleviate the problems encountered in convening the Working Group of the Plenary in parallel with conference committees, which has made it difficult for all administrations to participate. Nevertheless, every effort should be made to avoid parallel sessions of the group responsible for producing the draft agenda and the main committees.

4.5 The requirements of developing countries and LDCs in particular may not be given sufficient weight in the current process. Consideration should be given to the means by which these requirements could be identified and incorporated into conference agendas.

4.6 It has been argued that limited-agenda (or specialized or single-service) conferences could be more efficient. On the other hand, it might be necessary to convene such conferences in addition to the "regular" conferences, with the associated budgetary and scheduling implications. It is not possible to draw general conclusions on the desirability of convening specialized WRCs. Each conference should consider the relative merits in the light of the issues to be addressed.

4.7 In developing draft WRC agendas, the main emphasis should be on issues leading to treaty text.

5 Financial implications

5.1 Decisions of WRCs often have substantial budgetary implications. It should be noted that No. 489 of Article 34 of the Convention states that “No decision of a conference shall be put into effect if it will result in a direct or indirect increase in expenses beyond the credits that the Council is empowered to authorize.”

5.2 Accordingly, it is proposed that an ongoing mechanism be established in the proceedings of WRCs which clearly links the work of the Budget Control Committee with the Working Group of the Plenary responsible for undertaking agenda-setting activities. Furthermore, it is proposed that representatives of BR and the Finance Department closely track the work of the two groups in order to provide a conference with accurate estimates of the resource implications of WRC decisions. It is further proposed that an amendment to the terms of reference of future budget control committees be made to clearly reflect this approach. As a final point, this would imply that recommended agendas for future conferences would need to identify items that can proceed within budgetary credits and those that could proceed only if additional credits be made available.

6 ITU preparations

6.1 The current arrangements with regards to the convening of the two CPM meetings should be retained for the time being, although the eighth RAG meeting supported a review being initiated of the CPM process. RAG is currently undertaking such a review by means of a correspondence group and conclusions will be considered at the next RAG meeting early in 2001.

6.2 With regard to the allocation and handling of preparatory work, the seventh meeting of RAG reconfirmed the conclusion of the Special Meeting of RAG in September 1997 (see Administrative Circular CA/45). It concluded specifically that, for each issue, a single group (which could be a study group, task group or working party, etc.) should be identified to take responsibility for the preparatory work, inviting input and/or participation from other groups as necessary, and that, as far as possible, existing groups should be used for the above purpose; new groups being established only where this is considered to be necessary.

6.3 Early indications of the likely structure of the next WRC is of considerable assistance in the organization of the preparatory work, in ITU, in regional organizations, and within countries. It also helps in the consultations on chairmanships. Early identification of possible committee and working group chairpersons enables them to prepare more thoroughly. Notwithstanding the responsibilities of the Secretary-General, every effort should be made to reach an informal consensus on conference structure and possible chairpersonships, using RAG, meetings of informal groups, etc., while recognizing that the final decision on these issues rests with WRC itself.

6.4 The informal discussions on WRC preparations are considered to be playing an important role and should be continued, with practical support and advice from the BR and BDT.

7 Regional preparations

7.1 Coordination at the regional level provides a good opportunity to explain issues, exchange views, identify the key issues, and ideally to resolve conflicts. Such coordination can therefore help to ease the pressure on WRC itself. Regional coordination should be continued and strengthened where possible. Where adequate arrangements do not exist for regional coordination in preparation for WRCs, BR should encourage the development of such arrangements and facilitate the convening of regional meetings. The value of the participation of Sector Members in regional coordination meetings is recognized.

7.2 BR staff should participate in such meetings, subject to the availability of resources, to provide information and to assist the ITU Secretariat with conference preparations.

7.3 Coordination between regional organizations should be encouraged. Subject to the availability of resources, BR should facilitate the convening of interregional meetings. Organizers of regional meetings should be encouraged to allow participation by other regional organizations or their representatives. The timetable of regional and interregional meetings should be more widely publicized, if possible using ITU facilities (e.g. website).

7.4 It should be recognized that not all ITU Member States are included in the membership of regional organizations.

8 Working practices during WRCs

8.1 Means of reducing operating costs (such as printing, translation and interpretation) should be explored while maintaining the necessary quality of these activities and fulfilling the obligations of the conference.

8.2 All official meetings should, as far as possible, take place during normal working hours. This would leave room for informal discussions and conflict resolution.

8.3 Chairpersons should exercise the powers available to them under the Rules of Procedure to limit the time to be made available for each discussion, the length and number of interventions, etc.

8.4 The introduction of each proposal should be kept brief, and carried out once only, in the appropriate committee, working group, etc.

8.5 Information documents should not be introduced orally.

PLENARY MEETING

Director, Radiocommunication Bureau

REPORT OF THE DIRECTOR ON THE ACTIVITIES OF THE RADIOCOMMUNICATION SECTOR

1 On page 18 (English version), please replace in the fourth paragraph "(Annex BBB)" by "(Annex 2)".

2 Add Annex 2 as attached.

Annex: 1

ANNEX 2

Rules concerning Article S13 of the RR

In reviewing Sections III and IV of Article **S13**, the Radio Regulations Board noted that modifications were introduced by WRC-97 particularly in relation to the process of considering proposed changes or additions to Rules of Procedure and the opportunity available to administrations to comment on such proposals.

Nos. **S13.14** and **S13.15** in Section III establish procedures for changes to the Rules of Procedure and a sequence for Board consideration, publication, comment by administrations and possible further review or special study. On the other hand, No. **S13.17** in Section IV also refers to preparation of draft modifications or additions to Rules of Procedure.

The Board has concluded that there is a lack of clarity in the procedures to be followed for modifications or additions to Rules of Procedure. It also had regard to the desirability for transparency in considering such proposed modifications or additions.

Accordingly, the Board decided that, until the matter may be considered by WRC-2000, the following procedures should be followed with respect to the application of Nos. **S13.14**, **S13.15** and **S13.17**:

a) Proposals for changes or additions to the Rules of Procedure can emerge from administrations, from the Radiocommunication Bureau, or from the Board itself. Irrespective of the source of proposals, the Board regards No. **S13.17** as requiring that the Bureau should prepare draft modifications or additions to the Rules of Procedure arising from such proposals. In the interests of transparency, the Board considers that such drafts should then be made available for a period of at least four weeks for comment by administrations.

b) The Bureau, in accordance with No. **S13.14**, shall submit to the Board the final drafts of all proposed changes to the Rules of Procedure, as well as the comments received in response to the procedure in § *a)* above.

c) Any need pursuant to No. **S13.15**, for a special study in relation to the Rules of Procedure submitted by an administration or identified by the Board or the Bureau, or the need for any new Rules or modification or addition to the existing Rules of Procedure shall be handled in accordance with the procedure in § *a)* and *b)* above.

PART C

Rules concerning working methods of the Radio Regulations Board

Introduction

These working methods are intended to complement basic provisions which have been included in Article 14 of the Constitution and Article 10 of the Convention, in accordance with the provisions of No. 147 of the Convention (Geneva, 1992), and in accordance with the pertinent provisions of the Radio Regulations (e.g. Articles **S7**, **S13**, **S14**).

1 Board meetings

1.1 Notwithstanding the possibility for the members of the RRB to consult each other as and when required between meetings, by also using modern means of communication, a meeting of the Board will be held approximately every three months. On the basis of a provisional annual meeting plan, the specific date for and duration of the next meeting will be decided at the end of each Board meeting, taking into consideration the foreseeable workload. Any subsequent change of date will only be made with the agreement of all the members.

1.2 An appropriate convening notice for the next meeting shall be prepared by the Executive Secretary of the Board, before the closure of each meeting.

1.3 A specific draft agenda shall be proposed to the members of the RRB by the Executive Secretary, after consultation with the Chairperson, at least three weeks before the next meeting. The draft agenda should include, *inter alia*, the following, as required:

a) approval of the minutes of the previous Board meeting, if not already approved by correspondence;

b) consideration of the Director's report;

c) approval of the new or revised Rules of Procedure (CS95) together with any comments from administrations, if available;

d) consideration of Review of Findings which cannot be resolved by the use of the Rules of Procedure (CV171);

e) consideration of Reports on Harmful Interference (CV140, CV173);

f) consideration of any other matters which cannot be resolved through the application of the Rules of Procedure (CS96);

g) matters which should be referred to the Radiocommunication Conference (CS95, Resolution 1);

h) any item requested by any member of the Board;

i) any item requested by the Director of the Radiocommunication Bureau;

j) miscellaneous (CS97, etc.);

k) approval of the Summary of Decisions.

1.4 Input documentation listed on the draft agenda should be distributed to the members at the latest two weeks before the meeting. Should exceptional circumstances not allow documents to be provided in all required language versions in a timely manner, the original language version shall be made available. Any such documentation becoming available later shall be discussed only if the matter is considered urgent and if all members of the RRB so agree.

1.5 Meeting attendance will be as follows:

– Members

– Executive Secretary/Director of the Radiocommunication Bureau

– Secretary

– Minute writer(s)

– Any staff of the Union, on case-by-case basis, as necessary.

The Director of the Radiocommunication Bureau may be accompanied by any necessary staff of the Bureau on a case-by-case basis.

1.6 The minutes should clearly indicate whether a decision was unanimous or by majority. Minutes should be approved as soon as possible after the meeting of the Board and at the next meeting, at the latest.

1.7 A summary of decisions shall be prepared by the Executive Secretary in a tabular form (subject, decision, follow-up) and approved by the Board at the end of each meeting.

2 Maintenance of the Rules of Procedure

The provisions of Section III and Section IV of Article **S13** of the Radio Regulations will be applied.

3 Review of Findings

The procedure for the review of a Finding or any other decision of the Bureau, as outlined in Article **S14** of the Radio Regulations will be applied.

4 Recommendations on interference

4.1 When an administration has requested the Bureau to investigate the resolution of a case of harmful interference in accordance with CV173, and the case cannot be resolved following the established procedures, a report shall be submitted to the Board at the request of an administration involved, which includes the following:

a) Brief explanation of the case which will include the degree of reported interference, history of the reported interference and the status of notification of the concerned assignments.

b) The statements by the administrations concerned which clarify the views of those administrations.

c) Draft recommendation to those administrations.

4.2 The Board will decide on the appropriate action.

____

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 41-E
14 April 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Director, Radiocommunication Bureau

REPORT OF THE DIRECTOR ON THE ACTIVITIES OF THE RADIOCOMMUNICATION SECTOR

1 Introduction

1.1 General

This report on the activities of the Radiocommunication Sector since the last World Radiocommunication Conference is submitted pursuant to the provisions of CV180 and item 9.1 of the agenda of WRC-2000. It is based largely on reports submitted previously to Council and to the Radiocommunication Assembly.

a) The Radiocommunication Bureau continued to support all Sector activities. The Bureau provided services to administrations and users in application of the Radio Regulations, including the coordination and registration of radio-frequency assignments and satellite orbits. It allocated international identification series and provided maritime mobile information services. It conducted seminars and training sessions for international spectrum management requirements, in close cooperation with the Bureau for Telecommunication Development. The Bureau provided, on behalf of the Radiocommunication Sector, liaison, coordination and assistance to the Telecommunication Development and Telecommunication Standardization Sectors and supported the Radio Regulations Board (RRB).

b) The Radiocommunication Bureau developed operational plans for the Bureau for 1998, for 1999, and for 2000, which were presented to the Radiocommunication Advisory Group. Such plans represent an important tool in attempting to reconcile the growing Radiocommunication Sector workload and the resources available.

c) The Radio Regulations Board provided, through its approved Rules of Procedure, important directives for the application of the Radio Regulations. An important element in the management of the Radiocommunication Sector was the advice from the Radiocommunication Advisory Group.

d) Three main activities characterized the work in the Radiocommunication Bureau: the processing of notifications for space and terrestrial radiocommunication services; the support for the work of the ITU-R Study Groups and the preparatory work for radiocommunication conferences.

1.2 Implementation of Council Resolution 1121

The report of the WRC-97 Budget Control Committee gave a preliminary estimate of the workload and consequential financial implications of tasks assigned by WRC-97 to the Radiocommunication Bureau in addition to its regular work. This evaluation indicated an overall cost of about 10.7 million Swiss francs. These estimates did not include additional work for the ITU-R Study Groups, which had to increase their number of meetings in relation to the above-mentioned additional activities.

Taking into consideration that a significant part of these costs could be absorbed by the existing BR budget, the 1998 session of Council adopted Resolution 1121, thus increasing the budget of the Radiocommunication Bureau by 5.01 million Swiss francs.

The overall cost of WRC-97 post-conference work was established on the basis of 17 activities (see Council Document C98/8(Rev.1)). Among these activities, five IRG and four GTE meetings could be held during the same period (see 12.3 of the present report).

Seventy-four per cent of the 5.01 million has been spent to implement these activities, including the cost of equipment, furniture and premises. The 26 per cent savings are mainly due to recruitment delays and the human resources redeployment policy carried out in the Radiocommunication Bureau in 1998 and 1999. Details on these expenditures are given in **Annex 1**. These savings were reallocated to other ITU projects at the end of 1999.

2 Space services

In the period since WRC-97 there has been a continuing increase in the numbers of filings received by the Radiocommunication Bureau for advance publication, requests for coordination and notification. In respect of coordination requests in particular there has been a progressive increase in filings received and, as a consequence, an increase in the backlog of work in the Bureau. Whilst there has not been a similar growth in receipt of requests for notification of assignments in the MIFR, there has been little opportunity to reduce the backlogs in the processing of such requests. Additional tasks arising from WRC-97 required a diversion of resources from processing notifications to other higher priority tasks, in particular the work flowing from implementation of Resolutions 532 and 533 (WRC-97). For example, the extensive analysis required by Resolution 533 meant that, during a period of 23 months, the Bureau was unable to process any new submissions for modification or notification in application of Articles 4 and 5 of Appendices S30 and S30A respectively.

The increasing workload continues to have a serious effect on the capacity of the Bureau to handle the filings in a timely manner and the backlogs of work in various categories have reached quite unacceptable proportions. Details of activities and the extent of backlogs are noted in the specific categories covered below.

2.1 Advance publication of information pertaining to satellite networks

Immediately following WRC-97 the Bureau had a backlog of 850 filings with a treatment delay of approximately 40 weeks between receipt of the API and publication; well beyond the 12 weeks envisaged in No. S9.2B. The data requirements for API were revised and simplified by WRC-97 and the Bureau subsequently rearranged internal functions and applied more resources to enable this backlog to be reduced. As at the end of 1999 there were 220 cases awaiting publication with an average treatment delay of six weeks.

Whilst the backlog in treatment is now within the limit of three months in S9.2B, the Bureau's observation is that the API stage of processing seems to provide little, if any, benefit to administrations in the overall process of satellite coordination. In addition to the workload involved in API processing, the Bureau notes that administrations send copies to the Bureau of approximately 600 pieces of correspondence monthly flowing from the API process. No action is required, nor taken, by the Bureau on this correspondence. Modification or suppression of the API part of the overall coordination and notification process would seem to be one avenue to reduce the work of the Bureau without disadvantage to administrations.

2.2 Coordination requests pertaining to satellite networks

The processing of requests for coordination (Article S9) is the most important step in the overall processing of new or modified satellite network systems to the point of notification for entry into the Master Register.

Backlogs in processing such filings through the Space Services Department have been, and remain, unacceptable. Full details of requests for coordination in the two-year period to end December 1999 are shown in **Table 1**. Almost 1 400 systems were awaiting publication as at 31 December 1999. This represents close to three years delay based on an average processing volume of 40 per month. This current situation compares with a backlog of approximately 700 systems on hand as at January 1998 with an average processing delay at that time of 83 weeks. This current situation is unacceptable in the context of the more rapid development of new satellite systems. The Bureau has streamlined its internal processing and improved the software capabilities, but current rates of processing remain below the current level of receipt of new requests for coordination. More details of problems and possible remedial steps are included in this report in respect of the implementation of Decision 483 (Council 1999).

TABLE 1

Coordination requests pertaining to satellite networks

Month	Received during month	Published	Number of pages	Earliest date of receipt	Backlog	Treatment delay (weeks)
Jan 98	32	20	X	**28/5/96**	**711**	**83**

Dec 99	99	12	1 832	**13/3/98**	**1 352**	**90**

2.3 Due diligence

Following the adoption of Resolution 49 (WRC-97) the Bureau established appropriate mechanisms, forms and software to implement administrative due diligence. A separate report has been submitted to the Conference (Document WRC2000/32).

2.4 Notification for recording in the Master Register

Processes for notification of space network systems follow procedures in Article S11 as a third stage of the overall satellite network processing framework. There is a backlog of work in this respect also. As at January 1998 the Bureau held 237 notification requests pertaining to the space segment of satellite networks. This represented a processing delay of around 130 weeks from the date of receipt of the request. As at the end of 1999 there were 204 systems awaiting treatment, a backlog of 146 weeks. Similarly there were 350 requests pertaining to earth stations on hand at 1 January 1998 and this was reduced to around 260 by December 1999, which represents a processing delay of 140 weeks.

2.5 Modifications to frequency assignment Plans and conversion of allotment Plan

As of November 1999, the Bureau resumed its activities relating to the technical examination of the requests for modification submitted under Article 4 with the earliest date of receipt of 18 March 1996 as noted in the separate report on Resolution 533 (WRC-97) (Document WRC2000/17). The Bureau suspended normal processing under Article 4 to complete the review required by Resolution 533.

Based on the new criteria adopted at WRC-97 and available tools the Bureau performed the regulatory and technical examinations and published the results in Part A of APS30 and APS30A Special Sections relating to the modifications to the Appendices S30 and S30A Plans submitted by administrations under Article 4 of those Appendices. A total of 38 Special Sections for feeder links were published during the five months from November 1999 to April 2000.

The Bureau will continue to perform the regulatory and technical examinations and publish the remaining cases of the modifications to the Appendices S30 and S30A Plans (109 for downlink and 114 for uplink) in Special Sections. The earliest date of receipt of the network to be published in April 2000 was 2 September 1996 and is expected to be 12 October 1998 at the end of 2000.

2.6 Modifications to frequency assignment Plans (Appendix S30B)

Examination of the notices concerning the FSS Allotment Plan submitted by administrations in application of Article 6 of Appendix 30B continued and the results were conveyed to administrations through Special Sections and Circular and Multi-address Telegrams, as appropriate. In total, 16 systems were processed.

2.7 Resolution 533 (WRC-97) - Implementation of the decisions of WRC-97 relating to Appendices S30 and S30A

The Bureau informed all ITU administrations in its Circular Letter CR/91 of 6 March 1998 that pursuant to the adoption of the revised Plan for the Broadcasting-Satellite Service and the associated feeder link for Regions 1 and 3 by WRC-97, as contained in Appendices S30 and S30A and in accordance with Resolution 533 (WRC-97), the Radiocommunication Bureau was instructed to review the requirements for coordination of the satellite networks submitted under Article 4 of the above-mentioned Appendices including those which were already published in the Special Sections annexed to the Bureau Weekly Circulars since the establishment of the initial Plans at WARCSAT-77 and WARC Orb-88.

According to this Resolution, the Bureau was instructed to apply in its examination of Article 4 submissions of Regions 1 and 3, the new technical planning criteria and reference situation of the revised Plan for Regions 1 and 3, derived, in particular, from the application of the protection ratios used for Equivalent Protection Margin (EPM) analyses at WRC-97 as defined in Annexes 5 and 3 to Appendices S30 and S30A respectively (protection ratios contained in Recommendation ITU-R BO.1297) instead of protection ratios applied at WARCSAT-77 and WARC Orb-88.

The implementation of Resolution 533 (WRC-97) insofar as the revision of the Special Sections related to Broadcasting-Satellite Service (Downlink and Feeder-Link Plans) was concerned, was completed at the end of October 1999. A full report on the outcome is in Document WRC2000/17.

2.8 Resolution 53 (WRC-97) - Updating of the remarks columns of the BSS Plan

WRC-97, in revising the BSS and Feeder-Link Plans for Regions 1 and 3, adopted new texts relating to the symbols in the “Remarks” columns of Article 9A of Appendix S30A and Article 11 of Appendix S30 to the Radio Regulations. It also adopted new entries in the “remarks” columns of the above-mentioned Articles, on the understanding that, based on the report of the Bureau, the lists of identified administrations will be reviewed and revised, as appropriate, by WRC-2000.

It was not possible, however, during WRC-97, to analyse fully the effect of all assignments which were received before 27 October 1997 but which had not been processed at that time.

The Bureau was therefore instructed to complete the required analyses based on the new Notes 3 to 7 in section 9A.2 of Article 9A of Appendix S30A and Notes 5 to 7 in section 11.2 of Article 11 of Appendix S30 added during the Conference.

The Bureau was also instructed to publish the results of its revised compatibility calculations in the form of a Circular Letter.

In accordance with *resolves* 3 of Resolution 53 (WRC-97), the concerned administrations were requested to examine their respective situations in the relevant Tables within a period of 60 days from the date of that Circular Letter.

The Bureau has received comments from four administrations (D, FIN, J and MLA) within the 60 days time-limit specified in the Resolution to the above-mentioned Circular Letter. The detailed report on the implementation of this Resolution is contained in Document WRC2000/39.

2.9 Resolution 532 (WRC-97) - Review and possible revision of BSS Plans

WRC-97, in its Resolution 532 (WRC-97) established the Inter-conference Representative Group with the following tasks:

a) to study the feasibility of increasing the minimum capacity for countries in Regions 1 and 3 to around the equivalent of ten analogue channels;

b) to examine Annex 7 in the light of its studies for possible revision of the BSS Plans and with respect to decisions taken by WRC-97, such as the reduction of the downlink e.i.r.p. Its advice on the relevance of that Annex in providing protection to all services sharing the planned bands, and particularly the Region 2 BSS Plan, should be reported to WRC-99;

c) to consider concerns identified by WRC-97: modifications of the plans for additional requirements and subregional systems should not lead to monopolization of the use of the bands by a country or group of countries. Advice on how to address these concerns should be reported to WRC-99. A detailed report on the implementation of the Resolution is in Document WRC2000/34.

2.10 Council Decision 482 - Cost recovery for satellite network filings

Decision 482 of the Council established a basis for implementing Resolution 88 (Minneapolis, 1998). Accordingly, the Radiocommunication Bureau is taking a number of steps to implement the necessary administrative procedures and to establish a firm basis for meeting further reporting requirements for Council 2000 and subsequent meetings of Council.

On the basis of the current level of Advance Publication notices, processing of coordination requests and cases under Appendices S30 and S30A, it is expected that there will be around 76 cases that will be subject to cost recovery during 2000 for which it will be necessary to:

i) identify the category of filing;

ii) establish the fee (flat fee plus any excess pages);

iii) establish those networks subject to free allowance; and

iv) provide advice to the Finance Department for invoicing and payment.

Appropriate database structure adjustments and a basis for statistical information are also required. Resources for this function have to come from within the existing staff complement of the Bureau. Full information on the implementation of cost recovery has been conveyed to administrations in Circular Letter CR/139.

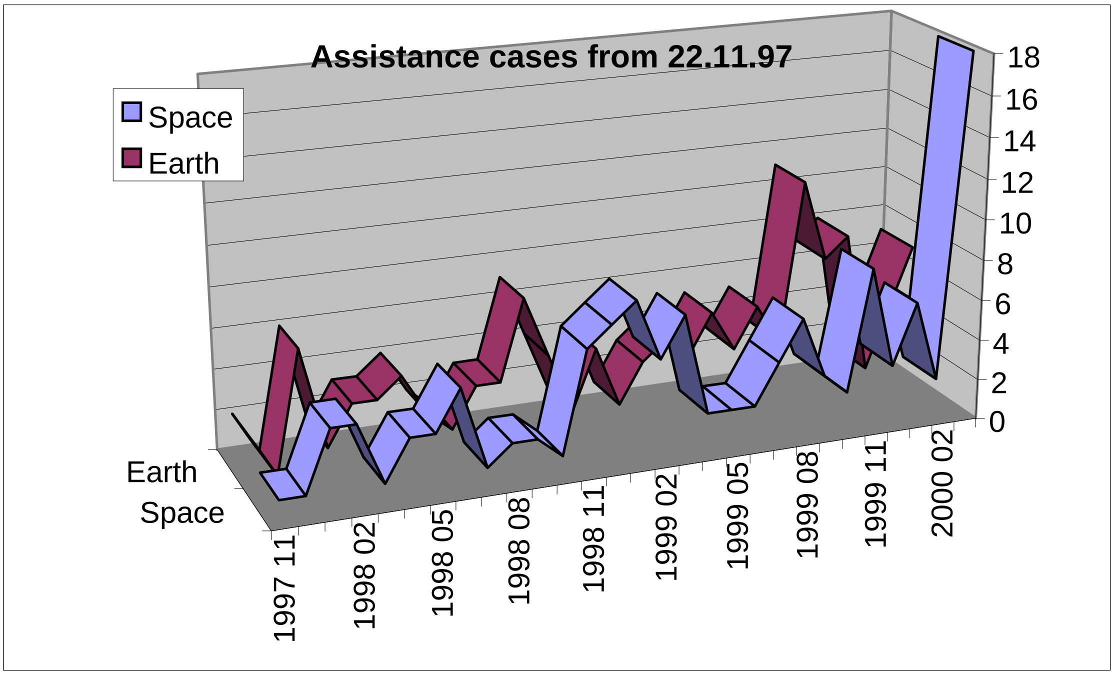
2.11 Special assistance on coordination, notification and plan modification

2.11.1 Assistance cases for non-planned services

Article S13 of the Radio Regulations specifies a wide range of possibilities for assisting administrations when they have difficulties in applying the procedures of Articles S9 and S11. Requests for assistance are received in two main respects, requests for assistance in coordination of space stations under Article S9 and Resolutions 46 and 33, and assistance provided to administrations for coordination of frequency assignments to earth stations operating with GSO or non-GSO satellite(s), with respect to the terrestrial services of other administrations. In the period since WRC-97, a little more than 100 cases were received for each space station and earth station assistance request type, with an average increase of 30 per cent per year. For space station assistance, a substantial increase is foreseen in 2000, especially in the context of an increasing rate of treatment of coordination cases and expected receipt of notification notices.

The volume of cases of assistance for both space stations and earth stations is noted in Figure 1 below.

FIGURE 1



2.11.2 Assistance cases for Appendices S30 and S30A

The Radiocommunication Bureau continued to provide assistance to administrations in application of the Radio Regulations including coordination and detailed information concerning the results of the Bureau's calculations related to the modifications to the Appendices S30 and S30A Plans.

The Bureau received seven assistance cases requested formally or informally by the Administrations of USA, EGY, LUX, S, F, F/EUT and TUR concerning the status of the comments for the networks published in Special Sections to which necessary reply assistance was provided by the Bureau.

The Bureau also received 47 assistance cases from the Administrations of ARM, ARS, BFA, CZE, DBI, GAB, KGZ, MDA, PHL, MLD, QAT, SEN, SWZ, UGA concerning the detailed results of the calculations performed by the Bureau. The Administrations of ARM, QAT, ARS, SWZ and UGA were provided with the result of the calculations as requested.

2.11.3 Assistance cases for Appendix S30B

Four administrations were assisted in application of provisions of Appendix S30B and corresponding Rules of Procedure.

2.12 Software development relating to the space services

The major activity during 1999 was the migration of the SNS notice processing system from the Siemens/IDMS mainframe environment to the Ingres/PC client-server environment. Most of the available IAP resources for space software development were allocated to this task in view of its urgency (non-availability of the Siemens/IDMS system due to Y2K non-compliance). This required the development of most of the notice processing software in the new environment using new PC-based tools. The cutover of the SNS from Siemens to Ingres took place during the first two weeks of December.

In addition to this, resources were allocated to supporting SSD's requirements in carrying out tasks related to Resolutions 532 and 533 (WRC-97). In this context, substantial additions were made to the MSPACEg software, software was developed to load the BSS space plan's files into the SNS database, and the Graphical Interference Management System (GIMS) was modified to generate composite beams.

Various other tasks were carried out related to software distributed to administrations on CD-ROM. The capability to handle notices related to Advance Publication of Information (API) and Resolution 49 (Due Diligence) was added to the capture and publication packages. Many enhancements to GIMS were made, based on a priority list created with input from SSD users. Queries on Resolution 49 notices were added to SNS-Online, which provides Web access to the SNS database. Improvements were made to SNTRACK (internal tool to manage workflow) taking into account the requirements of the SSD users.

2.13 Council Decision 483 - Improving the satellite network notification process

Council Decision 483 recognized the current difficulties being experienced in processing the large volume of satellite network filings in the Radiocommunication Bureau but, in particular, the problems associated with computer software development. Whilst recognizing the work under way within the Bureau to update and improve the efficiency of the software tools, it instructed the Director of the Radiocommunication Bureau:

1) to complete as soon as possible the software development activities listed in paragraph 2.6 of the 1999 Operational Plan for the ITU-R Sector;

2) to provide a means, such as calling information exchange meetings, for enabling administrations and network operators to be both informed of the Bureau's activities and to provide input for further improvements in the overall satellite network notification processing system; and

3) to conduct, in coordination with the Director of the Telecommunication Development Bureau (BDT), workshops for familiarizing developing countries, and in particular least developed countries (LDCs), who hold an interest in satellite notification and in using software and databases developed by the Bureau.

The Bureau has continued, within the limited resources available, to develop software as noted in paragraph 2.12 above and has continued a programme of regional seminars for developing countries (see paragraph 9.1 below).

In addition, in specific recognition of concerns from administrations, the Bureau has:

a) completed a software revision to enable resumption of the regular publication of a Space Network List (SNL) in both paper and electronic forms;

b) published with the BRIFIC a complete listing of all systems still to be processed in the current backlog of filings;

c) made available, free of charge, access to the Space Network Systems (SNS) Online to all registered TIES users. The service was previously only available on subscription;

d) completed software to be used by administrations for validation of requests for coordination under Article S.9 and associated data under Appendix S4 of the Radio Regulations.

The Bureau also conducted an Information Exchange Meeting in Geneva on 21 January 2000 immediately following the Radiocommunication Advisory Group (RAG) meeting. The Information Exchange Meeting explored a range of options for improving satellite coordination and notification processes and noted, in particular, that the greatest scope for improvement would come from changes to the currently complex regulatory framework. The results of the Information Exchange Meeting were covered in CA/75 of 8 February 2000. An outcome of the meeting was to establish an informal correspondence group coordinated by Mr Keith Whittingham of the United Kingdom. This group has generated considerable discussion of possible options for reform of regulatory procedures noting also the objective of Resolution 86 (Minneapolis, 1998). Details of the work of this group and the various papers generated by it can be found on the ITU website at www.itu.int/brconf/sat-net/informal-group/index.html.

3 Terrestrial services

In the period between WRC-97 and WRC-2000, the Bureau examined frequency assignment notices to terrestrial services under two different sets of provisions: under Article 12 of the RR (edition of 1994) for notices received prior to 1 January 1999, and under Article S11 of the RR (edition of 1998) for notices received after 31 December 1998. Also, due to the changes in the processing systems, the Bureau treated notices under two different formats: in FMS format for notices received by 1 October 1999 (excepting the broadcasting service in the VHF and UHF bands where the FMS format was receivable only until 1 April 1999) and in TerRaSys format (for notices to stations in the broadcasting service in VHF and UHF bands as from 1 April 1999, for all other services as from 1 October 1999). This variety of procedures and formats made the processing and the examination of notices rather complex. Nevertheless, the Bureau succeeded in keeping pace with terrestrial notifications as the major part of notices were processed and examined within the statutory limits. At the time of the preparation of this report (15 March 2000), the Bureau was still not in a position to process some types of notices in TerRaSys format (i.e. notices received after 1 October 1999); however, the Bureau expects to commence with the processing of these notices in the near future.

3.1 Coordination requests pertaining to terrestrial services

This activity comprises the processing of coordination requests under No. S9.21 (former Article 14 procedure), including regulatory and technical examinations and publication of the initial and final results in appropriate Special Sections. Table 3-1 summarizes the Bureau's activities in this respect.

TABLE 3-1

Activities related to coordination requests pertaining to terrestrial services

	1997	**1998**	**1999**
No. of received cases	44	13	157
No. of treated cases	44	11	159

At the time of preparation of this report, there was no backlog in this activity.

The Bureau also provided various types of assistance to administrations for coordination of frequency assignments to terrestrial stations with respect to earth stations of other administrations (mainly due to no reply or no decision of the consulted administration). Some 60 cases were treated in this respect, varying from a single frequency assignment in some cases to a substantive number of frequency assignments (more than 100) in other cases.

3.2 Plan modification procedures for terrestrial services

This activity comprises the processing of submissions under various plan modification procedures (APS25, APS26, ST61, GE75, RJ81, GE84, GE85MM, GE85EMA, GE89, RJ88), including the relevant compatibility examinations, where appropriate, and publication of the initial and final results in appropriate Special Sections. Table 3-2 summarizes the Bureau's activities in this respect.

TABLE 3-2

Activities related to plan modification procedures pertaining to terrestrial services

	1997	**1998**	**1999**
No. of received assignments	5 587	5 012	3 374
No. of examined assignments	3 674	5 639	4 250

At the time of preparation of this report, there was a slight backlog in the treatment of the notices governed by Regional Agreements ST61 and GE84, due to the delay in putting into production of all relevant components of the new system for processing of terrestrial notifications (TerRaSys).

In addition to the standard examination procedures, the Bureau published regularly, on a yearly basis, the updated versions of the Plans (Terrestrial Frequency Assignment Plans) on CD-ROM.

3.3 Notification, examination, recording and other regulatory procedures pertaining to terrestrial services

3.3.1 Notification procedure (Articles 12 and S11)

This activity comprises the processing (i.e. reception, registering, validation, correspondence, data correction and publication in the WIC/BR IFIC) of the notices received from administrations, as well as subsequent examination under the relevant provisions of Articles 12/S11 of the Radio Regulations (conformity with the Table of Frequency Allocations and other provisions of the Radio Regulations, and, where appropriate, from the viewpoint of their conformity with the coordination procedures or with a frequency allotment or assignment Plan and/or to other provisions of the Agreement, when applicable). Table 3-3.1 summarizes the Bureau's activities in this respect.

TABLE 3-3.1

Activities related to notification procedures pertaining to terrestrial services

	1997	1998	1999
No. of received notices	33 855	45 603	51 748
No. of examined notices	39 227	24 146	55 586

At the time of preparation of this report, there was a slight backlog in the treatment of the notices in the bands governed by Regional Agreements ST61 and GE84, due to the delay in putting into production of all relevant components of the new system for processing of terrestrial notifications (TerRaSys). There was also a delay in the examination of the notices pertaining to terrestrial services in the bands shared with space services, as these examinations depend on the status of examination of notices to space services.

It is to be noted that the Bureau undertook a comprehensive set of activities, after WRC-97, in order to implement the relevant decisions of WRC-97 related to the notification procedures for terrestrial services, notably:

- the major part of notices received by 31 December 1998 were examined by 31 March 1999, under the relevant provisions of Article 12 of the Radio Regulations, and the March-99 edition of the IFL/CD-ROM (released in April 1999) contained the updated situation (except some cases in the bands shared with space services); all remaining notices of this category were examined by the end of November of 1999 and the December-99 edition of the IFL/CD-ROM (released in January 2000) contained the updated situation;
- all internal procedures were reviewed and many elements of the production chain (registry, validation rules, finding system) have been adapted to the requirements of the Simplified Radio Regulations and the new numbering system was timely introduced in the relevant publications (Preface to the IFL, service documents, etc.);
- the relevant forms of notice were reviewed and redesigned so as to conform with the requirements of revised Appendix S4 to the Radio Regulations, as well as to those of the new processing system TerRaSys, and appropriate circular letters were prepared and sent to administrations containing guidelines as to the use of these forms;
- several categories of recorded frequency assignments were reviewed (e.g. those governed by No. S5.148, by Resolution 8 and by Resolution 412) and the relevant findings were modified and reflected in the March-99 edition of the IFL/CD-ROM. In addition, the findings of the recorded assignments were reformatted, through

appropriate mass-update procedures, so as to conform to the requirements stipulated in the Simplified Radio Regulations, and the December-99 edition of the IFL/CD-ROM contains findings consistent with the provisions of the Simplified Radio Regulations.

In addition to the above activities, the Bureau introduced the new publication, the BR International Frequency Information Circular (IFIC) which integrates, as from 11 January 2000, all former publications related to frequency assignments (the IFL, Frequency Assignment Plans, WIC and Special Sections), as requested by Resolution 30 (WRC-97).

3.3.2 Processing of submissions for HF broadcasting schedules

This activity comprises technical processing of submissions related to HF broadcasting schedules under the procedure of Article 17 of the Radio Regulations (for all schedules in 1997 and 1998) and under the procedure of Article S12 (as from 1 January 1999), including the identification of severe incompatibilities and selection of appropriate bands and frequencies when requested by administrations, and preparation of tentative and final schedules. Table 3-3.2 summarizes the Bureau's activities in this respect.

TABLE 3-3.2

Activities related to preparation of HF broadcasting schedules

	1997	**1998**	**1999**
No. of processed cases	28 357	31 446	17 379

The Bureau undertook a comprehensive set of activities, after WRC-97, in order to implement the relevant decisions of WRC-97 as to the introduction of the new procedure as stipulated in Article S12 and Resolution 535 (WRC-97). In these activities, which comprised the development of new software and establishment of various reference tables, the Bureau obtained valuable assistance from one administration, as well as full cooperation of many regional coordination groups; thanks to such collaboration, the Bureau was able to timely commence with the application of the new procedure. The related processing and the technical examination of notices is now being carried out on a weekly basis resulting in the publication, every month, of the Tentative Schedule on CD-ROM.

3.3.3 Other regulatory procedures pertaining to terrestrial services

The Bureau continued to apply other regulatory procedures described in various Resolutions and Recommendations, although some of them are decreasing in terms of generated workload. Table 3-3.3 summarizes the Bureau's activities in this respect.

TABLE 3-3.3

Activities related to other regulatory procedures pertaining to terrestrial services

	1997	**1998**	**1999**
No. of cases under RS300	50	83	21
No. of cases under RC402	8	35	18

Additional considerations on these two procedures are contained in Document WRC2000/16 (sections 2.5 and 2.7).

3.3.4 Monitoring summaries (regular and special monitoring)

The Bureau continued to process data on regular monitoring, as submitted to it by monitoring stations of the Member States, as well as to conduct the necessary liaison between administrations performing special monitoring programmes under Resolution 205 (in the band 406-406.1 MHz) and the administrations from where unauthorized emissions are generated. Table 3-3.4 summarizes the Bureau's activities in this respect.

TABLE 3-3.4

Treatment of monitoring reports

	1997	**1998**	**1999**
Regular monitoring: No. of observations processed	59 345	60 000	52 664
Special Monitoring under RS205: No. of unauthorized emissions	276	161	125
Special Monitoring under RS205: No. of unauthorized emissions that ceased	107	47	38

The summary reports relating to regular monitoring are now available on the ITU website (starting with Summary No. 273 which covers observations for the period 1 January - 31 March 1997).

3.4 Application of administrative and operational procedures

The Bureau provided various kinds of assistance to administrations and other entities in the application of administrative and operational procedures that constitute a significant part of the Radio Regulations. It also continued to allocate means of identification to administrations, in accordance with the relevant provisions of the Radio Regulations. Table 3-4 contains a summary of the allocated means of identification in the period 1997-2000.

TABLE 3-4

Allocation of means of identifications

	1997	**1998**	**1999**	**2000**[1]
No. of international call sign series	–	–	1 (PSE)	1 (UN)
No. of blocks of ship station selective call numbers	4 (INS, KOR, MLT, PHL)	2 (MLA, VCT)	3 (CYP, INS, J)	–
No. of blocks of coast station identification numbers	3 (HKG, KOR, USA)	1 (EGY)	3 (MAU, EQA, TUN)	–
No. of maritime identification digits	3 (MLT, PNR, TZA)	3 (MDA, F, PNR)	6 (G, DNK, TKM, VCT, KAZ, CHN)	1 (J)

All the blocks of ship station selective call numbers (SSSCN) were exhausted in the first quarter of 1999 and an appropriate note was published in the ITU Operational Bulletin (No. 693 of 1 June 1999). Administrations submitting requests for additional blocks of SSSCN are advised to reuse the

[1] Period 1 January - 15 March 2000.

same five-digit ship station selective call numbers for both SFSC and NBDP (where applicable), or to migrate to the numerical identification system based on MID, and the proposed course of action is generally accepted. See also Document WRC2000/16 (paragraph 3.6).

3.5 Implementation of Conference Resolutions relating to terrestrial services

The Bureau completed essentially all activities referred to in various Resolutions from WRC-97 and from previous conferences that treat issues pertaining to terrestrial services.
Document WRC2000/16 contains reports with respect to Resolutions 13, 27, 28, 73, 300, 339, 340, 344, 535, 537, 703 and 716, as well as Recommendation 402. Paragraph 7.4 of this report contains information on the implementation of Resolution 30. In addition to these reports, the Bureau also undertook a general review of all Resolutions and Recommendations from WARC/WRC, as requested by Resolution 95. Appropriate comments in this respect are summarized in Document WRC2000/15.

3.6 Software development relating to the terrestrial services

1999 had barely begun when it was found that the existing Frequency Management System (**FMS**) would no longer be able to run as of 1 January 2000 because of a “Year 2000” problem with the underlying IDMS Database Management System. The portion of the 1999 Operational Plan related to the development of the new Terrestrial Radiocommunication System (***TerRaSys***) was therefore extensively modified.

The entire FM/TV portion of ***TerRaSys*** was placed into production during 1999. This includes data capture of paper notices, treatment of electronic notices, validation, various (regulatory, technical, plan, etc.) examinations, publication, and so forth.

The terrestrial portion of the BRIFIC CD-ROM was placed into production for FM/TV, with LF/MF available for “beta” testing. As 1999 ended, the remaining services (i.e. non-broadcasting services, such as fixed, mobile, aeronautical, etc.) were made available on the BRIFIC CD-ROM for “beta” testing. Work on the remaining portions of ***TerRaSys*** was under way at the time of preparation of this report.

4 Study Groups

4.1 Activities of the ITU-R Study Groups in preparation for WRC-2000

The preparation for WRC-2000 has involved all ITU-R Study Groups. As regards propagation aspects, a significant contribution has been the revision of the propagation prediction methods for earth station coordination. Also, a considerable amount of work has led to a review of the regulatory conditions relating to the coexistence of non-GSO FSS and GSO FSS systems as well as the work on development of a methodology for calculating the power levels produced by non-GSO FSS systems and sharing criteria and power limits. Joint activities between the concerned Study Groups finalized the studies on the sharing between non-GSO FSS and a wide range of other services including GSO/FSS, GSO/BSS, and FS. Additional studies have addressed high-altitude platform stations (HAPS).

Extensive preparatory work has been carried out to consider requirements for additional frequency spectrum for IMT-2000, for both its terrestrial and satellite components. Methodologies for the spectrum estimation were established in new Recommendations and details of the studies were retained in new Reports. Sharing studies were also conducted in several candidate bands.

4.2 Conference Preparatory Meeting (CPM)

The first Conference Preparatory Meeting (Geneva, 26-27 November 1997) organized preparatory studies for WRC-2000 and identified studies for the following WRC. A structure for the CPM Report to WRC-2000 was agreed together with a preparatory process, working procedures and a chapter structure. The meeting also appointed a Rapporteur for each chapter to assist the Chairperson in managing the development and flow of draft report contributions. The meeting decided that all appropriate regulatory/procedural studies on relevant agenda items would be carried out by the Special Committee on Regulatory/Procedural matters on the basis of proposals from the membership of ITU and the relevant ITU-R Working Party/Task Group/Joint Rapporteur Group. According to Resolution ITU-R 38-1 the results of the studies were submitted as contributions to the work of the second CPM in preparing its report to WRC-2000.

4.3 Special Committee on Regulatory/Procedural Matters

At the first session of the CPM (Geneva, 26-27 November 1997), the Special Committee on Regulatory/Procedural Matters (SC) organized its work in four Rapporteur Groups, which worked mainly by correspondence.

The SC meeting (Geneva, 12-16 July 1999) considered the reports by the four Rapporteurs as well as contributions from administrations and Sector Members. The material in the input documents was consolidated into a Report to the Conference Preparatory Meeting (CPM). The SC Report was used during the CPM together with the draft CPM Report and contributions from administrations and Sector Members to create the Report of the CPM to WRC-2000.

4.4 ITU-R Study Group Chairmen and Vice-Chairmen meetings

The meetings of the Radiocommunication Study Group Chairmen and Vice-Chairmen were organized in the period between the 1997 and 2000 Radiocommunication Assembly, namely 25-28 November 1997, 14-16 December 1998 and 26 November 1999. Further to establishing the Study Group meeting schedule for the relevant study period, the first meeting dealt mainly with the results of WRC-97 and the organization of studies requested for WRC-2000 and led to the establishment of Joint Task Group 4-9-11. The subsequent meetings updated the yearly meeting schedule and considered the Study Group management aspects, i.e. compliance with allocated budget (based on financial progress reports submitted by the Director) and measures addressed to limit documentation costs. The next meeting of the ITU-R Study Group Chairmen and Vice-Chairmen will be held, as usual, following the WRC-2000, in the week 6 to 9 June 2000 in association with the first session of the CPM. Both newly elected Study Group Chairmen and Vice-Chairmen and those leaving office will be participating.

4.5 Support of Study Group activities in the study period 1997-2000 meetings

The Study Group Department provided support to more than 167 meetings with a total of 845 meeting days in the study period 1997-2000 (starting December 97 and ending April 2000). The main meetings were held for the Conference Preparatory Meeting, the Special Committee, Study Groups (12 meetings), Working Parties, Task Groups. Smaller meetings were organized for Joint Rapporteur Groups, Experts' Groups and Handbook Groups.

The total documentation for these meetings consisted of 13 000 documents with approximately 130 000 pages.

Meetings

About 35 meetings have been held, at the invitations of administrations or Sector Members, outside Geneva.

A problem area for meetings in Geneva, as well as outside, is the usual very late arrival of contributions. The Secretariat sometimes has to handle the reproduction of a huge quantity of pages in the few days before the opening of the meeting.

Correspondence and telephone inquiries

Some 220 circular letters have been disseminated in this study period. These letters mainly concern the approval of Questions and Recommendations (CAR), the invitation to Study Group meetings (CACE), the announcement of approved Questions and Recommendations (CACE) and the invitation letters to Working Party, Task Group, Special Rapporteur Group and Handbook Group meetings (LCCE).

Most of the routine correspondence is received by E-mail. BRSGD also answers about 1 000 E-mails/month on various technical and administrative subjects.

Information requests are also received from administrations/Sector Members by telephone.

Quality control

The Radiocommunication Bureau Study Group Department has put considerable effort to ensure adequate support to the above-mentioned meeting activities guaranteeing a high-quality standard in the provided services.

The BR Operational Plan includes some means to assess the quality of the services offered to our “customers”. As regards the support to Study Group activity, a “key performance indicator” has been identified in making received contributions electronically available to participants in the shortest time scale. In the study period concerned BR/SGD has met and exceeded the target fixed in the Operational Plan. In most cases, all contributions supplied in electronic form, have been posted on the WWW not later than 24 hours after receipt by the Secretariat. This databank is made available to all registered TIES (Telecommunication Information Exchange Services) users.

5 Radio Regulations Board

5.1 General

In the period since WRC-97, the Radio Regulations Board has changed both in size and composition. In the period up to the Plenipotentiary Conference in 1998, it comprised nine members as follows:

Name	Country	1997	1998
Mr João C.F. Albernaz	Brazil	Chairperson	
Mr Thormod Bøe	Norway		
Mr Henry Kieffer	Switzerland		
Mr Makoto Miura	Japan		
Mr Gerald L. Mutti	Zambia		
Mr Ryszard G. Struzak	Poland		
Mr Valery Timofeev	Russian Federation	Vice-Chairperson	Chairperson
Mr Kouakou J.-B. Yao	Côte d'Ivoire		Vice-Chairperson
Mr Sanbao Zhu	Republic of China		

As result of a change to the Constitution (CS.93A) and the consequent elections at the Plenipotentiary Conference (Minneapolis, 1998), the composition of the Radio Regulations Board increased to twelve members as noted in the following table. The new Board held its first (15th) meeting 1-5 March 1999.

Name	Country	1999	2000
Mr R.N. Agarwal	India	Vice-Chairperson	Chairperson
Mr P. Aboudarham	France		Vice-Chairperson
Mr James R. Carroll	United States		
Mr Muhammad Javed	Pakistan		
Dr Gabor Kovacs	Hungary		
Mr Carlos Merchan Escalante	Mexico		
Mr Hugh Railton	New Zealand		
Mr Ryszard Struzak	Poland		
Mr John Tandoh	Ghana		
Mr Valery Timofeev	Russian Federation		
Mr Ahmed Toumi	Morocco		
Mr J.-B. Kouakou Yao	Côte d'Ivoire	Chairperson	

5.2 Review of Rules of Procedure

The Board undertook a comprehensive general review of its Rules of Procedure in accordance with principles adopted at its 11th meeting (26-30 January 1998) and, in particular, noting the requirement to align the Rules with new provisions of the Radio Regulations to come into effect (provisional application) from 1 January 1999. The review was undertaken progressively over three meetings of the Board (12th, 13th and 14th) during 1999 and resulted in a comprehensive revision being promulgated in loose-leaf form which is amended from time to time, as necessary, with replacement pages. The new Rules of Procedure (1998 edition) became available early in 1999.

5.3 Working methods - Resolution 84 (Minneapolis, 1998)

The Board gave early consideration to its working methods, having particular regard to Resolution 84 (Minneapolis, 1998) and the desirability of improving transparency in the work of the Board. As a result of consideration at its 15th and 16th meetings, the Board promulgated revised

Rules of Procedure (Part C (rev.1) of the 1998 Consolidated Volume) and these were published by Circular Letter (CR/127 of 3 August 1999). No comments were received from administrations as regards the revised working methods.

In the same context, the Board also considered Rules of Procedure to clarify the application of Article S13 of the Radio Regulations. These Rules were circulated for comment (CCRR/2 of 15 July 1999) and, noting the general support received in comments from administrations, the RRB adopted the new Rules at its 17th meeting (13-17 September 1999).

These new Rules were promulgated by Circular Letter (CR/129 of 3 November 1999) and were incorporated in the 1998 edition of the Rules of Procedure (Part AI, ARS 13 (rev. 2)). The Board has followed the provisions of S13 and these associated Rules of Procedure in its consideration of any proposals for modifications or additions to the Rules of Procedure.

Copies of the relevant parts of the Rules of Procedure relating to the above changes are attached (Annex BBB).

5.4 Issues raised at RRB meetings which may require consideration by WRC-2000

A number of issues have been raised by administrations with the Radio Regulations Board for consideration in terms of application of the Radio Regulations or for review of decisions of the Radiocommunication Bureau in terms of the application of S14. In virtually all cases, the RRB has drawn conclusions or reached decisions that have resolved the issues which have been acceptable to the parties involved. In some cases, however, the RRB has concluded that the Radio Regulations may not specifically, or sufficiently, cover the circumstances of a case, or that there is an ambiguity in the provisions.

In these cases, the RRB concluded that it would be desirable for WRC-2000 to consider the particular issue in question. Cases in this category are noted as follows:

a) At its 15th, 16th and 17th meetings, the RRB considered reports from the Radiocommunication Bureau on progress with applying the provisions of Resolution 49 (WRC-97). The Bureau provided reports to the Board and noted that the overall progress would be reported to WRC-2000 in accordance with provisions of the Resolution.

One of the issues reported to the RRB arose from an exchange of correspondence between the Bureau and the Administration of the Russian Federation on the specific application of *resolves* 3 of Resolution 49 to satellite network systems already in operation and recorded in the MIFR. The RRB gave specific guidance to the Bureau on the application of the Resolution within the context of *resolves* 2 and 3 of Resolution 49 to enable it to continue its work in the period prior to WRC-2000 and in its treatment of space network systems of the Russian Federation.

The RRB concluded, however, that there appeared to be ambiguity in the application of *resolves* 3 and that it would be appropriate to report the matter to WRC-2000. The Board noted that this ambiguity did not raise immediate concerns as it relates to information required to be provided before 21 November 2000.

The issue is included in detail in the Report of the Director to WRC-2000 on the application of Resolution 49 (WRC-97) to enable the Conference to consider the specific issue of the application of *resolves* 3 of the Resolution (see Document WRC2000/32).

b) At its 16th meeting (24-28 May 1999), the RRB considered an issue raised by the Radiocommunication Bureau regarding the application of the coordination procedure of Article 14 (S9.21) to FSS in the band 11.7 to 12.2 GHz in Region 2 in the application of Article S5.488. It noted that there may be some uncertainty as to whether a specific change by WRC-95 to S5.488 may have been intentional or an editorial oversight.

The RRB revised the Rules of Procedure relating to S5.488 at its 13th meeting (6-14 July 1999) which became effective as from 1 January 1999. This revision was based on an understanding that the new text of S5.488, which had no explicit reference to S9.21, means that there is no longer a need for the specific procedures of S9.21 to be applied to FSS networks in the band 11.7-12.2 GHz in Region 2. Since there are now no hard pfd limits applicable to geostationary FSS in this band, no protection is available to terrestrial services from GSO FSS networks for which the coordination information was received in Region 2 after 1 January 1999.

The RRB notes that the matter has been considered by the CPM on the basis of information from the Bureau and from two administrations and that it is included in the CPM Report to the Conference (paragraph 7.6) with some possible options for the Conference to consider.

c) At its 18th meeting (8-12 November 1999), the RRB considered a submission from the Administration of Spain in which it contested a decision of the Radiocommunication Bureau pursuant to the provisions of Article S14. The issue related to the decision of the Bureau to cancel the HISPASAT-2 analogue and digital satellite network at 30° W in application of the provisions of Articles 11 and 9A of Appendices S30 and S30A respectively (eight year regulatory time limit for bringing the network into use).

In its examination of the case and of the associated regulatory provisions, the RRB concluded that the decision of the Bureau was correct but the RRB recognized a potential ambiguity between the text of *resolves* 2 of Resolution 533 (WRC-97) and the above-mentioned provisions of Appendices S30 and S30A. Accordingly, the RRB established arrangements to avoid suspension of the processing of submissions from administrations by the Bureau until WRC-2000, namely for the Bureau to continue, whilst still processing the HISPASAT-2 analogue and digital assignments on a provisional basis pending consideration of the issue by WRC-2000.

d) At its 18th and 19th meetings, the RRB considered the question of application of the Radio Regulations to cases involving inter-satellite links between GSO and non-GSO systems. The matter had been brought to the RRB by the Bureau on the basis that there are no specific technical criteria, calculation methods or associated tools available to the Bureau to undertake an examination of conformity pursuant to Article S11.32.

The RRB agreed that the matter be brought to the attention of Study Group 4 to consider appropriate technical criteria, calculation methods and tools. However, the RRB also concluded that it would be desirable for the matter to be considered by WRC-2000.

The RRB, at its 17th meeting (13-17 September 1999) adopted a Rule of Procedure in the application of S5.392 in respect of inter-satellite links in frequency bands 2 025-2 110 MHz and 2 200-2 290 MHz but, in these cases, it involved specific cases of space services allocated to space research, earth exploration and space operation services and the space-to-space services are limited to data-relay satellite systems.

Accordingly WRC-2000 may wish to consider the most appropriate regulatory approach to be taken for inter-satellite systems operating in a number of bands allocated to the inter-satellite service. This issue is explained in more detail in a separate document with some possible options for consideration (see Document WRC2000/16).

5.5 Backlog in processing satellite network filings

The RRB considered reports from the Bureau to its 17th, 18th and 19th meetings and noted with considerable concern the implications of the backlog in processing satellite network filings, particularly those relating to requests for coordination. At its 19th meeting (21-25 February 2000) the RRB considered possible changes to the Rules of Procedure that could reduce the work involved by the Bureau in meeting requirements of the Radio Regulations. Whilst it noted that the scope for such improvement through changes to the Rules of Procedure is extremely limited, the RRB approved a modification in respect to the practical application of S11.32 and its previously equivalent provisions.

The RRB concluded that necessary improvements can be achieved primarily through changes to the Radio Regulations or appropriate Resolutions and it has urged all administrations to seriously consider proposals for such changes to WRC-2000.

The RRB has noted that some initiatives are emerging following consideration of the situation by regional groups of administrations and by administrations as a result of an Information Exchange Meeting conducted by the Bureau on 21 January 2000 as required by Council Decision 483. The Board had also noted the possible options for reform in Administrative Circular CA/75 of 8 February 2000 and generally supported these options.

The RRB has expressed its hope that proposals to WRC-2000 will be able to better meet the real needs of those responsible for the planning and operation of satellite networks and overcome the problems of the backlog of work in the Bureau.

5.6 Consideration of Resolution 80 (WRC-97)

The RRB considered the steps that may be possible to recognize the concern that led to the adoption of Resolution 80 at WRC-97. It has considered the issue at a number of its meetings since WRC-97.

The RRB has prepared a detailed report for WRC-2000 as required by the Resolution and this Report has been submitted as a separate document (WRC2000/29).

6 Radiocommunication Advisory Group

During the concerned period the RAG held three meetings.

Sixth Meeting (12-16 January 1998)

RAG discussed the relevant results of RA-97 and WRC-97, in particular the need to associate the RA in time and place with the WRC. It reviewed the draft Strategic Plan of ITU as well as the 1998 BR Operational Plan. After some discussion, a number of improvements were suggested. The potential consequences of lack of adequate resources were evaluated. RAG advised giving priority on the ongoing processing of frequency notices. The principles for the application of cost recovery were fully endorsed. RAG also fully endorsed the action taken by the Director to get additional resources from Council to keep current BR staff. In a broader context, RAG reflected on the financial consequences of conference decisions. Considerable discussions were held on the relevant Recommendations on ITU-2000 as well as on RAG’s status in the Constitution and Convention. An ad hoc group on IPR was unable to reach a common position. It was considered necessary to continue discussions within RAG.

Seventh Meeting (22-26 February 1999)

RAG noted the inclusion of provisions setting out its mandate in the Convention. It considered a report by the Chairperson of the Council Working Group on the implementation of cost recovery for satellite notifications. RAG prepared consolidated summaries on its advice concerning ways to reduce WRC’s documentation and on improving the efficiency of WRCs. Following a general discussion, RAG noted with appreciation the completion of a substantial volume of work on publications during 1998. It endorsed the various experiments with advertising and outsourcing. With respect to IPR issues, the meeting endorsed the use of the forms similar to those used in ITU-T to keep policy aligned in the two Sectors.

Eighth Meeting (17-20 January 2000)

RAG endorsed a draft resolution on the status of Associates. It also prepared advice on many amendments to ITU-R Resolutions concerning study group structure, administrative recommendations, IPR policy, rights of Sector Members, appointment of study group and RAG Chairpersons and Vice-Chairpersons, updating of maintained recommendations and the general review of ITU-R Resolutions. RAG encouraged greater emphasis at WRC on the financial implications of WRC decisions. The Director was invited to incorporate this conclusion in his report to WRC-2000. RAG initiated the review of the CPM process by means of a correspondence group. Although a consensus was not achieved, it also raised the idea of associating the Radiocommunication Assembly in time and place with CPM-2. The meeting agreed that RA-2000 should be invited to consider giving RAG the mandate to develop a mechanism for implementing an alternative approval process and to implement that process on an experimental basis. RAG considered the BR draft 2000 Operational Plan. It recognized the enormous problems faced by BR in the Space Services Department and encouraged discussions on possible ways forward. The importance of assistance in spectrum management, particularly in developing countries was stressed. The Director was invited to ensure that this was recognized in the Plan and that every effort be made to find the resources necessary to assist administrations. RAG concluded that the ICG on Satellite Matters was serving a useful purpose. However, it did not consider that there was sufficient justification for creating an ICG on IMT-2000. RAG fully endorsed the merger of Study Group 10 and Study Group 11. However, it noted concerns expressed by TSAG regarding the scope of the new study group. Informal discussions, outside the meeting, resulted in an amended text that could not be considered by RAG due to lack of time. Discussions will continue during RA-2000.

7 Seminars and conference preparation

The Bureau organized five regional radiocommunication seminars in the 1998-1999 period:

- Gabon April 98
- Namibia June 98
- Cuba April 99
- Mali May 99
- Ukraine June 99

A World Radiocommunication Seminar was also held in Geneva in November 1998.

7.1 Preparations for future conferences

7.1.1 The general scope of the WRC agenda is normally established four to six years in advance (CV118, PP-98). In accordance with the standard practices, WRC-97, by its Resolution 722, established a preliminary agenda for WRC-02/03 (initially envisaged for the year 2001). WRC-2000, by its agenda item 7.2, is expected to recommend to Council items for inclusion in the agenda for the next WRC, and to give its views on the preliminary agenda for the subsequent conference and on possible agenda items for future conferences.

7.1.2 Chapter 8 of the CPM-99 Report to WRC-2000 contains indications on the progress of studies for future conferences. In addition to these indications, the Bureau wishes to report on other issues that were drawn to the attention of the Bureau with a view to reporting them to WRC-2000. Administrations may wish to take note of this information when considering the proposals concerning the agenda for WRC-03.

a) In May 1999, the Bureau received a letter from the organization *No-Code International* (United States), containing a formal complaint regarding provision No. S25.5, which, in the opinion of that organization, involves discrimination. To remedy the situation, this organization requested placing of the subject matter on the WRC-2000 agenda with a view to deleting No. S25.5 at WRC-2000. That organization was informed that, according to "*resolves* 2.2" of Resolution 722, the consideration of Article S25 may be included in the preliminary agenda for WRC-03, which would enable consideration of No. S25.5.

b) In July 1999, the Bureau was approached by the Transport Division of the Economic Commission for Europe (ECE) concerning the possible course of action that would enable the extension of the scope of the application of No. S5.138 to all three Regions, thus contributing to the harmonization of the construction requirements for road vehicles (in this particular case, use of the frequency 433.92 MHz for automotive radio control of anti-theft systems). The ECE was given appropriate advice in this regard (as WRC-2000 has no explicit mandate to consider the extension of the application of No. S5.138 to all other ITU Regions, appropriate proposals as to the inclusion of this issue in the preliminary agenda for WRC-03 should be submitted to WRC-2000 by the administrations of the ITU Member States).

7.1.3 In addition to the issues regarding possible agenda items for future WRCs, the Bureau wishes to inform the Conference that several Member States belonging to the European Broadcasting Area have initiated the procedure for convening a regional radiocommunication conference for revision of the European Broadcasting Agreement for VHF/UHF broadcasting (Stockholm, 1961). According to that initiative, which is conducted under the provisions of No. 310 of the Convention of ITU, the concerned Member States propose holding of a two-session conference, the second session of which may take place at the seat of the Union in the year 2005 at the latest.

7.2 Implementation of Resolution 30 (WRC-97)

The World Radiocommunication Conference (WRC-97) has resolved, by its Resolution 30 that the publication of the Weekly Circular and the Special Sections on paper, microfiche and diskette formats, be migrated to a CD-ROM format. It also decided 1) that the new publication be produced on a fortnightly basis; 2) that tests should be conducted in cooperation with all administrations before introducing CD-ROM replacing the former formats; 3) that the search software should be capable of easily identifying and extracting to file parts I, II and III of the Weekly Circular and the Special Sections as well as for plan assignments. It also instructed the Director, BR, 1) to consider an alternative name for the Weekly Circular, and 2) to report to the next world radiocommunication conference on the experience gained in the introduction of the CD-ROM format with a view to making any necessary consequential amendments to the RR. Furthermore, it requested the Secretary-General to consider the provision of suitable software and/or hardware for the least developing countries requesting it.

In response to this Resolution, the Bureau undertook a comprehensive set of activities in order to implement the WRC-97 decisions in this respect. The first information on the new publication, with partial data, was presented to the participants in the BR Seminar, in September/October 1998. In December 1998, the Bureau introduced a beta-1 version of the new publication in CD-ROM format (subsequently named as BR International Frequency Information Circular - IFIC), which contained data on the frequency assignments in the broadcasting service in LF, MF, VHF and UHF bands, as well as a database query program (***TerRaQ***) allowing the user to extract the last published data in

Parts 1, 2 and 3 and also Parts A, B and C of the Special Sections (please refer to Circular Letter CR/110 of 4 December 1998). In a parallel activity in 1998, ITU provided some 50 PCs to least developed countries, with installed WindowsNT, so as to enable these countries to use the new software being developed in BR under NT.

Following this initial test in which 34 administrations and users participated, the Bureau commenced with the formal test of the new CD-ROM publication, as requested by "*resolves* 3" of Resolution 30. The formal tests commenced on 15 June 1999 (please refer to Circular Letter CR/123 of 7 June 1999). During the period from 15 June 1999 to 7 September 1999, in which the formal testing was conducted, there was a parallel weekly publication of paper, microfiche and diskette formats in the FMS along with CD-ROM format in ***TerRaSys*** every two weeks (the testing of the LF/MF broadcasting portion was extended up to the end of 1999).

Following the successful completion of the tests, the Bureau effected the production cutover from the former FMS to the new ***TerRaSys***, for the VHF/UHF broadcasting portion, on 29 August 1999. Administrations were informed accordingly (see Circular Letter CR/128 of 9 September 1999) that, as from 7 September 1999, the CD-ROM format became the sole publication format for the frequency assignments in the broadcasting service in the VHF and UHF bands, both those notified under Article S11 of the Radio Regulations, as well as those submitted under the relevant provisions of the Regional Agreements, Stockholm, 1961, Geneva, 1984 and Geneva, 1989.

By its Circular Telegram of 13 January 2000, the Bureau informed administrations that the BR IFIC for Terrestrial Services also contains information on the fixed and mobile services. This information was further confirmed in Circular Letter CR/138 dated 14 February 2000. It is to be noted that, at the time of preparation of this report, the status of the BR IFIC information concerning the fixed and mobile services was still unofficial, pending the formal verification that the data contained therein are correctly converted from the FMS format. This verification was delayed due to the fact that, in the conversion process, a considerable amount of errors were detected and they are now being corrected.

In January 2000, the Bureau introduced BR IFIC for Space Services which contains, in Adobe Portable Document Format (PDF), the files corresponding to Parts 1, 2 and 3 and the various Special Sections (please refer to Circular Letter CR/134, dated 22 December 1999). This is a temporary implementation of Resolution 30. The Bureau will later add to these PDF files an Access database and query software similar to the one used for terrestrial services. As from 11 January 2000, the BR IFIC CD-ROM represents the sole publication format for stations in the space services, for those notified under former Articles 11(S9) and 13(S11) of the Radio Regulations in force, as well as those that are submitted under the relevant provisions of the Radio Regulations or which are subject to the Appendices S30, S30A and S30B Plans.

As from 11 January 2000, when other components were added (i.e. assignments related to the remaining terrestrial services as well as portions related to space services), the new publication in CD-ROM format integrates all radiocommunication services and represents the sole regulatory publication resulting from the application of the relevant provisions of the Radio Regulations and the associated Regional Agreements related to the international management of the frequency spectrum/orbit resource.

Prior to January 2000, the Weekly Circulars were published in paper, microfiche and diskette forms. Additionally, the International Frequency List on CD-ROM (IFL on CD-ROM) and SRS on CD-ROM were published every six months and Frequency Assignment Plans on CD-ROM (Plans on CD-ROM) every year. As a result of the above decisions of the Conference, all these publications are being replaced by a single publication on CD-ROM, which is published every two weeks. As instructed by Resolution 30, the Bureau can provide an index of Parts I, II, III and the Special Sections printed on paper, for those administrations requesting it. So far, no administration has made such a request. Also as instructed by Resolution 30, this data is available on TIES by remote electronic access.

Later in 2000, the Bureau will consider the option of offering the BR IFIC on Digital Versatile Disks (DVD). The main advantage of the DVD format is its storage capacity of 4.7 GB. This will allow the grouping of terrestrial and space services on a single uncompressed DVD, thus eliminating the need to store the CD content on a PC hard drive.

In summary, as from 11 January 2000, BR IFIC on CD-ROM format integrates all radiocommunication services and represents the sole regulatory publication resulting from the application of the relevant provisions of the Radio Regulations and the associated Regional Agreements related to the international management of the frequency spectrum/orbit resource.

8 Publications

8.1 Regulatory publications

Table 8-1 summarizes the Bureau's activities on publications resulting from the application of the Radio Regulations in the period 1997-1999.

TABLE 8-1

Publications resulting from the application of the Radio Regulations

	1997	**1998**	**1999**
Weekly Circulars	50 issues (on paper, microfiche and diskette)	50 issues (on paper, microfiche and diskette)	50 issues (on paper, microfiche and diskette) and 7 issues on CD- ROM
HFBC Schedules	12 issues (on diskettes)	12 issues (on diskettes)	9 issues (on CD-ROM)
IFL	2 issues (on CD-ROM)	2 issues (on CD-ROM)	2 issues (on CD-ROM)
SRS	2 issues (on CD-ROM)	2 issues (on CD-ROM)	2 issues (on CD-ROM)
Terrestrial Plans	1 issue (on CD-ROM)	1 issue (on CD-ROM)	– (incorporated within BR IFIC)
Preface to the IFL	1 edition and 1 update	1 edition and 1 update	7 editions on CD-ROM (with BR IFIC)

8.2 Service documents

Table 8-2 summarizes the Bureau's activities on publications of service documents in the period 1997-1999.

TABLE 8-2

Publication of service documents

	1997	**1998**	**1999**
List IV (Coast Stations)	One supplement	One full edition	Two supplements
List V (Ship stations)	One full edition and three supplements	One full edition and three supplements	One full edition and three supplements
List VI (Radiodetermination and special services)	One edition	Two supplements	Two supplements
List VIIA (Call signs - maritime mobile)	One full edition and three supplements	Four supplements	One full edition and three supplements
List VIIB (Call signs - other than MMS)	One full edition and one supplement	Two supplements	One full edition and one supplement

Lists IV, V, VI and VIIA are, *inter alia*, service documents whose carriage is mandatory for certain categories of ships. In view of the importance of the operational information contained in these Lists, particularly with regard to safety, and bearing in mind that information contained in some of these Lists is also used for other administrative procedures (e.g. eligibility for additional MID), administrations are communicating regularly the necessary amendments to these Lists. It should be further noted that the numbers of printed and sold copies of these Lists are increasing with each new edition.

On the other hand, List VIIB, List of call signs of stations other than amateur stations, experimental stations and stations of the maritime mobile service, is not a service document whose provision is mandatory to any station. The List was conceived primarily in order to identify stations, by their call signs, that are causing harmful interference. At the present time, with the use of some new modulation techniques where information is coded and consequently not readily available for rapid identification of the originating radiation, the List is becoming obsolete. In addition, very few administrations are responding to requests of the Bureau for amending the information concerning their call signs included in this List. The number of printed and sold copies of this List is decreasing with each new edition. The last but one edition of this List (1997) 271 copies were sold out of 1 533 that were printed. In view of the above, and bearing in mind the fact that the information contained in List VIIB could be retrieved from the new publication, the International Frequency Information Circular (IFIC), **the Conference may wish to amend Section I of Article S20 of the Radio Regulations, by deleting provision No. S20.11.**

8.3 Text publications

Good results were achieved in reducing the delays and costs associated with publication of ITU-R texts and in expanding the range of products available electronically (online and CD-ROM).

Table 8-3 summarizes the Bureau's activities on publications of ITU-R texts in the period between WRC-97 and WRC-2000.

9 Assistance to Member States

9.1 Assistance to administrations of developing countries

In the period between WRC-97 and WRC-2000, the Bureau provided various kind of assistance to the administrations of developing countries in the following areas:

- in supporting the activities of the national spectrum management units; having in mind the changes in the regulatory structures in many countries; to this end, several missions were undertaken either on request of the administrations of the Member States, or under special missions through BDT. Furthermore, experts from administrations of the less developed countries were granted appropriate fellowships to attend the BR Radiocommunication Seminars. Several experts were also received for individual in-service training on radio regulatory procedures. In 1998, some fifty administrations were provided with appropriate hardware and software to ensure the testing and use of the new BR publication on CD-ROM, the BR International Frequency Information Circular;
- in organizing initial meetings of the regional coordination groups, as requested by Article S12;
- in providing assistance in frequency selection.

9.2 Treatment of cases of harmful interference

The Bureau has treated all reports of harmful interference as matters of urgency, particularly where safety services were involved. All these cases were handled in accordance with the relevant provisions of the Radio Regulations. In several cases, the Bureau was asked to provide assistance in determining the source of interference; such assistance was provided in collaboration with the monitoring stations of the Member States. Table 9-2 summarizes the Bureau’s activities in this respect. The Bureau has not been asked to raise any of these cases to the Radio Regulations Board.

TABLE 9-2

Treatment of cases of harmful interference

	1997	1998	1999
No. of cases received	100	58	45
No. of cases closed	82	98	81

10 Cooperation

10.1 Cooperation with ITU-D

Effective liaison has been maintained with the ITU-D Sector through inter-Bureau contacts and via the Advisory Groups.

The Radiocommunication Bureau has followed the work of ITU-D Study Groups 1 and 2, together with their corresponding Working Parties and Rapporteur Groups. Liaison has concerned topics of common interest to the two Sectors, with the Radiocommunication Bureau drawing attention to those ITU-R Questions and Recommendations of special relevance to developing countries. The Bureau, together with the relevant ITU-R Study Groups, has kept the Development Sector informed of progress in key projects such as IMT-2000, highlighting aspects having significant impact on developing countries. In particular, the Radiocommunication Bureau has assisted the Development Bureau in the organization of IMT-2000 Seminars to help preparations for RA-2000 and WRC-2000.

In relation to the Handbook programme of ITU-D, the Radiocommunication Bureau has kept ITU-D Study Group 2 informed of handbooks produced by, or currently under preparation in, the ITU-R Study Groups.

Collaboration has also been maintained in the area of radiowave propagation where ITU-R Study Group 3 and the Radiocommunication Bureau maintain a keen interest on measurements and propagation modelling in low latitude and tropical regions.

The Radiocommunication Bureau, in conjunction with the Telecommunication Development Bureau, maintains its connections with the International Centre for Theoretical Physics (ICTP) at Trieste which has, as its principal objective, the advancement of science and engineering in developing countries. Projects frequently relate to spectrum management and propagation.

The Radiocommunication Bureau has also supported the distance project organized in the framework of the Virtual Training Centre by the Telecommunication Development Bureau. Counsellors have been made available for distance tutoring as well as for “face-to-face” sessions, contributing to the success of the initiative. On IMT-2000, presentations by ITU Task Force members were given to participants at the September 1999 meeting of ITU-D Study Group 2. This support will continue in the next study period.

In response to Resolution 9 (WTDC-98) which requires the Directors of ITU-D and ITU-R to develop a report on current and foreseen national uses of the radio-frequency spectrum, ITU-R Study Group 1 and ITU-D Study Group 2 have jointly developed a programme of work that leads towards the production of the required report.

As envisaged in the proposed work programme for the Joint Group on Resolution 9, the scope of the proposed work includes 1) collecting selected information from all Member States and all Sector Members of the Radiocommunication and Telecommunication Development Sectors, through the use of a two-part questionnaire distributed jointly by the Radiocommunication and Telecommunication Development Bureaux; 2) using the spectrum management expertise in the Joint Group on Resolution 9 to analyse the collected information; and 3) producing a report that will be reviewed by ITU-R Study Group 1 and ITU-D Study Groups 1 and 2.

See also paragraph 10.5 in this report.

10.2 Cooperation with ITU-T

ITU-R and ITU-T coordination was carried out through ICGs, rapporteurs and liaison statements. Coordination was also carried out between Directors of the Bureaux directly.

Liaison statements have been frequently exchanged throughout the study period, particularly on performance and availability issues (ITU-T Study Group 13), maintenance (ITU-T Study Group 4), synchronous digital hierarchy (SDH)-based network (ITU-T Study Group 15) and radio local area networks (RLAN) (ITU-T Study Group 7). Rapporteurs have actively and timely conveyed relevant information for both Sectors.

A meeting of ICG/SAT (Sophia Antipolis, France, from 10 to 12 August 1999) reviewed and updated the work programme on satellite related aspects of the ITU-T and ITU-R Study Groups and prepared reports on a number of topics including IP/Satellite related matters, service and network convergence and working methods. The RAG meeting reviewed its report and concluded that the ICG/SAT was serving a useful purpose and should be continued. Coordination will be extended to include ITU-D, which has nominated a representative to follow the work of ICG.

Both Sectors have recognized the overlapping issue between the studies of the proposed new ITU-R Study Group on Broadcasting and ITU-T Study Groups 9, 12 and 16. After considerable discussion, RAG agreed that every effort should be made to resolve the problems identified before RA-2000. In reviewing the proposed scope of the broadcasting Study Group, the principles in Annex 1 of Resolution ITU-R 6 would be taken into account. Informal discussions resulted in a possible amendment to the proposed scope of the new Study Group. It was stressed that any change to the proposed scope would have to be linked with appropriate mechanisms, to be adopted by RA-2000, to deal with the overlap of activities between ITU-R and ITU-T on broadcasting-related issues.

RAG also recognized that intersector coordination on IMT-2000 warranted special attention. It was agreed that increased informal coordination between the Chairpersons of the relevant ITU-R and ITU-T Study Groups would be beneficial.

Remaining issues in Resolution ITU-R 6 were also considered to need some revision. A draft baseline revision of Resolution ITU-R 6 can be found in Document RA2000/PLEN/6.

10.4 Cooperation with international and regional organizations

As in the past, the Bureau maintained close cooperation with many international and regional organizations with the following objectives: 1) to promote dialogue amongst bodies having common interests; 2) to help coordination, leading to more effective preparation for events such as WRCs; and 3) to keep ITU-R abreast of relevant activities in other organizations to help planning of work programmes. In these activities, an emphasis was given to the elimination of parallel studies with other organizations; this limits the risk of duplicating studies between ITU-R and other international organizations.

BR ensured liaison and cooperation with the UN Committee on the Peaceful Uses of Outer Space (UN-COPUOS), the International Maritime Organization (IMO), the International Maritime Satellite Organizations (IMSO), Cospas-Sarsat, CICR and ICAO with regard to the application of ITU treaty texts. BR experts also participated in various meetings of these organizations.

The BR also ensured liaison and cooperation with many regional organizations, and particularly with CEPT, CITEL, APT, WMO, ATU, etc., with an emphasis on the activities related to effective preparation for WRC-2000. Appropriate liaison and cooperation was also maintained with EBU, ABU, ASBU, WBU, IEC, ISO, ETSI, RCC, etc. The BR staff also followed URSI activities, RAST and COST Projects of relevance to ITU-R studies.

10.5 Resolution 72 (WRC-97)

WRC-97, by its Resolution 72 (see Annex D), instructed the Director of the Radiocommunication Bureau to consult the regional telecommunication organizations on the means by which assistance could be given to their preparations for future WRCs in a number of areas (organization of regional preparatory meetings, information sessions, development of coordination methods, identification of major issues, facilitation of regional and interregional meetings, convergence of interregional views on major issues) and to submit a report on the consultations to the Plenipotentiary Conference for consideration. WRC-97 also invited the Plenipotentiary Conference to consider the report submitted by the Directors of BR and BDT and take appropriate measures to provide the necessary resources for BR and BDT to provide the necessary assistance to regional telecommunication organizations in the preparations for WRCs.

The Director of the Radiocommunication Bureau wrote to the regional telecommunication organizations and received a number of comments, including several suggestions on how better to support preparatory meetings. Those suggestions included:

- the participation of an ITU official in regional coordination meetings to clarify any contentious or complex issues;
- the dissemination of relevant information through regional offices;
- the provision of regular briefing reports to generate discussion and identify the needs of the region;
- the granting of fellowships for participation in CPMs;
- the holding of informative seminars, particularly for the dissemination of information after a CPM;
- the provision of meeting facilities and technical support for informal groups seeking to consolidate positions.

The Plenipotentiary Conference adopted Resolution 80 on “World Radiocommunication Conference Process”. The PP resolved:

1 that world radiocommunication conference preparations and administration, including budgetary appropriations, should be planned on the basis of two consecutive world radiocommunication conferences; items which are recommended for inclusion in the agenda of the second world radiocommunication conference and for which study work is already under way shall be given priority when finalizing the agenda for that conference;

2 to support the regional harmonization of common proposals, as stated in Resolution 72 (WRC-97), for submission to world radiocommunication conferences;

3 to encourage both formal and informal collaboration in the interval between conferences with a view to resolving differences on new, or conference agenda issues.

It instructed the Director of the Radiocommunication Bureau to study, with advice from the Radiocommunication Advisory Group, ways of improving the preparations for, and the structure and organization of, world radiocommunication conferences, for consideration by the conference.

It also instructed the Secretary-General to encourage the participation of all Member States and Sector Members in addressing this issue.

As recommended in Document WRC2000/15, the Radiocommunication Bureau is of the view that Resolution 72 could now be suppressed.

11 Statistics

11.1 Financial report

DIRECT COSTS (CHF)	1998-1999 budget	1998-1999 expenditures	Balance as at 31-12-1999
Seminars	517 000	485 935	31 065

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 42-E
23 March 2000
Original: French

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Senegal (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

CHAPTER 1

IMT-2000, maritime and aeronautical issues

Agenda items 1.6 and 1.6.1

1.6 issues related to IMT-2000

1.6.1 review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Senegal proposes:

SEN/42/1

that each country should conduct a review in order to determine its short-term and long-term spectrum requirements for IMT-2000;

SEN/42/2

that no new spectrum allocation should be made for IMT-2000 during the period 2000-2010;

SEN/42/3

that IMT-2000 spectrum requirements should be met within the existing mobile service allocations;

SEN/42/4

candidate bands for preliminary extension may be identified by WRC-2000, and ITU-R should conduct the necessary feasibility studies for those bands, for approval at the next WRC;

SEN/42/5

that the introduction of IMT-2000 applications should not jeopardize any existing or essential space services;

SEN/42/6

that any constraints imposed on the satellite component of IMT-2000 should not be less stringent than existing regulatory constraints on the MSS.

Agenda item 1.7

1.7 review of the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting operational, distress and safety communications, taking into account Resolution **346 (WRC-97)**

Senegal proposes:

SEN/42/7

that precautions should be taken by radiotelephone distress communications operators in order to avoid interference;

SEN/42/8

that these frequencies should be reserved solely for distress and safety communications;

SEN/42/9

that each administration should take appropriate measures to prohibit use of these frequencies for ordinary calls;

SEN/42/10

that no amendments should be made to Appendix S27 in the near future;

SEN/42/11

that the HF frequency spectrum allocated to the aeronautical mobile (R) service should be safeguarded and protected.

Agenda item 1.18

1.18 to consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix **18/S18**, taking into account Resolution **342 (WRC-97)**

Senegal proposes:

SEN/42/12

that ITU should continue studies with a view to adopting new digital technology to improve efficiency in this band;

SEN/42/13

that until such technology becomes operational, measures should be taken in respect of the Radio Regulations to allow certain channels of Appendix S18/18 to be used in simplex mode in addition to duplex mode, in order to reduce congestion.

CHAPTER 2

Mobile-satellite and radionavigation-satellite services

Agenda item 1.9

1.9 to take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions **213 (Rev.WRC-95)** and **220 (WRC-97)**

Senegal proposes:

SEN/42/14

that sharing of the band 1 559-1 610 MHz between MSS and ARNS/RNSS should not be accepted;

SEN/42/15

that no allocation to the MSS should be made in the band 1 559-1 567 MHz;

SEN/42/16

Resolution 220 (WRC-97) should be deleted.

Agenda items 1.15.1, 1.15.2 and 1.15.3

1.15.1 to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Senegal proposes:

SEN/42/17

that in view of the fact that the band 960-1 215 MHz is allocated on a worldwide basis to the aeronautical radionavigation service (ARNS), further studies should be conducted before any additional allocation is made to the RNSS;

SEN/42/18

that adequate spectrum should be made available to GNSS systems.

1.15.2 to consider the addition of the space-to-space direction to the radionavigation-satellite service allocations in the bands 1 215-1 260 MHz and 1 559-1 610 MHz

Senegal proposes:

SEN/42/19

that the addition of the space-to-space direction for the RNSS in the bands 1 215-1 260 MHz and 1 559-1 610 MHz, given that analysis of the results of the studies shows that no additional interference will be caused to other services.

1.15.3 to consider the status of allocations to services other than the radionavigation-satellite service (Nos. **S5.355** and **S5.359**) in the band 1 559-1 610 MHz

Senegal proposes:

SEN/42/20

that the discontinuation, by 2015 at the latest, of the operation of fixed services in the frequency bands in Nos. S5.355 and S5.359 of the Radio Regulations.

CHAPTER 3

Non-GSO FSS issues

Agenda items 1.13, 1.13.1 and 1.13.2

1.13 on the basis of the results of the studies in accordance with Resolutions **130 (WRC-97)**, **131 (WRC-97)** and **538 (WRC-97)**

1.13.1 to review and, if appropriate, revise the power limits appearing in Articles **S21** and **S22** in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

1.13.2 to consider the inclusion in other frequency bands of similar limits in Articles **S21** and **S22**, or other regulatory approaches to be applied in relation to sharing situations

Senegal proposes:

SEN/42/21

that the necessary regulatory procedures should be developed to ensure protection of GSO BSS, GSO FSS and FS from interference which could be caused by non-GSO FSS systems operating in those bands;

SEN/42/22

that ITU-R should continue relevant studies in this regard.

CHAPTER 5

Appendices S30 and S30A

Agenda items 1.19, 1.19*bis* and 1.20

1.19 to consider the report of the inter-conference representative group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

1.19*bis* in accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board's Rules of Procedure relating to the application of No. 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference

1.20 to consider the issues related to the application of Nos. **S9.8**, **S9.9** and **S9.17** and the corresponding parts of Appendix **S5** with respect to Appendices **S30** and **S30A**, with a view to possible deletion of Articles 6 and 7 of Appendices **S30** and **S30A**, also taking into consideration Recommendation **35 (WRC-95)**

Senegal proposes:

SEN/42/23

the adoption of the draft BSS Plan at WRC-2000 on the basis of national coverage by 10 channels in a continuous band of 400 MHz for Region 1, as already successfully simulated by GTE;

SEN/42/24

that modifications to the Plans which are necessitated by existing systems or coordinated systems for which information has been submitted to ITU under Resolution 49 (WRC-97), or by regional systems which must enjoy priority owing to their importance for the development of the regions which they cover, should be entered in a list in annex to the Master International Frequency Register (MIFR), with a time-limit on the entry;

SEN/42/25

that the provisions of Articles 6 and 7 should be maintained as they stand in Appendices S30 and S30A;

SEN/42/26

the adoption of a new Plan, together with a review of current procedures, necessarily entailing the revision of certain articles of Appendices S30 and S30A.

CHAPTER 6

Fixed and fixed-satellite services

Agenda item 1.8

1.8 to consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Senegal proposes:

SEN/42/27

that no provision should be adopted authorizing the use of FSS earth stations on board vessels until all technical and regulatory aspects have been resolved, including the identification of the authorities responsible for such stations, and all costs pertaining to the coordination processes should be borne by the responsible administrations concerned.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 43-E
27 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Kazakstan (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

In 1999, in the Republic of Kazakstan, in the Table of Frequency Allocations, band allocation between the radio services of the Republic of Kazakstan was created within the framework of the TACIS Programme. The conditions of any frequency band use are specified in the notes to this table. Taking into account this circumstance, the Ministry, as a Member State of ITU, proposes the following:

Agenda item 1.1 - requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

Kazakstan proposes to:

MOD KAZ/43/1

S5.55 *Additional allocation:* in Armenia, Azerbaijan, Bulgaria, Russian Federation, Georgia, ~~Kazakstan,~~ Kyrgyzstan, Tajikistan, Turkmenistan and Ukraine, the band 14-17 kHz is also allocated to the radionavigation service on a primary basis.

MOD KAZ/43/2

S5.75 *Different category of service:* in Armenia, Azerbaijan, Belarus, Georgia, ~~Kazakstan,~~ Moldova, Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan, Ukraine and the Black Sea areas of Bulgaria and Romania, the allocation of the band 315-325 kHz to the maritime radionavigation service is on a primary basis under the condition that in the Baltic Sea area, the assignment of frequencies in this band to new stations in the maritime or aeronautical radionavigation services shall be subject to prior consultation between the administrations concerned.

MOD KAZ/43/3

S5.202 *Additional allocation:* in Saudi Arabia, Armenia, Azerbaijan, Belarus, Bulgaria, United Arab Emirates, Georgia, the Islamic Republic of Iran, Jordan, ~~Kazakstan,~~ Latvia, Moldova, Oman, Uzbekistan, Poland, Syria, Kyrgyzstan, Slovakia, the Czech Republic, Romania, Russian Federation, Tajikistan, Turkmenistan, Turkey and Ukraine, the band 136-137 MHz is also allocated to the aeronautical mobile (OR) service on a primary basis. In assigning frequencies to stations of the aeronautical mobile (OR) service, the administration shall take account of the frequencies assigned to stations in the aeronautical mobile (R) service.

MOD KAZ/43/4

S5.290 *Different category of service:* in Afghanistan, Armenia, Azerbaijan, Belarus, China, Japan, ~~Kazakstan,~~ Mongolia, Uzbekistan, Kyrgyzstan, Slovakia, the Czech Republic, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the allocation of the band 460-470 MHz to the meteorological-satellite service (space-to-Earth) is on a primary basis (see No. **S5.33**), subject to agreement obtained under No. **S9.21**.

MOD KAZ/43/5

S5.422 *Additional allocation:* in Saudi Arabia, Armenia, Azerbaijan, Bahrain, Belarus, Bosnia and Herzegovina, Brunei Darussalam, the Central African Republic, the Congo, Côte d'Ivoire, Cuba, Egypt, the United Arab Emirates, Eritrea, Ethiopia, Gabon, Georgia, Guinea, Guinea-Bissau, the Islamic Republic of Iran, Iraq, Israel, Jordan, ~~Kazakstan,~~ Lebanon, Malaysia, Mali, Morocco, Mauritania, Moldova, Mongolia, Nigeria, Oman, Uzbekistan, Pakistan, the Philippines, Qatar, Syria, Kyrgyzstan, Dem Rep. of the Congo, Romania, Russian Federation, Somalia, Tajikistan, Tunisia, Turkmenistan, Ukraine, Yemen, Yugoslavia and Zambia, the band 2 690-2 700 MHz is also allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis. Such use is limited to equipment in operation by 1 January 1985.

MOD KAZ/43/6

S5.428 *Additional allocation:* in Azerbaijan, Bulgaria, Cuba, ~~Kazakstan,~~ Mongolia, Poland, Kyrgyzstan, Romania, Turkmenistan and Ukraine, the band 3 100-3 300 MHz is also allocated to the radionavigation service on a primary basis.

MOD KAZ/43/7

S5.454 *Different category of service:* in Armenia, Azerbaijan, Belarus, Bulgaria, Georgia, ~~Kazakstan,~~ Mongolia, Uzbekistan, Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the allocation of the band 5 670-5 725 MHz to the space research service is on a primary basis (see No. **S5.33**).

MOD KAZ/43/8

S5.469 *Additional allocation:* in Armenia, Azerbaijan, Belarus, Bulgaria, Georgia, Hungary, ~~Kazakstan,~~ Lithuania, Moldova, Mongolia, Uzbekistan, Poland, Kyrgyzstan, Slovakia, the Czech Republic, Romania, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the band 8 500-8 750 MHz is also allocated to the land mobile and radionavigation services on a primary basis.

MOD KAZ/43/9

S5.473 *Additional allocation:* in Armenia, Austria, Azerbaijan, Belarus, Bulgaria, Cuba, Georgia, Hungary,~~ Kazakstan,~~ Moldova, Mongolia, Uzbekistan, Poland, Kyrgyzstan. Slovakia, the Czech Republic, Romania, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the bands 8 850-9 000 MHz and 9 200-9 300 MHz are also allocated to the radionavigation service on a primary basis.

MOD KAZ/43/10

S5.478 *Additional allocation:* in Azerbaijan, Bulgaria,~~ Kazakstan,~~ Mongolia, Kyrgyzstan, Slovakia, the Czech Republic, Romania, Turkmenistan and Ukraine, the band 9 800-10 000 MHz is also allocated to the radionavigation service on a primary basis.

MOD KAZ/43/11

S5.545 *Different category of service:* in Armenia, Azerbaijan, Belarus, Bulgaria, Georgia, ~~Kazakstan,~~ Mongolia, Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the allocation of the band 31-31.3 GHz to the space research service is on a primary basis (see No. **S5.33**).

MOD KAZ/43/12

S5.546 *Different category of service:* in Saudi Arabia, Armenia, Azerbaijan, Belarus, Bulgaria, Egypt, United Arab Emirates, Spain, Estonia, Finland, Georgia, Hungary, the Islamic Republic of Iran, Israel, Jordan,~~ Kazakstan,~~ Latvia, Lebanon, Moldova, Mongolia, Uzbekistan, Poland, Syria, Kyrgyzstan, Romania, the United Kingdom, Russian Federation, Tajikistan, Turkmenistan, Turkey and Ukraine, the allocation of the band 31.5-31.8 GHz to the fixed and mobile, except aeronautical mobile, services is on a primary basis (see No. **S5.33**).

MOD KAZ/43/13

S5.550 *Different category of service:* in Armenia, Azerbaijan, Belarus, Bulgaria, Georgia, ~~Kazakstan,~~ Mongolia, Uzbekistan, Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the allocation of the band 34.7-35.2 GHz to the space research service is on a primary basis (see No. **S5.33**).

Agenda item 1.15.1 - to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Kazakstan proposes to:

KAZ/43/14

on direction "space-to-Earth" **to consent** with the frequency band allocation for radionavigation satellites in the frequency range 1 164-1 184 MHz, **on condition that** the radionavigation-satellite earth stations will not be the reason of interference or to limit the development of the aeronautical radionagivation service;

on direction "Earth-to-space" **to consent** with the frequency band allocation for radionavigation satellite in the frequency range 1 300-1 350 MHz. The frequency band 5 000-5 030 MHz is used intensively by radio means and cannot be considered as a version for new allocations for radionavigation satellites.

Agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

Kazakstan proposes to:

KAZ/43/15

support the proposed transformation.

Agenda item 1.21 - to consider the report from the Radiocommunication Bureau on results of the analysis in accordance with Resolution 53 (WRC-97) and take appropriate actions

Kazakstan proposes to:

KAZ/43/16

support the work of the Radiocommunication Bureau; on the other issues of the agenda of the Assembly we support the positions of the Regional Commonwealth in the field of Communications (RCC).

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 45-E
10 April 2000
Original: Russian

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Armenia (Republic of), Azerbaijani Republic, Belarus (Republic of), Georgia, Kazakstan (Republic of), Moldova (Republic of), Uzbekistan (Republic of), Kyrgyz Republic, Russian Federation, Tajikistan (Republic of), Turkmenistan, Ukraine

PROPOSALS FOR THE WORK OF THE CONFERENCE

The above countries,

having regard to the need to ensure the smooth operation, future development and enhancement of operating and planned radio services, taking into account technological progress;

considering that decisions at the Conference should be taken on the basis of the need to balance the interests of operating and planned radio services and with due regard to the different technological and economic capabilities of ITU Member States;

seeking to strengthen international cooperation in the development of radiocommunication facilities and systems;

hereby make the following proposals:

Agenda item 1.2

RCC/45/1

We support adoption of the agreed results of the ITU-R studies on additions and amendments to Appendix S3, which would make the appendix more universal and logical, while keeping the same values for all the spurious emission limits for the transmitters of different services and applications.

Agenda item 1.3

RCC/45/2

We support adoption of the improved method of calculating coordination areas around earth stations developed by ITU-R, but nevertheless consider that further studies need to be carried out within ITU-R on the application of the methodology in order to ensure that there is not an unwarranted increase in the number of administrations affected in the coordination process.

We further consider that WRC-2000 should instruct ITU-R to develop a single software program for the calculation of coordination areas around earth stations in order to unify and simplify the coordination process.

Agenda item 1.4

RCC/45/3

We support the use of the frequency bands 31.8-33.4 GHz, 37-39.5 GHz, 40.5-42.5 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz by high-density systems in the fixed service, subject to the introduction of appropriate limits in order to permit sharing with other services, as specified in the CPM-99 Report.

We also support worldwide allocation of the band 40.5-42.5 GHz to the fixed-satellite service (space-to-Earth) on a primary basis, subject to limitation of aggregate pfd in order to protect the radio astronomy service in the band 42.5-43.5 GHz and the inclusion in the Radio Regulations of criteria to ensure the protection of terrestrial services, in line with the conclusions in the CPM-99 Report.

We consider that a definition of “high-density fixed service system” needs to be drawn up and included in the Radio Regulations.

Agenda item 1.5

RCC/45/4

We propose that no amendments be made to the Radio Regulations in respect of the use of high altitude platform stations in the fixed service, and that the time-frame in Resolution 122 be extended, so that additional studies may be carried out with a view to taking an appropriate decision at a future WRC.

Agenda item 1.6.1

RCC/45/5

With respect to the terrestrial component, we support the studies carried out by ITU, but nevertheless believe that the adoption of a decision on the allocation of additional frequency bands should not be considered before WRC-03, on the basis of practical experience once the commercial operation of IMT-2000 systems has started in existing allocations under No. S5.388 of the Radio Regulations. Thus, the RCC countries propose that no amendments be made at this Conference to the current provisions of the Radio Regulations in relation to additional allocations and frequency bands to be used by first- and second-generation cellular systems for the terrestrial component of IMT-2000, and that studies on such bands be pursued, focusing on the feasibility of their reallocation and use by IMT-2000 systems, with a view to taking an appropriate decision at a forthcoming WRC. It is also proposed that footnote S5.388 and Resolution 212 should be maintained as they stand.

With respect to the satellite component, we also propose that no amendments be made to the provisions of the Radio Regulations in relation to the current MSS allocations and that studies be continued within ITU for their possible identification as the space component for IMT-2000 systems.

We support the use of HAPs as base stations for IMT-2000 systems through the inclusion in the Radio Regulations of an appropriate footnote, as indicated in the CPM-99 Report.

Agenda item 1.6.2

RCC/45/6

We support the conclusion in the CPM-99 Report that there is no need for a global control channel.

Agenda item 1.7

RCC/45/7

We do not see any grounds for reallocating HF bands between the aeronautical mobile (R) and maritime mobile services, but we support the inclusion in the Radio Regulations of additional procedures designed to protect frequencies used for distress and safety communications in response to Resolution 346.

Agenda item 1.8

RCC/45/8

We propose that no amendments be made to the Radio Regulations in relation to the use of FSS stations on board vessels in the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz, since ITU-R studies have not yet been completed on various technical, regulatory and procedural aspects of such an application, in particular the lack of agreed criteria to ensure the operation and development of FS systems.

Agenda item 1.9

RCC/45/9

With respect to Resolution 220, we consider that the results of ITU-R studies and the CPM-99 Report clearly indicate that no part of the band 1 559-1 610 MHz can be allocated for the mobile-satellite service. Accordingly, we propose that no amendments be made to Article S5 and that Resolution 220 be deleted.

With respect to Resolution 213, we believe that the studies to identify a possible allocation (space-to-Earth) for the mobile-satellite service have not demonstrated the feasibility of allocating any portion of the band 1 350-1 525 MHz for the purpose at this Conference, and we therefore propose that the Radio Regulations should remain unchanged in this respect.

Agenda item 1.10

RCC/45/10

We support the conclusions of the CPM-99 Report on this item with a view to providing the necessary spectrum to accommodate the global maritime distress and safety system (GMDSS) and aeronautical mobile-satellite (R) service systems.

Agenda item 1.11

RCC/45/11

On the basis of the results of studies carried out in ITU-R, we propose that the provisions of the Radio Regulations relating to the existing allocations for non-GSO MSS below 1 GHz should not be modified and that new allocations for this service should not be adopted in that band.

As regards Resolution 219, we propose that the allocation of the band 405-406 MHz should not be modified, in view of the need to protect operation and development of the meteorological aids service in that band. Resolution 219 should be deleted.

Agenda item 1.12

RCC/45/12

We support the conclusion of CPM-99 to the effect that this agenda item may be resolved by means of ITU-R recommendations and does not require any amendment of the Radio Regulations. Resolution 121 may be deleted.

Agenda item 1.13

RCC/45/13

While understanding that a decision on the allocation of frequencies for non-GSO FSS is both important and necessary, we nevertheless propose that appropriate provisions be included in the Radio Regulations to give priority to the operation and development of GSO FSS and BSS systems in the planned bands.

We support including in the Radio Regulations the criteria indicated in the CPM-99 Report to protect operating and planned systems in the fixed service.

Agenda item 1.14

RCC/45/14

We support use of the frequency band 15.43-15.63 GHz by non-GSO MSS feeder links, subject to appropriate amendment of the Radio Regulations to limit the number of systems operating in this band to those in respect of which advance publication information is received by the Bureau before the end of WRC-2000, and to limiting pfd from such systems in the band 15.35-15.4 GHz in line with the conclusion in the CPM-99 Report in order to protect radio astronomy.

Agenda item 1.15.2

RCC/45/15

We support allocation of the frequency bands 1 215-1 260 MHz and 1 559-1 610 MHz to the radionavigation-satellite service (space-to-space) by modifying the Table of Frequency Allocations and inserting a footnote ensuring that there are no constraints for the development of existing or planned RNSS systems in these bands, as per Option A in the CPM-99 Report.

Agenda item 1.15.3

RCC/45/16

We propose a two-stage approach in respect of use of the band 1 559-1 610 MHz by the fixed service: maintaining primary status for FS until 2005, secondary status for FS from 2005 to 2015, followed by deletion of the FS allocation. The corresponding amendments should be made to footnotes S5.355 and S5.359.

Agenda item 1.16

RCC/45/17

We support the idea of a single worldwide frequency allocation above 71 GHz and the proposals formulated by the CEPT countries (Document WRC-2000/13, proposals EUR/13/154-188).

Agenda item 1.17

RCC/45/18

We support the 18.6-18.8 GHz allocation for the Earth exploration-satellite service on a primary basis in Regions 1 and 3, subject to inclusion in the Radio Regulations of the criteria specified in the CPM-99 Report to enable sharing with FS and FSS.

Agenda item 1.18

RCC/45/19

We support amendments to the Radio Regulations aimed at introducing and developing digital technologies in the maritime mobile service in the band 156-174 MHz, and the continuation of studies on the subject within ITU-R.

Agenda item 1.19

RCC/45/20

The studies that have been carried out since the end of WRC-97 show that it is basically feasible to establish a BSS plan providing each country with the equivalent of at least 10 analogue TV channels.

The studies have shown that the most complex replanning problem is the problem of compatibility of the new BSS plan with other services, in particular FSS, using the planned frequency band with equal rights. In order to resolve the problem of compatibility between the plan and other services, when developing the plan one has to either take existing services into account in the planning process or give the assignments in the new plan priority status in relation to other services.

It is proposed that the following principles be adopted for establishment of the BSS plan:

1) Provide all Regions 1 and 3 countries with a capacity at least equivalent to 10 analogue TV channels, while maintaining the proportions used in establishing the 1977 and 1997 Plans. The existing number of channels must be maintained for countries having more than 10 channels in the 1997 Plan.

2) Planning should be based primarily on national coverage. At the same time, account should be taken of the wishes of neighbouring countries for the allocation of unified orbital positions for the possible establishment of multinational systems.

3) In the planning, only digital transmission methods are to be used.

4) Where possible, specific requests of countries concerning orbital positions, frequency channels and feeder-link frequency band should be accommodated.

5) Planning must maintain and protect: plan frequency assignments which have been brought into service, and for which the date of bringing into service has been confirmed; plan frequency assignments which have not yet been brought into service but for which the date of bringing into service has been determined by a notice under Article 5 of Appendices S30/S30A and for which, where appropriate, information has been submitted in accordance with Resolution 49 (WRC-97). These assignments shall not claim greater protection than in the 1997 Plan.

6) Equitable access to the BSS orbit/spectrum resource shall be ensured, to which end in the planning a common arc for Regions 1 and 3 shall be maintained as was adopted in establishing the 1977 and 1997 Plans.

7) Countries’ requests concerning the establishment of subregional systems should be accommodated where possible. In this process, allocation of the orbit/spectrum resource to subregional systems shall not constrain allocation of the necessary resource to national systems.

8) Compatibility of the plan shall be ensured with other services in all three Regions having frequency assignments recorded in the frequency register, i.e. only with those which are compatible or have been coordinated with the existing (1997) or initial (1977) Plans.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 46-E

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Malaysia

PROPOSAL FOR THE WORK OF THE CONFERENCE

CONTRIBUTION TO RESOLUTION 86 (MINNEAPOLIS, 1998) - COORDINATION AND NOTIFICATION PROCEDURES FOR SATELLITE NETWORKS

With reference to the above-mentioned subject, the Malaysian Administration would like to submit, for review in accordance with Resolution 86 (Minneapolis, 1998), the following proposal on modification to footnote S5.502 of the Radio Regulations.

The Malaysian Administration proposes to modify footnote S5.502 of the Radio Regulations as follows:

MOD MLA/46/1

S5.502 In the band 13.75-14 GHz, the e.i.r.p. of any emission from an earth station in the fixed-satellite service ~~shall~~ should be at least 68 dBW~~, and should not exceed 85 dBW, with a minimum antenna diameter of 4.5 m~~. In addition the e.i.r.p., averaged over one second, radiated by a station in the radiolocation or radionavigation services towards the geostationary-satellite orbit shall not exceed 59 dBW.

Reasons:

1 The recent suppression of the Rules of Procedure concerning footnote S5.502 under Circular Letter CR/122 no longer considers an e.i.r.p. exceeding 85 dBW as the basis for an unfavourable finding.

2 The proposal to delete the requirement of a minimum antenna diameter of 4.5 m was made in view of the recent suppression of the Rules of Procedure concerning footnote S5.502 under Circular Letter CR/122.

This suppression indicates that fixed-satellite services operating in the frequency band 13.75-14 GHz are no longer required to accord any protection to the radiolocation or radionavigation services. Thus, administrations should be allowed to use a smaller antenna since interference due to side-lobe performance is minimal compared to higher transmitting power.

3 On the proposal of a “soft” limit instead of a “hard” limit on the e.i.r.p. requirement of at least 68 dBW in the frequency band 13.75-14 GHz, the Malaysian Administration believes that it should be an obligation of the responsible administration to meet this requirement.

Transmission of an e.i.r.p. level lower than 68 dBW would only result in unacceptable interference into ones own system. Instead, a reduction in power level would contribute less interference into other services operating in the same band. Thus, if a system is able to operate with an e.i.r.p. level lower than 68 dBW in the band 13.75-14 GHz, then they should be allowed to do so since this does not carry any negative impact on other services.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Malaysia

PROPOSAL FOR THE WORK OF THE CONFERENCE

CONTRIBUTION TO RESOLUTION 86 (MINNEAPOLIS, 1998) - FOOTNOTE S5.556A OF THE RADIO REGULATIONS

With reference to the above-mentioned subject, the Malaysian Administration would like to submit for review a proposal to disregard the power flux-density limit of footnote S5.556A of the Radio Regulations during the technical examination of satellite filings submitted prior to the implementation of this footnote.

The Malaysian Administration proposes that the Bureau disregard the power flux-density limit of footnote S5.556A of the Radio Regulations during the technical examination of satellite filings in the inter-satellite service (ISS) frequency bands of 54.25-56.9 GHz, 57-58.2 GHz and 59-59.3 GHz submitted prior to the implementation of footnote S5.556A based on the ITU trend of non-retroactive impact. It is therefore proposed that footnote S5.556A be modified as follows:

MOD MLA/47/1

S5.556A Use of the bands 54.25-56.9 GHz, 57-58.2 GHz and 59-59.3 GHz by the inter-satellite service is limited to satellites in the geostationary-satellite orbit. The single-entry power flux-density at all altitudes from 0 km to 1 000 km above the Earth’s surface produced by a station in the inter-satellite service, for all conditions and for all methods of modulation, shall not exceed –147 dB(W/m^2/100 MHz) for all angles of arrival. This limitation shall not be applicable to satellite filings submitted prior to the implementation of this footnote.

Reasons:

1 WRC-97 approved the addition of footnote S5.556A of the Radio Regulations. This footnote permits only the operation of geostationary-satellite (GSO) networks in the ISS band of 54.25-56.9 GHz, 57-58.2 GHz and 59-59.3 GHz. In addition, a limitation on the power flux-density produced by a station operating in these bands in the inter-satellite service was also implemented.

The Malaysian Administration fully supports the limitation of GSO networks in the ISS frequency bands of 54.25-56.9 GHz, 57-58.2 GHz and 59-59.3 GHz. However, we request that the Bureau disregard the power flux-density limitation for satellite filings submitted prior to the implementation of footnote S5.556A based on the ITU trend of non-retroactive impact.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Document 48-E
29 March 2000

PLENARY MEETING

Malaysia

PROPOSAL FOR THE WORK OF THE CONFERENCE

CONTRIBUTION TO RESOLUTION 86 (MINNEAPOLIS, 1998) - INTER-SATELLITE LINK BETWEEN GSO AND NON-GSO SYSTEMS

With reference to the above-mentioned subject, the Malaysian Administration requests that WRC-2000 establish a competent study group to address and develop a method to calculate interference probability for communication in the inter-satellite link (ISL) between geostationary (GSO) and non-GSO systems.

MLA/48/1

The Malaysian Administration requests that WRC-2000 establish a competent study group to address and develop a method to calculate interference probability for communication in the inter-satellite link (ISL) between geostationary (GSO) and non-GSO systems.

Reasons: Due to the unavailability of a method to calculate the interference probability for communication in the ISL between GSO and non-GSO systems, satellite filings with communication links between GSO and non-GSO are being penalized by the Bureau with the following statement:

“These frequency assignments are not subject to the coordination procedure and are included in this publication for **information purposes only**.”

Prior to the establishment of such a method, the Bureau should not give any conclusive findings that would penalize the notifying administrations.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 49-E
29 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Malaysia

PROPOSAL FOR THE WORK OF THE CONFERENCE

Agenda item 1.8 - to consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

With reference to the above-mentioned subject, the Malaysian Administration supports the CPM's view on the use of the bands 3 700-4 200 MHz and 5 925-6 425 MHz by earth stations on board vessels (ESVs) to provide wideband services to cruise liners, passenger ships, naval vessels, seismic research, petroleum vessels and other deep draft vessels.

However, the Malaysian Administration believes that the request to study for possible extension of the bands for ESV operation should not be conducted until the results of the compatibility of sharing the bands 3 700-4 200 MHz and 5 925-6 425 MHz between ESV and other systems is established.

Therefore, the Malaysian Administration would like to submit for review, the following proposal.

MLA/49/1

The Malaysian Administration proposes that the implementation of the bands 3 700-4 200 MHz and 5 925-6 425 MHz for use by ESVs be given the utmost priority.

Only upon the successful implementation of the ESV service in this band with the assurance that no harmful interference would be caused to other systems, should the study for potential extension to the other frequency bands for ESV operation be carried out.

Reasons:

1 The proposed system utilizing the bands 3 700-4 200 MHz and 5 925-6 425 MHz has not been implemented and is still undergoing a rigorous developmental process. Thus, it is important to ensure that the operation and technical limits of the ESV system is sufficient for the protection and future growth of other systems operating in the same frequency bands.

2 It is vital to evaluate the severity of the impact of ESVs into other systems sharing the same service (especially existing systems) in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, prior to conducting the study on expansion to other frequency bands.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Addendum 1 to Document 51-E
19 May 2000
Original: English

COMMITTEE 5

Malaysia

PROPOSAL FOR THE WORK OF THE CONFERENCE

Agenda item 1.16 - to consider the allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 (WRC-97)

With a view to accommodating the need for additional frequency bands above 71 GHz to satisfy user requirements for passive sensing of the Earth's environmental conditions, the Malaysian Administration would like to submit for review the following proposal as a compromise solution to space stations with frequencies in the proposed modified band, for which complete Appendix S4 coordination information or notification information, is considered as having been received by the Bureau by the end of WRC-2000.

MLA/51/2

The Malaysian Administration proposes that space stations with frequencies in the proposed modified bands, for which complete Appendix S4 coordination information or notification information, is considered as having been received by the Bureau by the end of WRC-2000, shall be permitted the following:

a) to resubmit the relevant Appendix S4 information, while retaining the original dates of receipt;

b) the resubmitted Appendix S4 coordination information or notification information shall be excluded from the cost-recovery procedures;

c) the Bureau shall allow sufficient time to the responsible administration for the preparation to resubmit the Appendix S4 coordination information or notification information.

Reasons:

a) A non-retroactive impact on space stations with frequencies in the proposed modified band, for which complete Appendix S4 coordination information or notification information, is considered as having been received by the Bureau by the end of WRC-2000.

b) The resubmitted Appendix S4 coordination information or notification information should not be treated as a new filing. Thus, cost-recovery procedures should not apply.

c) In view of the proposed change in direction of the frequency bands 71-74 GHz and 81-84 GHz, a new set of the design budgets for these space stations would have to be created.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Malaysia

PROPOSAL FOR THE WORK OF THE CONFERENCE

Agenda item 1.16 - to consider the allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 (WRC-97)

With reference to the above-mentioned subject, the Malaysian Administration recognizes the importance of proper consideration of science service issues and is aware of the need for additional frequency bands above 71 GHz to satisfy user requirements for passive sensing of the Earth's environmental conditions.

However, the Malaysian Administration believes that any modifications to the Table of Frequency Allocations should not have any impact to space stations with frequencies in the proposed modified band, for which complete Appendix S4 coordination information, or notification information, is considered as having been received by the Bureau by the end of WRC-2000.

Therefore, the Malaysian Administration would like to submit for review, the following proposal.

MLA/51/1

The Malaysian Administration proposes that any modifications to the Table of Frequency Allocations should not have any impact to space stations with frequencies in the proposed modified band, for which complete Appendix S4 coordination information, or notification information, is considered as having been received by the Bureau by the end of WRC-2000.

Reasons:

1 There would be a severe impact to the development process of space stations, which have already submitted to the Bureau Appendix S4 coordination information or notification information, frequencies in the proposed modification bands.

Furthermore, the trend in ITU is based on non-retroactive impact. Hence, the space stations, which have submitted the Appendix S4 coordination information or notification information, should not be affected by any future modification to the Radio Regulations.

2 In view of the current trend of wideband transmissions for multimedia applications and technological advancement, it is inevitable that the frequency bands above 71 GHz for the fixed-satellite service will be used in the near future.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Australia

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.6.1 - IMT-2000 terrestrial component

1 Introduction

The issue is the need to identify global additional frequency bands for the terrestrial component of IMT-2000, beyond those identified in No. S5.388, to satisfy future spectrum requirements, which have been based on projected market demand.

2 Proposals

AUS/52/1

Australia supports APT proposals ASP/20/1 to ASP/20/7.

Reasons: In reaching its conclusions on the preference for the two bands identified, Australia has taken into account further detailed study of the future requirements in major Australian centres, the possible transition options for current second generation systems to third generation and the extensive use of alternate bands elsewhere in Region 3 and the other Regions for other services. The Australian studies, based on traffic estimates at 2010, have shown that the geographic area where the peak demand may be needed is limited to the dense central business districts of cities with populations in excess of 3 to 4 million. Outside the central business district the spectrum demand falls at least 50%. This allows for reasonable geographic sharing arrangements to be put in place on a national basis.

ADD AUS/52/2

RESOLUTION ZZZ (WRC-2000)

Implementation of IMT-2000 and requirements for further studies

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that ITU-R has recommended the 1-3 GHz range as the most suitable for IMT-2000;

b) that WARC-92 identified the bands 1 885-2 025 MHz and 2 110 -2 200 MHz, intended for use on a worldwide basis for IMT-2000, including the bands 1 980-2 010 MHz and 2 170-2 200 MHz for the satellite component of IMT-2000 in No. **S5.388** and under the provisions of Resolution **212 (Rev.WRC-97)**;

c) that WRC-2000 has updated the identification of frequency bands suitable for IMT-2000 including the identification of additional spectrum for advanced mobile spectrum in the context of IMT-2000;

d) that all or portions of the bands identified for IMT-2000 are currently used by either first or second generation mobile services or other radiocommunication services;

e) that Recommendation ITU-R M.1308 addresses the evolution of existing mobile communication systems to IMT-2000;

f) that the sharing implications between services sharing the bands identified for IMT-2000 in [Nos. **S5.388**, **S5.AAA** and **S5.BBB**] have not been fully studied;

g) that administrations may have differing requirements for IMT-2000 spectrum allocations and other services sharing the bands identified;

h) that the amount of spectrum for IMT-2000 identified by WRC-2000 may not completely satisfy the expected requirements of all administrations;

i) [that WRC-02/03 will have on its agenda the review of radiolocation allocations in the band 2 700-3 400 MHz under agenda item 2.6,]

noting

a) that all or parts of the 1 710-1 785/1 805-1 885 MHz bands in Regions 1 and 3 and 1 850-1 910/1 930-1 990 in Region 2 are used by administrations for second generation mobile communication systems and the operators of such systems may wish to use these bands for IMT-2000;

b) that community sensitive services such as broadcasting-satellite services are in operation or planned by several Region 1 and Region 3 administrations in the band 2 500-2 690 MHz which will affect the possibility for development of that band for IMT-2000 for those administrations;

c) that the differential requirements between the areas of maximum demand and the areas outside the central business districts of large cities may offer previously untested sharing opportunities;

d) that not all administrations may need, or be able to implement, all of the IMT-2000 extension bands identified at this Conference due to the existing services,

recognizing

a) that administrations might decide to make available, according to their own market demand and using their own timeframe, only portions of the frequency bands identified for IMT-2000 and might also impose operational and technical constraints on IMT-2000 in order to facilitate co-frequency sharing with other existing services;

b) that administrations might take into account the results of the ITU-R work as mentioned in *requests ITU-R* 1 and 2 before introducing IMT-2000 systems in the additional bands,

resolves to invite administrations

to make available, based on market demand, extension bands, up to the projected requirements of 160 MHz; for the terrestrial component of IMT-2000 to meet the forecasted growth of these systems, giving due consideration to the benefits of harmonized utilization of the spectrum for the terrestrial component of IMT-2000, taking into account the use of these bands by the other services to which these bands are allocated,

requests ITU-R

1 to study the feasibility of sharing appropriate bands listed as candidate bands in the CPM Report to WRC-2000 as suitable for IMT-2000, in particular the 2 520-2 670 MHz band, and to report to WRC-02/03 on the results of this study, and on the need for identifying additional usable spectrum for IMT-2000 in these bands;

2 to develop frequency arrangements for operation of IMT-2000 in the spectrum identified in [Nos. **S5.388, S5.AAA** and **S5.BBB**] of this Conference, aiming to accommodate the evolution of first and second generation mobile communication systems to IMT-2000,

further resolves

1 that these studies should be commenced forthwith;

2 that these frequency arrangements should be published by ITU-R in one or more Recommendations.

Reasons: While the CPM Report to WRC-2000 identified some of the difficulties applying in the bands considered suitable for IMT-2000, the sharing implications for the other services allocated in these bands could be examined further to see what sharing opportunities can be employed by administrations when implementing IMT-2000 and to see if there are further suitable bands that can be identified for IMT-2000.

PLENARY MEETING

Australia

PROPOSAL FOR THE WORK OF THE CONFERENCE

Agenda item 1.13.1 - proposed modification to Section VI of Article S22

1 Introduction

Annex 7 to Chapter 3 of the CPM Report provides three options for possible modification to Section VI of Article S22. Australia has considered all of these options and makes the following conclusions:

- Option 1 - This option will not provide protection from interference to the new non-GSO FSS networks from high e.i.r.p. GSO earth stations.
- Option 2 - This option establishes sharing criteria which limits off axis e.i.r.p. to facilitate sharing between non-GSO and GSO networks.
- Option 3 - This option would require incorporation by reference from a yet to be developed Recommendation, require action by a future conference and is therefore not viable.

2 Proposal

AUS/53/1

Australia proposes option 2 of Annex 7 of Chapter 3 of the CPM Report.

PROPOSAL FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.13.1 - CRITERIA AND PROCESS FOR RESOLUTION OF POSSIBLE MISAPPLICATION OF NON-GSO FSS SINGLE-ENTRY LIMITS IN ARTICLE S22 [Rev.WRC-2000]

1 Introduction

The CPM had a clear intention to disallow misapplication of single-entry limits. The CPM Report acknowledges this in *considering i)* of the example Resolution WWW and in § 3.1.2.4.10 invites administrations to make proposals on how to regulate possible misapplication of single-entry limits.

The most common understanding of the term “misapplication” is that the single-entry criteria should not be applied in a given case where it is attempted to split a satellite network into two or more parts in such a manner that each part meets the single-entry criteria and thus gets through the hurdle of single-entry limits, whereas without such splitting, the network consisting of the sum total of these parts would have been disallowed by application of single-entry limits. See Attachment 1 for the example of splitting.

While the example in Attachment 1 is sufficient for understanding the basic issue and to identify that there is a problem, a little more thought is needed to develop a regulation to overcome the resultant difficulty in effective application of single-entry limits. This is because there are other ways to bypass single-entry limits. At least one other way to bypass single-entry limits is to combine, at the implementation stage, networks of what may appear at the filing stage to be two different corporate entities filing two different networks. See Attachment 2 for the example of combining.

2 Considerations for finding a solution

It is therefore necessary that the regulatory solutions focus not just on “the splitting of networks” but “combining of networks” as well. While disallowing “splitting or combining of networks” as a regulatory threshold criterion though, reasonable allowance needs to be made for the fact that some applications will use two or more different networks at certain times. The key then is to define certain limits in a way that will allow single-entry criteria to work effectively in practice, while at the same time allowing certain practical combinations of networks up to a point, from time to time.

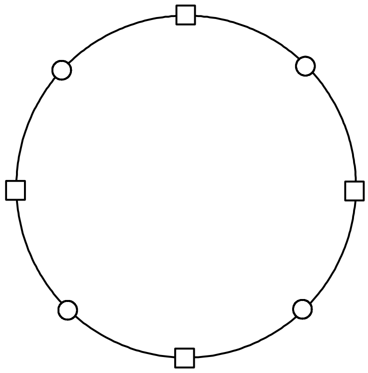
3 Way forward

Australia has developed a draft regulatory text needed to define and deal with such misapplication in attached Resolution QQQ and its Annex 1. See proposal at Annex A.

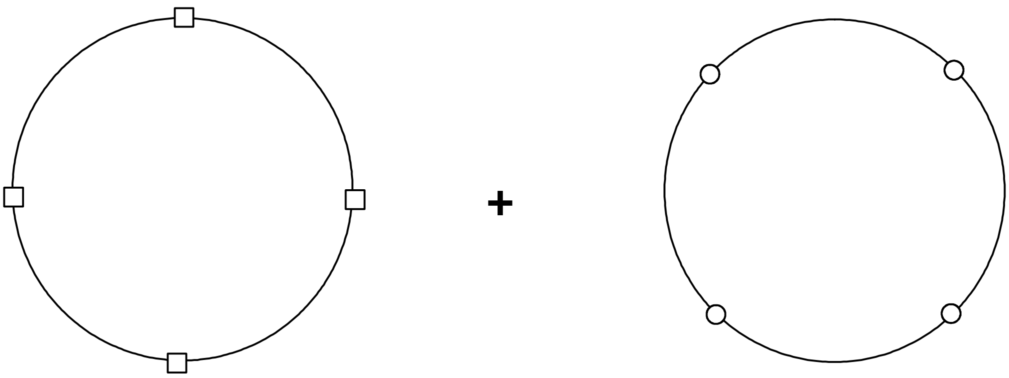
ATTACHMENT 1

Example of splitting

Before splitting: The whole network - as a single network - does not meet single-entry limits



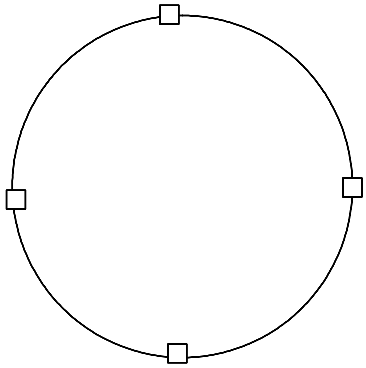
After splitting: When broken into two (or more) parts, each part network meets single-entry limits.



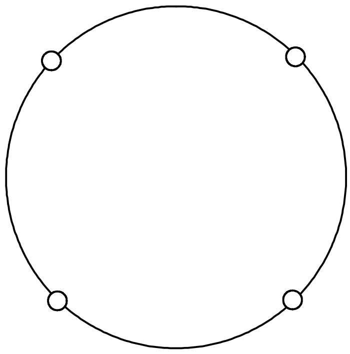
ATTACHMENT 2

Example of combining

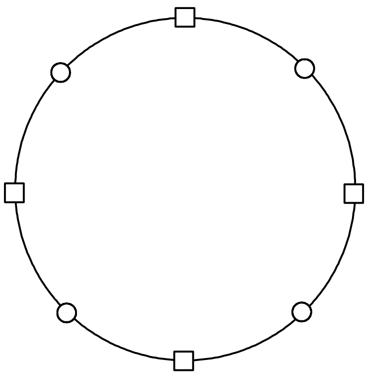
At filing stage (before combining): XYZ Ltd. owns network A. Network A meets single-entry limits.



At filing stage (before combining): ABC Ltd. owns network B. Network B meets single-entry limits.



At implementation stage (after combining): XYZ Ltd. and ABC Ltd. combine networks A and B to implement end-to-end non-GSO services full-time (if filed as such, the total of networks A and B will fail to meet the single-entry limits).



ANNEX A

Proposed new Resolution QQQ

ADD AUS/54/1

RESOLUTION QQQ (WRC-2000)

CRITERIA AND PROCESS FOR RESOLUTION OF POSSIBLE MISAPPLICATION OF NON-GSO FSS SINGLE-ENTRY LIMITS IN ARTICLE S22 [Rev.WRC-2000]

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the non-GSO FSS single-entry limits in Article **S22** [Rev.WRC-2000] are based on certain assumptions as acknowledged in *considering d)* of Resolution [**WWW** in the CPM Report for WRC-2000];

b) that [as per section 3.1.2.4.10 of the CPM Report] these single-entry limits can be misapplied;

c) that misapplication of single-entry limits should be avoided,

noting

a) that the Resolution [**WWW**] [CPM Report for WRC-2000] in *considering i)* also calls for misapplication of single-entry limits to be avoided;

b) [that the CPM Report for WRC-2000 in section 3.1.2.4.10 calls for misapplication of single-entry limits to be avoided and the CPM Report invites administrations to make proposals to that effect],

recognizing

a) that misapplication of single-entry limits can reduce the number of competing non-GSO FSS systems;

b) that misapplication of single-entry limits can lead to differing regulatory regime for non-GSO FSS systems meeting limits with respect to non-GSO FSS systems capable of misapplying such limits;

c) that misapplication of single-entry limits can disadvantage non-GSO FSS systems meeting, and intending to always meet, single-entry limits in Article **S22** [Rev.WRC-2000],

resolves

1 that misapplication of single-entry limits shall not be permitted;

2 that BR shall determine if and when misapplication of single-entry limits has occurred or will occur based on the process described in Annex 1;

3 that BR shall take necessary steps to avoid misapplication of single-entry limits as described in this Resolution;

4 that all concerned administrations, [and Sector Members], when so requested by BR to provide information or assistance as needed by BR for analysing or resolving the situation arising out of possible misapplication of single-entry limits in accordance with this Resolution, should provide requested information and assistance;

5 that BR, shall develop and apply a Rule of Procedure in the interim period to implement the process in this Resolution and in Annex 1 to prevent misapplication of single-entry limits occurring or recurring;

6 that the Rule of Procedure shall be submitted to the next competent conference for consideration;

7 that BR shall develop and submit appropriate text to the next competent conference to incorporate such a Rule of Procedure within the Radio Regulations;

8 that the administrations and Sector Members concerned should, in the spirit of cooperation, take adequate steps to ensure that the repetition of a situation resolved by BR does not recur,

requests

the Secretary General of ITU to note this Resolution in the context of Article 1 of the ITU Convention.

ANNEX 1 TO RESOLUTION QQQ (WRC-2000)

Process to be followed by BR in developing and implementing a Rule of Procedure to avoid misapplication of non-GSO FSS single-entry limits in Article S22 [Rev.WRC-2000]

1 In determining the following, BR will take all information available to it, or made available to it, into account in arriving at a decision or at a course of action to ensure that the requirements of Resolution **QQQ** are met.

2 For the purpose of determining if misapplication of non-GSO FSS single-entry limit has occurred or will occur, BR will take a view that two or more non-GSO FSS networks, each meeting single-entry limits in Article **S22** [Rev.WRC-2000], and filed as separate networks with ITU, will be deemed to be separate networks each meeting single-entry limits, except where:

a) one of these non-GSO FSS networks uses or proposes to use the whole or part of the other non-GSO FSS network(s)' space resources for more than [10%] of time; or

b) one of these non-GSO FSS networks uses or proposes to use more than [20%] of other non-GSO FSS network(s)' space resources for more than [5%] of time within any period of [30] days.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Australia, Korea (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.13.1

COORDINATION PROCEDURE BETWEEN NON-GSO FSS AND GSO FSS SERVICES HAVING VERY LARGE ANTENNAS

1 Introduction

WRC-97 adopted provisional equivalent power flux-density down ($epfd_{down}$) limits for systems in a non-geostationary orbit (non-GSO) in certain frequency bands in the fixed-satellite service (FSS) in order to facilitate sharing with FSS networks in the geostationary orbit (GSO).

The Conference Preparatory Meeting (CPM) reported that:

"Some links with very large earth station antennas may not be adequately protected by the $epfd_{down}$ limits proposed in Annex 1. The following points were agreed regarding GSO FSS networks having earth stations with very large antennas:

- Transmissions to earth stations with very large antennas need to be protected, and thus it may be desirable that they be treated separately. A coordination procedure would be one possible mechanism to ensure this protection.
- Downlink transmissions to very large GSO earth station antennas are most sensitive to interference. This sensitivity is more related to the availability degradation than to the potential for synchronization loss (i.e. the 100% $epfd_{down}$ value).
- For very large GSO earth station antennas, the following factors would facilitate achieving mutually satisfactory coordination:
  – Non-GSO interference $epfd_{down}$ levels at or near the maximum are likely to occur over only a small proportion of the Earth's surface.
  – The locations of interference $epfd_{down}$ levels at or near the maximum are likely to differ from one non-GSO system to another.
- Coordination would be triggered for GSO FSS networks having very large earth station antennas meeting all of the following conditions:

- Earth station antenna maximum isotropic gain (APS4/C.10 *c)* 2)) of 64 dBi or higher for the band 10.7-12.75 GHz and 68 dBi or higher for the bands 17.8-18.6 GHz and 19.7-20.2 GHz, which corresponds to approximately 18 metres.
- G/T_l of 44 dB/K or higher, where G is earth station antenna maximum isotropic gain and T_l (APS4/C.10 *c)* 5)) is the lowest total system receiving noise temperature which includes the earth station noise temperature, retransmitted uplink noise, cross-polarization noise, inter-modulation noise, and any other internal link noise sources. The link noise temperature as defined herein excludes external noise sources.
- Space station emission bandwidth (APS4/C.7 *a)*) of 250 MHz or higher for the band 10.7-12.75 GHz and 800 MHz or higher for the bands 17.8-18.6 GHz and 19.7-20.2 GHz.

• In addition to the conditions indicated in the preceding point, the coordination trigger should contain the condition of the $epfd_{down}$ level radiated by the non-GSO FSS system into the earth station employing the very large antenna considered when this earth station is pointed to the wanted GSO satellite. Two $epfd_{down}$ values in each band would be needed and exceeding either $epfd_{down}$ would trigger coordination. Coordination would be triggered if the $epfd_{down}$ exceeds:

- either –174.5 dB(W/(m^2 · 40 kHz)) for any percentage of time or [x] dB(W/(m^2 · 40 kHz)) for [y]% of the time in the frequency band 10.7-12.75 GHz;
- either –151 dB(W/(m^2 · MHz)) for any percentage of time or [x'] dB(W/(m^2 · MHz)) for [y']% of the time in the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz.

These $epfd_{down}$ threshold criteria would be sufficiently conservative to trigger coordination. A reference to these $epfd_{down}$ thresholds is needed in Appendix S5.

• Based on the responses to Circular Letter CR/115, setting the threshold size of very large GSO earth station antennas at 64 dBi in the band 10.7-12.75 GHz and 68 dBi for the bands 17.8-18.6 GHz and 19.7-20.2 GHz clearly indicates that there would be few cases requiring coordination.

• Additional regulatory and procedural conditions (e.g. due diligence provisions) may be needed to reduce the number of cases requiring coordination.

• The conditions required to initiate coordination would be that the notifying administration provide the specific earth station location (APS4/C.10 *b)*) and satellite location (APS4/C.10 *a)*) and that BR check that all conditions required to initiate coordination are met.”

The CPM was unable to agree on the values for the $epfd_{down}$ triggers and further studies have been performed within Study Group 4 to develop these values.

Subsequent studies have demonstrated that neither the WRC-97 provisional equivalent power flux-density ($epfd_{down}$) limits and associated percentages of time adequately protect existing fixed-satellite service (FSS) networks in geostationary-satellite orbit (GSO) with very large earth station antennas.

Working Party 4A has agreed the following text for inclusion in the WP 4A Chairperson’s Report and the ITU-R SG 4 Chairperson’s Report to RA-2000:

“Studies demonstrated that neither WRC-97 provisional equivalent power flux-density ($epfd_{down}$) limits and associated percentages of time nor the proposed modifications agreed during ITU-R studies adequately protect existing fixed-satellite service (FSS) networks in geostationary-satellite orbit (GSO) with very large earth station antennas. Coordination triggers based on the characteristics of the satellite network using the GSO were agreed by ITU-R and confirmed by CPM-99. In addition to the GSO network triggers, it was decided to include the condition of the $epfd_{down}$ radiated by the non-GSO FSS system. CPM-99 proposed that two values would be needed in each band and that exceeding either $epfd_{down}$ value would trigger coordination, requesting that WP 4A carry out studies to enable further advice to be given to RA-2000 on the issue of coordination triggers for very large earth station antennas (CPM Report, section 3.1.2.1.2 e)).

On the basis of additional studies, WP 4A agreed that coordination should be triggered if the $epfd_{down}$ radiated by the non-GSO FSS system exceeds the following values:

- –174.5 dB(W/(m^2 · 40 kHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or
  –202 dB(W/(m^2 · 40 kHz)) for any percentage of the time for non-GSO systems with any satellites operating above 2 500 km altitude in the frequency band 10.7-12.75 GHz;
- –157 dB(W/(m^2 · MHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or
  –185 dB(W/(m^2 · MHz)) for any percentage of the time for non-GSO systems with any satellites operating above 2 500 km altitude in the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz.

It was agreed that the first trigger in each band would apply to non-GSO systems operating in low-Earth orbit and that the second trigger in each band would apply to non-GSO systems in other orbits. This solution has the advantage that it reflects the expected interference situation and eases the burden on BR to identify affected administrations and perform the necessary calculations. WP 4A also agreed that the trigger applying to non-GSO systems in low-Earth orbit in the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz should be reduced from –151 dB(W/(m^2 · MHz)) to –157 dB(W/(m^2 · MHz)).”

2 Proposals

Proposed coordination procedure between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antennas

These proposals are based on the example of modifications to the Radio Regulations given in Annex 3 to Chapter 3 of the CPM Report. The text has been changed only where it is necessary to reflect the output of Study Group 4, Working Party 4A.

ARTICLE S9

Sub-Section IIA – Requirement and request for coordination

ADD AUS/KOR/55/1

S9.7A a1)[12bis, 13bis] for a specific earth station within a geostationary-satellite network in the fixed-satellite service in certain frequency bands in respect of a non-geostationary-satellite system in the fixed-satellite service;

ADD AUS/KOR/55/2

S9.7B a2) [12bis, 13bis] for a non-geostationary-satellite system in the fixed-satellite service in certain frequency bands in respect of a specific earth station within a geostationary-satellite network in the fixed-satellite service;

ADD AUS/KOR/55/3

12*bis* **S9.7.A.1** and **S9.7.B.1** The coordination of a specific earth station under **S9.7A** or **S9.7B** shall remain within the authority of the administration having this station located on its territory.

ADD AUS/KOR/55/4

13*bis* **S9.7.A.2** and **S9.7.B.2** Coordination information relating to a specific earth station received by the Bureau prior to [date to be established by WRC-2000] is considered as complete **S9.7A** or **S9.7B** information from the date of receipt of complete information of the associated satellite network under **S9.7** provided that the characteristics of the specific earth stations are within the parameters of any typical earth station included in the GSO FSS network coordination request.

(MOD) AUS/KOR/55/5

~~12~~13*ter* **S9.8.1** and **S9.9.1** Application of this provision with respect to Articles 6 and 7 of Appendices **S30** and **S30A** is suspended pending a decision of WRC-99 on the revision of these two Appendices.

Reasons: GSO FSS earth stations with very large antennas may not be adequately protected by the $epfd_{down}$ limits contained in Table MOD S22-1 and case-by-case coordination of systems operating co-frequency, co-directional links in the space-to-Earth direction would then be required. The proposed ADD S9.7A and ADD S9.7B would require coordination between non-GSO FSS transmit satellites and GSO FSS receive earth stations with very large antennas. By referring to coordination provisions under S9.7A and S9.7B, the request for coordination would be sent by the requesting administration to the Bureau under S9.30. The Bureau would act under S9.34 to identify administrations with which coordination may need to be effected and publish the information in the Weekly Circular. Since coordination between a non-GSO FSS space station and very large GSO FSS earth stations is a new type of coordination that does not currently exist in Article S9, it is necessary to add two new entry points in Article S9:

- One entry point to enable the non-GSO space station administration to request coordination with administrations having specific very large earth station antennas located on their territory.

- Another entry point to enable the reciprocal coordination to take place, i.e. the possibility for an administration planning to implement a specific very large GSO earth station stations located on their territory to request coordination with administrations having non-GSO FSS transmit space.

TABLE **S22-4**1

ADD AUS/KOR/55/6

[1] For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

Reasons: Case-by-case coordination is required by the proposed modifications in ADD S9.7A and ADD S9.7B.

ARTICLE S11

Section II – Examination of notices and recording of frequency assignments in the Master Register

MOD AUS/KOR/55/7

S11.32A *c)* with respect to the probability of harmful interference that may be caused to or by assignments recorded with a favourable finding under Nos. **S11.36** and **S11.37** or **S11.38**, or recorded in application of No. **S11.41**, or published under Nos. **S9.38** or **S9.58** but not yet notified, as appropriate, for those cases for which the notifying administration states that the procedure for coordination under No. **S9.7, S9.7A or S9.7B** could not be successfully completed (see also No. **S9.65**);[10] or

MOD AUS/KOR/55/8

---

[10] **S11.32A.1** The examination of such notices with respect to any other frequency assignment for which a request for coordination under Nos. **S9.7, S9.7A or S9.7B** has been published under No. **S9.38** but not yet notified shall be effected by the Bureau in the order of their publication under the same number using the most recent information available.

Reasons: The insertion of a coordination trigger related to epfd$_{down}$ level radiated by the non-GSO FSS system into the earth station employing the very large antenna considered when this earth station is pointed to the wanted GSO satellite provides a mechanism to examine the notice with respect to the probability of harmful interference that may be caused to or by above-listed assignments, and therefore S11.38 and S11.41 are applicable.

MOD to Appendix S4

The required characteristics for coordinating specific very large GSO earth stations with non-GSO FSS transmit space stations could be items for “Notification or coordination of a GSO network (including Appendix **S30B**)” or “Notification or coordination of an earth station”.

ANNEX 2B

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 56-E
30 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Australia

PROPOSAL FOR THE WORK OF THE CONFERENCE

Agenda item 1.13 - proposed modification to footnote No. S5.502

1 Introduction

The band 13.75-14 GHz is allocated on a co-primary basis to the fixed-satellite service and the radiolocation service.

Radio Regulation No. S5.502, prescribes sharing conditions based on a minimum e.i.r.p. requirement of +68 dBW for fixed-satellite service earth stations coupled with the maximum e.i.r.p. restriction on the radiolocation service.

Some systems operating in the fixed-satellite service may be able to share successfully with the radiolocation service whilst using an e.i.r.p. of less than the +68 dBW required by No. S5.502. In order to facilitate this sharing and yet ensure that the radiolocation service is protected against claims by the fixed-satellite service that interference is caused by the radiolocation service it is proposed:

- to suppress the minimum e.i.r.p. restriction prescribed in No. S5.502, but
- to retain the limitation of the minimum antenna diameter, and
- to prescribe that systems operating in the fixed-satellite service with an e.i.r.p. of less than +68 dBW be unable to claim protection from interference by the radiolocation service.

2 Proposal

Australia proposes the following specific modification of No. S5.502:

MOD AUS/56/1

S5.502 In the band 13.75-14 GHz, the e.i.r.p. of any emission from an earth station in the fixed-satellite service ~~shall~~should be at least 68 dBW, and should not exceed 85 dBW~~,~~. The earth station shall transmit with a minimum antenna diameter of 4.5 m. The fixed-satellite service shall not claim protection against harmful interference caused by the radiolocation service where the fixed-satellite service uses an e.i.r.p. of less than +68 dBW. In addition the e.i.r.p., averaged over one second, radiated by a station in the radiolocation or radionavigation services towards the geostationary-satellite orbit shall not exceed 59 dBW.

Reasons: A minimum e.i.r.p. restriction is overly prescriptive for some fixed-satellite service systems and its removal could lead to more efficient frequency spectrum utilization. However the radiolocation service requires ongoing protection from claims of interference to systems in the fixed-satellite service that use less than +68 dBW. Australia believes that the above proposal could satisfy the requirement of all the services allocated to this frequency band. Australia also believes that further studies are required before any further changes are made to the sharing criteria.

PLENARY MEETING

Australia

PROPOSAL FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.21

1 Introduction

Circular Letter CR/135 of 7 January 2000 contains the results of the Radiocommunication Bureau's analysis in connection with Resolution 53 (WRC-97). The results reported in that circular letter demonstrate that all assignments of Australia entered in the Appendix S30 Plan will neither cause interference to, nor require interference protection from, assignments of other services or other Regional Plans. Therefore, Australia proposes that the assignment table contained in Article 11 of Appendix S30 should be revised to remove the comments against its assignments which were included in the "Remarks" column of that table pending the completion of Resolution 53 (WRC-97).

Australia would support similar treatment for national assignments of other administrations that are entered in the Appendix S30/S30A Plans (except in cases where the assignment is qualified by a comment in the "Remarks" columns pertaining to the need to accept interference from, or not to cause interference to, other assignments).

2 Proposal

See modification to the assignment table in Article 11 of Appendix S30 on the following page.

Assignment Table in Article 11 of Appendix S30

In the Table associated with Article 11 of Appendix **S30** remove “Remarks” column entries for the Australian assignments as indicated below.

PLENARY MEETING

Australia

PROPOSAL FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.21

1 Introduction

Circular Letter CR/135 of 7 January 2000 contains the results of the Radiocommunication Bureau's analysis in connection with Resolution 53 (WRC-97). The results reported in that circular letter demonstrate that all assignments of Australia entered in the Appendix S30 Plan will neither cause interference to, nor require interference protection from, assignments of other services or other Regional Plans. Therefore, Australia proposes that the assignment table contained in Article 11 of Appendix S30 should be revised to remove the comments against its assignments which were included in the "Remarks" column of that table pending the completion of Resolution 53 (WRC-97).

Australia would support similar treatment for national assignments of other administrations that are entered in the Appendix S30/S30A Plans (except in cases where the assignment is qualified by a comment in the "Remarks" columns pertaining to the need to accept interference from, or not to cause interference to, other assignments).

2 Proposal

See modification to the assignment table in Article 11 of Appendix S30 on the following page.

Assignment Table in Article 11 of Appendix S30

In the Table associated with Article 11 of Appendix **S30** remove “Remarks” column entries for the Australian assignments as indicated below.

PLENARY MEETING

Australia

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA FOR WRC-03 - PROPOSED MODIFICATIONS TO RESOLUTION 722 (WRC-97)

1 Introduction

WRC-2000 agenda item 7.2 requests WRC-2000 to recommend to the Council items for inclusion in the agenda for the next WRC, and to give its view on the preliminary agenda for the subsequent conference and on possible agenda items for future conferences.

2 Proposals

Australia proposes that the following items be included in Resolution **722 (WRC-97)**:

ADD AUS/58/1

• to take into account ITU-R studies in accordance with Resolution **342 (WRC-97)** and consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix **S18**;

Reasons: This item is needed to complete the work of agenda item 1.18 (WRC-2000) which could not be completed until relevant studies on ITU-R are complete.

ADD AUS/58/2

• to consider results of the ITU-R studies conducted in accordance with Resolution **207 (Rev.WRC-2000)** [to mitigate HF interference in the bands allocated to the maritime mobile and aeronautical mobile (R) service];

Reasons: Australia and other countries in the Asia-Pacific region suffer harmful interference in the HF communications bands from unauthorized operators. To combat this interference, which is affecting aviation and maritime operational and emergency channels as well as other services, Australia has proposed modifications to Resolution 207 requiring ITU-R to study possible solutions to mitigate this interference.

ADD AUS/58/3

- to consider an additional allocation on a worldwide basis for EESS active radio altimeters in the band 5 460-5 570 MHz;

Reasons:

- TOPEX/POSEIDON currently operates over the frequency range 5.15-5.47 GHz;
- compatibility studies were conducted in JWP 7-8R and WP 7C to extend the radio spectrum for high-resolution radar altimeters;
- these studies have considered the feasibility of sharing between EESS active and other services above the band 5 250-5 460 MHz currently allocated to EESS (active). This has drawn attention to the drafting of a new Recommendation on sharing in the band 5 250-5 570 MHz between the EESS active and space research active services and other services allocated in this band;
- sharing studies have shown the potential for sharing between spaceborne altimeters and proposed Hiperlan systems above 5 460 MHz.

PLENARY MEETING

Indonesia (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

FIXED AND FIXED-SATELLITE SERVICES

(WRC-2000 agenda item 1.4)

1 Introduction

The near future systems in telecommunications are as exciting as well as demanding in satisfying the need of broadband connectivity, domestically and internationally. Evolutionary development of satellite technologies from geostationary-satellite systems to non-geostationary multi-orbit constellations (of low-Earth orbit (LEO) and medium-Earth orbit (MEO) satellite constellations) is followed by high altitude platform stations (HAPS). Terrestrial technological development to satisfy demand for broadband systems are the developing wireless high density applications in fixed services (HDFS). Both HAPS and HDFS systems are exploring millimetre waves.

Wireless links are increasingly being used for broadband services because they can be designed quickly and are cheaper to install and operate compared to the high cost and slow process of burying copper or fibre lines. Wireless technology promises a significant drop in the cost-to-capacity ratio, because of the decline in the cost of radio links while its capacity is increasing. (It is predicted that the cost per radio and per channel in the year 2005 will be around 50% and 10% respectively of that in 1998).

Indonesia's vision

Indonesia is of the opinion that the two systems, HDFS and HAPS, are the coming systems for serving population centres and suburban areas. In Indonesia and in many other countries, millimetre waves are still practically unused, however, to anticipate growth of the demand in the not too distant future, advanced planning is required.

HDFS relates to WRC-2000 agenda item 1.4:

to consider issues concerning allocations and regulatory aspects related to Resolutions **126 (WRC-97)**, **128 (WRC-97)**, **129 (WRC-97)**, **133 (WRC-97)**, **134 (WRC-97)** and **726 (WRC-97)**;

2 APT Member countries common proposals

APT Member countries (Asia Pacific Telecommunity with 31 members) at its fourth meeting of the APT Preparatory Group for WRC-2000 (APG2000-4) considered a number of frequency bands above 30 GHz for high-density applications in the fixed service (HDFS). Indonesia supports these proposals.

For appropriate sharing criteria to protect the fixed service from other services to which they are allocated, the same bands should be established in each band.

Three groups of the common proposals submitted by APT are related to:

- Resolution 126 (WRC-97), allocation of the band 31.8-33.4 GHz for HDFS, review of pfd limits in Table S21-4 to SRS and ISS, and modification of S5.547 and S5.547A;
- Resolution 133 (WRC-97), allocation of the band 37-40 GHz, and 40.5-42.5 GHz, review of pfd limits in this band for non-GSO and GSO systems by insertion of text applied to Table S21-4, including review of Resolution 133 (WRC-97); and
- allocation of the bands above 50 GHz for HDFS and adding a footnote S5.ZZZ (output power densities at 55.78-59 GHz).

In essence, the practical approach of the sharing criteria of the band 37-42.5 GHz, is a “soft” segmentation of the said band, whereby HDFS is protected or permitted to have preferred pfd values below 40 GHz and FSS is protected, or to have preferred values above 40 GHz.

3 Proposals

In light of the above, Indonesia proposes:

INS/59/1

Revise Resolution **133 (WRC-97)** and consider the pfd limits of FSS and other services sharing the band for the protection and the dense and ubiquitous deployment of high-density applications of FS in the 37-40 GHz band, while allowing certain FSS uses of this band, such as feeder links, that would not otherwise constrain HDFS applications.

Reasons: The band 37-40 GHz is recommended to be used for dense and ubiquitous development of HDFS. FSS could still use this band for feeder links and other specific uses, however, dense use for high-density application of FSS in this band ought to be discouraged.

INS/59/2

Revise Resolution **134 (WRC-97)** for the purpose of studies in defining the sharing criteria between FSS and FS and other services, to support the ubiquitous deployment of high-density application of FS in the band 40.5-42.5 GHz, as a matter of urgency, while allowing certain FS uses of this band that would not otherwise constrain ubiquitous FSS earth stations.

Reasons: The band 40.5-42.5 GHz is recommended to be used for dense and ubiquitous development of FSS. High-density application of FS could still use this band, however, its dense use in this band ought to be discouraged.

Hence, ubiquitous development of high-density application of both FS and FSS could be planned harmoniously in the bands 37-40 GHz and 40.5-42.5 GHz respectively, without constraining either.

Indonesia (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

MSS ALLOCATION BELOW 1 GHz

(WRC-2000 agenda items 1.11 and 7.2)

Introduction

This administration has submitted, in the past, proposals for additional allocations for MSS below 1 GHz. We understand that many administrations were not yet ready to agree to such allocations, as they wanted assurance that the Little LEO system will not cause harmful interference to their terrestrial services, although recognizing the benefits of the system for complementing the crucial needs for accessibility to their national telecommunication network.

Taking into account the wishes of most administrations for more studies to be done, this administration has withdrawn its original proposal to have WRC-2000 consider an additional uplink allocation at this Conference, and proposes to postpone its consideration until the next available World Radiocommunication Conference, WRC-02/03. Indonesia further retains the other proposals to have further studies for a feeder-link allocation in the 1.4 GHz, and an additional allocation for the downlink in the 405-406 MHz band.

The Little LEO, a non-voice-non-geostationary (NVNG) low-Earth orbiting satellite constellation allows better penetration to remote areas using simple terminals or handhelds. The system will be capable of providing various new non-voice or slow data rate communications services, at the same price to both urban and rural areas, applicable to individuals, businesses of all sizes, governments and organizations. More importantly, it provides the same access for all citizens, rural as well as urban population. This is crucial to developing countries, where their networks are generally not well developed, in providing facilities to under-served urban areas as well as unserved rural areas.

Behind the policy of rural community empowerment are the potentialities of the vast majority of rural people if they were given equal opportunities to their urban counterparts. In fact, the biggest problem for developing countries is not between the metropolitan areas in industrialized and developing countries, but more between the metropolitan areas and the rural areas in their own country. The social and economic gap between urban and rural areas is due to the disparity in facilities, and further disturbs the distribution of resources in favour of the high-growth areas. Information and communication services are expected to break their isolation from the rest of the world, enhancing their knowledge and skills. The Internet and e-commerce facilities supposed to be established in the centre of the villages, are expected to provide new potential for village communities in raising their living standards - and even to become rich because of better deals for their products (vegetables, poultry, handicraft, and other agro-industrial products) with the outside world.

Having considered the above reasons, and supporting the common proposals from the Asia-Pacific Member States endorsed during the fourth meeting of the APT Preparatory Group for WRC-2000 (APG-2000/4), Indonesia proposes the following:

INS/60/1

Further studies on sharing between the mobile-satellite services below 1 GHz for narrow-band data applications and the terrestrial services, in particular digital trunked systems, are required to ascertain that it will not cause harmful interference to these terrestrial services, before additional allocations for the uplink of the mobile-satellite service in part of the 450-460 MHz band or other suitable bands could be proposed to WRC-02/03 for its consideration.

Reasons: The CPM99-2 Report concluded with favourable findings for the additional uplink allocations in the 450-470 MHz band. However, it also mentioned that more study is required for sharing between digital trunked systems and MSS (section 2.3.2.3).

Modify the relevant parts of Resolution 214 (Rev.WRC-97) referring to WRC-99 with WRC-02/03, as follows:

MOD INS/60/2

RESOLUTION 214 (Rev.WRC-~~97~~2000)

Sharing studies relating to consideration of the allocation of bands below 1 GHz to the non-geostationary mobile-satellite service

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

resolves

2 that WRC-~~99~~02/03 be invited to consider, on the basis of the results of the studies conducted within ITU-R and the studies referred to in *resolves* 1 above, additional allocations on a worldwide basis for the non-GSO MSS below 1 GHz;

~~4 that WRC-99 be invited to consider a review of the technical and regulatory constraints on non-GSO MSS allocations in the bands below 1 GHz, taking into account *considering d)*,~~

invites ITU-R

2 as a matter of urgency, to carry out studies in preparation for WRC-~~99~~02/03, ~~including a review of the operating constraints referred to in *noting c)* necessary to protect the existing and planned development of all of the services to which the bands below 1 GHz are allocated,~~ having regard to *noting d)*;

3 as a matter of urgency, to ~~carry out~~ continue studies in preparation for WRC-~~99~~02/03 with respect to interference mitigation techniques, such as the dynamic channel activity assignment system described in Recommendation ITU-R M.1039-1, necessary to permit the continued development of all of the services to which the bands are allocated;

5 to bring the results of these studies to the attention of WRC-~~99~~02/03 and the relevant preparatory meetings,

Reasons:

1 *Resolves* 4 is no longer required since this issue will be addressed at WRC-2000;

2 Review of the constraints under *invites ITU-R* 2 and as stated in *noting c)*, is no longer required as constraints on the duration of single transmission and the period between consecutive transmission from an individual MSS mobile earth station have been taken into account in the previous studies, and has demonstrated its adequateness to confine the additional interference within the 10% criteria. However, continued studies as referred to in *invites ITU-R* 2 and 3 could still be retained.

Continued studies for the feeder-link allocations in the 1.4 GHz band for the operation of MSS below 1 GHz are required pursuant to Resolution 127 (WRC-97). Consideration for its additional allocation at WRC-02/03 is required.

Modify *resolves* 4 of Resolution 127 (WRC-97) as follows:

MOD INS/60/3

4 to invite ~~a future competent conference~~WRC-02/03* to consider, on the basis of completion of studies referred to in *resolves* 1, 2 and 3, additional allocations for feeder links on a worldwide basis for non-GSO MSS systems with service links below 1 GHz,

Reasons: As a logical consequence of the studies carried out under Resolution 127 (WRC-97).

A study in ITU-R indicates that the frequency band 1 429-1 432 MHz could be suitable for use by non-GSO MSS feeder downlinks and the frequency band 1 390-1 393 MHz could be suitable for use for non-GSO feeder uplinks (Document 8D/TEMP/58(Rev.1)).

Modify *resolves to give the view* 3 of Resolution 722 (WRC-97), as follows:

MOD INS/60/4

3 to consider the results of the studies related to the following with a view to considering them for inclusion in the agenda of WRC-02/03, and as required in the agendas of other future conferences:

3.5 allocations on a worldwide basis for feeder links in bands around 1.4 GHz to the non-GSO MSS with service links operating below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolution **127 (Rev.WRC-~~97~~2000)**;

Reasons: *Resolves* 3.5 is a logical consequence of the studies carried out under Resolution 127 (WRC-97). As for the other *resolves* points, it is necessary for WRC-2000 to review its necessity to include it in the WRC-02/03 agenda.

Previous ITU-R studies under Resolution 127 (WRC-97), showed that sharing in the 1 390-1 393 MHz and 1 429-1 432 MHz bands was theoretically feasible, but the study group requested hardware testing to be performed to validate the theory. These tests will be complete prior to WRC-02/03 at which time allocations should be considered.

Continued studies are required for the possibility of additional downlink allocations in the band 405-406 MHz (space-to-Earth) for the MSS service, for its consideration of WRC-02/03.

Add *resolves to give the view* 3.5*bis* to Resolution 722 (WRC-97), as follows:

ADD INS/60/5

3.5*bis* additional allocations on a worldwide basis for downlinks in the 401-406 MHz band to the non-GSO MSS, taking into account the results of ITU-R studies conducted in response to Resolution 219 (WRC-97);

Reasons:

1 Member States in the Asia-Pacific Region endorsed a review of (not suppress) Resolution 219 (Rev.WRC-97). Section 2.3.3.1 of the CPM99-2 Report states that co-channel sharing between MSS and MetAids is not possible. However, sufficient studies have not been done to consider the possible transition of the meteorological aids service out of the band 405-406 MHz, which could minimize the impact on the meteorological aids service, while taking into account requirements for the implementation of non-GSO MSS, as well as considering a transition plan, pursuant to *resolves to invite ITU-R* 2 and 3.

2 The second paragraph of section 2.3.3.1 states that ITU-R has also completed studies regarding the use of the MetAids band and developed a draft revision to Recommendations ITU-R SA.1258-1 and ITU-R SA.1165-1. The studies conducted by several administrations and by WMO considered the worldwide spectrum requirements in this band for radiosonde systems in the MetAids service and for data collection systems in the EESS and the MetSat service.

3 The summary of section 2.3.3.3 states that operation of the MSS in the band 405-406 MHz is considered as not being feasible in the foreseeable future, based on assessments and studies carried out by ITU-R. Studies on improved technology and operational techniques may result, in the long term, in more efficient use of these bands, and may enable future review of requirements for the band 401-406 MHz. Some administrations are continuing studies in this area.

Modify the relevant parts of Resolution 219 (WRC-97) referring to WRC-99, as follows:

MOD INS/60/6

RESOLUTION 219 (Rev.WRC-~~97~~2000)

Studies relating to consideration of the allocation to the non-geostationary mobile-satellite service in the meteorological aids band 405-406 MHz and the impact on primary services allocated in the adjacent bands

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

noting

b) that Resolution **214 (Rev.WRC-~~97~~2000)** also addresses sharing studies relating to consideration of the allocation of bands below 1 GHz to the non-GSO MSS,

resolves

that WRC-~~99~~02/03 be invited to consider, based on the outcome of *resolves to invite ITU-R* above, the possibility of allocating the band 405-406 MHz to the MSS, including any appropriate transition plan,

Reasons: No other changes are required, taking into account Reasons 1, 2 and 3 to INS/60/5.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Indonesia (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

APPENDIX S7, AGENDA ITEM 1.3

1 Introduction

Agenda item 1.3 (ITU-R studies in respect of Appendix S7 of the Radio Regulations), § 7.2.2.2 of the CPM Report, indicates that some issues should be studied further. These include, among others:

a) refinements to propagation mode (2) to address elevation angle dependency and the displacement of the centre of propagation mode (2) contour from the coordinating earth station;

b) methods to address propagation mode (1) water vapour density for both radio climatic Zones B ("cold" sea) and C ("warm" sea).

The purpose of Appendix S7 is to set the coordination trigger for determining whether coordination is required between an earth station and a terrestrial station. The method of calculation is based on conservative assumptions for propagation path and for the unknown terrestrial parameters and, therefore, on an unfavourable assumption with regard to interference potential. The above assumptions and conditions result in calculation distances and coordination areas that are larger than actually required, causing more work and unnecessary coordination.

In order to improve this time-consuming process, the relevant technical parameters which are available in ITU-R Recommendations and/or actual technical parameters should be used.

2 Results of studies

Studies have been carried out by the Radiocommunication Bureau, and some of these parameters appear in Recommendations and Reports.

a) Elevation angle of the earth station:

The elevation angle of the earth station plays an important role in determining the coordination distance relating to the rain propagation path.

In rain-scatter propagation mode (2), the rain attenuation is determined by specific attenuation γ_R and diameter of the rain cell d_C.

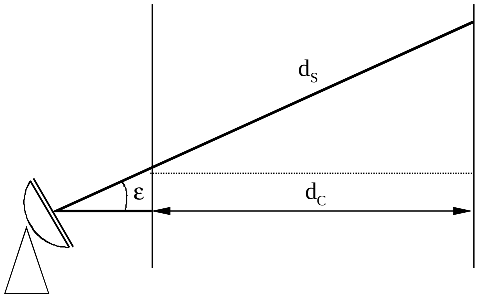
The specific attenuation (dB/km) due to rain cells is given by:

$$\gamma_R = k\,R^{\alpha} \tag{1}$$

and the rain cell is:

$$d_C = 3.3\,R^{-0.08}\ \text{km} \tag{2}$$

The effective diameter of the rain cell depends on the path d_S (km). Thus,



CMR/61-01

$$d_S = \frac{d_C}{\cos\varepsilon}$$

$$d_S = \frac{3.3}{\cos\varepsilon} R^{-0.08} \tag{3}$$

where:

θ = elevation angle of the earth station (in degrees)

R = rain rate (mm/h)

k = factor as function of frequency

For attenuation Γr outside the rain cell between the edge of the cell and a point at distance d, an exponential decrease is assumed, as follows:

$$\Gamma_R = \frac{\gamma_R r_m}{\cos\varepsilon}\left(1 - e^{-d/r_m}\right)(\text{dB})$$

r_m is the scale length of attenuation (in km)

where:

$$r_m = 600\,R^{-0.5}\,10^{-(R+1)^{0.19}}\ \text{km}$$

Factor e^{-d/r_m} is very small $\left(e^{-d/r_m} \approx 0\right)$ and can be ignored

Thus,

$$\Gamma_R = \frac{\gamma_R r_m}{\cos\varepsilon}$$

$$= (k\,R^{\alpha})\,600\,R^{-0.5}\,[10^{-(R+1)}]^{0.19} / \cos\varepsilon$$

$$= 600 \quad k\,R^{\alpha-0.5}\,[10^{-(R+1)}]^{0.19} / \cos\varepsilon$$

The above analysis shows that the effective diameter of the rain cell and attenuation outside the common volume are a function of the elevation angle of the earth station.

It is therefore suggested that equations II-10 and II-12 in the suggested new draft text for Appendix S7 (draft Recommendation ITU-R SM.[Document 1/1004] be replaced by:

INS/61/1

$$d_S = \frac{3.3\,R^{-0.08}}{\cos\varepsilon}$$

INS/61/2

$$\Gamma_2 = \frac{600\,k}{\cos\varepsilon} R^{(\alpha-0.05)} \times \left[10^{-(R+1)}\right]^{0.19}$$

respectively.

b) Water vapour density γ_W:

The distinction between Zone B (“cold” sea) and Zone C (“warm” sea) is due to the difference in water vapour density γ_W in each zone.

According to Recommendation ITU-R P.836, for Zone C the value γ_W varies from 1 to 10 g/m^3, and for Zone B from 15 to 25 g/m^3 (see Attachment 1). Based on the above values, it is suggested that the value of γ_W = 10 g/m^3 for Zone C and γ_W = 20 g/m^3 for Zone B. Thus:

INS/61/3

$\gamma_{Wds} = \gamma_W\ (10.0)$ for Zone C (I-13c)

and

INS/61/4

$\gamma_{Wds} = \gamma_W\ (20.0)$ for Zone B (I-13c1)

c) Determination of the centre of propagation mode (2) contour:

It is found that the centre of propagation mode (2) contour is the distance Δd (km) from the earth station along the azimuthal angle of the earth station (in the horizontal plane). The distance Δd can be calculated using:

INS/61/5

$$(\Delta d)_{Te} = 5.88 \times 10^{-5}\,(d_r - 50)\cot\varepsilon$$

for a transmitting earth station

INS/61/6

$$(\Delta d)_{Re} = 5.88 \times 10^{-5}\,d_r \cot\varepsilon$$

for a receiving earth station

where:

d_r = coordination distance for propagation mode (2)

ε = elevation angle of the earth station

We can see that the distance Δd (see Attachment 2) is a function of d_r.

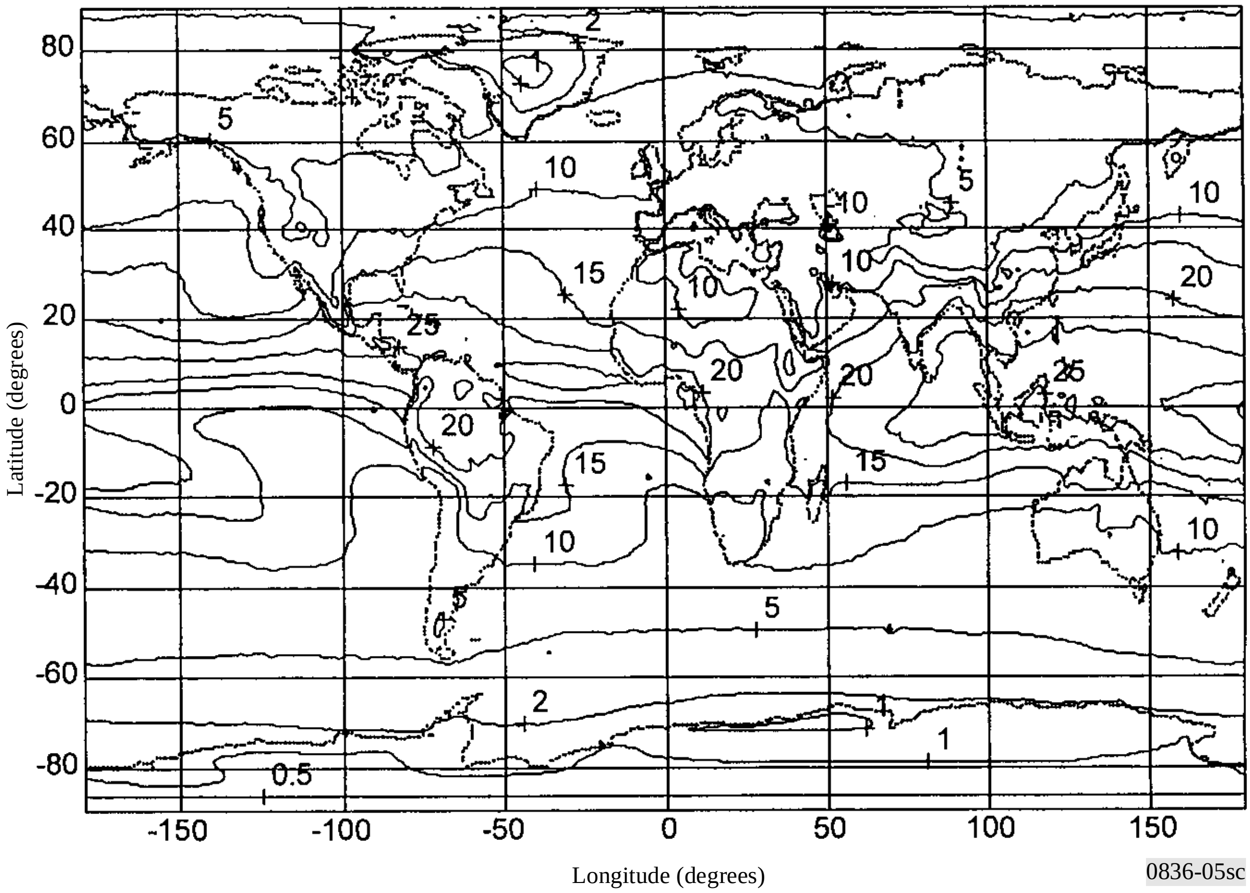
It is suggested that equation II-23 in the suggested new draft text for Appendix S7 be replaced by the above two equations.

Attachments: 2

ATTACHMENT 1

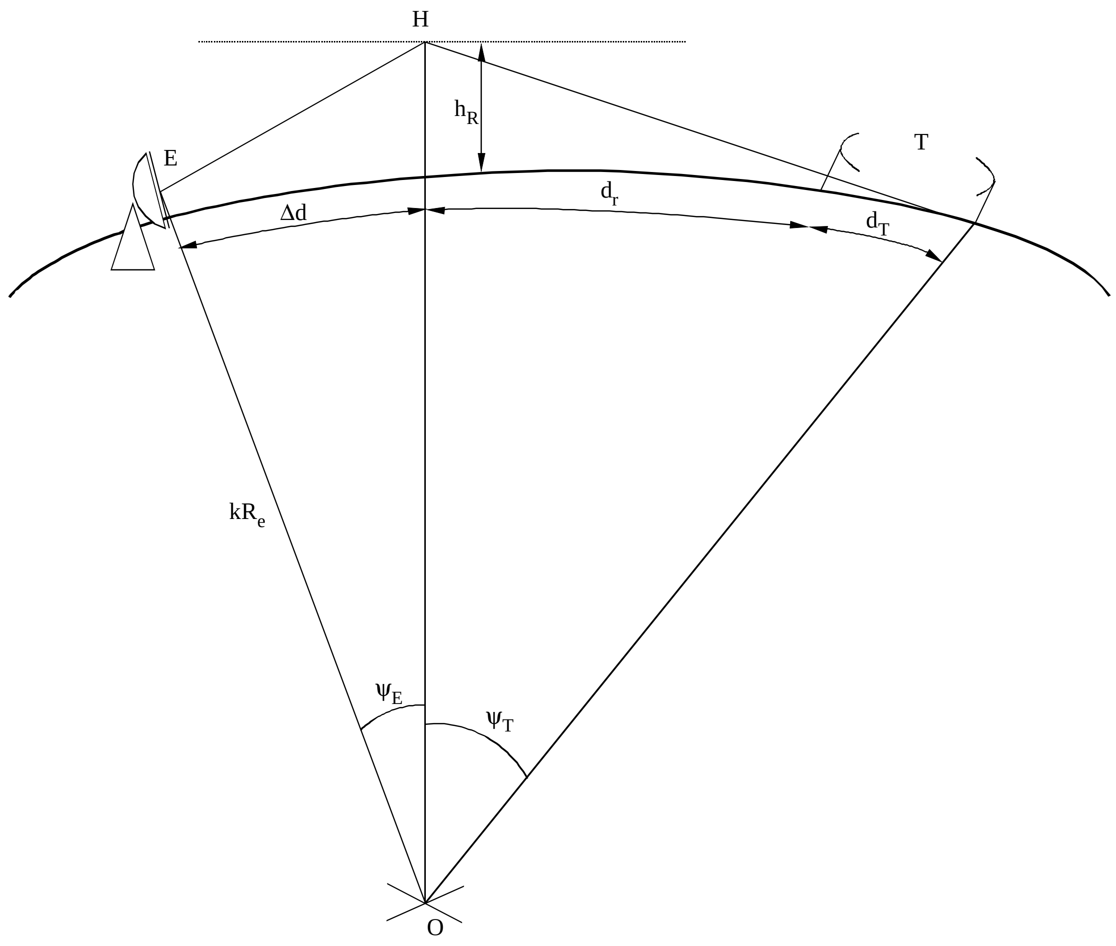
FIGURE 5

September, October, November: surface water vapour density (g/m³)



0836-05sc

ATTACHMENT 2



CMR/61-02

$$\Psi_E = \frac{\Delta d}{k\,R_e}\ \text{rad}$$

k = refraction index
Re = radius of the Earth
d_r = rain coordination distance
d_T = terrestrial station distance

$$\Psi_T = \frac{d_r}{k\,R_e}$$

$$\cos\Psi_T = \frac{k\,R_e}{OH} \quad \rightarrow \quad OH = \frac{k\,R_e}{\cos\Psi_T}$$

$$h_R = OH - k\,R_e$$

$$= \frac{k\,R_e}{\cos\Psi_T} - k\,R_e$$

$$h_R = k\,R_e\left(\frac{1}{\cos\Psi_T} - 1\right)$$

$$\tan\varepsilon \approx h_R/\Delta\,d$$

$$\Delta d = \frac{h_R}{\tan \varepsilon} = \frac{k\, R_e}{\tan \varepsilon}\left(\frac{1}{\cos \Psi_T} - 1\right)$$

$$\Delta d = \frac{k\, R_e}{\tan \varepsilon}\frac{(1 - \cos \Psi_T)}{\cos \Psi_T}$$

ψ_T is very small,

$$\cos \Psi_T = 1 - \Psi_T{}^2 / 2$$

Error! Objects cannot be created from editing field codes.

$$\Delta d = \frac{k\, R_e}{\tan \varepsilon}\left(\frac{d_r}{k\, R_e}\right)^2 \Big/ 2 \qquad = \qquad \frac{d_r{}^2}{2\, kR_e \tan \varepsilon}$$

if $d_T = 50\,\text{km}$
$k = 4/3$
$R_e = 6\,370\,\text{km}$

$$\Delta d_1 = \frac{(d_r - 50)^2}{17\,000}\cot \varepsilon$$

The above formula is for an earth station with respect to a receiving terrestrial station.

For the case of a receiving earth station, the following equation should be used:

$$\Delta d_2 = \frac{d^2}{12\,000}\cot \varepsilon \quad (\Delta d_2 \text{ must be greater than } \Delta d_1 - \text{see figure})$$

COMMITTEE 4

Uruguay (Eastern Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

The Administration of Uruguay hereby makes the following proposal for the work of the World Radiocommunication Conference (WRC-2000) under agenda item 1.1 with respect to the footnote contained in Article S5:

MOD URG/62/2

S5.390 In Argentina, Brazil, Chile, Colombia, Cuba, Ecuador, ~~and~~ Suriname and Uruguay, the use of the bands 2 010-2 025 MHz and 2 160-2 170 MHz by the mobile-satellite services shall not cause harmful interference to stations in the fixed and mobile services before 1 January 2005. After this date, the use of these bands is subject to coordination under No. **S9.11A** and to the provisions of Resolution **716 (WRC-95)**.

MOD URG/62/3

S5.481 *Additional allocation:* in Germany, Angola, China, Ecuador, Spain, Japan, Morocco, Nigeria, Oman, Democratic People's Republic of Korea, Sweden, Tanzania, ~~and~~ Thailand and Uruguay, the band 10.45-10.5 GHz is also allocated to the fixed and mobile services on a primary basis.

____

* Pursuant to Resolution 26 (Rev.WRC-97) the secretariat notes that this contribution was received on 12 May 2000.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Norway

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.1

In accordance with WRC-2000 agenda item 1.1, administrations should review the footnotes to the Table of Frequency Allocations in the Radio Regulations with the view to delete their country footnotes or to have their country's name deleted from footnotes, if the footnotes are no longer required.

Norway therefore proposes modifications, as follows, to the following footnotes:

MOD NOR/63/1

S5.112 *Alternative allocation:* in Bosnia and Herzegovina, Cyprus, Denmark, France, Greece, Iceland, Italy, Malta, ~~Norway,~~ Sri Lanka, Turkey and Yugoslavia, the band 2 194-2 300 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

Reasons: This footnote is no longer required by Norway.

MOD NOR/63/2

S5.114 *Alternative allocation:* in Bosnia and Herzegovina, Cyprus, Denmark, France, Greece, Iraq, Italy, Malta, ~~Norway,~~ Turkey and Yugoslavia, the band 2 502-2 625 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

Reasons: This footnote is no longer required by Norway.

MOD NOR/63/3

S5.117 *Alternative allocation:* in Bosnia and Herzegovina, Cyprus, Côte d'Ivoire, Denmark, Egypt, France, Greece, Iceland, Italy, Liberia, Malta, ~~Norway,~~ Sri Lanka, Togo, Turkey and Yugoslavia, the band 3 155-3 200 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

Reasons: This footnote is no longer required by Norway.

MOD NOR/63/4

S5.495 *Additional allocation:* in Bosnia and Herzegovina, Croatia, Denmark, France, Greece, Liechtenstein, Monaco, ~~Norway,~~ Uganda, Portugal, Romania, Slovenia, Switzerland, Tanzania, Tunisia and Yugoslavia, the band 12.5-12.75 GHz is also allocated to the fixed and mobile, except aeronautical mobile, services on a secondary basis.

Reasons: Norway does not use this band for either the fixed or the mobile services any more.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

IATA INFORMATION PAPER

I have the honour to bring to the attention of the Conference, at the request of the International Air Transport Association (IATA), the annexed information paper.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

Introduction

The International Air Transport Association (IATA) represents 269 international air carriers, or more than 95% of the world's scheduled international carriers. The air transport industry carries more than 1.6 billion passengers per annum and this is expected to grow to 2.3 billion by the year 2010. Equally importantly the industry carries 40% by value of the world's manufactured exports. The growing world economy requires an air transport industry capable of delivering passengers and goods on time. In 1998 the air transport industry provided at least 28 million jobs for the world's workforce and USD 1.360 trillion in gross annual output. The airline industry is the prime engine of international travel and tourism, one of the fastest growing sectors of the world economy, representing some 12% of the world's Gross Domestic Product.

To support the continued growth in the world economy, aviation must continue to introduce new technologies to maintain and improve safety and efficiency and reduce the ATC delays and the environmental impact of its operations. These new technologies can only be implemented if the spectrum presently used by aviation is protected from interference from other users and access is guaranteed.

General concerns

WRC-2000 has the task of balancing a number of important public interest concerns. The growth of air transport and the benefits it delivers to the communities that it serves is in part attributable to the work of ITU assuring the industry of sufficient spectrum to allow it to operate safely.

Aviation relies on adequately protected frequencies as a tool to be able to do its job safely and efficiently. A large part of the mobile telecommunication industry uses spectrum as a direct revenue producing commodity. These respective uses of the spectrum need to be addressed in an equitable and balanced manner according due priority to community needs.

Safe operations are the basis of the viability of the aviation industry. It is also the prime issue for States, acting through ICAO. It is the reason why States insist on global standards agreed in advance of the introduction of any technologies. This internationally agreed certification process is extremely rigorous and as a prerequisite requires consideration of all known failure modes including interference to communication and navigation signals. There is no "call waiting" facility during short finals. A "lost call" for an aircraft can be disastrous.

There is growing concern towards the tendency of the modern spectrum management process to make allocation decisions in the expectation that subsequent studies will justify these decisions. This is not the way States demand that aeronautical authorities approach their task. The aviation industry urges States to apply the same rigour for allocation of spectrum as they require for certification of aircraft systems. Decisions should never by taken before studies are completed.

IATA's position is:

- The system currently in place forms a vital part of the world's capital infrastructure and continues to be necessary for many users, including civil aviation. As the world's economy globalizes, the integrity of this public system needs to be maintained by protecting it from interference.
- There must be a balance between those users of frequencies that resell and profit from that action and those that use them for other purposes. This includes the frequencies for safety of life functions in aviation operations.

- The next generation of aviation radio systems, now being introduced, has been predicated on interference-free operation, and has been certificated for safe use on that basis.
- This certification process is thorough, rigorous, and in advance, as required by States, and is appropriate given that lives are at stake. Those same standards must apply to allocation decisions that affect these services.
- The new technologies, such as satellite-based communications systems, have the potential to reduce congestion through improved air traffic control, reduce delays and make air travel safer.
- A number of studies have been mandated to investigate and review these issues. No decisions can be made until those studies have been completed, and it can be shown that interference problems can be resolved in a manner satisfactory to all interested parties.

WRC-2000 agenda item 1.1 - requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

Country footnotes Nos. S5.181, S5.197 and S5.259 were inserted by WARC Mob-87 in the three bands concerned with the provision of instrument landing systems (ILS) (RR Nos. S1.104, S1.105 and S1.106). The footnotes allocated the bands to the mobile service on a secondary basis, with the express provision that mobile service stations "shall not be introduced in the band until it is no longer required for the aeronautical radionavigation service by any administration which may be identified in the application of the procedure invoked under No. **S9.21**".

The ICAO standardized ILS is an operational system used universally for precision landing and guidance down to and along the runway. Stations of the mobile service up to 100 km from the airport have the potential to cause harmful interference to aircraft using any component of the ILS system. The use of these frequencies for mobile services is, therefore, severely constrained, particularly in areas where there is a widespread use of ILS.

In the years since WARC Mob-87, ILS services have continued, and even increased in some areas. **There is no expectation that the need for ILS will diminish**. **As the need for ILS will continue, there is no practical value in maintaining these footnotes.** The allocation should be restored to an exclusive basis, as it was prior to 1987.

Airline position: agenda item 1.1

The aviation industry supports the deletion by WRC-2000 of footnotes S5.181, S5.197 and S5.259.

WRC-2000 agenda item 1.6.1 - frequencies for IMT-2000

It is claimed that IMT-2000 will require additional spectrum between 1 and 3 GHz for mobile services. One of the bands identified to allow for this increased demand is the aeronautical radionavigation band at 2 700-2 900 MHz. Deployment is understood to be in those urban areas where the highest number of channels is required. These are the same areas where the highest concentrations of airport radar using the band are located.

The band 2 700-2 900 MHz is used for primary radar surveillance systems to ensure safe separation of aircraft. At airports, where the density of air traffic is high, they maintain safe and efficient landing rates. Airport congestion has become critical in many parts of the world, and delays have become a major political issue.

Primary radar is also used to monitor and to detect intruder aircraft flying into controlled areas without an approved flight-plan, as well as for meteorological and law enforcement purposes. The band is also used for national defense and security purposes. **In many urban areas the band is fully occupied.**

Theoretical studies and simulations on sharing reported to ITU-R have not produced conclusive evidence to support sharing between radar and terrestrial mobile stations. Before any sharing can be recommended, the operational and regulatory aspects (including the provision of a safety case) must also be addressed in accordance with agreed international standards. A minimum requirement is a safe framework of operation that includes agreed procedures for the expeditious and effective removal of interference.

The assurances necessary to protect this safety-critical service are not capable of realization without thorough examination, which cannot be achieved in time to enable a decision at WRC-2000. The aviation industry should be involved at all stages in any study being undertaken to determine the safety case for any sharing of the 2 700-2 900 MHz band. **Until that time, it cannot support any allocation to mobile services.**

IMT-2000 also includes satellite components proposed to use frequencies allocated to the MSS. In the case of the mobile satellite bands to be used by aeronautical services at 1.5-1.6 GHz, it is necessary that the special considerations, in particular those defined in No. S5.357A, for use of these bands are preserved intact.

Airline position: agenda item 1.6.1

No allocation to be made to mobile services in the aeronautical radionavigation service band 2 700-2 900 MHz at WRC-2000.

A comprehensive examination of the technical, operational and regulatory aspects (safety case) to be carried out before any allocation is approved.

In the MSS bands at 1.5-1.6 GHz the special considerations for use of these bands by aeronautical services contained within footnotes, particularly No. S5.357A, must be maintained.

WRC-2000 agenda item 1.7 - interference on HF aeronautical service bands

This agenda item is the “review of the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting the operational, distress and safety communications, taking into account Resolution **346 (WRC-97)**”.

The frequencies allotted to the aeronautical mobile (R) service in Appendix S27 are used to preserve the “safety and regularity of flight” along civil air routes in accordance with No. S43.1. In some areas of the world, airlines are experiencing harmful interference to their Air Traffic Services communications in flight. This is a serious and, unfortunately, increasing problem. The transmissions are believed to originate from unlicensed installations.

The operational use of the HF bands is coordinated internationally by ICAO and satisfies the present and future uses of the service. Any amendments to the Standards for equipment characteristics and performance contained in ICAO Annex 10, which are in accord with Appendix S27 to the Radio Regulations, would necessitate worldwide changes in aircraft equipment. The solution to this problem is considered to be more appropriate to a rigorous enforcement and control of the radio environment, than to technical measures of doubtful effectiveness, or by a review of the frequencies contained in the allotment plan.

The airlines request ITU’s urgent attention to the removal of this harmful interference **through effective enforcement of the regulations and international cooperation.**

Airline position: agenda item 1.7

To support measures leading to a removal of all unauthorized use of bands between 850 kHz and 22 MHz that are allocated to the aeronautical mobile (R) service through effective enforcement of the regulations and complementary international cooperation.

No change to Appendix S27.

WRC-2000 agenda item 1.9 - allocation in band 1 559-1 567 MHz

Satellite navigation is a core technology for the future of aviation. It enables airlines to improve aircraft navigation and positioning for increased airspace capacity, improved safety, and enhanced operational efficiency. These are all international imperatives. Aviation needs to sustain the integrity and operational viability of GNSS (GPS, GLONASS and augmentation systems) in order to continue supporting implementation of the worldwide, seamless, ATS infrastructure adopted by States through ICAO.

The GNSS is the cornerstone of Eurocontrol's ATM 2000+ Programme, U.S. Free Flight initiatives, and developments in South America, Asia/Pacific, and Africa. **Unimpeded evolution of the GNSS is key to the continued safe growth of global air transport and the national economies which aviation serves. It will reduce flight times, with subsequent reduction of congestion and environmental impact.**

WRC-97 adopted Resolution 220 (WRC-97) in response to a proposal to add an allocation to the 1 559-1 567 MHz band for mobile-satellite services. Radiocommunication WP 8D was then requested to study the feasibility of sharing between MSS and the aeronautical radionavigation-satellite services (ARNS/RNSS). No. S4.10 states, "Member States recognize that the safety aspects of radionavigation and other safety services require special measures to ensure their freedom from harmful interference; it is necessary therefore to take this factor into account in the assignment and use of frequencies."

Radiocommunication WP 8D has completed its feasibility studies on MSS interference to GPS under Resolution 220 (WRC-97). **The studies concluded that sharing with MSS in the 1 559-1 567 MHz band is not feasible,** a view shared by ICAO. **The CPM Report endorses this conclusion. The aviation industry supports the ITU study recommendations.** Continuing studies after this conclusive report would discourage operational stability.

Airline position: agenda item 1.9

No allocation should be made to the MSS in the band 1 559-1 567 MHz.

Suppress Resolution 220 (WRC-97) at WRC-2000.

WRC-2000 agenda item 1.10 - AMS(R)S

Resolution 218 (WRC-97) was agreed at WRC-97 to determine, *inter alia*, the "feasibility of prioritization, real-time pre-emptive access and, if necessary, interoperability" for AMS(R)S when operating in a "generic" environment. Future spectrum requirements were also to be addressed for safety communications as defined in Categories 1 to 6 of Article S44. These studies were to identify the necessary practical aspects of the operation of the generic allocations made by WRC-97 in the 1.5/1.6 GHz MSS bands. **These studies have not yet been concluded.**

Air-ground communication, utilizing satellites for air-traffic management and other airline purposes, has been identified as fundamental for the future of air transport. System and equipment standardization through ICAO has been globally agreed. **Aviation systems must have global interoperability, which requires worldwide harmonization.** These standards are subject to a long period of development and require a significant retrofit of aircraft around the world. Over 2 500 aircraft have been fitted with terminals at a significant level of investment and the number is increasing steadily.

The present system is certified for Air Traffic Services communication. In order to obtain the benefit of these developments, guaranteed access to adequate frequencies is a prerequisite. A situation of disrupted or unsafe communications, or limitations on operating schedules due to frequency shortage, has serious implications for all airlines and the communities which they serve.

CPM-99 has examined the technical aspects contained in Resolution 218 (WRC-97). Pre-emption within a network, for Categories 1 to 6 of Article S44, is feasible. **Between networks, there is no evidence of the feasibility of pre-emption.** Interoperability between different MSS networks would require the incorporation of special technical features. **Further work is necessary to provide conclusive evidence that this would be feasible.**

CPM noted that aviation would require 10.8 MHz up to 2 010 and 18 MHz up to 2 018. CPM favours the capacity planning approach carried out through periodic coordination between operators of MSS services. Aviation has serious concerns about this and on the adequacy of No. S5.357A to have the necessary regulatory force to ensure future access to the AMS(R)S. **Operator coordination by itself, without the involvement of administrations, is not sufficient. The airline view is that clear mechanisms must be given regulatory force to guarantee access into the future.**

Airline position: agenda item 1.10

Provide adequate exclusive allocations to meet the expected growth in AMS(R)S. The present estimate for this is 10.8 MHz by 2010.

It is necessary to provide a clear mechanism to give regulatory force to ensure that AMS(R)S communications in Categories 1 to 6 of Article S44 are given priority and immediate access at all times. Services operating in the subject band must support the requirement to enable the priority and pre-emption for AMS(R)S communications within a network and between networks.

Maintain and expedite the studies under Resolution 218 (WRC-97) on these matters.

WRC-2000 agenda item 1.15.1 - allocations for new RNSS in bands from 1 to 6 GHz

This item addresses requirements for additional spectrum for existing RNSS and future systems in four separate frequency bands involving three ARNS bands and the existing RNSS band.

Band 1 151-1 215 MHz

This band supports distance measuring equipment (DME) services to aircraft. DME provides accurate distance measuring relative to a ground station, used for both approach and en-route navigation operations. The operation can be affected by the addition of an RNSS service. The DME system remains a fundamental part of the aeronautical aviation infrastructure. **Reduction of DME facilities will incur penalties in increased delays and the inability to meet increasing air traffic demand.** The addition of RNSS would only be acceptable provided that it can be conclusively shown that it neither causes interference to DME nor leads to claims for protection from DME.

Band 1 260-1 300 MHz

This ARNS band is used for primary surveillance radar for air traffic management purposes and is a safety service requiring protection from interference. The non-safety RNSS element proposed for this band is not anticipated to be used by aircraft. As stated above, an RNSS allocation may be acceptable provided it will not cause interference nor lead to claim for protection. Again, it is essential to study the pfd limits for downlink transmissions and other related matters.

Band 1 559-1 610 MHz

At present the ICAO global navigation satellite system (GNSS) operates in this band. New RNSS systems have the right of entry into this band, subject to coordination in compliance with the Radio Regulations. **Plans for expanding RNSS in this band must continue to take account of aviation requirements.**

Band 5 000-5 150 MHz

The band 5 000-5 150 MHz is reserved for microwave landing system (MLS) under No. S5.444A. The part of the band 5 030-5 090 MHz supports the present ICAO MLS channel plan, with the remainder earmarked for future use. **Resolution 114 (WRC-95) requests ICAO to review the use of this band and to report to WRC-02/03.** That report is in the process of being prepared.

MLS is a modern replacement for ILS and is fully standardized by ICAO. The ICAO new communication, navigation, surveillance and air traffic management (CNS/ATM) concept includes MLS for precision approaches and landings. Its protection from harmful interference must be assured through regulatory provision. Recommendation ITU-R S.1342 governs the coordination between MLS and stations in the FSS in the band 5 090-5 150 MHz. Any change in allocation should only be agreed upon after the studies required under Resolution 114 (WRC-95) have been concluded. MLS will be deployed at a number of major airports around the world, for instance, London Heathrow.

RNSS (space-to-Earth) use in the part of the band 5 000-5 030 MHz is acceptable to airlines provided that MLS use in the adjacent band is protected. **Any Earth-to-space use in this band must address the question of out-of-band emissions**, which may affect MLS services in the band 5 030-5 150 MHz.

General Comment: When the feasibility of new allocations in existing ARNS is being studied, due allowance must be made for the limited potential to provide physical isolation between antennas on board aircraft.

Airline position: agenda item 1.15.1

Band 1 151-1 215 MHz

An RNSS (space-to-Earth) allocation of minimum size in this band is acceptable, subject to adequate regulatory measures to protect existing and future uses of DME. The RNSS service should be on a no-protection basis with respect to DME use. IATA supports studies to define these measures, including the value of a pfd limit on the RNSS downlink transmissions.

Band 1 260-1 300 MHz

An RNSS allocation in this ARNS band is acceptable, subject to adequate regulatory measures to protect existing services. The allocation should be on a no-protection basis. IATA supports studies to define these measures, including the value of a pfd limit on the RNSS downlink transmissions before the allocation is made.

Band 1 559-1 610 MHz

New RNSS will require coordination in accordance with the appropriate Radio Regulations and must accommodate aviation requirements.

Band 5 000-5 150 MHz

a) **The study required by Resolution 114 (WRC-95) must be completed before any allocation is made.**

An allocation to RNSS in the band 5 030-5 150 MHz is not supported.

b) **An allocation to RNSS (space-to-Earth) is acceptable in the band 5 000-5 030 MHz, subject to the protection of MLS services in the band 5 030-5 150 MHz.**

c) **RNSS (Earth-to-space) use of the band 5 000-5 010 MHz will require study to ensure protection of MLS from out-of-band emissions.**

WRC-2000 agenda item 1.15.3 - fixed service use of band 1 559-1 610 MHz

Footnotes No. S5.355 (secondary) and No. S5.359 (primary) permit the use of this RNSS band by fixed services in the countries whose names appear in the footnotes. ITU-R studies have concluded that these services can interfere with RNSS use by aircraft at distances in excess of 100 km. **Aircraft use of RNSS for air navigation comes under the terms of Nos. S1.59 and S1.169 and must be protected against harmful interference.** Appropriate procedures contained in the Radio Regulations for dealing with harmful interference to apply. **No safe sharing is possible between these two services.**

GNSS is a core technology to meet, safely and efficiently, the current and anticipated demands for air traffic, whilst reducing congestion and environmental impact. **An interference risk such as that presented by fixed service use seriously impedes the establishment of a global regulatory approval regime for GNSS.** These footnotes should be deleted.

Airline position: agenda item 1.15.3

The airlines support the deletion of Nos. S5.355 and S5.359 in their entirety.

PLENARY MEETING

Spain

MAINTAINING HISPASAT-2 FREQUENCY ASSIGNMENTS IN APPENDICES S30 AND S30A PLANS

In 1991, the Administration of Spain communicated to the former International Frequency Registration Board (IFRB) the information listed in Annex 2 of Appendices 30 and 30A relating to a new satellite system, HISPASAT-2, requesting IFRB to modify the Plans contained in those Appendices, in application of Article 4 thereof. Since then, a series of events have taken place in ITU that have significantly altered the regulatory environment within which the Administration of Spain has had to apply the requisite procedures for modification of the Plans.

As a result of these events and associated resolutions, the Administration of Spain was forced to take a series of decisions that changed its initial project, so as to adapt to the new technical and regulatory environment that was being developed.

These include, *inter alia*, modification of the technical parameters of the HISPASAT-2 network, and particularly a change of orbital position (from 31º W to 30º W) adopted by WRC-97. In consequence of the above, the Administration of Spain was obliged to modify the date of bringing into use of HISPASAT-2, postponing it by ten months, from 31 January 1999 to 1 December 1999.

Nevertheless, the Administration of Spain, knowing that the frequency assignments to the HISPASAT-2 network were entered in Part B of the Plan in 1996, considered that, pursuant to § 4.3.17 of Article 4 of Appendix S30: "*The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan*". Also, when WRC-97 adopted a revision of the Plans, the HISPASAT-2 frequency assignments were, of course, included as an integral part of the Plan.

This is entirely confirmed by the wording of *resolves* 2 of Resolution 533 (WRC-97), which states in relation to the application of § 4.3.5 of Article 4 that "*the replacement of assignments at 31° W by assignments at 30° W and 33.5° W; shall not be considered as new or additional assignments under § 4.1b) of Article 4 of Appendices **S30** and **S30A**. Therefore, these assignments shall not be subject to the provisions of § 4.3.5 of Appendix **S30** and § 4.2.5 of Appendix **S30A** and the associated Rules of Procedure. In particular, the associated orbital positions shall be treated as* "*orbital positions in the Plan*"*, and the assignments shall not lapse even if they are not brought into use within eight years from the adoption of the revised Plans"*.

Therefore, the Administration of Spain, by virtue of those provisions, considered that the frequency assignments to HISPASAT-2 were covered in the wording of Resolution 533.

However, in 1999 the Radiocommunication Bureau informed the Administration of Spain that the frequency assignments to the HISPASAT-2 network were to be deleted from the Plan as a result of the Rule of Procedure on § 4.3.5 of Appendix S30 as revised by the Radio Regulations Board in December 1998.

In view of that decision, which seriously affected its interests, and in defence of those interests, the Administration of Spain submitted a report to the Radio Regulation Board at its 18th meeting (8-12 November 1999) setting out the reasons why it considered that the frequency assignments in question should be maintained in the Plans. At that meeting, RRB recognized that there was some ambiguity between the text of *resolves* 2 of Resolution 533 and certain sections of Articles 11 and 9A of Appendices S30 and S30A, respectively, and thus decided to instruct the Bureau "*to continue to take into account HISPASAT-2 in its calculations on a provisional basis pending the decision of WRC-2000 on the matter*".

The Administration of Spain notified the Bureau of the launch of the third satellite in the HISPASAT series in February 2000; this new satellite uses the frequency assignments contained in the HISPASAT-2 network. The Administration of Spain also fulfilled the due diligence process, even though this was not required from the regulatory point of view, and notified the Bureau that the date of bringing into use of this new satellite was 16 February 2000.

In the light of the foregoing, the Administration of Spain **requests WRC-2000**:

- to maintain the frequency assignments to HISPASAT-2 in the Appendices S30 and S30A Plans and to instruct the Bureau to take the necessary action in order to carry out this decision.

Details of the procedure followed and the grounds on which the Administration of Spain bases its request for consideration by WRC-2000 are given in the annex to this document.

Annex: 1

ANNEX

Introduction

1 In 1991, the Administration of Spain communicated to the International Frequency Registration Board (IFRB) the information listed in Annex 2 of Appendices 30 and 30A relating to a new satellite system, HISPASAT-2, requesting IFRB to modify the Plans contained in those Appendices, in application of Article 4 thereof. The modification consisted in adding 10 channels to the 5 channels already recorded in the Plans on behalf of Spain. While both Plans were based on the use of analogue modulation, the Administration of Spain signified its intention to use the 10 channels with analogue and/or digital modulation, as permitted by the provisions of both Appendices. The system was scheduled to be brought into use on 31 January 1999, i.e. less than eight years after receipt of the information by IFRB (7 March 1991).

Since 1992, however, a series of events has taken place in ITU that has significantly altered the environment within which the Administration of Spain has had to apply the requisite procedures for modification of the Plans. These include:

- Abolition of IRFB by the Additional Plenipotentiary Conference, (Geneva, 1992), replacing it with the part-time Radio Regulations Board.
- Adoption by the 1995 World Radiocommunication Conference (WRC-95) of the simplified Radio Regulations. While the procedures of Appendices 30 and 30A were not incorporated in the standard procedure of the simplified Regulations, many of their parts were modified with a view to bringing them in line with standard procedure.
- As part of the process of updating the technical parameters, WRC-95 adopted a series of measures on the basis of which entries in the Plans would be revised; those measures were to be used for those systems, such as HISPASAT-2, for which the Plan modification process was under way.
- Adoption by the 1997 World Radiocommunication Conference (WRC-97) of revised Plans including those systems, such as HISPASAT-2, for which the procedure of Article 4 had been successfully completed.
- A series of Rules of Procedure, some of which have been modified more than once.
- Delay in the issuing of Rules of Procedure relating to the calculations required for identifying the administrations that may be affected by the use of digital modulation employed by the HISPASAT-2 system. The only calculation method that the Radiocommunication Bureau could use was one provided by Joint Working Party 10-11S only in 1996, i.e. more than five years after receipt of the information by IFRB.

2 Administrations, in keeping with their international commitments, have to operate their systems in conformity with the Plan as indicated in § 3.1 of Article 3, which stipulates that: "*The Member States in Regions 1, 2 and 3 shall adopt, for their broadcasting-satellite space stations operating in the frequency bands referred to in this Appendix, the characteristics specified in the appropriate Regional Plan and the associated provisions*". The Administration of Spain, being among them, faced constant uncertainty regarding the characteristics of HISPASAT-2 that would finally appear in the Plans due to the continuous changes referred to in section 1 above. As a result of these events and associated decisions, the Administration of Spain was forced to take a series of decisions that changed its initial project, so as to adapt to the new technical and regulatory environment that was being developed. These decisions include, *inter alia*, modification of the technical parameters of the HISPASAT-2 network, and particularly a change of orbital position (from 31º W to 30º W) adopted by WRC-97. In consequence of the above, the Administration of

Spain was obliged to modify the date of bringing into use of HISPASAT-2, postponing it by ten months, from 31 January 1999 to 1 December 1999. On the surface of it, this circumstance could give the impression that the period between the date of receipt of the information by IFRB and the date of bringing into use of HISPASAT-2 exceeded the time-frame set in § 4.3.5 of Article 4 of Appendix S30 (eight years). However, that is not the case, because here, as in any such procedure, an interruption of the procedure for reasons arising in the course of its application stays the period set *a priori*, which only resumes when the causes of the interruption disappear. Nevertheless, in 1999, despite its enormous processing delays and the various decisions adopted by different conferences, the Bureau informed the Administration of Spain that the frequency assignments to the HISPASAT-2 network were to be deleted from the Plan as a result of the Rule of Procedure on § 4.3.5 adopted by RRB in December 1998.

One of the events to which we refer above is the revision of the Plans by a future conference. In connection with that revision, some 300 systems have been communicated to the Radiocommunication Bureau, the majority of which are paper satellites that will never be brought into use. The decision of the Bureau, based on a Rule of Procedure adopted by the Board, will have the effect of relegating HISPASAT-2 to the end of the queue, and yet it is a real system which was brought into use on 16 February 2000.

Case history

3 Since the Administration of Spain communicated to IFRB the information listed in Annex 2 of Appendices 30 and 30A, there has been extensive correspondence between the Spanish Administration and the Radiocommunication Bureau (initially IFRB), relating to the application of Appendices 30/30A and S30/S30A procedures to the satellite system HISPASAT-2, adding new channels to those already recorded in the downlink Plan and the uplink Plan on behalf of Spain. In addition, two World Radiocommunication Conferences - WRC-95 and WRC-97 - adopted decisions in relation to the above Appendices which considerably affected the development of the system. It is therefore essential to consider the action taken by IFRB and subsequently BR and by the Spanish Administration together with the decisions of WRC-95 and WRC-97. This action is described below. None of what follows should be taken in any way as a criticism of any of the parties involved in modification of the Plans. However, it is necessary to point out that the consequences of the actions taken have repeatedly affected the development of the HISPASAT system, making it impossible for both those responsible for developing the system and the responsible administration to know on which bases the system should continue to be developed.

Phase 1: Commencement of the procedures for modification of the Plans

4 On 7 March 1991, IFRB received from the Administration of Spain the information contained in Annex 2 of Appendices 30 and 30A, modifying those Appendices by adding 10 new channels for Appendix 30 (1, 3, 5, 7, 9, 11, 13, 15, 17 and 19) and 10 channels for Appendix 30A (21, 23, 25, 27, 29, 31, 33, 35, 37 and 39). The communication contained, *inter alia*, the following information:

- All the channels were intended to be used with analogue modulation (27M0F3F) and/or digital modulation (27M0G9W).
- The service area was described as an ellipse covering the continental territory and the Canary Islands, such that any coverage of the territories of other countries was due to unavoidable overlap required by the need to develop the system in an economical manner.

- The date of bringing into use was 31 January 1999, so that the period between the submission of information to IFRB and the bringing into use of the system did not exceed eight years; here, the Spanish Administration took into account that a possible extension of the date of bringing into use could be accepted by the then IFRB, pursuant to the Rules of Procedure in force, as for similar situations to which Articles 11 and 13 of the Radio Regulations apply.
- Some carriers were indicated for use on an experimental basis.

The communication also contained the following note: "*We do not rule out the use of other systems which guarantee interference lower than or equal to that produced by the system considered in the appropriate Regional Plan or which comply with the provisions of § 3.2 of Article 3 of Appendix 30*". This commitment applies equally to the digital use for which § 3.2 of Article 3 applies.

5 The IFRB secretariat examined the information received in application of §§ 4.3.1-4.3.6 of Appendix 30 and §§ 4.2.1-4.2.7 of Appendix 30A and included the results of this examination in Documents D37825 and D37826 for consideration by the Board. The Board adopted those two documents at its meeting of 27 May 1992. In essence, the Board's decisions:

- identified definitively those administrations whose services may be affected by the use of the proposed additional channels with analogue modulation; and
- recognized that no calculation method was available for the purpose of identifying administrations that may be affected by the use of digital modulation. That fact is also recognized in Appendix S30, in footnote 26, which states that "*Protection masks for verifying that this provision is met are not yet fully defined in existing ITU-R Recommendations. Recommendations for interference between analogue and digital signals are still under development. In absence of criteria to evaluate interference, the Bureau will use the worst-case approach as adopted by the Radio Regulations Board*".

6 On 9 June 1992, IFRB published the results of its calculations in Special Sections AP30/E/14 and AP30A/E/11 annexed to Weekly Circular 2030. In those publications, no indication was given to the international community that the findings were limited to analogue modulation and that, due to the unavailability of a calculation method, countries that may be affected by the use of digital modulation were not indicated. If the worst-case approach mentioned above had been available to IFRB and IFRB had applied it and published the results together with the results for analogue modulation, the Spanish Administration would have been able to continue the development of its system in a clear environment.

Noting the rapid development of digital modulation in other systems in the fixed-satellite service bands and the associated potential difficulties, the Spanish Administration, much to its own regret, had no alternative but to delay the development of its system (the expected delay was estimated to be of no more than one year) until it had an idea of the extent of the difficulties it might encounter in coordinating digital modulation with countries other than those appearing in the Special Sections. The actual delay in publication of the list of affected administrations in fact exceeded five years.

Phase 2: Processing of the analogue case

7 On 25 July 1995, having made appropriate modifications to its system in order to obtain the agreement of the administrations identified by IFRB as being potentially affected by the use of analogue modulation, the Administration of Spain informed the Radiocommunication Bureau of the results obtained, in application of § 4.3.14 of Appendix 30 and § 4.2.15 of Appendix 30A.

Normally, after reviewing these results and confirming that all required agreements had been obtained or were no longer required, the Bureau should have included the modifications in the Plans.

8 On the same date, the Administration of Spain notified the frequency assignments for recording in the Master International Frequency Register (MIFR) in application of Articles 5 of both Appendices. In so doing, it took due account of § 5.1.3, which specifies that: "*Each notice must reach the Bureau not earlier than three years before the date on which the frequency assignment is to be brought into use*", and indicated its intent to bring the HISPASAT-2 network into use despite some uncertainties attached to the pending results of calculations for the digital case. Except if the Bureau found that some of the agreements required had not been obtained, the date of receipt of this information should be the date of modification of the Plans, i.e. before WRC-95. In any event, the Administration of Spain is entitled to consider that the decisions of that Conference apply to the Plans as modified, including the Article 4 modifications for both Appendices proposed by the Spanish Administration.

9 On 30 July 1996, the Bureau published Special Sections (Part B) AP30/E/47 and AP30A/E/43 containing the results of the successful application of Articles 4 of both Appendices for the additional channels to be used by the HISPASAT-2 network with analogue modulation. These publications meant that the Appendices 30 and 30A Plans had been modified to include 10 additional channels with analogue modulation, which is the type of modulation on which the two Plans were based. The use of digital modulation was considered within the framework of § 3.2 of Article 3, § 5.2.1 *c)* of Article 5 and § 3.1.3 of Annex 5.

Phase 3: Processing of the digital case

10 On 13 October 1995, the Bureau informed the Spanish Administration of the results of its examination relating to digital modulation 27M0G9W using the algorithms submitted by JWP 10-11S; it had not been possible to finalize that examination for the initial publication of 9 June 1992 due to the unavailability of a calculation method. Through an exchange of correspondence between the Spanish Administration and the Bureau during the period from 13 October 1995 to 20 February 1996, the situation in respect of the final characteristics to be used was clarified; among other modifications to the system, the transmitting space station power was reduced from 24.1 dBW to 22.1 dBW.

11 On 13 August 1996, the Bureau published Special Sections AP30/E/14(Corr.1) and AP30A/E/11(Corr.1) annexed to Weekly Circular 2240. These Special Sections contained the list of administrations identified using an algorithm provided by JWP 10-11S on 29 November 1994 and 1 December 1995. This delay in publication prevented Spain from effectively completing the required negotiations with the administrations concerned, for two reasons:

- Experience in other cases of coordination shows that a requested administration often prefers to start negotiations only after the publication of the related Special Sections.
- Since no draft Rule of Procedure had been published containing the calculation algorithm, the Administration of Spain could reasonably anticipate objections by administrations once such a draft was published or when the calculation algorithm was used without having yet been published.

Consequently, **the Administration was effectively unable to carry out negotiations until more than five years after receipt of the information by IFRB**. Moreover, the environment within which these negotiations were to be conducted changed radically. In 1992, very few cases of modifications to the Plans were in the hands of IFRB. In 1996, WRC-95 had adopted Resolution 531, and the studies carried out in the Study Groups in preparation for the Conference Preparatory Meeting (CPM) resulted in a large number of submissions of modifications of the Plans to the Bureau. The effect of this was to raise doubts in the minds of the financing partners of HISPASAT-2 as to the ability of the Spanish Administration to finalize all the required agreements, hence adding delays in the construction of the satellite.

Phase 4: Impact of WRC-95 decisions

12 WRC-95 discussed many issues relating to Appendices 30 and 30A. Many proposals were placed before the Conference, leading to the adoption of Resolution 531 containing instructions to the Study Groups to carry out the necessary studies for revision of the Plans by WRC-97. The Bureau was also instructed to apply new technical criteria (see Recommendation 521) to the entries in the Plans and to systems in the process of modifying the Plans, and to include entries in the Plans for new countries. Annex 2 of that Resolution contains a very useful summary of the situation prevailing in 1995 regarding the difficulties associated with the application of both Appendices, including:

- the fact that the technical criteria on the basis of which the 1977 Plan was adopted are not adapted to the technology in use in 1995;
- the limited spectrum available to each country prevents economical development of a broadcasting-satellite network, obliging countries such as Spain which planned to develop such systems to apply the procedure of Article 4 for additional channels[1].

13 The decisions contained in Resolution 531 which are of direct interest to HISPASAT-2 include:

- § 2.1.4 of Annex 1, as an instruction to the Bureau: "… *and protect, on the basis of the planning parameters contained in Recommendation **521 (WRC-95)** and, as far as possible, on the basis of the criteria set forth in Appendix **S30/30** (respectively **S30A/30A**), the assignments which are in conformity with Appendix **S30/30** (respectively **S30A/30A**) and have been notified under § 5.1 of Article 5 of Appendix **S30/30** (respectively **S30A/30A**)*"
- § 2.2.2 of Annex 1, permitting a change of the orbital location: "*utilization of existing orbital locations, except for those administrations wishing alternative ones…*."
- § 5.3.4 relating to non-standard parameters, which is the case of HISPASAT-2: "*WRC-95 instructs the Bureau to identify the systems still under Article 4 of Appendices **S30/30** and **S30A/30A**, including those using parameters different from those on the basis of which the current Plans were developed, in order to include a Note in the relevant publications*.

  This Note is intended to indicate that if the proposed system has not successfully completed the Article 4 procedures by WRC-97, WRC-97 will take account as far as possible of its parameters (see § 2.1.7 above); otherwise, if this is not possible, the administration responsible for this system may either revise its parameters, at WRC-97, so as to be compatible with the revised Regions 1 and 3 Plan, or maintain the modification and continue coordination under the modification procedures adopted by WRC-97, as of their entry into force."

---

[1] Spain was able to include in the HISPASAT-1 system the five channels appearing in the 1977 Plan, by combining them on board the same satellite with a payload for the fixed-satellite service. Currently, the only way that the Spanish Administration can meet the expected demand for satellite services is to extend its capacity using BSS bands due to the overcrowded situation in the Ku-band.

This decision introduced an additional uncertainty in relation to the future of HISPASAT-2. What can an administration do in the development of its system knowing that there is a probability that WRC-97 may ask it to modify its characteristics?

- § 5.4 which instructs the Bureau to conduct planning exercises starting by: "*Step 1: Modify the existing Plan assignments on the basis of the new parameters contained in Recommendation **521 (WRC-95)***."

Phase 5: Follow-up action on WRC-95 decisions

14 In application of the decisions of WRC-95, the Bureau modified the characteristics recorded in both Appendices for the use of analogue modulation by HISPASAT-2. The Bureau also used the modifications notified by the Spanish Administration to evaluate the impact of the use of digital modulation, as indicated in section 11 of this report above.

Phase 6: Impact of WRC-97 decisions

15 WRC-97 considered in detail Appendices S30 and S30A on the basis of a report by the Bureau on the work assigned to it by WRC-95. While the purpose of this consideration was, in principle, to include entries in the two Plans for new countries, the end result was the adoption of new Plans incorporating the new countries and a number of beams to which Articles 4 of both Appendices had been successfully applied, including HISPASAT-2. By virtue of this action, the entries on behalf of Spain for HISPASAT-2 for analogue modulation received formal recognition by the Conference. Moreover, the change in orbital location from 31° W to 30° W was also formally adopted by the Conference. The Spanish Administration was therefore entitled to consider the HISPASAT-2 entries for analogue modulation as an integral part of the Plans, like any other entry adopted in 1977, for two reasons:

- The HISPASAT-2 analogue entry was published, 30 July 1996, in Part B of Special Sections AP30/E/47 and AP30A/E/43, and therefore § 4.3.17 of Appendix S30 and the corresponding paragraph of APS30A apply to it. These state that: "*The Bureau shall publish in a special section of its weekly circular the information received under § 4.3.14 together with the names of any administrations with which the provisions of this Article have been successfully applied.* ***The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan***."

- WRC-97 adopted a revision of the Plans and therefore the entries for HISPASAT-2 **are no longer to be considered as modification of the Plans** through the successful application of the procedure of Article 4. They are confirmed as entries in the Plans made by a conference which revised the Plans.

  This interpretation is confirmed by the wording of *resolves* 2 of Resolution 533 which stipulates, in relation to the application of § 4.3.5 of Article 4, that:

  "– *the replacement of assignments at 31° W by assignments at 30° W and 33.5° W**;

  *shall not be considered as new or additional assignments under § 4.1b) of Article 4 of Appendices **S30** and **S30A**. Therefore, these assignments shall not be subject to the provisions of § 4.3.5 of Appendix **S30** and § 4.2.5 of Appendix **S30A** and the associated Rules of Procedure. In particular, the associated orbital positions shall be treated as "orbital positions in the Plan", and the assignments shall not lapse even if they are not brought into use within eight years from the adoption of the revised Plans*".

* The orbital position at 31° W shall no longer be considered as an orbital position in the Plan.

Despite these provisions, entries for HISPASAT-2 in the revised Plan bear the remarks 5 and 7, leaving the door open to comments from administrations and subjecting the date of bringing into use to the agreement of these administrations, under the additional procedure contained in Resolution 53.

16 WRC-97 also adopted decisions in its Resolutions 53 and 533 affecting the development of HISPASAT-2. Resolutions 53 and 533 contain two additional procedures. Insofar as aspects affecting HISPASAT-2 are concerned, the content of these two Resolutions may be summarized as follows:

- Resolution 533:
  - confirms the analogue entry for HISPASAT-2 in the Plans;
  - confirms that § 4.3.5 does not apply to it;
  - sets a procedure for the coordination of the digital use.
- Resolution 53:
  - sets a procedure for the revision of remarks 5 and 7 appearing in the Plans against the analogue entries for HISPASAT-2.

16.1 Resolution 533 contains, among others, the following points:

– *resolves* 1.: Use of new technical parameters: The Conference used new technical parameters and instructed the Bureau to use them "*in its subsequent examination of submissions for modification and notifications of assignments in the Regions 1 and 3 Plan received under Articles 4 and 5 of Appendices **S30** and **S30A***".

– *resolves* 3.: Establishment of a new reference situation, which is the basis for the Bureau to conclude if a modification to the Plans affects entries in the Plans.

– *resolves* 2.: The new reference situation referred to in *resolves 3* shall take account of the new orbital locations adopted by the Conference for seven systems; HISPASAT-2 is one of these, as it is displaced from 31° W to 30° W.

– *resolves* 2.: The status of HISPASAT-2 is clearly defined. The third indent of this *resolves* specifies that:

"– *the replacement of assignments at 31° W by assignments at 30° W and 33.5° W*;*

*shall not be considered as new or additional assignments under § 4.1b) of Article 4 of Appendices **S30** and **S30A**. Therefore, these assignments shall not be subject to the provisions of § 4.3.5 of Appendix **S30** and § 4.2.5 of Appendix **S30A** and the associated Rules of Procedure. In particular, the associated orbital positions shall be treated as "orbital positions in the Plan", and the assignments shall not lapse even if they are not brought into use within eight years from the adoption of the revised Plans*".

– *resolves* 4. to 6.: Applicable to the digital use by HISPASAT-2. Special Sections AP30(Res.533)/E/14 and AP30A(Res.533)/E/11 were published on 15 September 1998 and the second indent of *resolves* 6 states that: "*within four months from the date of the above publication, possibly affected administrations should provide comments to the Radiocommunication Bureau and to the notifying administration; however, the notifying administration shall indicate any agreements which have been obtained previously and any new agreements*". The time-limit for such comments in respect of

* The orbital position at 31° W shall no longer be considered as an orbital position in the Plan.

HISPASAT-2 was 15 January 1999, i.e. **15 days before the initially notified date of bringing into use**. Such a short period of time would have been insufficient to allow the Administration of Spain to reach an agreement with the newly identified administrations. Also, the special section for the downlink was published in a provisional way due to the provisional application of § 4.3.1.4 of Appendix S30 and, therefore, the list of affected administrations was not definitive. Later, on 21 December 1999, a corrigendum (Special Section AP30(Res.533)/E/14(Corr.1)) was published with a definitive list of affected administrations. Keeping in mind that § 5.1.3 of Article 5 requires notification to be effected three months before the date bringing into use and the footnote thereto requires administrations to "*initiate the procedure for modifying the Plan concerned in sufficient time to ensure that this limit is observed….*", this would literally take HISPASAT-2 back to 9 June 1992, the date on which the initial calculations were published.

16.2 Resolution 53: This Resolution adds a little more complexity to the problem, since it subjects the date of bringing into use of the analogue carriers of HISPASAT-2 to additional agreements to be obtained under a procedure contained in the Resolution. Entries for HISPASAT-2 bear remarks 5 and 7.

Remark 5 states: "*This assignment shall be brought into use only when the limits given in Table 1 are not exceeded or with the agreement of the affected administrations identified in Table 2 with respect to*:

a) *assignments in the Region 2 Plan on 27 October 1997; or*

b) *assignments in the terrestrial services which are recorded in the Master Register with a favourable finding or received by the Bureau prior to 27 October 1997 for recording in the Master Register and which subsequently receive a favourable finding based on the Plan as it existed on 27 October 1997; or*

c) *assignments in the fixed-satellite service which: are recorded in the Master Register with a favourable finding; or those which have been coordinated under the provisions of No.* ***1060*** *or § 7.2.1 of Appendix* ***S30****; or those that are in process of coordination under the provisions of No.* ***1060*** *or § 7.2.1 of Appendix* ***S30*** *prior to 27 October 1997.*"

Remark 7 states: "*This assignment shall not claim protection from the assignments of the administration indicated in Table 3 which are recorded in the Master Register with a favourable finding prior to 27 October 1997 to which No.* ***S5.487/838*** *and No.* ***S5.43/435*** *do not apply*".

The remarks 5 and 7 associated to them are dealt with under the procedure of Resolution 53, which indicates in *resolves* 4: "*that the new coordination requirements identified in the above-mentioned circular-letter shall apply provisionally from the date of the above-mentioned circular-letter until a decision is taken by WRC-99;*". The procedure set forth in that Resolution permits any administration identified by the Bureau to decide whether or not to remain in the list of potentially affected administrations whose agreement is required before bringing HISPASAT-2 into use. This means that, irrespective of the results of coordination required under the procedure of Resolution 53, the remarks associated with the HISPASAT-2 assignments will be reviewed by the next conference. In the light of the foregoing, **in no way can the assignments be deleted, since doing so would mean that a Rule of Procedure of RRB supersedes a decision of the conference.**

Coordination under Resolution 53 is a new constraint on HISPASAT-2, since it has to take account of all new terrestrial and space systems notified to the Bureau between 9 June 1992 (date of publication of Special Sections AP30/E/14 and AP30A/E/11 for Spain) and 27 October 1997. This applies equally to proposed modifications to the Region 2 Plans.

17 In the light of these last events, in addition to a series of amendments to the Rules of Procedure, such as the one that considers the date of a modification as a new date (see CR/59)[2], **the Administration of Spain is entitled to consider that it could postpone the date bringing into use**. Considering that it could never be entirely sure that the final status of its system would remain unchanged, and taking into account operational requirements, the Spanish Administration decided to go ahead with the launch and operation of HISPASAT-2. It confirmed the contracts it had with the manufacturer and the launch provider and, in agreement with them, fixed the date of bringing into use at 1 December 1999 as notified to the Bureau on 14 June 1999. In so doing, the Administration of Spain was confident that it would be able to comply with any action that the Bureau may request of it in application of the decisions of WRC-97.

Conclusion

18 The above sections have described the changing regulatory environment which the Administration of Spain has had to cope with in applying the required regulatory procedures, from submission of the information listed in Annex 2 of Appendices 30 and 30A up to the application of Resolution 533 to the HISPASAT-2 network after WRC-97. Taking into account the above considerations, the Administration of Spain requests WRC-2000 to maintain the frequency assignments to HISPASAT-2 in the Plans contained in Appendices S30 and S30A of the Radio Regulations.

[2] CR-59 reads as follows "*Moreover if the information, provided either under this inquiry or at any stage of application of Article 4, adds new affected administrations on the basis of technical examination methods and criteria described in Appendix 30 (C/I, power flux-density, Appendix 29), **the parts of the network relating to these changes shall have a new date of receipt***."

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.6.1 - IMT-2000 ISSUES

MSS OPERATIONS IN THE BANDS IDENTIFIED FOR IMT-2000 OPERATIONS

Background

Considerable work has gone on internationally over the last few years to identify the possible long-term needs for the satellite component of IMT-2000. New Zealand has noted that there have been a number of MSS networks both operational, and under planning, that have come under financial difficulties. This brings into question the usefulness of further MSS allocations for IMT-2000 satellite component operations.

In its document, Principles for evaluating IMT-2000 candidate bands, New Zealand made the point that administrations need flexibility when deciding how much spectrum is required nationally on the one hand to meet their IMT-2000 needs while on the other hand satisfying the requirements of existing services in these bands.

Given this need for flexibility, it would appear to New Zealand that it would be useful for the Conference to identify bands where there are already mobile service allocations within the Table of Frequency Allocations sharing with the MSS[1], for possible use by the terrestrial or satellite component of IMT-2000.

This would mean that if MSS use does not materialize or is not necessary nationally, greater flexibility would be available to administrations to apportion the spectrum requirements between IMT-2000 uses and other services.

It should be noted that geographical separation may be required between MSS and MS IMT-2000 operations in the same frequency band.

[1] This applies to the band 2 500-2 520 MHz and 2 670-2 690 MHz.

Proposal

NZL/66/1

In the event of the Conference identifying the band 2 520-2 670 MHz for the terrestrial component of IMT-2000 and identifying the bands 2 500-2 520 MHz and 2 670-2 690 MHz, for the satellite component of IMT-2000, then the latter two bands should additionally be identified for use by both the terrestrial and satellite components.

NZL/66/2

The dual identification of the bands should be reviewed at a future conference.

PROPOSALS FOR THE WORK OF THE CONFERENCE

RESOLUTION 85 (MINNEAPOLIS, 1998)

RESOLUTION 49 (WRC-97)

1 Introduction

The Plenipotentiary Conference (Kyoto, 1994) adopted Resolution 18 to deal in part with the increasing number of “paper satellites”. *Considering* c) of that Resolution reads as follows:

> “that there is growing concern about the accommodation of new satellite networks, including those of new ITU Members, and the need to maintain the integrity of ITU procedures and agreements.”

In the review under Resolution 18, there were considerable concerns expressed about the number of satellite filings submitted to ITU and for which many administrations considered as “paper satellites”, i.e. those of a speculative nature and which will probably never be brought into service. Proposals were made to WRC-97 attempting to address this aspect of the problem. Some of the proposals related to an administrative due diligence process and others related to a financial due diligence process. WRC-97 finally adopted, in Resolution 49, an administrative due diligence procedure and this Resolution also instructed the Director to report to WRC-99 and subsequent WRCs on the results of the implementation of this procedure.

There were proposals made to PP-98, which continued to express concern about this problem, and as a consequence PP-98 adopted Resolution 85. In that Resolution WRC-2000 is requested to evaluate the results of the implementation of administrative due diligence and report to PP-02 and also instructs the Director to inform WRC-2000 about the effectiveness of the administrative due diligence procedure.

Council-99 also took up this problem and as consequence it adopted Decision 483. This Decision instructed the Director (among other things) “to provide a means, such as calling information exchange meetings, for enabling administrations and network operators to be both informed of the Bureau’s activities and to provide input for further improvements in the overall satellite network notification processing system”. Due to the increasing magnitude of the “backlog” problem of satellite network filings with the Bureau, the Director of BR organized an informal information exchange meeting in January 2000 to exchange ideas on how the problem could be addressed. At that meeting, the Director, in his opening statement, indicated:

> "Reform of the Radio Regulations - While all of the above factors touch on the backlog, I believe, and indeed the RRB agreed, that the area which could bring the greatest impact is a serious reform of the Radio Regulations to bring them much more into line with the real requirements of satellite operators as they seek to coordinate their systems. Yes, we must try to address the above five areas but, for example, rather than spending a lot of scarce resources automating a flawed regulatory process, shouldn't we redouble our efforts to improve the regulatory framework to ensure that what we are doing is really what is required? In this regard, WRC-2000 is crucial. As I said at the RAG, if the Member States of the ITU do not make significant improvements and simplifications of the regulatory process pursuant to Minneapolis Resolution 86 by means of changes in the Radio Regulations and perhaps the adoption of Resolutions to implement certain measures, I fear that by the next WRC in 2003, if the ITU becomes increasing irrelevant to the needs of the satellite community, its credibility will have suffered irreparable damage and satellite operators will look elsewhere for mechanisms to coordinate their satellite networks. This would be a great pity, indeed. Technology is continuing to develop more rapidly and should not, cannot and will not wait for slow, bureaucratic processes to be followed. We can't go down the path we followed for the so-called simplification of the Radio Regulations where the process was initiated by the Plenipotentiary Conference in 1989 and the results implemented only almost ten years later on 1 January 1999. During today, I hope that there will be discussion generated on ways to substantially improve, if not resolve, the situation."

In one of the contributions to the January meeting, it was stated that:

> "In our view this very long delay in the process is due to two major reasons:
>
> - the complexity of the data and procedural process of the Radio Regulations which may not reflect the real needs of administrations satellite operators;
> - the volume of space system filings (including the extensive overfilings that occurs) which are submitted to the BR."

Other contributions to WRC are addressing the question of the complexity of the Radio Regulations, but so far, there have been no contributions which will have an impact on the volume of the filings with the Bureau, and that is the purpose of this document.

The consequence of this very large number of "paper filings" for the Bureau is an extraordinary amount of work on filings for which many (if not most) of the networks will never be implemented and thus the backlog problem. The consequences for administrations and satellite operators is the very large number of satellite networks/administrations that are identified as potentially affected when new notices for real systems are submitted. This forces the network operators to either attempt to coordinate with these very many "paper satellite networks" with substantial costs or make some risk assessment as to which networks are likely to be "real" and those which are likely to be "paper", and only coordinate with the "real" systems at some risk.

It is recognized that under Resolution 85 (Minneapolis, 1998) WRC-2000 is to report to PP-02 on this matter, but as the Director noted in his statement to the January meeting, the problem is so serious that WRC-03 is probably too late and, as the Director indicated at that time:

> "I fear that by the next WRC in 2003, if the ITU becomes increasing irrelevant to the needs of the satellite community, its credibility will have suffered irreparable damage and satellite operators will look elsewhere for mechanisms to coordinate their satellite networks."

Consequently, in spite of the request of PP-98, it is necessary that WRC-2000 take some definitive decisions and report on these decisions to PP-02.

At the information exchange meeting in January 2000, the Bureau indicated that the administrative due diligence process under Resolution 49 is having no positive impact on reducing the number of filings. This result was not unexpected, as the administrative due diligence process of Resolution 49 provides for the submission of certain data near the end of the period for bringing into use of the network, which is after all the work has been done by the Bureau. Because the administrative due diligence is near the end of the process, it has no impact on the submission of new filings. It is for this reason that it is not possible to wait until WRC-03 before taking further action to reduce the number of filings. One of the suggestions made to the correspondence group set up at the 21 January 2000 information meeting was that the present administrative due diligence data be submitted much earlier in the process and possibly at the same time as the coordination request is submitted. As the coordination request is submitted to ITU 4 1/2 to 5 years in advance of the in-service date, any data submitted on satellite construction contracts and launching contracts submitted with the coordination data is not likely to be data based on firm contracts and thus is not of much value as administrative due diligence data.

It is also noted that in the Report of the Director to WRC (Document 32) the Director has indicated 37 networks have been cancelled, but as indicated in the document "all of these cancellations had reached the maximum (nine year) period for bringing into use and pursuant to the application of <*resolves* 1 and 2> of Resolution 51 (WRC-97) and S11.44 of the Radio Regulations and hence would have been cancelled in any event".

2 Financial due diligence

2.1 Background to the proposals

The above Administrations are of the view that the only reasonable means to constrain the numbers of filings to the Bureau is to adopt some form of financial due diligence.

The proposals for financial due diligence that were made to WRC-97 consisted of the following three elements:

- a **one time** financial deposit which would be based on the operating bandwidth of the proposed network and would be submitted at the time of the coordination request. The interest from this deposit would be retained by ITU and the principle amount of the deposit would be returned when the network frequencies are brought into use within the time period provided for by the Regulations. If the network is not brought into use within the specified time period, then the deposit is forfeited to ITU. This element is aimed at the addressing of the "paper satellite" problem during the coordination phase of the process;
- an **annual** registration fee (here referred to as an annual coordination fee), again based on the operating bandwidth of the planned network, and payable starting at the beginning of the coordination process and continuing until the network frequencies are recorded as being in operation. This is an alternative to the deposit approach with the same objective;

- an **annual** registration fee that would also be based on the operating bandwidth and would be payable upon the recording of the network frequencies in the MIFR that the frequencies are in operation and would continue as long as the network frequencies are recorded in the Master Register. This element is aimed at addressing those “paper satellites” that are recorded in the MIFR;
- in both cases of the **annual** fees, any default in paying the annual fee would result in the network frequencies no longer having to be taken into consideration by BR and other administrations and the corresponding publications or recordings in the MIFR would be cancelled.

The main problem facing ITU today is the backlog of filings with the Bureau. A secondary problem is that there may be a number of “paper satellites” recorded in the MIFR which increase the workload of the administrations/operators primarily but do not have a significant impact on today’s backlog problem of the Bureau. Consequently, it is proposed in this document that WRC-2000 deal with the backlog issue and that WRC-03 may wish to consider the question of “paper satellites” recorded in the MIFR.

2.2 Financial deposit

The idea of the deposit is that at the time of submission of the coordination data to BR, the administration would have to submit, within a short fixed time period, a financial deposit. This deposit would be dependent on the operating frequency bandwidth of the network. This deposit and the interest earned would be returned to the administration/operator if the network were brought into use within the time period provided for by the Radio Regulations. However, if the frequencies are not brought into use within the required period, then the deposit would be forfeited to ITU. All income from any forfeited deposits is to be used by Council in reducing the value of the contributory unit and thus providing a benefit to all members including the developing countries. This approach, in our view, would be the most effective means in addressing the problem of “paper satellites” that are submitted for coordination. It is also the simplest approach to implement.

2.3 Amount of financial deposit

The amount of the financial deposit must be such that it is a deterrent to frivolous filings but not so high as to be a deterrent to the development of “real” networks. A deposit of about 1 per cent of the cost of building and launching a satellite into service would seem to be an adequate balance. Thus it is proposed that the deposit for a typical satellite having a total bandwidth of 500 MHz would be CHF 5 million or CHF 10 000 per MHz.

2.4 Scope of applicability

It is proposed that this financial due diligence procedure be applied to all MSS, BSS and FSS filings in the following frequency bands: 3 400-8 400 MHz and 10.7-31 GHz. This procedure would apply to all satellite coordination requests under S9.7 and S9.11A as well as requests for modifications under Article 4 of Appendices S30/S30A. As the fee is based on a fee per MHz of bandwidth, the bandwidth will be calculated on the basis of the amount of contiguous spectrum used by the satellite (uplink, downlink and inter-satellite) including the guardbands between channels and at the edge of the used spectrum.

2.5 Timing of submission of deposits

When the Bureau publishes the coordination request (No. S9.38, § 4.3.6 of Appendix S30, and § 4.2.7 of Appendix S30A), the Bureau shall calculate the amount of the deposit and send the invoice to the administration. If the invoice is not paid within six months (with suitable reminders), the Bureau shall cancel the publication.

2.6 Transition arrangements

Considering the magnitude of the filings now with ITU, it is our opinion that any new measures should be applicable to all satellite networks that have been filed with ITU and not yet brought into use, and either recorded in the MIFR or recorded in the Plans of Appendices 30/30A. Therefore, we are proposing that the effective date of such fees should be [1 January 2001]. In order to implement this new approach, we propose that immediately after WRC-2000 the Bureau would inform all administrations that have satellite networks still at the coordination phase as to the amount of the deposit and they would have until 1 January 2001 to submit the fee. Any networks for which the fee has not been submitted by 1 January 2001 (with suitable reminders by the Bureau) would have the publication cancelled by the Bureau and this network would no longer be taken into consideration by the Bureau and other administrations. As the financial approach is administered by ITU and the submission of funds to ITU is a necessary part of the process, it is clear that this approach is very transparent to outsiders and that it will be administered in a consistent and objective manner.

2.7 Proposals

The Annex to this document proposes the adoption of a Resolution dealing with the financial due diligence process and the following are some consequential modifications to give the necessary regulatory effect to the Resolution.

ARTICLE S9

MOD DNK/LIE/LUX/NOR/HOL/SUI/67/1

Procedure for effecting coordination with or obtaining agreement of other administrations[1, 2, 3, 4, 5, 5*bis*]

ADD DNK/LIE/LUX/NOR/HOL/SUI/67/2

5*bis* **A.S9.5*bis*** In the application of this Article, Resolution [**XXX (WRC-2000)**] shall also be applied.

Reasons: To give regulatory effect to the financial due diligence procedure.

ARTICLE S11

MOD DNK/LIE/LUX/NOR/HOL/SUI/67/3

Notification and recording of frequency assignments[1, 2, 3, 3*bis*]

ADD DNK/LIE/LUX/NOR/HOL/SUI/67/4

3*bis* **A.S11.3*bis*** In the application of this Article, Resolution [**XXX (WRC-2000)**] shall also be applied.

Reasons: To give regulatory effect to the financial due diligence procedure.

APPENDIX S30

Provisions for all services and associated Plans for the broadcasting-satellite service in the frequency bands 11.7-12.2 GHz (in Region 3), 11.7-12.5 GHz (in Region 1) and 12.2-12.7 GHz (in Region 2)

(See Article **S9**)

ARTICLE 4

MOD DNK/LIE/LUX/NOR/HOL/SUI/67/5

Procedure for modifications to the Plans[1*bis*]

ADD DNK/LIE/LUX/NOR/HOL/SUI/67/6

1*bis* In the application of this Article, Resolution [**XXX (WRC-2000)**] shall also be applied.

Reasons: To give regulatory effect to the financial due diligence procedure.

APPENDIX S30A

Provisions and associated Plans for feeder-links for the broadcasting-satellite service (11.7-12.5 GHz in Region 1, 12.2-12.7 GHz in Region 2 and 11.7-12.2 GHz in Region 3) in the frequency bands 14.5-14.8 GHz[1] and 17.3-18.1 GHz in Regions 1 and 3, and 17.3-17.8 GHz in Region 2

ARTICLE 4

MOD DNK/LIE/LUX/NOR/HOL/SUI/67/7

Procedure for modifications to the Plans[2*bis*]

ADD DNK/LIE/LUX/NOR/HOL/SUI/67/8

2*bis* In the application of this Article, Resolution [**XXX (WRC-2000)**] shall also be applied.

Reasons: To give regulatory effect to the financial due diligence procedure.

ANNEX

ADD DNK/LIE/LUX/NOR/HOL/SUI/67/9

DRAFT RESOLUTION XXX (WRC-2000)

Application of financial due diligence to certain space networks

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the Kyoto Plenipotentiary Conference, 1994, identified the need for a review of the ITU coordination and notification procedures for space networks and adopted Resolution **18**;

b) that the number of submissions of satellite networks to ITU has increased substantially in 1994-1999 and continues to increase;

c) that various mechanisms of possible procedural approaches to due diligence have been studied and WRC-97 adopted Resolution **49** to address the problem of the excessive filings;

d) that PP-98 considered this problem and requested WRC-2000 to consider the matter and report to PP-02;

e) that the administrative due diligence process has not had any impact on the problem of excessive filings of satellite networks;

f) that the Conference decided that the problem of excessive filings is quite serious and is becoming even more serious and that it is necessary that early action be taken to implement these financial measures before WRC-03,

resolves

to apply a refundable financial deposit fee for those MSS, FSS and BSS satellite networks that are subject to coordination under Article **S9** and Article 4 of Appendices **S30/S30A** in accordance with the Annex to this Resolution.

ANNEX TO DRAFT RESOLUTION XXX (WRC-2000)

Application of the refundable financial deposit

WRC-2000 has adopted a one-time refundable deposit to be applicable to certain satellite networks that are subject to coordination. This fee shall be applied as follows as of [1 August 2000]:

a) all satellite networks of the FSS, MSS and BSS in the following frequency bands: 3 400-8 400 MHz and 10.7-31 GHz that are subject to coordination under Nos. **S9.7** and **S9.11A** shall be subject to this fee;

b) all modifications to the Plans of Appendices **30** and **30A** that involve the addition of new frequencies and/or orbit positions shall also be subject to this deposit;

c) the refundable deposit for GSO networks will be calculated on the basis of [10 000] Swiss francs per MHz of operating frequency range per orbit position, including the total of the uplinks and downlinks and any inter-satellite links. For non-GSO networks, the deposit will be calculated on the basis of [10 000] Swiss francs per MHz of operating frequency range per network, including the total of the uplinks and downlinks and any inter-satellite links;

d) as of the date of the publication of the details of the planned network under No. **S9.38** or § 4.3.6 of Appendix **30**, or § 4.2.7 of Appendix **30A**, the Bureau shall calculate the amount of the deposit and inform the notifying administration that it has four months to submit the deposit. If the deposit is not received by ITU within four months, the Bureau shall cancel the relevant publication and the Bureau and other administrations shall no longer take the concerned network into consideration;

e) the deposit with the interest will be returned to the notifying administration if all of the satellite network frequencies are bought into use by the dates provided for in the Radio Regulations, otherwise the deposit shall be forfeited to ITU. If only some of the frequencies are actually brought into use within the time period, a proportional part of the deposit shall be retained by ITU;

f) as a transitional measure for those networks submitted to ITU and published prior to [1 August 2000] but not yet recorded in the MIFR, the following measures shall be applied to those networks that are subject to the deposit:

- as of [1 August 2000] the Bureau shall inform those administrations having such networks subject to these deposits of the amount of the deposit and request that the deposit be submitted to ITU prior to [1 January 2001];
- any networks for which the deposit has not been received by ITU by [1 January 2001] (after suitable reminders) shall have the publication cancelled by the Bureau and these networks shall no longer be taken into consideration by the Bureau and other administrations.

PROPOSALS FOR THE WORK OF THE CONFERENCE

RESOLUTION 86 (MINNEAPOLIS, 1998)

1 Introduction

The ITU Radiocommunication Bureau organized an information exchange meeting on the problems associated with satellite procedures on 21 January 2000. The report of that meeting was sent to administrations and Sector Members in Administrative Circular CA/75. The above administrations have reviewed the suggestions contained in that circular and, as a result of this review, make the following proposals to WRC-2000.

2 Application of the Radio Regulations in the space services

We now have the situation in the application of the Radio Regulations for space services where the process has almost collapsed and is nearly unworkable in terms of the real world for the putting into service of satellite networks. If the process is not fixed in the near future, it will lead to more and more cases where satellites are put into operation without completing the ITU process. As a result of this breakdown, operators who must find means to ensure non-interference and to ensure continuity of service will tend to find solutions outside the framework of ITU. It must be recognized that, despite what the Radio Regulations say, a satellite network operator, with the approval of the administration, once the satellite construction and launch has been contracted for, will not stop the process including the launch just because the ITU process has not been completed and all problems resolved.

At the present time it takes the Bureau almost two years to publish a coordination request and about three years to record a space network in the Master Register. During the recent Radiocommunication Bureau information meeting on satellite procedures, it was stated by the Bureau that if there were no more coordination requests received it would take three years to process those that have already been filed with the Bureau. It was also noted at the same meeting that an extremely large percentage of the correspondence, which the Bureau must handle, is related to comments concerning Advance Publication of Information, where the correspondence has no regulatory effect and the information is simply put on file. It has also been suggested that perhaps the API process could be merged with the coordination process, thus eliminating this unnecessary burden which has been imposed on the Bureau.

Our comments with regard to the delay before publication are not intended to be a criticism of the Bureau, but are a criticism of the process that the Members have imposed on the Bureau in the Radio Regulations. If we take this time period and add to it a minimum period of about two to three years to effect the coordination, we then have a total period of about seven to eight years from the submission of a coordination request to the Bureau until the frequencies are recorded in the Master Register. It is necessary to contrast that seven- to eight-year period with the time it takes to contract, build and launch a satellite which is about two years. Even with no time considered for the actual coordination, the Bureau time is about five years - more than twice the time needed to build and launch a satellite. This contrast in time periods tells us that there is something seriously wrong with the administrative process that ITU has adopted.

In our view this very long delay in the process is due to two major reasons:

- the complexity of the data and procedural process of the Radio Regulations which may not reflect the real needs of administrations and satellite operators;
- the volume of space system filings (including the extensive overfilings that occur) which are submitted to the Bureau. This document does not address the problem of the volume of filings.

3 RR procedures

3.1 In Administrative Circular CA/75 the following possibilities to address the backlog were identified:

“a) suppression of the API process for networks subject to coordination;

b) mandatory electronic filing for new requests for coordination or notification;

c) establish methods for rapid electronic capture of filings still awaiting processing;

d) the use of a coordination arc as a trigger in identifying coordination requirements for FSS in certain cases;

e) separation of uplink and downlink data in determining the need for coordination;

f) make available on the ITU website, in the SNS database, details of new (electronic) filings “as received” with no further examination other than through the application of validation software tools;

g) publication to include only findings by the Bureau and a list of administrations with which coordination is required. Other detailed APS4 information to be available in the SNS database on the Web. This information could also include details of networks that triggered the need for coordination;

h) eliminate duplication of data requirements and technical/regulatory examination between coordination (S9) and notification (S11);

i) restrict the number of modifications to a network filing that can be made over a given period of time;

j) simplification of the Master Register;

k) improve software for capture, validation and technical examination;

l) any scope for further improvement in processes within BR;

m) noting deficiencies in the effect of Resolution 49 (WRC-97), consider again the concept of financial due diligence."

3.2 Due to the complexity of satellite networks and the difficulty of reaching allocation decisions at a WRC, we have arrived at a situation where there have been many different types of limits placed in the Radio Regulations. In association with these limits there are provisions where the Bureau is required to make examinations with respect to these limits. This leads to the situation where the data sent to the Bureau is complex and the Bureau must validate it in order to do the required examinations and then to publish this data. This has imposed an enormous workload on the Bureau, but without giving the Bureau the necessary resources to do this work. While one option would be to provide the Bureau with more resources this is not realistic given the magnitude of the increase that would be required and it is not the approach that we would favour. Our preference would be to very seriously reconsider the role of the Bureau in dealing with these matters, and reduce that role of the Bureau so that less work by the Bureau and thus less time would be necessary between a submission being received and its publication. The Bureau would thus have a very simple and more limited role, and more of the detailed work would be done between the operators during the frequency coordination process. Resolution 86 (Minneapolis, 1998) does provide the scope and possibility for a WRC to make major changes to the procedures for space systems. As mentioned previously, there have been some informal discussions between the Bureau, administrations and satellite operators to discuss some of these problems, and this document is a result of those informal discussions and Administrative Circular CA/75.

3.3 It is also necessary to ensure that the decisions of WRC-2000 do not increase the workload of the Bureau. In fact, some of the proposals contained in the Report of the CPM will complicate the process further and increase the workload of the Bureau. In this respect, CS92 provides in part that when adopting Resolutions and Decisions, a WRC "…shall take into account the foreseeable financial implications…".

3.4 In Document CMR2000/13, Europe has proposed a number of changes under Resolution 86 and these proposals are in addition to those proposals.

4 Proposals

4.1 Some of the suggestions can be implemented by WRC-2000 making specific changes to the Radio Regulations, and the following proposals are made for adoption by WRC-2000. In addition, some proposals are made that do not relate to the backlog issue but do relate to problems with satellite procedures.

4.2 We would propose to suppress the API process for all satellite networks that are subject to satellite-to-satellite coordination under Article S9 (see Annex 1).

This will reduce, to some extent, the workload of the Bureau with little loss of effectiveness as the API for systems requiring coordination is very brief and does not include much information. More importantly, it would provide an additional period of six months for the coordination process. The current provisions include an automatic delay of six months between the API and the request for coordination and also permits an administration (which has a previous API) to submit a coordination request for a new orbital position without requiring a new API. This results in unreliable information but is also an abuse of the process. As an example, Administration A may have an API filing at 50° E and one year later Administration B submits an API for 90° E. The present procedure permits Administration A to move its API position to 90° E as soon as it finds out about the submission of Administration B, and then have priority over the filing of Administration B.

If the proposal in Annex 1 is not accepted, it is proposed to modify No. S9.2 as follows:

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/1

S9.2 Amendments to the information sent in accordance with the provisions of No. **S9.1** shall also be sent to the Bureau as soon as they become available. The use of an additional frequency band or in the case of geostationary satellites, an orbital position outside the original service arc will require the application of the advance publication procedure for this band.

Reasons: At the present time it is possible to change the orbital position of a satellite at the API stage to a position 180 degrees from the original position. This network is obviously not the same satellite network because the service area is completely different, and this new network should be subject to a new API.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/2

S9.3 For those cases where coordination under Section II is not required, ~~If~~if, upon receipt of the Weekly Circular containing information published under No. **S9.2B**, any administration believes that interference which may be unacceptable may be caused to its existing or planned satellite networks or systems, it shall within four months of the date of publication of the Weekly Circular communicate to the publishing administration its comments on the particulars of the anticipated interference to its existing or planned systems. A copy of these comments shall also be sent to the Bureau. Thereafter, both administrations shall endeavour to cooperate in joint efforts to resolve any difficulties, with the assistance of the Bureau, if so requested by either of the parties, and shall exchange any additional relevant information that may be available. If no such comments are received from an administration within the aforementioned period, it may be assumed that the administration concerned has no objections to the planned satellite network(s) of the system on which details have been published.

Reasons: If the proposal in Annex 1 to suppress the API is not accepted, then it is proposed to modify S9.3 to indicate that the requirement that a copy of the comments shall be sent to the Bureau and that the Bureau is to make a publication of its summary of the comments, is to be applied only in the cases of networks not requiring coordination. This provision gives the Bureau a significant amount of work in the case of GSO networks with no benefit to the administrations involved in the process.

4.3 The best way to implement any such changes would be to propose modifications to the Radio Regulations, but there has not been much time between the BR Information Meeting in January and the WRC. In some cases the proposals are of a transitional nature and to be applied immediately after the WRC. Taking into account these two factors and the shortage of time available to prepare and decide on such important changes to the Radio Regulations for some of the ideas, it is proposed that, rather than make specific changes to the Radio Regulations at WRC-2000, it would be preferable at this time to concentrate on the preparation of a Resolution for WRC-2000. The intent of this Resolution would be to implement a number of changes on a provisional basis (including its application to those networks already filed with the Bureau) and then WRC-02/03 could consider the necessary permanent changes to the Radio Regulations. Attached as Annex 2 to this document is a draft Resolution dealing with both transitional measures and some other measures, which should be used until WRC-02/03. WRC-02/03 can then decide, if considered appropriate, to make the necessary permanent changes to the Radio Regulations.

4.4 In the present Radio Regulations, there are a number of references to the Weekly Circular. Following the decisions of WRC-97 and the Bureau, the new name is the International Frequency Information Circular; consequently it is proposed to change these terms in the Radio Regulations.

ANNEX 1

NOTE - The proposals in this Annex relate only to suppression of the API (as discussed in § 4.2).

ARTICLE S9

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/3

Procedure for effecting coordination with or obtaining agreement of other administrations[1, 2, 3, 4, 5, 5*bis*]

Section I – Advance publication of information on satellite networks or satellite systems that are not subject to coordination under Section II

~~*General*~~

Reasons: To restrict the API to only those networks not subject to coordination.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/4

S9.1 ~~Before~~When initiating any action under this Article or under Article **S11** in respect of frequency assignments for a satellite network or a satellite system that are not subject to coordination under Section II, an administration, or one[6] acting on behalf of a group of named administrations, shall, ~~prior to the coordination procedure described in Section II of Article **S9** below,~~ where applicable, send to the Bureau a general description of the network or system for advance publication in the ~~Weekly~~International Frequency Information Circular not earlier than five years and preferably not later than two years before the planned date of bringing into use of the network or system (see also Nos. **S11.44** and **S11.44B** to **S11.44I**). The characteristics to be provided for this purpose are listed in Appendix **S4**. ~~The coordination or notification information may also be communicated to the Bureau at the same time; it shall be considered as having been received by the Bureau not earlier than six months after the date of receipt of the information for advance publication where coordination is required by Section II of Article **S9**. Where coordination is not required by Section II, notification shall be considered as having been received by the Bureau not earlier than six months after the date of publication of the advance publication information.~~

Reasons: To restrict the API to only those networks not subject to coordination.

ADD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/5

5*bis* **A.S9.5*bis*** In applying the provisions of this Article, the provisions of Resolution [**XXX (WRC-2000)**] shall also be applied, where appropriate, in lieu of the provisions of this Article.

Reasons: It is necessary to add a footnote to the title of this Article making reference to draft Resolution XXX (WRC-2000) to give it the necessary regulatory effect.

ADD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/6

S9.1A Notification information may be communicated to the Bureau at the same time; however, it shall be considered as having been received by the Bureau not earlier than six months after the date of receipt of the advance publication information under No. **S9.2B**.

Reasons: Due to the rearrangement of the provisions.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/7

S9.2 Amendments to the information sent in accordance with the provisions of No. **S9.1** shall also be sent to the Bureau as soon as they become available. The use of an additional frequency band will require the application of ~~the advance publication~~this procedure for this band.

Reasons: Due to the rearrangement of the provisions.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/8

S9.2B On receipt of the complete information sent under Nos. **S9.1** ~~and~~or **S9.2**, the Bureau shall publish it in a Special Section of its ~~Weekly~~International Frequency Information Circular within three months. When the Bureau is not in a position to comply with the time limit referred to above, it shall periodically so inform the administrations, giving the reasons therefore.

Reasons: These modifications are of an editorial nature.

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/9

Sub-Section IA – Advance publication of information on satellite networks or satellite systems that are not subject to coordination procedure under Section II

Reasons: To suppress the API for networks subject to coordination.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/10

S9.3 If, upon receipt of the ~~Weekly~~International Frequency Information Circular containing information published under No. **S9.2B**, any administration believes that interference which may be unacceptable may be caused to its existing or planned satellite networks or systems, it shall within four months of the date of publication of the ~~Weekly~~International Frequency Information Circular communicate to the publishing administration its comments on the particulars of the anticipated interference to its existing or planned systems. A copy of these comments shall also be sent to the Bureau. Thereafter, both administrations shall endeavour to cooperate in joint efforts to resolve any difficulties, with the assistance of the Bureau, if so requested by either of the parties, and shall exchange any additional relevant information that may be available. If no such comments are received from an administration within the aforementioned period, it may be assumed that the administration concerned has no objections to the planned satellite network(s) of the system on which details have been published.

Reasons: These modifications are of an editorial nature.

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/11

S9.5A

Reasons: The API for networks not subject to coordination is for more than just information.

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/12

Sub-Section IB – Advance publication of information on satellite networks or satellite systems that are subject to coordination procedure under Section II

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/13

S9.5B

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/14

S9.5C

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/15

S9.5D

SUP BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/16

S9.5B.1

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/17

S9.30 Requests for coordination made under Nos. **S9.7** to **S9.14** and **S9.21** shall be sent by the requesting administration to the Bureau, together with the appropriate information listed in Appendix **S4** to these Regulations. Requests for coordination under Nos. **S9.7** to **S9.14** and **S9.21** shall be sent to the Bureau no earlier than five years and preferably no later than two years before the planned date of bringing into use of the network or system (see also Nos. **S11.44** and **S11.44B** to **S11.44I**). In the case of coordination under No. **S9.21**, any terrestrial station is not subject to these time limits.

Reasons: To provide for the start of the five-year period as the API is no longer the starting point.

ADD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/18

S9.30A Amendments to the information sent in accordance with the provisions of No. **S9.30** shall also be sent to the Bureau as soon as they become available. The use of an additional frequency band will require the restart of the coordination procedure for this band.

Reasons: To carry over some of the provisions for the API.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/19

S9.38 *d)* publish, as appropriate, the complete information in the ~~Weekly~~International Frequency Information Circular within four months. When the Bureau is not in a position to comply with the time limit referred to above, it shall periodically so inform the administrations, giving the reasons therefore.

Reasons: This modification is of an editorial nature.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/20

S9.40 *e)* inform the administrations concerned of its actions and communicate the results of its calculations~~,~~ when requested drawing attention to the relevant ~~Weekly~~International Frequency Information Circular.

Reasons: To reduce the need for BR to send out this data to only when requested.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/21

S9.41 Following receipt of the ~~Weekly~~International Frequency Information Circular referring to requests for coordination under Nos. **S9.7** to **S9.9**, an administration believing that it should have been included in the request shall, within four months of the date of publication of the relevant ~~Weekly~~International Frequency Information Circular, inform the initiating administration and the Bureau, giving its technical reasons for doing so, and shall request that its name be included.

Reasons: These modifications are of an editorial nature.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/22

S9.51 Following its action under No. **S9.50**, the administration with which coordination was sought under Nos. **S9.7** to **S9.9** shall, within four months of the date of publication of the ~~Weekly~~International Frequency Information Circular under No. **S9.38**, either inform the requesting administration and the Bureau of its agreement or act under No. **S9.52**.

Reasons: This modification is of an editorial nature.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/23

S9.52 If an administration, following its action under No. **S9.50**, does not agree to the request for coordination, it shall, within four months of the date of publication of the ~~Weekly~~International Frequency Information Circular under No. **S9.38**, or of the date of dispatch of the coordination data under No. **S9.29**, inform the requesting administration of its disagreement and shall provide information concerning its own assignments upon which that disagreement is based. It shall also make such suggestions as it is able to offer with a view to satisfactory resolution of the matter. A copy of that information shall be sent to the Bureau. Where the information relates to terrestrial stations or earth stations operating in the opposite direction of transmission within the coordination area of an earth station, only that information relating to existing radiocommunication stations or to those to be brought into use within the next three months for terrestrial stations, or three years for earth stations, shall be treated as notifications under Nos. **S11.2** or **S11.9**.

Reasons: This modification is of an editorial nature.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/24

S9.52A In the case of coordination requested under No. **S9.14**, on receipt of the special section of the ~~Weekly~~International Frequency Information Circular referred to in No. **S9.38**, and within the same four-month period from the publication of that special section, an administration in need of assistance may inform the Bureau that it has existing or planned terrestrial stations which might be affected by the planned satellite network, and may request the Bureau to determine the need for coordination by applying the Appendix **S5** criteria. The Bureau shall inform the administration seeking coordination of this request, indicating the date by which it may be able to provide the results of its analysis. When these results are available, the Bureau shall inform both administrations. This request shall be considered as a disagreement, pending the results of the analysis by the Bureau of the need for coordination.

Reasons: This modification is of an editorial nature.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/25

S9.55 All administrations may use correspondence, any appropriate means of telecommunication or meetings, as necessary, to assist in resolving the matter. The results thereof shall be communicated to the Bureau, which shall publish them in the ~~Weekly~~International Frequency Information Circular, as appropriate.

Reasons: This modification is of an editorial nature.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/26

S9.64 If the disagreement remains unresolved after the Bureau has communicated its conclusions to the administrations involved, the administration which requested coordination shall, having regard to the other provisions of this Section, defer the submission of its notice of frequency assignments under Article **S11** to the Bureau for six months from the date of the request or the ~~Weekly~~International Frequency Information Circular containing the request for coordination, as appropriate.

Reasons: This modification is of an editorial nature.

ARTICLE S11

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/27

Notification and recording of frequency assignments[1, 2, 3, 3bis]

ADD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/28

[3bis] **A.S11.3*bis*** In applying the provisions of this Article, the provisions of Resolution [**XXX (WRC-2000)**] shall also be applied, where appropriate, in lieu of the provisions of this Article.

Reasons: It is necessary to add a footnote to the title of this Article making reference to draft Resolution XXX (WRC-2000) to give it the necessary regulatory effect.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/29

S11.44 The notified date of bringing into use of any assignment to a space station of a satellite network shall be no later than five years following the date of receipt by the Bureau of the relevant information under No. **S9.1** or **S9.30** as applicable. The notified date of bringing into use may be extended at the request of the notifying administration by not more than two years, only under the conditions specified under Nos. **S11.44B** to **S11.44I**. Any frequency assignment not brought into use within the required period shall be cancelled by the Bureau after having informed the administration at least three months before the expiry of this period.

Reasons: Consequential to the suppression of the API for networks subject to coordination.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/30

S11.44A A notice not conforming to No. **S11.44** shall be returned to the notifying administration with a recommendation to restart the advance publication procedure or coordination procedure, as applicable.

Reasons: Consequential to the suppression of the API for networks subject to coordination.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/31

S11.44B The notified date of bringing into use as published under **S9.2** or **S9.38** as applicable will be extended by the Bureau in accordance with No. **S11.44** if due diligence information required by Resolution **49 (WRC-97)** is provided for the satellite network~~; if the procedure for effecting coordination in accordance with Section II of Article **S9** as applicable has commenced;~~ and if the notifying administration certifies that the reason for the extension is one or more of the following specific circumstances:

Reasons: Consequential to the suppression of the API for networks subject to coordination.

MOD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/32

S11.48 If, after the expiry of the period of five years, plus the extension specified in No. **S11.44**, as appropriate, from the date of receipt of the complete information referred to in No. **S9.1** or **S9.30** as applicable, the administration responsible for the satellite network has not brought the frequency assignments to stations of the network into use, the corresponding information published under Nos. **S9.2B** and **S9.38**, as appropriate, shall be cancelled, but only after the administration concerned has been informed at least three months before the expiry date referred to in No. **S11.44**.

Reasons: Consequential to the suppression of the API for networks subject to coordination.

NOC BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/33

S11.49

APPENDIX S4

Consolidated list and tables of characteristics for use in the application of the procedures of Chapter SIII

Consequential modifications to Appendix S4 to reflect the suppression of the API for networks subject to coordination.

ANNEX 2

ADD BEL/DNK/LIE/LUX/NOR/HOL/SUI/68/34

DRAFT RESOLUTION XXX (WRC-2000)

Provisional improvements in the satellite coordination process

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) Resolution **18** of the Plenipotentiary Conference (Kyoto, 1994);

b) Resolution **86** of the Plenipotentiary Conference (Minneapolis, 1998);

c) that there now exists a large backlog of satellite network coordination requests pending with the Radiocommunication Bureau such that elimination of this backlog at current processing rates and with no new networks being received would take the Bureau nearly three years to accomplish;

d) that WRC-97 decreased the period between receipt of the Advance Publication Information and the placing of satellite networks into use from seven to five years (RR **S9.1, S11.44**) and decreased the extension period from three to two years (RR **S11.44B** to **S11.44I**);

e) the critical importance of efficient telecommunication services at affordable prices to all nations and users;

f) the key role played by communication satellite networks in providing such efficient and affordable communication services;

g) that the current breakdown of ITU’s satellite coordination procedures seriously compromises the ability of such networks to provide such services and compromises the role of ITU in this process;

h) that it is imperative, in view of the urgency of the situation and to maintain the credibility of ITU, that such reforms be adopted at WRC-2000, at least on a provisional basis, for review at WRC-03,

considering further

that the underlying objectives of this Resolution are:

i) to greatly simplify the existing procedures while preserving the rights and obligations of all administrations under the Radio Regulations;

j) to make the application of such simplified procedures transparent to administrations and operators;

k) to adopt such reformed procedures effective as of the end of this Conference, so as to have an immediate impact upon the present critical situation,

resolves

1 that the Bureau and administrations shall apply the following provisions in lieu of the equivalent provisions of Articles **S9** and **S11**:

a) for those networks for which the data has been already submitted to the Bureau under No. **S9.30** and No. **S11.15** which have not been submitted in the required electronic format, the notices shall be resubmitted to the Bureau by [1 January 2001] in electronic form using the Bureau format and these notices shall keep the date of the original paper submission. The Bureau shall continue the processing based on the electronic submission. For those networks subject to this provision, the Bureau shall scan the paper submission and post it on the WWW. If any administration subsequently indicates after the publication/posting of the electronic submission, and it is confirmed by the Bureau that the data of the electronic submission is different than that of the paper submission, the Bureau shall change the date of receipt to that of the electronic submission;

b) that all new notices for space networks submitted to the Bureau under No. **S9.30** and No. **S11.15** after [1 January 2001] shall be submitted in electronic form using the software provided by the Bureau, otherwise they shall be returned to the administration as being incomplete;

c) that the Bureau, in its publication of the Special Sections, shall publish only a limited summary subset of the data items and the findings. The remaining data items shall be available periodically on CD-ROM;

2 that the revised provisions of Section I of Article **S9** and Nos. **S11.44**, **S11.44A**, **S11.44B** and **S11.48** shall be applied by the Bureau and administrations as of [3 June 2000] for all new submissions as well as those received by the Bureau prior to that date and which have not yet been processed,

further resolves

3 that WRC-03 will review the experience gained with the implementation of the above procedures, with the objective of adopting any modifications, improvements or adjustments as may be necessary;

4 that ITU-R should study further possible improvements and simplifications to the Regulations in response to Resolution **86** (Minneapolis, 1988).

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Spain, Luxembourg, Norway, Netherlands (Kingdom of the)

PROPOSALS FOR THE WORK OF THE CONFERENCE

RESOLUTION 86 (MINNEAPOLIS, 1998)

Coordination Arc

1 We now have the situation in the application of the Radio Regulations for space services where the process has almost collapsed and is nearly unworkable in terms of the real world for the putting into service of satellite networks. If the ITU process is not fixed in the near future, it will lead to more and more cases where satellites are put into operation without completing the ITU process. As a result of this breakdown, operators who must find means to ensure non-interference and to ensure the continuity of service will tend to find solutions outside the framework of ITU. It must be recognized that despite what the Radio Regulations say, a satellite network operator, with the approval of the administration, once the satellite construction and launch has been contracted for, will not stop the process including the launch just because the ITU process has not been completed and all problems resolved.

2 At the present time it takes the Bureau almost two years to publish a coordination request and about three years to record a space network in the Master Register. During the recent Radiocommunication Bureau information meeting on satellite procedures, it was stated by the Bureau that if there were no more coordination requests received it would take three years to process those that have already been filed with the Bureau. Our comments with regard to the delay before publication are not intended to be a criticism of the Bureau but are a criticism of the process that the Members have imposed on the Bureau in the Radio Regulations. If we take these time periods and add to it a minimum period of about 2-3 years to effect the coordination we then have a total period of about 7-8 years from the submission of a coordination request to the Bureau until the frequencies are recorded in the Master Register. It is necessary to contrast that 7-8 year period with the time it takes to contract, build and launch a satellite of about two years. Even with no time considered for the actual coordination the Bureau time is about five years - more than twice the time needed to build and launch a satellite. This contrast in time periods tells us that there is something seriously wrong with the administrative process that ITU has adopted.

3 As mentioned above the ITU Radiocommunication Bureau organized an Information Exchange meeting on the problems associated with the satellite procedures on 21 January 2000. The report of that meeting was sent to administrations and Sector Members in CA/75. One of the items considered was the use of a coordination arc instead of the delta T/T of Appendix S8.

4 The use of a coordination arc would greatly simplify the work of the Bureau and thus it would have a drastic effect in reducing the time that it takes to process a filing. This matter was further considered by WP 4A during its recent meeting and a draft new Recommendation was prepared. In terms of dealing with the backlog in the processing of notices it is considered that the coordination arc should be adopted by WRC-2000 and that it should be applied to the FSS service in certain specified frequency bands. It is also considered that this new approach should be applied immediately after WRC-2000 and that it should also be applied to those notices that have already been filed with BR. Consequently, it is proposed that this new approach be implemented by means of a Resolution to be put into effect on the close of WRC. The annexed draft Recommendation is submitted to WRC.

5 The key features of the approach proposed are as follows:

- that it should be applied to the unplanned FSS in certain specified frequency bands;
- that any network that is more than the required coordination angle from the new network would not be included in the coordination process;
- the coordination angle would be different for different frequency ranges;
- any network that has a separation angle of less that the required arc could be excluded from the coordination process if the notifying administration could demonstrate that the delta T/T was less that six per cent;
- that this process would be applied to all new notices received after WRC;
- that it would also be applied to all coordination requests that have been submitted to the Bureau before the end of WRC;
- that, as a transitional measure for those networks still in the coordination process, a network that is outside the coordination arc should be included in the coordination if the responsible administration could demonstrate that the delta T/T exceeds six per cent.

6 There are other proposals to WRC which propose that in the application of the present procedures in the identification of possible affected administrations using Appendix S8, that there should be a separation of the uplink and downlink considerations. This proposal in this document is not inconsistent with those proposals in that application of the cases mentioned in the preceding paragraph the delta T/T would be calculated separately for the uplinks and downlinks.

7 As there is also a backlog in the processing of modifications to the Plans of Appendices S30 and S30A, it is also proposed that the same coordination arc process be applied with respect to the need for agreement between BSS and other BSS as well as FSS under Appendices S30 and S30A.

E/LUX/NOR/HOL/69/1

NOTE - It is necessary to add a footnote to the titles of Articles **S9**, **S11**, Appendix **S5** and Appendices **S30** and **S30A** which would make reference to this Resolution to give it the necessary regulatory effect such as:

"In applying the provisions of this Article, the provisions of Resolution **[XXX] (WRC-2000)** shall also be applied, where appropriate, in lieu of the provisions of this Article".

RESOLUTION [XXX] (WRC-2000)

Provisional improvements in the satellite coordination process

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) Resolution **18** of the Plenipotentiary Conference, Kyoto, 1994;

b) Resolution **86** of the Plenipotentiary Conference, Minneapolis, 1998;

c) that there now exists a large backlog of satellite network coordination requests pending with the Radiocommunication Bureau such that elimination of this backlog at current processing rates and with no new notices being received would take the Bureau nearly three years to accomplish;

d) that the current breakdown of the ITU's satellite coordination procedures seriously compromises the ability of such networks to provide such services and compromises the role of ITU in this process;

e) that it is imperative, in view of the urgency of the situation and to maintain the credibility of ITU, that such reforms be adopted at WRC-2000, and be applied on a provisional basis as of the end of WRC-2000,

resolves

that effective immediately, the Bureau and administrations shall apply the following provisions in lieu of the equivalent provisions of Articles **S9**, **S11**, Appendix **S5** and Appendices **S30** and **S30A**:

1 for the identification under No. **S9.36** of the FSS networks of administrations with which coordination is required under No. **S9.7** for networks operating in the non-planned 6/4 GHz, 11-12/13-14 GHz and 18/30 GHz bands, the use of a coordination arc shall be used in lieu of Appendix **S5** in accordance with the following:

a) for all networks presently filed with the Bureau for which the publication has not yet been made and for all networks submitted after 3 June 2000, the Bureau shall use the coordination arc process;

b) the Bureau shall identify as networks possibly affected those which have an orbital separation of less than:

–	6/4 GHz	10 degrees
–	13-14/11-12 GHz	9 degrees
–	8-30 GHz	8 degrees

c) for those networks for which the complete coordination request has been received by the Bureau prior to 3 June 2000 and having an orbit separation of more than the above values, they shall be included in the coordination process if the responsible administration can demonstrate, using the Bureau software, that the criteria of Appendix **S8** have been exceeded;

d) for those networks that have orbital separations less than the above values, they shall be excluded from the need for coordination if the notifying administration can show that the delta T/T is less than six per cent;

2 for modifications to the Plans of Appendices **S30** and **S30A** the Bureau shall use a coordination arc separation of nine degrees to identify possibly affected planned assignments of the same or another Region and of FSS networks (both feeder link and non-feeder link) of the same or another Region in lieu of the criterion in the appropriate Annex of Appendices **S30/S30A**. This provision shall be applied to all new submissions as of 3 June 2000 as well as to all proposed modifications previously submitted to the Bureau but not yet entered in the Plan,

further resolves

that WRC-02/03 will review the experience gained with the implementation of the above procedures, with the objective of adopting any modifications, improvements or adjustments as may be necessary.

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 71-E
31 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

China (People's Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.2 - to finalize remaining issues in the review of Appendix S3 to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation 66 (Rev.WRC-97*)* and the decisions of WRC-97 on adoption of new values due to take effect at a future time, of spurious emissions for space services

Introduction

ITU-R has made in-depth studies on spurious emission limits for the space service and other issues not directly related to the space service such as spurious emission limits for radars. China supports the results of the ITU-R studies.

To make the first column of Table II in Appendix S3 simple and clear, China proposes to add a service category "safety service" and a footnote in Table II of Appendix S3. The footnote shall clarify that the safety service includes emergency position-indicating radio beacons, emergency locator transmitters, personal location beacons, search and rescue transponders, ship emergency, lifeboat and survival craft transmitters, land, aeronautical or maritime transmitters when used in an emergency, etc.

MOD CHN/71/1

TABLE II

Attenuation values used to calculate maximum permitted spurious emission power levels for use with radio equipment

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
All services except those services quoted below:	43 + 10 log (*P*), or 70 dBc, whichever is less stringent
Space services (earth stations) [10, ~~14~~16]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Space services (space stations) [10, ~~14~~17]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Radiodetermination[14*bis*]	43 + 10 log (*PEP*), or 60 dB, whichever is less stringent
Broadcast television[11]	46 + 10 log (*P*), or 60 dBc, whichever is less stringent, without exceeding the absolute mean power level of 1 mW for VHF stations or 12 mW for UHF stations. However, greater attenuation may be necessary on a case by case basis.
Broadcast FM	46 + 10 log (*P*), or 70 dBc, whichever is less stringent; the absolute mean power level of 1 mW should not be exceeded
Broadcasting at MF/HF	50 dBc; the absolute mean power level of 50 mW should not be exceeded
SSB from mobile stations[12]	43 dB below *PEP*
Amateur services operating below 30 MHz (including with SSB)~~[12]~~	43 + 10 log (*PEP*), or 50 dB, whichever is less stringent
Services operating below 30 MHz, except space, radiodetermination, broadcast, those using SSB from mobile stations, and amateur[12]	43 + 10 log (*X*), or 60 dBc, whichever is less stringent, where *X* = *PEP* for SSB modulation, and *X* = *P* for other modulation

TABLE II (*end*)

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
Low-power device radio equipment[13]	56 + 10 log (*P*), or 40 dBc, whichever is less stringent
Safety service [AAA] ~~Emergency position-indicating radio beacon~~ ~~Emergency locator transmitter~~ ~~Personal location beacon~~ ~~Search and rescue transponder~~ ~~Ship emergency, lifeboat and survival craft transmitters~~ ~~Land, aeronautical or maritime transmitters when used in emergency~~	No limit

ADD CHN/71/2

[AAA] The safety service includes “emergency position-indicating radio beacon”, “emergency locator transmitters”, “personal location beacons”, “search and rescue transponders”, “ship emergency and survival craft transmitters”, “land, aeronautical or maritime transmitters when used in an emergency” other than the ship movement service (**S1.31**).

Reasons: To make the first column of Table II in Appendix S3 simple and clear.

No. S1.65 defines the survival craft station as: A *mobile station* in the *maritime mobile service* or the *aeronautical mobile service* intended solely for survival purposes and located on any lifeboat, life-raft or other survival equipment. Obviously, lifeboat is included in survival craft transmitters, and shall be deleted from “ship emergency, lifeboat and survival craft transmitters”.

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.6.1

Issue A: IMT-2000 terrestrial component

Introduction

The bands 806-960 MHz and 1 710-1 885 MHz are currently widely used for first- and second-generation cellular systems. APT is proposing identification of the bands 1 710-1 885 MHz and 2 520-2 670 MHz for the IMT-2000 terrestrial component. This identification does not preclude other systems and other services from continuing to operate in this band. Some administrations may decide on a national basis according to their own market requirements and spectrum planning, to identify the band 2 300-2 400 MHz as the additional spectrum for the IMT-2000 terrestrial component in WRC-2000. The current service allocations in the band 2 700-2 900 MHz shall not be changed.

NOC CHN/74/1

S5.388 The bands 1 885-2 025 MHz and 2 110-2 200 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these bands by other services to which they are allocated. The bands should be made available for IMT-2000 in accordance with Resolution **212 (Rev.WRC-97)**.

MOD CHN/74/2

2 170-2 520 MHz

Allocation to services

ADD CHN/74/3

S5.AAA In China, [other administrations], the band 2 300-2 400 MHz is intended for use by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000) when the bands 1 710-1 885 MHz and 2 520-2 670 MHz are not made available for IMT-2000. This does not preclude the use of this band for other services to which the band is allocated. The band 2 300-2 400 MHz should be made available for IMT-2000 in accordance with Resolution **ZZZ (WRC-2000)**.

Reasons:

1 The band 2 300-2 400 MHz is allocated on a primary basis to the mobile service in all Regions.

2 ITU-R has recommended the 1-3 GHz range as the most suitable for IMT-2000.

3 The CPM Report concludes that there is a requirement for an additional spectrum of 160 MHz for the terrestrial component of IMT-2000 beyond the spectrum already identified in RR S5.388 and beyond the spectrum used in the three Regions for the second-generation mobile systems.

4 The band 2 300-2 400 MHz can provide administrations with an alternative when some countries have difficulties in implementing IMT-2000 on the bands 1 710-1 885 MHz or 2 520-2 670 MHz.

NOC CHN/74/4

2 700-4 800 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
2 700-2 900	AERONAUTICAL RADIONAVIGATION S5.337 Radiolocation S5.423 S5.424	

Reasons: The band 2 700-2 900 MHz is very important to the aeronautical radionavigation service and the weather radar service. Many countries, including China, have a great number of aeronautical radionavigation radars and weather radar systems working and further developing in this band. Since the aeronautical radionavigation service and the weather radar service are safety services, the current service allocations in the band 2 700-2 900 MHz shall not be changed so as to guarantee the operation of the aeronautical radionavigation service and the weather radar service and to meet their future development needs.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

China (People's Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.8 - to consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Introduction

Agenda item 1.8 is to consider regulatory and technical provisions to enable earth stations on board vessels to operate in the fixed-satellite service networks in bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands. The bands 3 700-4 200 MHz and 5 925-6 425 MHz are now allocated on a primary basis to FS, FSS and MS. China has a great number of point-to-point systems at 6 GHz with typical capacities of 34 Mbit/s and above distributed widely along the major port cities of the coastal provinces. Due to the long coastal line in China, the use of ESVs may have the potential to cause unacceptable interference to the existing and future fixed systems operating in the band 5 925-6 425 MHz. Although identification of a minimum distance may protect FS from interference, ITU-R needs to make further studies on the minimum distance value.

Operational issues

Option 1 in the CPM Report suggests a self-contained Resolution be considered by WRC-2000 as an interim provision. However, China considers the example draft Resolution to be not operable because of the mobility of interference sources. Even if the interference source could be found, the damages to the affected FS operator would not be made up. Besides, testing and regulatory conditions for searching for the interference source may bring extra costs to FS operators and the administration.

Conclusion

China considers that the existing Radio Regulations should not be modified before announcement of the study results. Under such circumstances, ESV terminals shall continue to be operated according to No. S4.4.

Reasons: In many countries, a great number of mobile services, fixed services and meteorological services are using the band 450-470 MHz, and these services are still developing. The current service allocations shall not be changed in order to protect the existing services and ensure their future development.

SUP CHN/77/3

RESOLUTION 219 (WRC-97)

Studies relating to consideration of the allocation to the non-geostationary mobile-satellite service in the meteorological aids band 405-406 MHz and the impact on primary services allocated in the adjacent bands

Reasons: The sharing studies carried out by ITU-R in the band 405-406 MHz between the mobile-satellite service and the meteorological aid service show that the frequency sharing in the band 401-406 MHz between the non-GSO mobile-satellite system which uses the narrow-band modulation technology and the meteorological aid service is not feasible. Once Resolution 219 is suppressed, such problem as the impact on primary services allocated in the adjacent bands from the non-GSO mobile-satellite service will not exist any more. With the technological development, there may be possibility of sharing, then sharing studies in other appropriate bands below 1 GHz between the mobile-satellite service and the terrestrial service can be carried out according to Resolution 214. If the non-GSO mobile-satellite systems is used for short message services, thorough studies shall be made on the market positioning and the situation of corresponding terrestrial services. A good lesson in this regard is the failure of the Iridium system. Sharing without careful studies and considerations will not only waste resources but also cause unduly interference.

China (People's Republic of)

PROPOSAL ON FREQUENCY ALLOCATION ON A WORLDWIDE BASIS TO RADIODETERMINATION-SATELLITE SERVICE IN THE BAND 1 610-1 626.5 MHz AND 2 483.5-2 500 MHz

Agenda item 1.15 - Issues related to the radionavigation-satellite service

Introduction

According to the Table of Frequency Allocations in the Radio Regulations (No. S5), the band 1 610-1 626.5 MHz is allocated on a primary basis to the radiodetermination-satellite service in Region 2 and to the radiodetermination-satellite service on a secondary basis in Region 3. Footnote S5.371 specifies the allocation of this band to the radiodetermination-satellite service on a secondary basis in Region 1, and footnote S5.369 specifies the allocation of this band to the radiodetermination-satellite service on a primary basis in 25 countries of Regions 1 and 3 (including Angola, Australia, Burundi, China, Cote d'Ivoire, Eritrea, Ethiopia, India, the Islamic Republic of Iran, Israel, Jordan, Lebanon, Liberia, Libya, Madagascar, Mali, Pakistan, Papua New Guinea, Dem. Rep. of the Congo, Syria, Senegal, Sudan, Swaziland, Togo and Zambia).

The band 2 483.5-2 500 MHz is allocated on a primary basis to the radiodetermination-satellite service in Region 2 and to the radiodetermination-satellite service on a secondary basis in Region 3. Footnote S5.371 specifies the allocation of this band to the radiodetermination-satellite service on a secondary basis in Region 1, and footnote S5.400 specifies the allocation of this band to the radiodetermination-satellite service on a primary basis in 23 countries of Regions 1 and 3 (including Angola, Australia, Bangladesh, Burundi, China, Eritrea, Ethiopia, India, the Islamic Republic of Iran, Jordan, Lebanon, Liberia, Libya, Madagascar, Mali, Pakistan, Papua New Guinea, Dem. Rep. of the Congo, Syria, Sudan, Swaziland, Togo and Zambia).

Taking into account the increasing demands for the radiodetermination-satellite service, the Chinese Administration proposes a primary allocation to the radiodetermination-satellite service on a worldwide basis in the band 1 610-1 626.5 MHz and 2 483.5-2 500 MHz. This proposal is submitted to be considered in WRC-2000 under the agenda item 1.15.

Proposal

Part of No. S5 of the Radio Regulations should be modified as follows:

MOD CHN/78/1

1 610-1 660 MHz

Allocation to services

S5.341 S5.355 S5.359 S5.363 S5.364 S5.365 S5.366 S5.367 S5.368 ~~S5.369 S5.371~~ S5.372	S5.341 S5.364 S5.365 S5.366 S5.367 S5.368 S5.370 S5.372	S5.341 S5.355 S5.359 S5.364 S5.365 S5.366 S5.367 S5.368 ~~S5.369~~ S5.372

Reasons: Compared with the former allocation table, there is no change in Region 2 but two changes in Region 3: the radiodetermination-satellite service is upgraded from a secondary service to a primary service, and footnote S5.369 is suppressed.

For Region 1, there are three changes:

- The radiodetermination-satellite service is added as a primary service.
- Footnote S5.371 is suppressed.

  According to footnote S5.371, the radiodetermination-satellite service is a secondary service in Region 1. If this service is upgraded to a primary one, footnote S5.371 shall be suppressed.
- Footnote S5.369 is suppressed.

  This is the consequence of upgrading the radiodetermination-satellite service from a secondary service to a primary one.

MOD CHN/78/2

2 170-2 520 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
2 483.5-2 500 FIXED MOBILE MOBILE-SATELLITE (space-to-Earth) RADIOLOCATION RADIODETERMINATION-SATELLITE (Earth-to-space) S5.398 ~~Radiolocation~~ S5.150 ~~S5.371 S5.397 S5.398 S5.399 S5.400~~ S5.402	**2 483.5-2 500** FIXED MOBILE MOBILE-SATELLITE (space-to-Earth) RADIOLOCATION RADIODETERMINATION-SATELLITE (space-to-Earth) S5.398 S5.150 S5.402	**2 483.5-2 500** FIXED MOBILE MOBILE-SATELLITE (space-to-Earth) RADIOLOCATION RADIODETERMINATION-SATELLITE (space-to-Earth) S5.398 ~~Radiodetermination-satellite (space-to-Earth) S5.398~~ S5.150 ~~S5.400~~ S5.402

Reasons: Compared with the former allocation table, there is no change in Region 2 but two changes in Region 3: the radiodetermination-satellite service is upgraded from a secondary service to a primary service, and footnote S5.400 is suppressed.

For Region 1, there are six changes:

- The radiodetermination-satellite service is added as a primary service.
- Footnote S5.371 is suppressed.

  According to footnote S5.371, the radiodetermination-satellite service is a secondary service in Region 1. If this service is upgraded to a primary one, footnote S5.371 shall be suppressed.

- The radiolocation service is upgraded from a secondary service to a primary one.

  According to footnote S5.399, harmful interference shall not be caused to, or protection shall not be claimed from, stations of the radiolocation service by stations of the radiodetermination-satellite service in Region 1. If the radiodetermination-satellite service is upgraded to a primary service, the radiolocation service shall also be upgraded to a primary status.

- Footnote S5.397 is suppressed.

  If the radiolocation service in Region 1 is upgraded to a primary service, footnote S5.397 in the band 2 483.5-2 500 MHz shall be suppressed.

- Footnote S5.399 is suppressed.

  Countries in Region 1 can require to maintain this footnote.

- Footnote S5.400 is suppressed.

  This is the consequence of upgrading the radiodetermination-satellite service from a secondary service to a primary one.

Reasons: At present, the allocation to the radiodetermination-satellite service in the band 1 610-1 626.5 MHz and 2 483.5-2 500 MHz is not on a worldwide basis, leading to difficulties in the worldwide application. The proposal will help form a worldwide allocation to meet this requirement, and the modification of the above footnotes is the right result of such an allocation.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 79-E
15 March 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

China (People's Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.15.1 - to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Introduction

Currently, the only frequency bands allocated to the radionavigation-satellite service are bands 1 559-1 610 MHz and 1 215-1 260 MHz in the direction of space-to-Earth. However, these bands are now occupied by GPS and GLONASS systems and some new systems already filed, thus can not meet the frequency needs of the existing radionavigation-satellite systems to add new signals and of the new generation of radionavigation-satellite systems. Therefore, new allocations shall be considered to the radionavigation-satellite service in the range from 1-6 GHz.

Proposals

1 **1 151-1 215 MHz**

MOD CHN/79/1

890-1 350 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
960-1 215	AERONAUTICAL RADIONAVIGATION MOD S5.328	

MOD CHN/79/2

S5.328 The band 960-1 215 MHz is reserved on a worldwide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based facilities. The 1 151-1 215 MHz portion of this band is allocated to the radionavigation-satellite service (space-to-Earth) on a co-primary basis. In this band, stations of the radionavigation-satellite services shall not cause interference to, claim protection from, or otherwise impose constraints on the operation or development of the aeronautical radionavigation service.

Reasons: China supports the allocation of the band 1 151-1 215 MHz to RNSS (space-to-Earth) on a co-primary and worldwide basis. The adequate bandwidth of this band can accommodate several independent RNSS systems. However, in order to guarantee the implementation of the aeronautical radionavigation service in this band, the radionavigation-satellite service shall be limited so as not to cause interference to the aeronautical radionavigation service or to constrain the use of this service.

2 1 260-1 300 MHz

MOD CHN/79/3

890-1 350 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 260-1 300	EARTH EXPLORATION-SATELLITE (active) RADIOLOCATION SPACE RESEARCH (active) RADIONAVIGATION-SATELLITE SERVICE (space-to-Earth) MOD S5.336 ADD S5.336A Amateur S5.282 S5.330 S5.331 S5.332 S5.334 S5.335	

MOD CHN/79/4

S5.336 ~~Not used~~Use of the radionavigation-satellite service in the band 1 260-1 300 MHz shall be subject to the condition that no harmful interference is caused to the radionavigation service authorized under No. **S5.331**.

ADD CHN/79/5

S5.336A Use of the radionavigation-satellite service in the band 1 260-1 300 MHz shall not cause harmful interference to wind profiler radars in the band 1 270-1 275 MHz.

Reasons: There is no major difference between the current allocations of 1 240-1 260 MHz and 1 260-1 300 MHz except for the absence of the radionavigation-satellite service in the latter. After adding allocations to the radionavigation-satellite service in the band 1 260-1 300 MHz, sharing can be realized in the same way as used in the band 1 240-1 260 MHz. Wind profiler radars are planned to use the band 1 270-1 295 MHz, so no interference shall be caused by the radionavigation-satellite service in the band 1 260-1 300 MHz.

3 1 300-1 350 MHz

MOD CHN/79/6

890-1 350 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 300-1 350	AERONAUTICAL RADIONAVIGATION S5.337 RADIONAVIGATION-SATELLITE SERVICE (Earth-space) ADD S5.337A ~~Radiolocation~~RADIOLOCATION S5.149	

ADD CHN/79/7

S5.337A The use of the band 1 300-1 350 MHz by earth stations in the radionavigation-satellite service and by stations in the radiolocation service shall not cause harmful interference to, or constrain the development of the aeronautical radionavigation service.

Reasons: This allocation is mainly for the terrestrial beacon reference stations of the radionavigation-satellite service. Results of ITU-R studies show that the radionavigation-satellite service (Earth-to-space) signal in the band 1 300-1 350 MHz:

a) can protect the aeronautical radionavigation service and the radiolocation service in the band 1 300-1 350 MHz by careful location of the beacons. The required separation distance between the radar and the beacon is less than 60 km;

b) is compatible with the emissions of the radars in the band 1 300-1 350 MHz with an adequate adjusting of the AGC loop in the receiver.

Upgrading of the radiolocation service is necessary to give this service the same status as that of the RNSS (Earth-to-space).

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

China (People's Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.19 - Proposal on BSS replanning

Introduction

In response to Resolution 532 adopted in WRC-97, IRG held five meetings and GTE held four during the past two years. IRG and GTE made in-depth studies on the replanning basis of the BSS in Regions 1 and 3, and on the method of analyzing the compatibility between the replanning on one side and the other services and the BSS Plans in Region 2 on the other side. As a result, a planning approach and a compatibility analysis method based on the digital technology are identified.

According to the study results of IRG, GTE helped BR conduct a BSS replanning exercise and compatibility analysis and came to the conclusion that it is fully feasible to allocate 10 channels to Region 1 and 12 channels to Region 3 according to the digital replanning approach identified by IRG/GTE and that the interference between the replanning on one side and the other services and BSS Plans in Region 2 on the other side is acceptable and solvable.

Proposals

CHN/80/1

1 The results of the replanning exercise communicated by BR to the Conference shall be considered as a draft Plan to be adopted by WRC-2000.

CHN/80/2

2 IRG be remained there to deal with the unsolved issues on BSS replanning in Regions 1 and 3 after WRC-2000.

Reasons:

1 Resolution 532 resolves:

> "2 that the Director of the Radiocommunication Bureau shall present the results of the IRG's studies to the WRC-99 regarding the feasibility of increasing the minimum assigned capacity for countries in Regions 1 and 3 to around ten analogue-equivalent channels, based on the planning principles in Annex 1;

3 that WRC-99 should consider the results of the above studies and, if the conclusion is that such replanning is feasible, initiate an appropriate revision for completion no later than 2001,”

2 WRC-2000 is the only conference before 2001 where the revision can be adopted.

3 Under the current BSS Plans, each country is allocated 4-5 channels, which restrains the economical implementation of the BSS systems of ITU member states. More and more countries are adding channels and orbital locations through the “procedure of modification” (Article 4), thus making the replanning more difficult, and affecting the equitable access to BSS resources by member states.

4 IRG/GTE's study on the BSS replanning in Regions 1 and 3 shows that it is feasible to allocate 10 channels to countries in Region 1 and 12 channels to countries in Region 3.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

China (People's Republic of)

PROPOSAL FOR THE WORK OF THE CONFERENCE

Agenda item 1.19*bis* - in accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board's Rules of Procedure relating to the application of RR 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference

Background

RR No. S23.13/2674, a generic provision applicable to the BSS in all the three Regions, states:

In devising the characteristics of a space station in the broadcasting-satellite service, all technical means available shall be used to reduce, to the maximum, the radiation over the territory of other countries unless an agreement has been previously reached with such countries.

The present Rule of Procedure concerning RR2674/S23.13 states:

"2.1 When examining, for data completeness, the information related to a BSS space station, received by the Bureau after 18 November 1995, for application in the Plan modification or coordination procedures in accordance with either Article 4 of Appendix **S30** or Section B (§ 3.2.1) of Resolution **33 (Rev.WRC-97)** or under No. **S9.11**, whose service area exceeds the territory of the notifying Administration, the Bureau shall require that the service area be defined in terms of other administrations (country/territory symbols) included in the service area. The notifying administration should therefor indicate whether a special (separate) agreement has been obtained from these administrations relating to the inclusion of their territories in the service area.

2.2 The Special Sections published by the Bureau in application of Article 4 of Appendix **S30** (APS30/E... series) or of Resolution **33 (Rev.WRC-97)** (RS33/C.. series) or of No. **S9.11** shall contain the indication of the agreements already obtained under No. **S23.13** or not yet obtained with a request for such agreement. The expiry period for comment relating to the inclusion or otherwise of the territory in the service area will be the same 4 months which is required for comments of administrations concerning technical compatibility with the proposed plan modification procedures.

2.3 If no comment is received either by the notifying administration or through the Bureau within the four month period mentioned in § 2.2 above, it is understood that there is no objection to the inclusion of the territory in the planned service area."

China is of the view that the Rule of Procedure concerning RR2674/S23.13 is not in full accordance with the conclusion of WRC-95 for the following reasons:

Provision RR2674/S23.13 was adopted as early as WARC-71, and shall be applied to all the BSS networks communicated to BR.

To provide BSS through space stations by the notifying administration to other countries means other countries included in the service area can directly receive TV and sound programs from these space stations.

As we know, different countries in the world have different cultural backgrounds, lifestyles and religions. It is not appropriate to take it for granted that the notified country has no objection to the inclusion of its territory in the service area of the BSS space station of the notifying country and that agreement under RR2674 has been obtained from the notified country for the space station only because no reply is received from the notified country within 4 months.

Resolution 531 Annex 1 explains the application of RR2674/S23.13, and Resolution 536 (WRC-97) also states:

In addition to observing No. **S23.13/2674**, and before providing satellite broadcasting service to other administrations, administrations originating the services should obtain the agreement of those other administrations.

Therefore, China proposes the following modifications to the present Rule of Procedure concerning RR2674/S23.13:

MOD* CHN/81/1

2.1 When examining, for data completeness, the information related to a BSS space station, received by the Bureau, for application in the plan modification or coordination procedures in accordance with either Article 4 of Appendix **S30** (Annex 2 data) or Section B (paragraph 3.2.1) of Resolution **33 (WRC-97)** or under No. **S9.11**, ~~after 18 November 1995,~~ whose service area exceeds the territory of the notifying Administration, the Bureau shall require that the service area be defined in terms of other administrations (country/territory symbols) included in the service area. The notifying administration should therefore indicate whether a special (separate) agreement has been obtained from these administrations relating to the inclusion of their territories in the service area.

Reasons: RR2674/S23.13 was adopted as early as in 1971, and shall be applied to all the BSS space stations communicated to the BR.

2.2 The Special Sections published by the Bureau in application of Article 4 of Appendix 30 or of Resolution 33 shall contain the indication of the agreements already obtained under RR2674 or not yet obtained with a request for such agreement. When receiving such a request, the affected administration shall make quick comments to indicate whether or not it agrees with the inclusion of its territory in the service area.

Reasons: We need to adopt a cautious attitude towards the issue of agreement under RR2674/S23.13.

* The proposed modification does not clearly indicate the changes as regards the text currently in the Rules of Procedure.

2.3 Only if the notifying administration or BR receives an explicit agreement from the notified administration concerning RR2674/S23.13 can it be understood that the notified administration has no objection to the inclusion of its territory in the service area of the BSS space station.

Reasons: No reply within 4 months can not be interpreted as an agreement.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

CONFERENCE RULES OF PROCEDURE AND THE USE OF VISUAL AIDS

Attention is drawn to Article 32A of the Convention (Right to Vote) and to the Rules of Procedure of Conferences and Other Meetings of the International Telecommunication Union as adopted by the Plenipotentiary Conference (Minneapolis, 1998) and published in the collection of basic texts of the International Telecommunication Union adopted by the Plenipotentiary Conference (edition 1999).

To ensure that the Conference runs smoothly and efficiently, delegates and observers are invited to review these rules, particularly those related to the rules for debates, and voting.

In order to assist the Chairperson and other conference officers in applying these rules, delegations and observers have been provided with a number of visual aids which are intended to be used as follows:

- all delegations and observers participating in the Conference will be issued yellow placards with country/organization/entity codes printed on them in black. These should be used when requesting the floor to speak on the substance of a matter under discussion;
- all delegations participating in the Conference will be issued yellow cards with squares printed on them in black. These should be used when raising motions of order and points of order in relation to a matter under discussion;
- all delegations having the right to vote at the Conference will be issued white cards with squares printed on them in red. These should be used in cases where there is a vote by show of hands.

Delegations and observers are kindly requested not to use their white name-plates when requesting the floor during debates since these name-plates are generally not legible from the podium.

Your cooperation in the use of these visual aids will assist the conference officers and is much appreciated.

PLENARY MEETING

Korea (Republic of)

PROPOSAL FOR THE WORK OF THE CONFERENCE

THE ORBITAL LOCATION OF THE REPUBLIC OF KOREA FOR THE ADDITIONAL CHANNELS IN ACCORDANCE WITH AGENDA ITEM 1.19 (WRC-2000)

Introduction

In the current Appendices S30/S30A of the Radio Regulations, the BSS beam, KOR11200, is assigned at 110º E for the Republic of Korea. In accordance with agenda item 1.19, at least 10 channels may be assigned to the administrations in Regions 1 and 3.

IRG (Inter-conference Representative Group) concluded that 10 channels can be assigned at 116º E for the Republic of Korea (refer to the final report of IRG, Document IRG99-5/24(Rev.4)). AGTE (APT Group of Technical Experts) concluded that 12 channels can be assigned at 116º E for the Republic of Korea.

Proposal

KOR/83/1

The Republic of Korea proposes that the BSS beam, KOR11200 at 110º E, be deleted in Appendices S30/S30A of the Radio Regulations for the replanning of the BSS Plan and its feeder-link Plan. It means that the additional channels, in accordance with agenda item 1.19 (WRC-2000), would be assigned at 116º E.

PLENARY MEETING

Korea (Republic of)

PROPOSAL FOR THE WORK OF THE CONFERENCE

APPLICATION PROCEDURE OF THE FILING FEE FOR THE REGISTRATION OF THE SATELLITE NETWORK

Introduction

The ITU Plenipotentiary Conference (Minneapolis, 1998) adopted Resolution 88 for the implementation of cost-recovery for satellite network filings. Pursuant to this Resolution, ITU Council (1999) adopted Decision 482 and decided that satellite network filings for the production of the special sections of the Weekly Circular for the space telecommunication services concerning advance publication, and their associated requests for coordination or agreement (Article 11, Article 14 plus Resolutions 33 and 46, or Article S9 of the Radio Regulations) and requests for modification of the space service plans contained in Appendices S30/30, S30A/30A and S30B/30B to the Radio Regulations, received by the Radiocommunication Bureau after 7 November 1998, shall be subject to charges as set out in Annex A to this Decision.

Each Member State shall be entitled to the publication of special sections for one satellite network each year, without charges, in accordance with this Decision. Each Member State may determine which category shall benefit from the “free” entitlement. However, there is no proper time to determine for each Member State the “free” entitlement within a year in Decision 482.

Proposal

KOR/84/1

The Republic of Korea proposes that each Member State choose a “free” satellite network for the publication of a special section in accordance with Decision 482 (1999) anytime within every year. However, in accordance with Decision 482 (1999), each Member State shall be required to pay a registration fee to the BR for the publication of the satellite network prior to the selection of a “free” entitlement. In this case, the pre-paid fee for the selected “free” satellite network shall be refunded to the Member State concerned immediately.

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.1 - requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

Introduction

In Circular Letter CR/131, the Radiocommunication Bureau requests administrations to review those footnotes to the Table of Frequency Allocations (Article S5 of the Radio Regulations) where their country names appear in order to identify any footnotes that may be reduced in scope or deleted. The need for a regular review of footnotes was established by Resolution 26 at WRC-95 and reaffirmed at WRC-97.

Proposals

The Republic of Korea Administration has reviewed the footnotes and makes the following proposals in respect of those footnotes which include explicit references to the “Republic of Korea”:

MOD KOR/85/1

S5.259 *Additional allocation:* in Germany, Austria, Cyprus, ~~the Republic of Korea,~~ Denmark, Egypt, Spain, France, Greece, Israel, Italy, Japan, Jordan, Malta, Morocco, Monaco, Norway, the Netherlands, Syria and Sweden, the band 328.6-335.4 MHz is also allocated to the mobile service on a secondary basis, subject to agreement obtained under No. **S9.21**. In order to ensure that harmful interference is not caused to stations of the aeronautical radionavigation service, stations of the mobile service shall not be introduced in the band until it is no longer required for the aeronautical radionavigation service by any administration which may be identified in the application of the procedure invoked under No. **S9.21**.

Reasons: No further requirements.

MOD KOR/85/2

S5.477 *Different category of service:* in Algeria, Saudi Arabia, Austria, Bahrain, Bangladesh, Brunei Darussalam, Cameroon, ~~the Republic of Korea,~~ Egypt, the United Arab Emirates, Eritrea, Ethiopia, Guyana, India, Indonesia, the Islamic Republic of Iran, Iraq, Jamaica, Japan, Jordan, Kuwait, Lebanon, Liberia, Malaysia, Nigeria, Oman, Pakistan, Qatar, Democratic People's Republic of Korea, Singapore, Somalia, Sudan, Sweden, Trinidad and Tobago, and Yemen, the allocation of the band 9 800-10 000 MHz to the fixed service is on a primary basis (see No. **S5.33**).

Reasons: No further requirements.

MOD KOR/85/3

S5.500 *Additional allocation:* in Algeria, Angola, Saudi Arabia, Bahrain, Brunei Darussalam, Cameroon, ~~the Republic of Korea,~~ Egypt, the United Arab Emirates, Gabon, Indonesia, the Islamic Republic of Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Madagascar, Malaysia, Mali, Malta, Morocco, Mauritania, Nigeria, Pakistan, Qatar, Syria, Senegal, Singapore, Sudan, Chad and Tunisia, the band 13.4-14 GHz is also allocated to the fixed and mobile services on a primary basis.

Reasons: No further requirements.

MOD KOR/85/4

S5.524 *Additional allocation:* in Afghanistan, Algeria, Angola, Saudi Arabia, Bahrain, Bangladesh, Brunei Darussalam, Cameroon, China, the Congo, ~~the Republic of Korea,~~ Costa Rica, Egypt, the United Arab Emirates, Gabon, Guatemala, Guinea, India, Islamic Republic of Iran, Iraq, Israel, Japan, Jordan, Kuwait, Lebanon, Malaysia, Mali, Morocco, Mauritania, Nepal, Nigeria, Oman, Pakistan, the Philippines, Qatar, Dem. Rep. of the Congo, Syria, Democratic People's Republic of Korea, Singapore, Somalia, Sudan, Tanzania, Chad, Togo and Tunisia, the band 19.7-21.2 GHz is also allocated to the fixed and mobile services on a primary basis. This additional use shall not impose any limitation on the power flux-density of space stations in the fixed-satellite service in the band 19.7-21.2 GHz and of space stations in the mobile-satellite service in the band 19.7-20.2 GHz where the allocation to the mobile-satellite service is on a primary basis in the latter band.

Reasons: No further requirements.

MOD KOR/85/5

S5.542 *Additional allocation:* in Algeria, Saudi Arabia, Bahrain, Bangladesh, Brunei Darussalam, Cameroon, China, the Congo, ~~the Republic of Korea,~~ Egypt, the United Arab Emirates, Eritrea, Ethiopia, Guinea, India, the Islamic Republic of Iran, Iraq, Japan, Jordan, Kuwait, Lebanon, Malaysia, Mali, Morocco, Mauritania, Nepal, Pakistan, the Philippines, Qatar, Syria, Democratic People's Republic of Korea, Somalia, Sudan, Sri Lanka and Chad, the band 29.5-31 GHz is also allocated to the fixed and mobile services on a secondary basis. The power limits specified in Nos. **S21.3** and **S21.5** shall apply.

Reasons: No further requirements.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Korea (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

INFORMATION PAPER

Agenda item 1.16 - to consider allocation of frequency bands above 71 GHz to the earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 (WRC-97)

Resolution 723 (WRC-97) "Consideration by a future competent world radiocommunication conference of issues dealing with allocations to science services"

1 Additional allocations for specially important frequency bands in the Republic of Korea

In the Republic of Korea, Figure 1 shows the 14 m radio telescope time statistics in the 85-175 GHz band for the radio astronomy services and measurements of mesospheric ozone. As shown in Figure 1 and Table 1, the bands 127-131 GHz and 171-174 GHz are of vital importance to the radio astronomy service for simultaneous observations of the silicon monoxide (SiO) molecule and its isotopic variants at 127.5, 128.4, 129.3, 130.3, 171.3, 172.5 and 173.7 GHz in the Republic of Korea. And these bands are now used for the following studies: time monitoring and survey of the SiO molecular lines toward late type stars and star forming regions, line survey and molecular line observations toward star forming regions, starless cores, supernova remnants and so on, and the interstellar chemistry. However, as shown in the present Radio Regulations, the RAS in these bands has not been allocated primary or secondary status. Therefore, it is proposed that the suggested minimum bands in Table 1 are allocated to the radio astronomy service on a primary basis.

Advantages

Since the RA operation is only passive and there are few RA stations in the world, the RAS should be able to share with terrestrial services having protection measures within limited radio quiet zones around the radio astronomy observatory. The impact of co-primary allocations to the terrestrial services and the RAS in these bands is expected to be limited. The impact of co-primary allocations to the satellite services (downlink) and the RAS in these bands is expected to be very limited because current major observing projects in the Republic of Korea may not be finished until 2015,

* Pursuant to Resolution 26 (Rev.WRC-97) the Secretariat notes that this contribution was received on 6 April 2000.

and these primary allocations will not be needed by the RAS after 2015. By 2015, all of these applications will have transitioned to the secondary service. Therefore, shared allocations with the terrestrial services and satellite services would permit the radio astronomy service assured access to bands that are required for astronomical research.

Disadvantages

There may be minor coordination requirements associated with the affected satellite services until 2015. Such coordination requirements may be limited by regulatory action, and may consist of no more than providing the orbital elements to radio astronomy stations through some pre-established mechanism.

FIGURE 1

14 m radio telescope time statistics in the 80-180 GHz range

(Taeduk Radio Astronomy Observatory in the Republic of Korea)

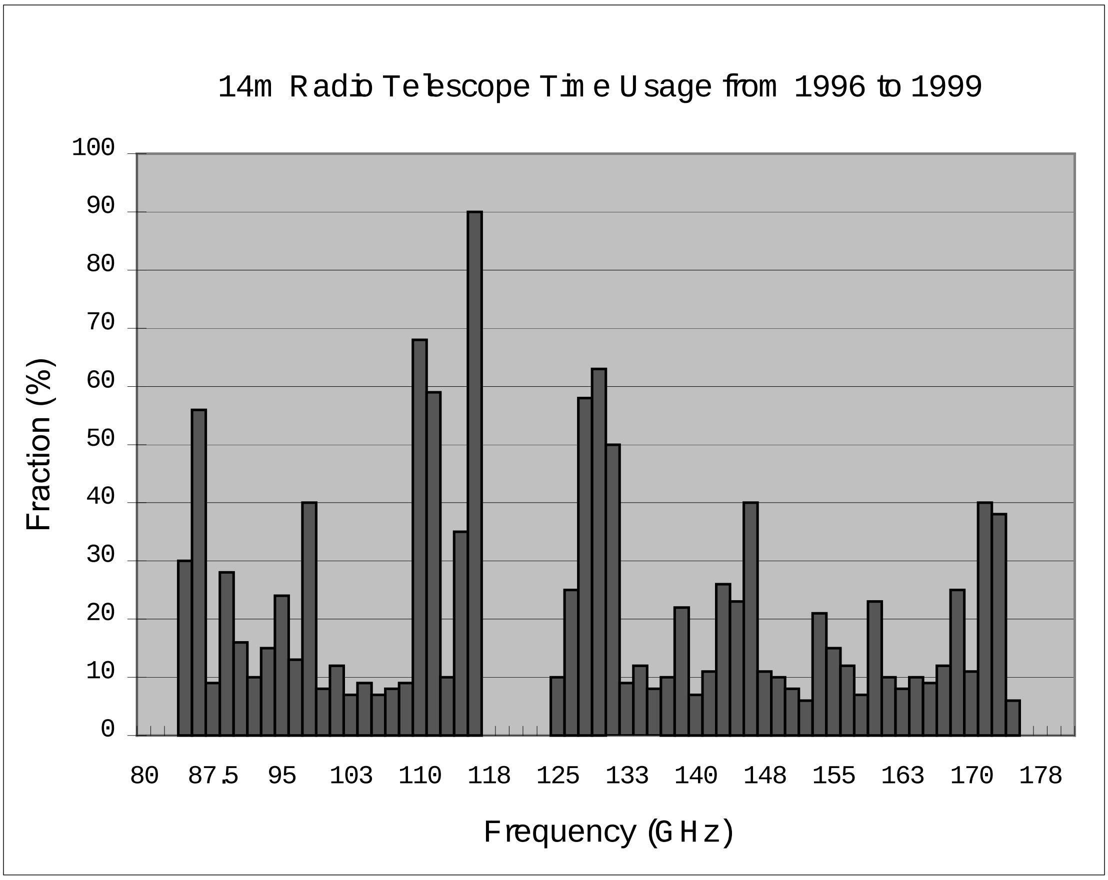

TABLE 1

Silicon monoxide molecules in the bands 127-131 and 171-174 GHz

Substance	Rest frequency (GHz)	Suggested minimum band (GHz)
SiO v=3, J=3-2	127.555240	127.42-127.68
SiO v=2, J=3-2	128.458888	128.33-128.59
SiO v=1, J=3-2	129.363368	129.23-129.49
SiO v=0, J=3-2	130.268702	130.13-130.39
SiO v=2, J=4-3	171.275105	171.11-171.45
SiO v=1, J=4-3	172.481060	172.31-172.65
SiO v=0, J=4-3	173.688142	173.52-173.85

2 Korean view

- In the Republic of Korea, the bands 85-116 GHz and 124-175 GHz are currently used for the radio astronomy services and measurements of mesospheric ozone, and it will be used in the near future at 200-275 GHz for the radio astronomy services and mesospheric ozone, respectively.
- The Korean view for agenda item 1.16 of WRC-2000 is to protect the above frequencies including 128-131 GHz and 171-174 GHz for the corresponding services.
- The APT proposals modify many of the allocation tables above 71 GHz to accommodate the requirements of the radio astronomy and Earth-exploration satellite (passive) services, while giving consideration to the needs of other services.
- As shown in the APT proposal, footnote S5.QQQ has been adapted for inclusion of allocations to the currently operating RAS in the bands 128-131 GHz and 171-174 GHz.

ADD KOR/86/1

S5.QQQ *Additional allocation*: in the Republic of Korea, the bands 127-131 GHz, 171-171.6 GHz, 172.2-172.8 GHz and 173.3-174 GHz are also allocated to the radio astronomy service on a primary basis until 2015.

Reasons: This footnote is required to protect the radio astronomy service operating in the Republic of Korea, since current operational instruments are already in these bands and these bands are of vital importance to the RAS for simultaneous observations of the silicon monoxide (SiO) molecule and its isotopic variants. The impact of co-primary allocations to the terrestrial/satellite services and the RAS in these bands is expected to be very limited since current observations in the Republic of Korea may not be finished until 2015, and these primary allocations will not be needed by the RAS after 2015. By 2015, all of these applications will have transitioned to the secondary service.

- Suggested changes to modify the frequency allocations above 71 GHz for agenda item 1.16 concerning the WRC-2000 are contained in the Annex.
- The Annex gives a comparison of the allocations and footnotes with a newly proposed table by APT, USA, CEPT and existing Radio Regulations above 71 GHz.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 87-E
6 April 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Korea (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

Agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Introduction

WRC-97 decided to include power limits in Articles S21 and S22 in order to ensure coexistence among non-GSO FSS, GSO FSS, GSO BSS, space sciences and terrestrial services in several frequency bands in the 10-30 GHz band range. WRC-97 also requested studies for WRC-2000 to consider the adoption of this concept or other regulatory approaches to address the above coexistence in other frequency bands.

Resolutions 130 and 538 (WRC-97) introduced provisional epfd limits for non-GSO FSS systems in certain bands intended to protect GSO FSS and GSO BSS systems operating co-frequency and requested ITU-R to conduct the appropriate technical, operational and regulatory studies to review the regulatory conditions relating to the coexistence of non-GSO and GSO systems.

In general, the Republic of Korea supports the CPM-99 Report related to agenda item 1.13.1.

The Republic of Korea proposes that these non-GSO systems should not impose undue constraints on existing and planned systems, and the future development of these systems and services while the non-GSO systems are operating. The Republic of Korea also proposes that the use of other frequency bands for non-GSO FSS might be considered not only after the complete study of sharing issues in ITU-R but also after the successful operation of non-GSO systems following Articles S21 and S22.

Proposals

MOD KOR/87/1

RESOLUTION 538 (Rev.WRC-~~97~~2000)

Use of the frequency bands covered by Appendices S30/30 and S30A/30A by non-geostationary-satellite systems in the fixed-satellite service

...

resolves

...

~~1.7 that, as of 22 November 1997, such a system shall be subject, for the coordination with non-GSO systems, to the application of the provisions of § 2.1 of Section II of Resolution **46 (Rev.WRC-97)**/No. **S9.12**;~~

Reasons: The Republic of Korea proposes the suppression of *resolves* 1.7 of Resolution 538 provided that suitable text is reflected in the relevant footnote.

Proposed modifications to footnote to reflect *resolves* 1.7 from Resolution 538 (WRC-97)

MOD KOR/87/2

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) in Regions 1 and 3 and 17.8-18.1 GHz (Earth-to-space) in Region 2 by non-geostationary-satellite systems in the fixed-satellite service is subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~ No. **S9.12** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO FSS systems and of the complete coordination information for the GSO networks.

Reasons: As a result of the modification to Resolution 538 (WRC-97), consequential changes to suppression of *resolves* 1.7 of the Resolution would be required to No. S5.516 in Article S5. The Republic of Korea proposes to modify the footnote based on Option 1A of Annex 6 of the CPM Report.

Proposed suppression to Section VI of Article S22

SUP KOR/87/3

~~Section VI – Earth station off-axis power limitations in the fixed-satellite service~~[11]

~~**S22.26** § 9 The level of equivalent isotropically radiated power (e.i.r.p.) emitted by an earth station shall not exceed the following values for any off-axis angle φ which is 2.5° or more off the main-lobe axis of an earth station antenna:~~

~~*Off-axis angle*~~	~~*Maximum e.i.r.p.*~~
~~2.5° ≤ φ ≤ 7°~~	~~(39 – 25 log φ) dB(W/40 kHz)~~
~~7° < φ ≤ 9.2°~~	~~18 dB(W/40 kHz)~~
~~9.2° < φ ≤ 48°~~	~~(42 – 25 log φ) dB(W/40 kHz)~~
~~48° < φ ≤ 180°~~	~~0 dB(W/40 kHz)~~

~~**S22.27** For FM-TV emissions with energy dispersal, the limits in No. **S22.26** above may be exceeded by up to 3 dB provided that the off-axis total e.i.r.p. of the transmitted FM-TV carrier does not exceed the following values:~~

~~*Off-axis angle*~~	~~*Maximum e.i.r.p.*~~
~~2.5° ≤ φ ≤ 7°~~	~~(53 – 25 log φ) dBW~~
~~7° < φ ≤ 9.2°~~	~~32 dBW~~
~~9.2° < φ ≤ 48°~~	~~(56 – 25 log φ) dBW~~
~~48° < φ ≤ 180°~~	~~14 dBW~~

~~**S22.28** FM-TV carriers which operate without energy dispersal should be modulated at all times with programme material or appropriate test patterns. In this case, the off-axis total e.i.r.p. of the emitted FM-TV carrier shall not exceed the following values:~~

~~*Off-axis angle*~~	~~*Maximum e.i.r.p.*~~
~~2.5° ≤ φ ≤ 7°~~	~~(53 – 25 log φ) dBW~~
~~7° < φ ≤ 9.2°~~	~~32 dBW~~
~~9.2° < φ ≤ 48°~~	~~(56 – 25 log φ) dBW~~
~~48° < φ ≤ 180°~~	~~14 dBW~~

~~**S22.29** The e.i.r.p. limits given in Nos. **S22.26**, **S22.27** and **S22.28** are applicable in the following frequency bands allocated to the fixed-satellite service (Earth-to-space):~~

~~12.75-13.25 GHz~~

~~13.75-14 GHz~~

~~14-14.5 GHz.~~

Reasons: The suppression of Section VI of Article S22 would impose no additional technical or regulatory constraints on GSO FSS earth stations. Members may be encouraged to use applicable ITU-R Recommendations. Therefore, the Republic of Korea proposes to suppress Section VI of Article S22.

~~[11] **S22.VI.1** The provisions of this section are suspended pending the review of the values in Nos. **S22.26**, **S22.27** and **S22.28** by WRC-99.~~

Modification to RR footnote No. S5.520 for the 18.1-18.4 GHz (Earth-to-space) band in Regions 1, 2 and 3

MOD KOR/87/4

S5.520 The use of the band 18.1-18.4 GHz by the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service using the geostationary-satellite orbit.

Reasons: According to the result of the CPM Report (section 3.2.3), the ITU-R study has not been completed for the use of the 18.1-18.4 GHz band by non-GSO FSS. Therefore, the Republic of Korea proposes that the possible introduction of the non-GSO FSS in the 18.1-18.4 GHz would be considered after the complete study by relevant ITU-R Study Groups, as well as after the successful operation of non-GSO systems following Articles S21 and S22.

Austria

PROPOSALS FOR THE WORK OF THE CONFERENCE

Introduction

The Administration of Austria wishes to make the following proposals which are closely interrelated and may only be processed as a package. These proposals relate to the amateur service allocation in the frequency range 1 810-1 830 kHz and are aimed at achieving conformity with the existing allocation in the Table of Frequency Allocations in RR Article S5 with the purpose of allowing operation of the amateur service in Austria in this band.

In bringing the allocation for Austria closer to the allocation in the Table of Frequency Allocations, these proposals are deemed to contribute to the simplification of the Radio Regulations. In principle it is only a change from *alternative* to *additional allocation* for the fixed and mobile service in the band 1 810-1 830 kHz. The proposal consists of two steps, namely:

1) add Austria to the countries listed in footnote S5.99;

2) delete Austria from the countries listed in footnote S5.98.

These changes will not adversely affect other countries listed in the relevant footnotes and open the door for future deletion of Austria from footnote S5.99 at a future WRC, as soon as the fixed and mobile services are no longer required in Austria.

In accordance with footnote S5.100, consultation with neighbouring countries regarding the addition of Austria to footnote S5.99 was carried out prior to the Conference with a positive response.

MOD AUT/89/1

S5.99 *Additional allocation:* in Saudi Arabia, Austria, Bosnia and Herzegovina, Iraq, Libya, Uzbekistan, Slovakia, the Czech Republic, Romania, Slovenia, Chad, Togo and Yugoslavia, the band 1 810-1 830 kHz is also allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

* Pursuant to Resolution 26 (Rev.WRC-97) the Secretariat notes that this contribution was received on 6 April 2000.

MOD AUT/89/2

S5.98 *Alternative allocation:* in Angola, Armenia~~, Austria,~~ Azerbaijan, Belarus, Belgium, Bulgaria, Cameroon, the Congo, Denmark, Egypt, Eritrea, Spain, Ethiopia, Georgia, Greece, Italy, Kazakstan, Lebanon, Lithuania, Moldova, the Netherlands, Syria, Kyrgyzstan, Russian Federation, Somalia, Tajikistan, Tunisia, Turkmenistan, Turkey and Ukraine, the band 1 810-1 830 kHz is allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

PROPOSAL FOR THE WORK OF THE CONFERENCE

Introduction

Austria requests to have its country name added to No. S5.96. The national allocation to the amateur service will, however, be limited to the frequency band 1 850-1 950 kHz. Due attention was given to consultation with administrations of neighbouring countries to prevent harmful interference from the amateur service in Austria to the fixed and mobile services of other countries.

MOD AUT/90/1

S5.96 In Germany, Armenia, Austria, Azerbaijan, Belarus, Denmark, Estonia, Finland, Georgia, Hungary, Ireland, Israel, Jordan, Kazakstan, Latvia, Lithuania, Malta, Moldova, Norway, Uzbekistan, Poland, Kyrgyzstan, Slovakia, the Czech Republic, the United Kingdom, Russian Federation, Sweden, Tajikistan, Turkmenistan and Ukraine, administrations may allocate up to 200 kHz to their amateur service in the bands 1 715-1 800 kHz and 1 850-2 000 kHz. However, when allocating the bands within this range to their amateur service, administrations shall, after prior consultation with administrations of neighbouring countries, take such steps as may be necessary to prevent harmful interference from their amateur service to the fixed and mobile services of other countries. The mean power of any amateur station shall not exceed 10 W.

Reasons: This proposal is made to harmonize the frequency allocation to the amateur service in Austria with the relevant allocation in the majority of its neighbouring countries.

____

[*] Pursuant to Resolution 26 (Rev.WRC-97) the Secretariat notes that this contribution was received on 6 April 2000.

PROPOSALS FOR THE WORK OF THE CONFERENCE

With reference to Resolution 721 (WRC-97)**,** agenda item 1.1 of the World Radiocommunication Conference 2000, the Administration of Austria requests to delete its country name from the following footnotes in accordance with Resolution 26 (Rev.WRC-97).

MOD AUT/91/1

S5.206 *Different category of service:* in Armenia~~, Austria~~, Azerbaijan, Belarus, Bulgaria, Egypt, Finland, France, Georgia, Greece, Hungary, Kazakstan, Lebanon, Moldova, Mongolia, Uzbekistan, Poland, Kyrgyzstan, Syria, Slovakia, the Czech Republic, Romania, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the allocation of the band 137-138 MHz to the aeronautical mobile (OR) service is on a primary basis (see No. **S5.33**).

Reasons: No further requirement for such use in Austria.

MOD AUT/91/2

S5.210 *Additional allocation:* in~~ Austria,~~ France, Italy, Liechtenstein, Slovakia, the Czech Republic, the United Kingdom and Switzerland, the bands 138-143.6 MHz and 143.65-144 MHz are also allocated to the space research service (space-to-Earth) on a secondary basis.

Reasons: No further requirement for such use in Austria.

MOD AUT/91/3

S5.508 *Additional allocation:* in Germany~~, Austria~~, Bosnia and Herzegovina, France, Greece, Ireland, Iceland, Italy, The Former Yugoslav Republic of Macedonia, Libya, Liechtenstein, Portugal, the United Kingdom, Slovenia, Switzerland, Turkey and Yugoslavia, the band 14.25-14.3 GHz is also allocated to the fixed service on a primary basis.

Reasons: No further requirement for such use in Austria.

PLENARY MEETING

Note by the Secretary-General

IMO INFORMATION PAPER

I have the honour to bring to the attention of the Conference, at the request of the International Maritime Organization (IMO), the annexed information paper.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

IMO position on WRC-2000 agenda items concerning matters related to maritime services

WRC-2000 agenda item 1.6 - issues related to IMT-2000:

1.6.1 review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

1.6.2 identification of a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000

Background

This agenda item is aimed at satisfying the demand for spectrum anticipated for third generation personal communication systems known generically as IMT-2000 (previously FPLMTS). A number of bands in the range 1-3.5 GHz allocated to existing mobile telephone systems or other services have been identified as possible candidates for IMT-2000 expansion.

The bands identified so far have no direct impact on maritime radiocommunication or radionavigation services, however, there may be difficulties resulting from the relocation of displaced services. In particular, it is becoming evident that there is considerable interest from telecommunications network operators in the band 2 700-2 900 MHz. The CPM Report noted the comments from equipment manufacturers that administrations should not rely on future, possibly costly, technological advancements (e.g. multimode, multiband reconfigurable or fully digitized "software" radios and adaptive antennas) to provide sufficient spectrum management flexibility and address the difficulties caused by band fragmentation, in order to offer global services without global spectrum. Manufacturers also considered that to do so may lead to unnecessary delay in implementing global services and result in roaming complications for customers, manufacturers and operators. Since the use of this band for aeronautical radar is both widespread and continuing for air traffic control purposes, there is the question of relocation of the existing services to consider. However, even with the considerable operational and financial problems involved in relocating aeronautical radar systems out of the band, there would still be significant advantages to providers of IMT-2000 services. If used on a global basis, this one band could accommodate the total requirement for additional spectrum for the terrestrial component of IMT-2000, which would yield considerable savings in complexity and costs in the design and construction of IMT-2000 user terminals. The obvious candidate band for relocation of aeronautical radars would be the maritime radionavigation band 2 900-3 100 MHz presently used by 3 GHz marine radars and racons. Such a solution would not be acceptable because air traffic radars and marine radars cannot normally operate in close proximity in the same band without causing harmful interference. If an air traffic control radar operating near a port were to operate in this band used by marine radars, ships entering that port would likely be prevented from using their 3 GHz radar. In that situation, ships would be limited to using 9 GHz radar only. In adverse weather conditions, 3 GHz radar has far superior performance compared to 9 GHz radar and such a restriction on the use of radar could cause a hazard to navigation.

The analysis of candidate IMT-2000 expansion bands in the CPM Report shows no consensus on the suitability of the 2 700-2 900 MHz band. A widely held view, supported by several studies, is that the possibility of sharing between IMT-2000 and radars is highly questionable and that more studies are needed. Another view is that sharing is technically feasible. A solution involving the shared use based on geographical separation seems difficult to achieve because the user terminals would be designed for worldwide use which means that they will be sensitive to radar transmissions in areas where localized use of the 2 700-2 900 MHz band for IMT-2000 is not available. Receiver blocking or damage to IMT-2000 terminals may be expected in these circumstances. The more likely solution, if there is general support for using the band 2 700-2 900 MHz for IMT-2000, is that the band will be identified for global use and transition arrangements instituted to relocate the existing services. However, as noted above, the maritime radionavigation band would be unsuitable for relocating aeronautical radar systems in operational terms, and indeed such a shared use would be potentially hazardous. Another factor for administrations to consider when assessing the suitability of candidate bands for IMT-2000 is that airports and ferries are popular places for mobile phone use. Since IMT-2000 terminals, regardless of the outcome of WRC-2000, will have to work over a very wide frequency range, users may experience loss of service in the vicinity of radars operating in an adjacent band.

IMO position

IMO opposes any allocations for IMT-2000 from existing spectrum allocated for maritime use. Further, allocations for IMT-2000 uses, both terrestrial and satellite, that are near a radionavigation band in widespread use by radars could degrade the usefulness of the radionavigation bands and cause deleterious effects on the IMT-2000 terminal units themselves. IMO opposes such allocations until compatibility studies are completed showing that these allocations are acceptable.

WRC-2000 agenda item 1.7 - review of the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting the operational, distress and safety communications, taking into account Resolution 346 (WRC-97)

Background

The purpose of this agenda item is to consider the use of the HF bands for high priority communications particularly as regards the protection of essential communications from harmful interference. HF channels are designated for various operational and distress and safety purposes by ships and coast stations in Article **S52** and Appendices **S13**, **S15** and **S17** of the Radio Regulations.

Concern has been expressed in IMO for many years over the harmful interference being caused on the HF GMDSS radiotelephone distress and safety communication frequencies 12 290 and 16 420 kHz and after a number of attempts the problem has been brought to a WRC for action. The problem arises because of the anomaly whereby the ship transmitting frequencies of international radiotelephone channels 1221 (ship transmits 12 290 kHz, ship receives 13 137 kHz) and 1621 (ship transmits 16 420 kHz, ship receives 17 302 kHz) are also designated as GMDSS radiotelephony channels for distress and safety purposes. The peculiar circumstance that these frequencies may also be used legitimately as ship transmitting frequencies for general calling has resulted in considerable disruption to distress and safety traffic. The existence of interference to 12 290 kHz and 16 420 kHz, together with disruption to the radiotelephony distress and safety frequency 8 291 kHz, was first noted at COM 40 in 1995 and subsequently publicized in COM/Circ.119. A revised Circular COMSAR/Circ.6 was developed following further discussion at COMSAR 1 in 1996.

The issue was examined during the 1997 World Radiocommunication Conference and Resolution **346 (WRC-97)** *"Protection of distress and safety communications on the frequencies 12 290 kHz and 16 420 kHz from harmful interference caused by these frequencies if also used for non-safety calling"* was developed, which repeated the call made in COMSAR/Circ.6 for administrations to move their coast station calling channels from the channels 1221 and 1621 to any other suitable HF channels.

More recently there have been a number of reports of more generalized interference to maritime and aeronautical communications in the HF bands. The problem is widespread in the Asia-Pacific Region where interference on all channels between 3 and 16 MHz occurs daily at different times, varying in intensity and duration. Monitoring observations have been carried out in the Region in the bands allocated exclusively to the maritime mobile service between 4 063 kHz and 27 500 kHz and these show that a number of frequencies in these bands are still being used by stations of other services. Many instances of interference are, however, caused by licensed stations of the maritime and aeronautical mobile services which are operating in contravention of the Radio Regulations.

Interference to maritime mobile HF communications may be reported under Article **S15** of the Radio Regulations, however, such action has not proved to be effective and, if anything, the interference has continued to increase. The CPM Report notes a number of methods that could prove useful in eliminating or reducing the impact of interference.

Elaborate means of reducing the impact of interference by adaptive measures such as frequency hopping and interference cancelling reception techniques were described in the CPM Report and operational systems are under development for civil aviation use. However, these developments were already in progress because of operational needs and such a solution would not be of immediate use to the maritime community. Also, over-reliance on mitigation techniques may actually tend to encourage illicit use.

Improved reporting procedures will be of use generally and are supported by IMO, however, widespread publicity concerning the particular difficulties in the 12 and 16 MHz bands has not actually reduced the main problem experienced in the maritime HF bands.

The most effective method of resolving the problem of interference to simplex distress and safety radiotelephony channels from duplex routine voice calling channels is to prohibit any use of those routine calling channels where the ship's transmit frequency coincides with the distress and safety channel. In the long term, equipment would have to be modified or replaced to make such use impossible. However, if coast stations are prohibited from using the interfering duplex channels with immediate effect, the problem will quickly decline. Other ideas such as promoting better use of DSC are also helpful in the long term but would be of little immediate effect.

IMO position

IMO reaffirms its opinion that the frequencies 12 290 kHz and 16 420 kHz should only be used for distress and safety communications and allocated solely for such a purpose by means of modification to the relevant parts of the Radio Regulations. IMO also supports efforts to reduce inappropriate use of the HF bands through improved regulatory procedures to safeguard distress and safety communications.

In respect of the CPM Report, IMO therefore supports actions in line with paragraphs 1.2.3.2.1 and 1.2.3.2.3, namely to:

– consider modification of Article **S52** and Appendices **S15** and **S17** in such a way that the HF distress and safety frequencies become exclusive (i.e. that no routine calling on these frequencies is allowed) with, in the long term, additional routine voice calling frequencies being made available;

– consider modification of performance standards for maritime HF transceivers so that, in the future, the forbidden routine calling channels are no longer physically available; and

– encourage the use of DSC thereby promoting the full use of GMDSS facilities.

WRC-2000 agenda item 1.8 - to consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Background

This agenda item seeks to permit the use of earth stations operating in the bands 3 700-4 200 MHz (space-to-Earth) and 5 925-6 425 MHz (Earth-to-space) on board ships as part of the fixed-satellite service rather than the maritime mobile-satellite service. This agenda item on C-band earth stations, as they are commonly known, was introduced at WRC-97.

The advantage for the maritime community is that it is possible to gain access to relatively low-cost broadband communication facilities using existing frequencies and space segments in the fixed-satellite service. Ship owners could benefit from the resulting possibilities for wideband communications which, moreover, can be operated with considerable cost savings over the current maritime-satellite systems. The main uses are telephone links for passengers on cruise liners and ferries. There are also a number of applications for ships that need to transfer large amounts of data to shore. The offshore oil industry is a prime example, especially as regards survey ship operations where real-time analysis ashore of data collected on-board ship becomes possible without the cost of the satellite link being a major limitation.

Typically, these links make use of the INTELSAT network of geostationary satellites which can provide a relatively cheap high bandwidth path. There is, however, some loss in flexibility of use, since there is no provision in such systems for on-demand service availability on connection. Instead, the use of a satellite transponder has to be pre-arranged on a permanent or a regular timeslot basis from the ship via a particular ground station into the public or a private telecommunications network.

However, preliminary examination of this issue has revealed a number of operational and legal issues that must be addressed arising from potential for interference to other services allocated in these bands.

The CPM Report notes that interference-free operation can only be guaranteed beyond a certain minimum distance from the coast. This effectively means that an exclusion zone will be defined within which the earth station operator will have to seek the permission of all potentially affected coastal states. There was no consensus on the size of the exclusion zone, however, there seems to be no argument that an eventual exclusion distance, determined on purely technical grounds, must be in excess of 100 km and very likely in excess of 300 km.

Even if the outcome of WRC-2000 suspended the use of 6/4 GHz terminals on ships until studies are complete, the most optimistic outcome could still be no more than a more accurate definition of the exclusion zone needed around coasts to ensure protection of fixed link networks.

Since the areas of most interest where high bandwidth communications are required at sea are all fairly close to shore, it is difficult to understand what benefit further studies into exclusion distances, as opposed to more generalized studies into improving maritime communications, will bring. The prime commercial applications of interest are oil industry survey work, which takes place mainly on the continental shelf and passenger cruising, which typically involves sailing around prime locations close to shore in the Mediterranean, Caribbean and Baltic Seas.

IMO position

IMO supports the orderly introduction of suitable bands for broadband maritime mobile communications when regulatory and technical provisions are accommodated.

WRC-2000 agenda item 1.9 - to take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions 213 (Rev.WRC-95) and 220 (WRC-97)

Background

The importance of this issue for maritime radiocommunications is that the band 1 559-1 567 MHz is heavily used for radionavigation purposes by the radionavigation-satellite service (GPS and GLONASS). The wider band 1 559-1 610 MHz is also used for important applications in the aeronautical radionavigation service.

The question of an additional allocation to the mobile-satellite service in the band 1 559-1 567 MHz was considered at WRC-97 with the conclusion that no immediate allocation could be made because of uncertainty as to whether the proposed criteria for new mobile-satellite systems in the band 1 559-1 567 MHz could guarantee satisfactory sharing between the mobile-satellite and the radionavigation services. The subject received great attention from both maritime and aeronautical interests because of the need to safeguard the operation of existing radionavigation services and to avoid constraints on the future development of radionavigation services in this band.

WRC-97 did, however, adopt Resolution **220 (WRC-97)** in order to initiate further studies into the technical criteria and operational and safety requirements needed to assess the feasibility of sharing between the aeronautical radionavigation and radionavigation-satellite services operating, or planned to operate, in the band 1 559-1 610 MHz, and the mobile-satellite service in a portion of the band 1 559-1 567 MHz. The intention was that the studies should be available in time for the next WRC to evaluate the feasibility of sharing a portion of the spectrum for new mobile-satellite communication systems.

Further studies have shown considerable doubt about the possibility of successful sharing in this band. Additionally, mobile-satellite services currently using bands adjacent to that used by GNSS, particularly hand-held satellite telephones used aboard ships, can cause interference to shipboard GNSS systems. The potential for interference from ship passengers using hand-held satellite telephones to shipboard GNSS systems is significant.

IMO position

In view of the importance of preserving the integrity of existing radionavigation-satellite systems which are vital to the safe navigation of vessels and the need to avoid constraints on the introduction of new radionavigation systems, IMO is of the opinion that no additional allocation to the mobile-satellite service should be introduced into the band 1 559-1 567 MHz at WRC-2000, and sees no need to continue with further studies. Additionally, technical limits should be placed upon mobile-satellite systems using bands adjacent to 1 559-1 567 MHz to ensure no harmful interference occurs to global navigation satellite systems on board ships.

WRC-2000 agenda item 1.10 - to consider results of ITU-R studies carried out in accordance with Resolution 218 (WRC-97) and take appropriate action on this subject

Background

This agenda item is of prime importance for IMO since it addresses two issues arising from the generic use of satellite L-band spectrum:

1) the future spectrum requirements for the provision of distress, safety and urgency communications in the GMDSS and aeronautical mobile-satellite (R) service communications with priority 1 to 6 of Article **S44**; and

2) the feasibility of prioritization, real time pre-emptive access and, if necessary, interoperability between different mobile-satellite systems for the GMDSS and aeronautical mobile-satellite (R) service communications.

Resolution **218 (WRC-97)** on the use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service was developed at WRC-97 as a result of the allocation of these bands for generic use by the mobile-satellite service, notwithstanding the previous predominant use of the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz by the maritime mobile-satellite service for satellite communications in the GMDSS. In addition, the bands 1 545-1 555 MHz and 1 646.5-1 656.5 MHz were allocated to the aeronautical mobile-satellite (R) service on a primary basis.

The stated purpose of the move to a generic allocation for the mobile-satellite service was to facilitate the assignment of spectrum to multiple mobile-satellite systems in a flexible and efficient manner. There was considerable concern that this course of action would prejudice the provision of satellite communications with aircraft and in the GMDSS, particularly in respect of distress and safety traffic.

The outcome at WRC-97 was that the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz were made generic to the mobile-satellite service. Additional provisions of the Radio Regulations, Nos. **S5.353A**[1] and **S5.357A**[2], were added to protect the GMDSS and aeronautical uses of these bands and the spectrum requirements for the maritime and aeronautical urgent communications. In addition, the new Resolution **218 (WRC-97)** was adopted which includes a call for studies on methods for determining the spectrum requirements for the GMDSS and aeronautical applications.

IMO position

IMO expressed concern at WRC-97 and the 1998 ITU Plenipotentiary Conference that the unique requirements of the maritime community had not been recognized, and expressed concern about the safeguards to be provided for the maritime mobile-satellite service. IMO believes that accommodating the spectrum requirements for maritime distress, urgency and safety

---

[1] **S5.353A** In applying the procedures of No. **S9.11A** to the mobile-satellite service in the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz, priority shall be given to accommodating the spectrum requirements for distress, urgency and safety communications of the Global Maritime Distress and Safety System (GMDSS). Maritime mobile-satellite distress, urgency and safety communications shall have priority access and immediate availability over all other mobile satellite communications operating within a network. Mobile-satellite systems shall not cause unacceptable interference to, or claim protection from, distress, urgency and safety communications of the GMDSS. Account shall be taken of the priority of safety-related communications in the other mobile-satellite services. (See Resolution **218 (WRC-97)**.)

[2] **S5.357A** In applying the procedures of No. **S9.11A** to the mobile-satellite service in the bands 1 545-1 555 MHz and 1 646.5-1 656.5 MHz, priority shall be given to accommodating the spectrum requirements of the aeronautical mobile-satellite (R) service providing transmission of messages with priority 1 to 6 in Article **S44**. Aeronautical mobile-satellite (R) service communications with priority 1 to 6 in Article **S44** shall have priority access and immediate availability, by pre-emption if necessary, over all other mobile-satellite communications operating within a network. Mobile-satellite systems shall not cause unacceptable interference to, or claim protection from, aeronautical mobile-satellite (R) service communications with priority 1 to 6 in Article **S44**. Account shall be taken of the priority of safety-related communications in the other mobile-satellite services. (See Resolution **218 (WRC-97)**.)

communications of the GMDSS in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz shall be given absolute priority in multilateral cooperation agreements.

IMO notes, however, the studies that have taken place since WRC-97 on methods of ensuring priority-access for distress, urgency and safety communications within a network and with other mobile-satellite services. IMO is not convinced that inter-system prioritization and pre-emption will be workable and prefers a capacity planning approach. Further action, however, is necessary within the ITU to demonstrate in a transparent manner that any resulting spectrum sharing arrangements have been developed in compliance with No. **S5.353A**.

The CPM Report provides some endorsement of the capacity planning approach in the short to medium term.

However, the issues of transparency do need to be addressed in a coherent manner. In particular, an eventual solution along such lines will need to describe how the results of the current periodical coordination process among a limited number of administrations and system operators will be placed in the public domain and made available to the ITU. Also the organizations referred to in Resolution **218 (WRC-97)** (ICAO, IMO and IALA) are not allowed to participate in the process as observers. Moreover, they are not informed of the results.

These defects need to be remedied so that all interested parties may have confidence in the process.

Therefore, IMO is of the opinion that WRC-2000 should adopt procedures ensuring that the frequency coordination agreements for mobile-satellite networks in the bands mentioned in No. **S5.353A** do demonstrably accommodate the spectrum requirements for all GMDSS distress, urgency and safety communications as defined in Articles **S32** and **S33**.

WRC-2000 agenda item 1.11 - to consider constraints on existing allocations and to consider additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions 214 (Rev.WRC-97) and 219 (WRC-97)

Background

Important maritime interests may be affected by the proposals under this agenda item to introduce non-geostationary mobile-satellite systems in the band 405-406 MHz, which is part of the band 401-406 MHz currently allocated to the meteorological aids service and adjacent to the band 406-406.1 MHz used by the COSPAS-SARSAT system.

The COSPAS-SARSAT system is essential to the operation of the GMDSS. The COSPAS and SARSAT networks of low-altitude polar-orbiting satellites are able to receive distress alerts transmitted from 406 MHz EPIRBs at any location at sea. The relevant information is then relayed to SAR authorities via local user terminals and mission control centres. Because the system operates with very low signal levels it is very sensitive to interference and must therefore be protected to the maximum extent possible. If an EPIRB transmission cannot be processed correctly at the first opportunity, it will be necessary to wait for another satellite pass thus delaying the activation of search and rescue services.

There is also a direct and immediate interest to the maritime community in the operation of meteorological aids in the frequency bands 400.15-406 MHz. These are essential to making upper air measurements for a number of important applications - weather forecasting and environmental monitoring, in particular. These vital measurements are made by radiosondes operating in the meteorological aids service. Many tens of thousands of radiosondes are launched every year now, which represents a considerable increase in use over the past decade.

At WRC-97 there were several proposals for an additional primary allocation for the mobile-satellite service in the band 405-406 MHz. These proposals were strongly opposed by the majority of countries throughout the world on account of the use of the entire frequency band 401-406 MHz for vital meteorological services. Since current radiosondes do not allow for spectrum use based on band segmentation, the conclusions were that it was premature to allocate even 1 MHz of spectrum to the mobile-satellite service and that the entire 5 MHz would still be needed for the use by the meteorological services.

Consequently, no spectrum was made available at WRC-97 and Resolution **219 (WRC-97)** was developed to cover further studies on the issue in collaboration with the WMO.

The main purpose of Resolution **219 (WRC-97)** was to cover studies into the possible transition of the meteorological aids service out of the band 405-406 MHz in favour of a new allocation to the mobile-satellite service in that band. Furthermore, the Resolution called for studies on the impact of unwanted emissions on the primary services, notably COSPAS-SARSAT, allocated in the adjacent bands.

Under the cover of Resolution **219 (WRC-97)** proposals to introduce non-geostationary mobile-satellite systems in the band 405-406 MHz will again be brought forward at WRC-2000. However, the results of technical analyses and studies carried out in respect of the Resolution do not justify a different conclusion from WRC-97 despite the case made for urgently needed spectrum for additional mobile-satellite services below 1 GHz.

All of the band 403-406 MHz is needed to secure the existing radiosonde operations, and there is actually an increase in the requirements for meteorological aids operations for weather forecasting, research, environmental and defence applications. In addition, there are also increasing requirements for the earth exploration-satellite and meteorological services in the band 401-403 MHz. It does not therefore appear feasible to accommodate all these requirements if meteorological aids have to be transferred out of the band 405-406 MHz in favour of an allocation to the mobile-satellite service. Also, since the band is needed in the future for meteorological aids there is no further purpose in considering transition plans as envisaged in Resolution **219 (WRC-97)**.

More importantly for preserving the integrity of the GMDSS, the resulting studies have led to proposals to tighten the current limits for the protection of COSPAS-SARSAT receivers. The very stringent protection requirements that have been established for the COSPAS and SARSAT search and rescue signal processors would, in any event, reduce the spectrum available to the mobile-satellite service in the band 405-406 MHz by up to 14%.

IMO position

Noting that there are maritime allocations (including distress and safety) existing below 1 GHz, IMO recommends that any new MSS allocations shall afford due protection to these maritime allocations.

IMO strongly opposes an additional allocation to the mobile-satellite service in the band 405-406 MHz and supports the maintenance of the current allocations in order to:

1) protect the proven life-saving capabilities of the COSPAS-SARSAT system in the adjacent band 406-406.1 MHz;

2) protect the meteorological aids service, in view of the importance of accurate weather forecasting for safety and commerce; and

3) enable the Earth exploration- and meteorological-satellite services and the meteorological aids service to meet increasing service requirements, in particular for weather forecasting, environmental monitoring and pollution control.

WRC-2000 agenda item 1.15 - issues related to the radionavigation-satellite service

Background

This agenda item deals with various aspects of how the radionavigation-satellite service should develop in the future. The existing service has developed out of a need to provide position information for military purposes and was not planned to provide the numerous civil applications that have since been able to exploit certain elements of the military systems. This has resulted in demands to augment existing systems or introduce new systems that are specifically designed to respond to the growth in civil applications and needs.

1.15.1 to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Extensive work has been carried out in the ITU Study Groups. Attention is now focused on four bands where additional spectrum may be available to support future development of the radionavigation-satellite service, namely:

- in the space-to-Earth direction:
  - either 1 164-1 188 MHz or parts of the band 1 151-1 215 MHz;
  - 1 260-1 300 MHz;
  - parts of the band 5 010-5 150 MHz;
- in the Earth-to-space direction:
  - 1 300-1 350 MHz;
  - 5 000-5 030 MHz.

Some sharing and compatibility problems remain to be resolved particularly in respect of the aeronautical radionavigation service; however, there should be no adverse effects on maritime services. With the exception of some frequencies used for landing and approach aids on aircraft carriers, none of these candidate bands affect existing maritime radiocommunications or radionavigation systems.

IMO position

IMO supports the implementation of new allocations for use with radionavigation-satellite systems given the importance of reliable navigational aids for enhancing the economic and safety aspects of shipping.

1.15.2 to consider the addition of the space-to-space direction to the radionavigation-satellite service allocations in the bands 1 215-1 260 MHz and 1 559-1 610 MHz

This agenda item deals with the addition of an allocation in the space-to-space direction to complement the present allocation in the bands 1 215-1 260 MHz and 1 559-1 610 MHz to the radionavigation-satellite service in the space-to-Earth direction.

Two radionavigation-satellite systems, GPS and GLONASS, currently use the bands 1 215-1 260 MHz and 1 559-1 610 MHz. Several satellite networks (e.g. TOPEX/Poseidon, AMSAT-3D, Orbcomm, Globalstar and IKONOS-1) make use of GPS signals to establish position and time references essential to the proper functioning of these networks. There are also plans to use signals from the GPS and GLONASS satellites in the control of a range of space-based applications.

The use of these radionavigation-satellite signals is presently protected only through a frequency allocation in the space-to-Earth direction, meaning that the reception of these signals on board other orbiting satellites has no normal protection. The addition of an allocation in the space-to-space direction would give protection to navigation systems on board scientific satellites, Earth-observation satellites, communications satellites and manned spacecraft.

It is necessary to provide the additional direction in both of the bands 1 215-1 260 MHz and 1 559-1 610 MHz because of ionospheric scintillation effects.

IMO position

In view of the importance of many existing and planned satellite systems for maritime purposes, notably communications and weather forecasting, IMO supports a space-to-space allocation subject to the application of appropriate safeguards for existing radionavigation-satellite networks in the space-to-Earth direction.

IMO is of the opinion that the option A identified in the CPM Report would give the most freedom for the further development of radionavigation-satellite applications. Option A involves the addition of the space-to-space direction to the radionavigation-satellite service (space-to-Earth) allocation in the bands 1 215-1 260 MHz and 1 559-1 610 MHz, coupled with a provision indicating that no protection should be given to spaceborne radionavigation-satellite receivers from radionavigation-satellite systems already operating in these bands or for which advance publication information is received by the ITU Radiocommunication Bureau, prior to the end of WRC-2000.

1.15.3 to consider the status of allocations to services other than the radionavigation-satellite service (Nos. S5.355 and S5.359) in the band 1 559-1 610 MHz

The band 1 559-1 610 MHz is allocated on a primary basis to the radionavigation-satellite service and the aeronautical radionavigation service. In addition, allocations to the fixed service are made through two provisions of the Radio Regulations, Nos. **S5.355** and **S5.359,** which respectively provide for an allocation to the fixed service on a secondary basis in 27 countries and on a primary basis to 47 countries.

The importance of this issue is the possible degradation caused to radionavigation-satellite services operating in this band, notably GPS, from other services that are permitted to make use of these bands.

In the case of transmissions in the fixed service, however, experience has shown that harmful interference to GPS reception is a real danger. Analysis of the problem shows radionavigation-satellite receivers are unable to tolerate co-frequency interference from transmissions in the fixed service within radio line-of-sight. Typically, this means that land-based GPS receivers in the main beam of a fixed service transmitter's antenna will experience harmful interference out to a distance of 50 km and out to 400 km distance in the case of aircraft receivers. For the case of non co-frequency transmissions in the fixed service, there is evidence to show that fixed service transmissions in and to either side of the band 1 559-1 610 MHz will cause interference to radionavigation-satellite receivers operating in the band 1 559-1 610 MHz up to 100 m away from the fixed service transmitter.

IMO position

IMO supports removing of the fixed service use of the band l 559-1 610 MHz in order to protect present and future applications in the radionavigation-satellite service. This conclusion is in line with the CPM Report.

WRC-2000 agenda item 1.18 - to consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix 18/S18, taking into account Resolution 342 (WRC-97)

Background

A similar agenda item on the use of new digital technology in the maritime radiotelephony channels was considered at the 1997 World Radiocommunication Conference. This item was considered in recognition of the pressure on maritime radio spectrum to provide additional capacity to accommodate new services and to meet the changing demand for radiocommunications. Because there seemed little likelihood of any new spectrum being made available for maritime VHF use, especially since there are similar demands for additional spectrum to meet the demand in the land mobile sector, it was considered that a better alternative would be to adopt new technologies that could support new services and provide more efficient use of the spectrum.

Studies in Radiocommunication Study Group 8 have been in progress for a number of years, going back to Recommendation **318 (Mob-87)** which called for urgent studies into the most appropriate means of promoting a more efficient use of the frequency spectrum in the VHF maritime mobile band. The most likely solution to the problems of congestion identified in the present use of Appendix **S18** was seen to be the adoption of technologies already implemented in the land mobile service. However, in order not to disrupt the provision of distress and safety services in the VHF band there was general acceptance that the adoption of new technologies would require a lengthy phasing-in period.

However, in the absence of any proposals at WRC-97, there was no major substantive action in respect of the VHF bands. Changes were introduced into Appendix **S18** to provide administrations with the flexibility to address any immediate problems of local congestion. In particular a note was added to Appendix **S18** to allow the use of 12.5 kHz channel interleaving on a non-interference basis to the use of the standard 25 kHz channels by other administrations and international shipping. In the main though, further consideration of this aspect was effectively postponed until the next Conference (WRC-2000) by means of Resolution **342 (WRC-97)**. This Resolution advocated that ITU-R should undertake thorough research into the future utilization of maritime VHF communications and the suitability of different technologies to meet future requirements.

It should also be noted that the use of adaptive control techniques could facilitate the introduction of packet-based digital communications technology without the need to re-allocate existing Appendix **S18** channels for sole use by new digital systems. The control protocols would ensure that spare capacity could be used on a dynamic basis without disrupting normal traffic.

IMO position

IMO supports in general the need to make the most efficient use of the maritime VHF band, but stresses that:

1) the introduction of new technologies should take into account the global use of maritime VHF equipment; and

2) new equipment utilizing digital technology must, in addition, be able to handle the existing system, especially for distress and safety purposes.

WRC-2000 agenda item 2 - to examine the revised ITU-R Recommendations incorporated by reference in the Radio Regulations in accordance with Resolution 28 (WRC-95); and decide whether or not to update the corresponding references in the Radio Regulations, in accordance with principles contained in the Annex to Resolution 27 (Rev.WRC-97)

Background

The concept of incorporation by reference is also employed by IMO.

In accordance with the provisions of Resolution **28 (WRC-95)** and Resolution **27 (Rev.WRC-97)**, each WRC now has to devote time to ensuring that references are up to date because the various Study Groups of the ITU Sectors routinely propose revisions of ITU-R Recommendations that have already been incorporated by reference and, in response to WRC agenda items, generate new Recommendations for incorporation by reference. It was, therefore, envisaged at WRC-97 to have a standing agenda item for all future WRCs to carry out this essential work. Because of the number of ITU-R Recommendations dealing with the design and operation in the maritime mobile and maritime mobile-satellite service the task of ensuring that references are kept up to date is of direct interest to IMO.

Incorporation by reference is quite well-suited to material of an operational nature or to stable technical material. However, some drawbacks have become apparent regarding the status of the referenced material and the structure of the Radio Regulations. In particular, the concept has failed to provide the practical benefit originally envisaged of simplifying or reducing the volume of the Radio Regulations. The status of incorporation by reference has been discussed during the VGE work and at WARC-92. However, there was no firm conclusion and, despite many requests, no definitive opinion emerged from the ITU legal service as to whether text incorporated by reference is an obligatory part of the Radio Regulations or not. The majority view at WRC-95 was that such texts are obligatory, but still many administrations cannot accept that they have to be treated as an obligatory part of the Radio Regulations.

Because the complexity of the Radio Regulations does not appear to have been reduced and there is still no firm agreement on the status of provisions employing incorporation by reference, the ITU Special Committee considered a number of options on the future use of incorporation by reference and these options were elaborated further at the CPM.

Although there was no immediate consensus on the future use of incorporation by reference at the CPM, there would now appear to be a general recognition that the concept should be retained in some form, and that its use is particularly appropriate in connection with the maritime mobile service.

The preliminary agenda for the WRC, now to be held in 2002 or 2003, includes an item 2.10 (see Resolution **722 (WRC-97)**) for the radio regulatory procedures concerning the maritime mobile and mobile-satellite service, particularly in regard to the completion of the transition to the GMDSS. At this Conference it would be possible to remove references to a large number of ITU-R Recommendations on pre-GMDSS procedures and to review the references to the ITU-R Recommendations related to the GMDSS.

IMO position

Incorporation by reference is of importance to IMO because of the close relationship between many of the ITU-R Recommendations related to GMDSS equipment, and its operation, to IMO performance standards.

IMO requests early indication of any changes proposed by ITU to the mechanism of incorporation by reference and to the list of incorporated Recommendations.

IMO requests that the removal of references to ITU-R Recommendations on pre-GMDSS procedures and review of references to the ITU-R Recommendations related to the GMDSS should be undertaken at WRC-02/03.

WRC-2000 agenda item 7.2 - to recommend to the Council items for inclusion in the agenda for the next WRC, and to give its views on the preliminary agenda for the subsequent Conference and on possible agenda items for future conferences

Background

Items 8.3 and 8.4 dealing with maritime issues were originally placed by WRC-97 on the WRC-2000 agenda. These agenda items were subsequently removed from that agenda according to Council Resolution 1130 during the 1998 session of the ITU Council.

IMO position

IMO notes with satisfaction that matters related to maritime distress and safety communications are placed on the preliminary agenda (items 2.4, 2.10, 2.11) for the next WRC (WRC-02/03). IMO strongly recommends these agenda items be retained on the final agenda for WRC-02/03 and to add agenda items postponed from WRC-2000 (items 8.3 and 8.4) to ensure the long-term integrity of the GMDSS.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 93-E
6 April 2000
Original: Spanish

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Spain

PROPOSALS FOR THE WORK OF THE CONFERENCE

UPDATING OF SHARING CONDITIONS
IN THE BAND 13.75-14 GHz

Agenda item 1.13.1 requires WRC-2000 "to review and, if appropriate, revise the power limits appearing in Articles **S21** and **S22** in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services;".

In this context, technical studies have been carried out during the period between WRC-97 and WRC-2000 on the criteria for sharing among the different services involved in different frequency bands and, in particular, in the band 13.75-14 GHz. The band 13.75-14 GHz is allocated on a primary basis to the fixed-satellite service (FSS) and the radiolocation service (RLS). In some countries, the band is also allocated to the fixed service and the mobile service (footnotes S5.499 and S5.500 of the Radio Regulations) and to the radionavigation service (footnote S5.501). Geostationary systems in the space research service (GSO SRS) use this band under footnote S5.503. From 2001, the only space research system that will remain in this band on a co-primary basis with the FSS is the tracking and data relay satellite system (TDRSS). In addition, the non-geostationary space research service (non-GSO SRS) and the Earth exploration-satellite service (EESS) have operated with protection from the FSS (footnote S5.503A) until 1 January 2000.

The technical studies carried out have shown that it is possible to maintain the protection currently afforded to RLS, SRS and FSS while reducing the constraints imposed in the sharing conditions for these services, and also enabling non-GSO fixed-satellite service (non-GSO FSS) systems to be accommodated in the band 13.75-14 GHz.

In the studies, various methods of evaluating sharing conditions have been envisaged, having regard to the possibility of reducing the operational constraints imposed on the different services. This would give the various services greater flexibility to accommodate different applications. A number of studies were submitted to the Conference Preparatory Meeting (CPM-99) on sharing conditions between GSO FSS and RLS in the band 13.75-14 GHz and between GSO FSS and SRS in the band 13.772-13.778 GHz. These studies refer to the possibility of reducing the minimum antenna diameter of 4.5 m set in footnote S5.502.

In the light of the studies presented at the CPM and various studies presented subsequently in ITU-R working parties, the Administration of Spain is of the opinion that the current limits in footnote S5.502 for the FSS are not technically justified, and proposes that:

1 WRC-2000 should adopt a new Resolution setting out the prevailing operational constraints in that band, the reasons for which footnote S5.502 is amended and the need for further studies with a view to making more efficient use of the band. A draft Resolution is attached in Annex 1;

2 footnote S5.502 should be amended in the light of the aforementioned Resolution. A proposed revision of the footnote is attached in Annex 2.

Annexes: 2

ANNEX 1

ADD E/93/1

RESOLUTION XXX (WRC-2000)

Sharing conditions applicable in the band 13.75-14 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the band 13.75-14 GHz is allocated on a primary basis to the fixed-satellite and radiolocation services, subject to the sharing conditions set out in No. **S5.502**;

b) that, until they cease to operate, geostationary space stations in the space research service for which information for advance publication was received by the Bureau prior to 31 January 1992 shall operate in the band 13.75-14 GHz under the same conditions as stations in the fixed-satellite service, subject to the conditions set forth in No. **S5.503**;

c) that WARC-92 allocated the band 13.75-14 GHz on a worldwide basis to the fixed-satellite service in order to provide the necessary spectrum resources in the Earth-to-space direction to balance the equivalent bandwidth allocated to the fixed-satellite service in the space-to-Earth direction;

d) that the purposes of ITU include, *inter alia*, promoting efficient use of the radio-frequency spectrum by all radiocommunication services and extension of the benefits of new telecommunication technologies to all the world's inhabitants,

considering further

e) that the conditions set out in No. **S5.502** for the fixed-satellite and radiolocation services are based on technical characteristics, applications and sharing environments that prevailed at the time when they were adopted (WARC-92 and WRC-95);

f) that, since Nos. **S5.502** and **S5.503** were drafted, new technologies and applications have been developed and implemented in the bands allocated to the fixed-satellite service, including the bands allocated to the fixed-satellite service (space-to-Earth) referred to in *considering c)* above;

g) that, in those bands, new applications are currently under development that require both narrow-band and wideband digital transmissions as well as terminals with smaller aperture antennas for use in both geostationary and non-geostationary fixed-satellite service networks,

noting

a) that various studies have shown that the sharing conditions set in No. **S5.502** impose severe constraints worldwide on efficient use of the band 13.75-14 GHz for existing satellite networks, and may also severely restrict access to and efficient use of this band for future satellite networks designed to accommodate emerging technologies and applications;

b) that various studies have shown that adopting off-axis e.i.r.p. spectral density masks like those specified for space transmissions in Section VI of Article **S22** of the Radio Regulations would afford the radiolocation service equivalent or greater protection than that resulting from the sharing conditions set in No. **S5.502**, with respect to interference from the fixed-satellite service;

c) that the maximum limit of 59 dBW specified in No. **S5.502** for e.i.r.p. averaged over one second radiated towards the geostationary-satellite orbit by a station in the radiolocation service affords adequate protection for the fixed-satellite service against interference from the radiolocation service;

d) that various studies have shown that there is no longer any technical justification for the reference in No. **S5.502** to a minimum antenna diameter of 4.5 m for the fixed-satellite service;

e) that the sharing conditions set in No. **S5.503** afford adequate protection to space research services against interference from the fixed-satellite service;

f) that, in virtue of the sovereign rights of each State to regulate telecommunications on its own territory, the administrations are currently applying, at the national level, a wide variety of different operating regimes for the fixed-satellite service in the band 13.75-14 GHz;

g) that there is an urgent need to enable economical and efficient use of the band 13.75-14 GHz by the fixed-satellite service, while continuing to guarantee protection for the radiolocation and space research services,

resolves

1 that, with effect from 3 June 2000, the conditions set in No. **S5.502** relating to a minimum antenna diameter of 4.5 m and a minimum e.i.r.p. of 68 dBW applicable to emissions in the fixed-satellite service (Earth-to-space) shall be suspended, pending their revision by a future competent conference on the basis of the studies to be carried out by ITU-R in line with *instructs ITU-R* 1 below;

2 that, with effect from 3 June 2000, the off-axis e.i.r.p. density of any emission in the fixed-satellite service (space-to-Earth) shall not exceed the limits given in Section VI of Article **S22**;

3 that, until the revision referred to in *resolves* 1 above takes effect, the sharing conditions set in No. **S5.503** applicable to the fixed-satellite service and the condition referred to in *noting c)* above applicable to radiolocation emissions shall continue to apply,

instructs ITU-R

1 as a matter of urgency, to carry out studies and develop sharing conditions worldwide that will lead to more efficient use of the band 13.75-14 GHz by the radiolocation, space research and fixed-satellite services, taking into account their foreseeable evolution and the requirements of those services;

2 to report on the results of those studies to the Conference Preparatory Meeting for WRC-03.

ANNEX 2

MOD E/93/2

S5.502 In the band 13.75-14 GHz, ~~the e.i.r.p. of any emission from an earth station in the fixed-satellite service shall be at least 68 dBW, and should not exceed 85 dBW, with a minimum antenna diameter of 4.5 m. In addition~~ the e.i.r.p., averaged over one second, radiated by a station in the radiolocation or radionavigation services towards the geostationary-satellite orbit shall not exceed 59 dBW.

PLENARY MEETING

Note by the Secretary-General

ROLE OF THE NOTIFYING ADMINISTRATION IN THE CASE OF AN ADMINISTRATION NOTIFYING ON BEHALF OF A NAMED GROUP OF ADMINISTRATIONS

Attached is a report by the Director of the Radiocommunication Bureau pursuant to Resolution 87 (Minneapolis, 1998).

Yoshio UTSUMI
Secretary-General

Attachment

ATTACHMENT

Director, Radiocommunication Bureau

ROLE OF THE NOTIFYING ADMINISTRATION IN THE CASE OF AN ADMINISTRATION NOTIFYING ON BEHALF OF A NAMED GROUP OF ADMINISTRATIONS

Resolution 87 (Minneapolis, 1998) noted that, under the Radio Regulations, one administration may act as the notifying administration on behalf of a named group of administrations, and there are a number of practical examples of this situation. It also noted that the notifying administration is responsible under the agreement with the organization responsible for multinational networks of this kind, for communicating any information from that entity to the Radiocommunication Bureau.

Resolution 80 also included an instruction to the Director, Radiocommunication Bureau, to prepare a report to the next world radiocommunication conference on the role of notifying administrations when notifying on behalf of a named group of administrations.

In order to assist the Director in this task, the Radiocommunication Advisory Group was invited to provide advice to the Director on these matters. The RAG considered the matter at its eighth meeting (17-20 January 2000) but noted that it is a regulatory matter to be dealt with at WRC-2000 and decided not to consider it further.

The Bureau notes that the issues were addressed comprehensively in the Report of the Conference Preparatory Meeting (CPM), including a summary of the various provisions of the Radio Regulations in which such arrangements are mentioned. The Bureau has nothing further to add to the CPM analysis which is reproduced below:

Extract from Chapter 7 of the CPM Report (Document 3).

7.5.3 Resolution 87 - Role of the Notifying Administration

This Resolution deals with the need to clarify the role of the notifying administration when it is notifying on behalf of a group of administrations. There was one administration which submitted proposals and one administration and a Sector Member which submitted comments not in favour of the original proposal. The original proposal which is included here as an example of how WRC-2000 could address this problem would be to have a Resolution with the following *resolves*:

1 that when an administration acts as the notifying administration of a satellite network on behalf of a group of named administrations in accordance with Nos. **S9.1.1** and **S11.15.1** and the Rules of Procedures for Appendices **S30** and **S30A**, the following procedures shall be applied:

- the group of named administrations shall select one of them to act as the notifying administration for that particular network;
- the administration identified as the notifying administration shall act on behalf of all members of the group of administrations listed in the application of the Radio Regulations with respect to particular networks;

2 that the group of named administrations shall ensure that the notifying administration is able to act on their behalf in carrying out the provisions of the Radio Regulations.

There were concerns expressed by one administration and one sector member as follows:

- Some administrations were of the view that the present provisions are adequate, work well and that such changes are not necessary.
- It was pointed out that intergovernmental organizations are composed of sovereign administrations and that the internal procedures of the organization include the identification of the notifying administration to communicate with the BR on its behalf.
- There were concerns expressed about the proposal that the notifying administration shall be one of the group of listed administrations and that the notifying administration may not wish to associate itself with a particular satellite network.
- The view was also expressed that in the case of intergovernmental organizations with its management organization, these organizations are responsible for carrying out the obligations under the Regulations and that the notifying administration is only requested to convey the collective decisions of the intergovernmental organization to the BR and that the notifying administration has no mandate over the intergovernmental organization to enforce the Radio Regulations.
- There were concerns expressed about the conflicting responsibilities between administrations, especially as regards action in the event of harmful interference, when ownership of satellites, licensing of satellites, location of control stations, etc. may involve administrations other than the notifying administration; accordingly the interaction of their relationships, especially the roles of licensing under Article **S18**, needs to be addressed.
- There were concerns that the present provisions of the Radio Regulations only provide an opportunity for the notifying administration to respond to the BR with respect to its own networks if the notifying administration is one of the listed administrations in the group.

In the contributions to some of the main provisions of the Radio Regulations that relate to the roles and responsibilities of the notifying administration were noted as follows:

- **S4.4** - assignment of frequencies not in conformity with the RR by an administration on the condition of no interference;
- **S8.4** - recording of assignments with a reference to No. **S4.4** only when the administration makes a commitment;
- **S9.3** - no comments within a time period equals no objection by the administration, and administrations shall endeavour to cooperate to resolve any difficulties;
- **S9.4** - the administration shall explore all possible means, etc.;
- **S9.43** - an administration not responding shall be considered as not affected;
- **S9.47-49** - an administration undertakes to not make a claim about harmful interference and to not cause harmful interference;
- **S9.51** - an administration shall act within a specified period;
- **S11.36** - undertaking by the notifying administration to not cause harmful interference;
- **S11.39B** - as per No. **S11.36**;
- **Art**. **S18**.

As for the question of licensing on Article **S18**, this issue is not applicable to Chapter **SIII** of the Radio Regulations, as there is no mention of licensed stations in this Chapter. Article **S18** is a parallel set of obligations under the Radio Regulations and not related to the provisions of Chapter **SIII**.

In addition some administrations do not license or are not authorized by national legislation to license the space stations for which they are the notifying administration and in the case of space stations operated by intergovernmental organizations, they are not licensed by any administration. Also the application of Article **S18** is limited to private stations.

Except for Article **S18** the other provisions listed in paragraph 1.2 fall into one of two categories:

- Those relating to the coordination of specific earth stations and terrestrial stations or between earth stations and the notification and operation of specific earth stations and in this case, it is the administration on whose territory the earth station is situated that is responsible.
- Those relating to the API, coordination, notification and operations of the space station (with typical earth stations as appropriate) and in this case (for non-intergovernmental operating entities) it is the notifying administration of the space station that is responsible. In the case of intergovernmental operating entities, this is the aspect that is not clear and is being addressed in this section.

PRINCIPLES FOR EVALUATING IMT-2000 CANDIDATE BANDS

WRC-2000 agenda item 1.6.1: spectrum and regulatory issues for IMT-2000

Introduction

WRC-2000 is considering the issue of additional spectrum for IMT-2000. There are various candidate bands for this purpose. In order to decide in favour of a candidate band(s), there are wide-ranging issues that need to be considered. This paper identifies principles for evaluating candidate bands. Appendix 1 gives examples of applications of these principles.

It is expected that the principles will be useful to the conference delegates in their deliberations.

Principles for evaluation of candidate IMT-2000 extension bands

1) In order to facilitate global roaming there should be common band(s) designated/allocated globally to IMT-2000. Therefore part or all of a band should be capable of being allocated to the mobile service in all three ITU Regions.

2) Individual administrations may only need part of the designated/allocated band and therefore should be able to apportion parts of a band for use by IMT-2000 global roaming, even if other services are operating in other parts of that band.

3) Bands designated or allocated to IMT-2000 should be able to comply with IMT-2000 technical and operational needs (such as parameters identified in ITU-R recommendations, for example ITU-R [IMT.RKEY]) and accommodate apportionment between competitive service providers.

4) Some or all of the existing systems currently using a candidate band should be able to migrate to other bands in the period between [2005 and 2010].

5) There should be synergies with the existing bands identified for IMT-2000 (WARC-92).

6) The needs of developing countries must be met.

WRC-2000 presents a unique opportunity for all three ITU Regions to formulate a Plan that sooner or later achieves global harmonization of some or all of the bands identified for use by IMT-2000. Forecasted bandwidth requirements for the terrestrial component of IMT-2000 are summarized in Table 1-1 of the CPM Report. Frequency bands identified in No. S5.388 are unlikely to be able to be used in a globally harmonized manner in the short term, due to the overlap in the band plans for USPCS and IMT-2000 technologies. By allocating a choice of bands, respective administrations can identify a development path that suits their needs, and approach the global harmonization objective over a number of years.

Additional bandwidth is needed by IMT-2000, from the year 2005, and before the year 2010. There is an urgent need to provide more spectrum for the terrestrial component of IMT-2000 applications, and priority should be given to terrestrial mobile spectrum needs with adjustments to the Table of Frequency Allocations as necessary. Even though decisions on identifying spectrum are sought at WRC-2000, access to the spectrum is some five to ten years away, and gives administrations time to select suitable ways to introduce IMT-2000 in each country.

While considering additional spectrum needs for IMT-2000, it is important that technical issues be taken into account in the evaluations of candidate bands. Technical aspects of IMT-2000 are documented in ITU-R recommendations, such as ITU-R [IMT.RKEY]. Bands identified for IMT-2000 usage will not be fully useable unless all technical needs and conditions are met.

With the various issues in mind, New Zealand proposes that the following principles should be used in the evaluation of candidate bands to be identified by WRC-2000 for future use by IMT-2000.

Appendix: 1

APPENDIX

Examples of applying the six principles

1 In order to facilitate global roaming there should be common band(s) designated/allocated globally to IMT-2000. Therefore part or all of a band should be capable of being allocated to the mobile service in all three ITU Regions

IMT-2000 is an application of the mobile service (MS). So, candidate spectrum for IMT-2000 is already allocated to MS or can be allocated through a modification to Article S5 of the International Radio Regulations by WRC-2000. For global harmonization to be possible, MS allocations are required in all three ITU Regions.

As was the procedure used at WARC-92 for FPLMTS, spectrum for use by IMT-2000 could be identified by way of *designation* from within one or more MS allocations.

2 Individual administrations may only need part of the designated/allocated band and therefore should be able to apportion parts of a band for use by IMT-2000 global roaming, even if other services are operating in other parts of that band

Opportunities for global roaming benefit from harmonized arrangements. Economies of scale for manufacturing mobile equipment are greatest when operating standards and frequency bands are consistent from region to region; that is, globally harmonized. Even if an administration has problems clearing a complete band due to existing services, a part may be cleared to allow for global roaming and then gradually expanded to allow for more IMT-2000 service expansion over time.

Section 1.1.1.3 of the CPM Report mentions that co-channel sharing with other radio services may be feasible only through geographic separation. This means that band segmentation is generally needed in order to introduce IMT-2000 in a shared band. Cost-effective ways of introducing IMT-2000 vary from administration to administration, and also with specific radio-frequency channel arrangements of existing services. Administrations could take a phased approach to meeting spectrum expansion for IMT-2000.

3 Bands designated or allocated to IMT-2000 should be able to comply with IMT-2000 technical and operational needs (such as parameters identified in ITU-R recommendations, for example ITU-R [IMT.RKEY]) and accommodate apportionment between competitive service providers

For an FDD option of IMT-2000, the minimum useful “building block” is 2 x 5 MHz of spectrum. For TDD, the minimum “building block” is 1 x 5 MHz. For data rates 2 Mbps and higher a minimum of three or more carriers may be needed. To accommodate multimedia and high-speed data rate services, the minimum useful building block for FDD may be 2 x 15 MHz of spectrum. As IMT-2000 radio interface consists of a choice of technologies, guardbands between different technologies in adjacent bands may also need to be accommodated.

For FDD the duplexer spacing should be at least 80 MHz to provide for practical and cost-effective mobile equipment. TDD could use the centre gap guardband of paired FDD sub-bands. Multiband multi-mode handsets are likely to be developed, with options depending on market demand. High altitude platform stations (HAPS) may be a delivery method for some IMT-2000 services.

In deregulated environments where administrations encourage multiple service providers, the available spectrum for IMT-2000 should be able to be readily subdivided into useful sized "packages" that would support adequate network capacity. This implies that any small band would be unlikely to be able to meet industry needs for IMT-2000 in a deregulated environment.

4 Some or all of the existing systems currently using a candidate band should be able to migrate to other bands in the period between [2005 and 2010]

This is a matter for individual administrations to consider. All radio equipment has some service or economic life, and a time for replacement presents options for relocation within existing bands, or relocation to other suitable bands, or changes to new technology with different spectrum needs. In bands designated for future use by IMT-2000, other systems due for replacement between the years 2005 and 2010 are in the critical time-frame when additional spectrum is sought for IMT-2000. Individual administrations can develop policies that best suit their national circumstances, possibly in several stages.

5 There should be synergies with the existing bands identified for IMT-2000 (WARC-92)

The bands identified by WARC-92 are the basic bands for IMT-2000. It is highly desirable that new bands for IMT-2000 be in harmony with the bands identified by WARC-92, in terms of:

- **frequency**, to achieve a practical tuning range for multiband handsets;
- **sub-bands**, for suitable capacity for FDD uplinks and downlinks, as well as TDD. Note that the two bands identified by WARC-92 are unequal in size;
- **duplex direction**, so the uplink and downlink directions of a new allocation are not inconsistent with WARC-92 designations or MSS allocations. Usually an FDD lower sub-band is specified for mobile transmit (uplink). A mixture of duplex directions could cause blocking and other forms of local interference to handsets.

6 The needs of developing countries must be met

IMT-2000 is expected to be of benefit to developing countries. Bands for IMT-2000 extension should consider the needs of developing countries so that the allocation/designation does not economically disadvantage developing countries and also require the displacement of existing fixed infrastructure.

PLENARY MEETING

New Zealand

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.6.1 - IMT-2000 ISSUES

MSS operations in the bands identified for IMT-2000 operations

Background

Considerable work has gone on internationally over the last few years to identify the possible long-term needs for the satellite component of IMT-2000. New Zealand has noted that there have been a number of MSS networks both operational, and under planning, that have come under financial difficulties. This brings into question the usefulness of further MSS allocations for IMT-2000 satellite component operations.

In its document, Principles for Evaluating IMT-2000 Candidate Bands, New Zealand made the point that administrations need flexibility when deciding how much spectrum is required nationally on the one hand to meet their IMT-2000 needs, while on the other hand satisfying the requirements of existing services in these bands.

Given this need for flexibility, it would appear to New Zealand that it would be useful for the Conference to identify bands where there are already mobile service allocations within the Table of Frequency Allocations sharing with the MSS[1], for possible use by the terrestrial or satellite component of IMT-2000.

This would mean that if MSS use does not materialize or is not necessary nationally, greater flexibility would be available to administrations to apportion the spectrum requirements between IMT-2000 uses and other services.

It should be noted that geographical separation may be required between MSS and MS IMT-2000 operations in the same frequency band.

[1] This applies to the bands 2 500-2 520 MHz and 2 670-2 690 MHz.

Proposal

NZL/96/1

In the event of the Conference identifying the band 2 520-2 670 MHz for the terrestrial component of IMT-2000 and identifying the bands 2 500-2 520 MHz and 2 670-2 690 MHz, for the satellite component of IMT-2000, then the latter two bands should additionally be identified for use by both the terrestrial and satellite components.

NZL/96/2

The dual identification of the bands should be reviewed at a future conference.

PROPOSAL FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.18

NOC NZL/97/1

APPENDIX S18

Table of transmitting frequencies in the VHF maritime mobile band

Reasons: The concept of moving to digital technology is being promoted. It is important to consider that the use of Appendix S18 is global, and the channelling arrangements satisfy not only normal commercial communications requirements, but distress, safety, ship movement, and other specific maritime service requirements. Until any new technology can satisfy all of these requirements, New Zealand considers it inappropriate to address the matter. Additionally, it is considered inadvisable to designate some channels for digital techniques since this may reduce the ability of a global change in the future.

New Zealand further considers that the studies outlined in Resolution 342 (WRC-97) have not yet been completed, and that it would be inadvisable for the Conference to address the matter on an ad hoc basis.

PROPOSALS FOR THE WORK OF THE CONFERENCE

PROPOSAL FOR AGENDA ITEM 1.13.1

On the basis of the results of the studies in accordance with Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97): to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Proposal to update the constraints related to the operational applications and technology in the band 13.75-14 GHz (MOD S5.502, ADD S5.502A and MOD S5.503)

Background information

At WARC-92 and as modified at WRC-95, Nos. S5.502, S5.503 and S5.503A were added to the Table of Frequency Allocations to facilitate compatibility between the existing applications of the radio services in the 13.75-14 GHz band. It was agreed that any modifications to any of these footnotes in order to accommodate new technology, new requirements and applications of the FSS should consider the overall interference environment in the 13.75-14 GHz band and be undertaken with great care in order to avoid upsetting the delicate balance previously achieved between the services. The present operational constraints, that satisfy the protection criteria of current operational applications and technology in the band 13.75-14 GHz, are to be found in Nos. S5.502 and S5.503.

Studies that led to the development of these footnotes did not account for non-geostationary-satellite orbit fixed-satellite service systems (non-GSO FSS). With the introduction of non-GSO FSS into this band at WRC-97, Resolution 130 (WRC-97) was, among other things, drafted to focus attention on the need to re-examine the sufficiency of these footnotes in maintaining the delicate balance between the services sharing the 13.75-14 GHz band.

Analysis of sharing between geostationary FSS and the radiolocation and radionavigation services is contained in Recommendation ITU-R S.1068. Some studies have shown that sharing with radiolocation systems is significantly more difficult for non-GSO FSS systems than for GSO FSS systems. Other studies have shown that more restrictive e.i.r.p. density limits are needed on non-GSO FSS systems than on GSO FSS systems for protection of space research systems. The protection criteria of the space research links used are those included in Recommendation ITU-R SA.1155. The CPM Report to WRC-2000 provides guidance on possible methods for maintaining the present balance in the sharing conditions between radiolocation, radionavigation, space sciences and FSS, and accommodates non-GSO FSS systems within the 13.75-14 GHz band. The CPM Report and also studies presented at the WP 4A meeting, 21-29 February 2000, do not provide any substantial evidence to relax the minimum 4.5 metre antenna diameter requirement. This requirement serves to limit the number of FSS earth stations thus maintaining a sharing balance. It would be premature to relax this requirement without further study. The following proposed modifications/additions to the governing footnotes are based on the work of ITU-R.

Proposals

MOD USA/98/1

S5.502 In the band 13.75-14 GHz, the e.i.r.p. of any emission from an earth station in the fixed-satellite service operating with a space station in geostationary-satellite orbit shall be at least 68 dBW, and should not exceed 85 dBW, with a minimum antenna diameter of 4.5 m. In addition the e.i.r.p., averaged over one second, radiated by a station in the radiolocation or radionavigation services towards the geostationary-satellite orbit shall not exceed 59 dBW.

Reasons: Footnotes MOD S5.502, ADD S5.502A and MOD S5.503 retain the delicate balance between the space research, fixed-satellite, radiolocation, and radionavigation services agreed to at WARC-92 and confirmed at WRC-95. Since the earlier studies did not account for non-GSO systems, their allocations requirements are redefined and addressed by new footnote S5.502A. Footnote S5.502 is clarified to apply to geostationary-satellite orbit fixed-satellite service systems.

ADD USA/98/2

S5.502A In the band 13.75-14 GHz, the e.i.r.p. of any emission from an earth station in the fixed-satellite service operating with a space station in non-geostationary-satellite orbit should not exceed 85 dBW and shall have a minimum antenna diameter of 4.5 metres. Receiving space stations in non-geostationary-satellite orbit shall not claim protection from radiolocation and radionavigation transmitting stations operating in accordance with the Radio Regulations.

Reasons: Footnotes MOD S5.502, ADD S5.502A and MOD S5.503 retain the delicate balance between the space research, fixed-satellite, radiolocation, and radionavigation services agreed to at WARC-92 and confirmed at WRC-95. Since the earlier studies did not account for non-GSO systems, their allocations requirements are redefined. Studies have shown that non-GSO receiving space stations will be susceptible to interference from radiolocation and radionavigation stations operating in accordance with the Radio Regulations.

MOD USA/98/3

S5.503 In the band 13.75-14 GHz, geostationary space stations in the space research service for which information for advance publication has been received by the Bureau prior to 31 January 1992 shall operate on an equal basis with stations in the fixed-satellite service; after that date, new geostationary space stations in the space research service will operate on a secondary basis. ~~The e.i.r.p. density of emissions from any earth station in the fixed-satellite service shall not exceed 71 dBW in any 6 MHz band in the frequency range 13.772-13.778 GHz u~~Until those geostationary space stations in the space research service for which information for advance publication has been received by the Bureau prior to 31 January 1992 cease to operate in this band~~.~~:

a) the e.i.r.p. density of emissions from any earth station in the fixed-satellite service operating with a space station in geostationary-satellite orbit shall not exceed 71 dBW in the 6 MHz band in the frequency range 13.772-13.778 GHz;

b) the e.i.r.p. density of emissions from any earth station in the fixed-satellite service operating with a space station in non-geostationary-satellite orbit shall not exceed 51 dBW in the 6 MHz band in the frequency range 13.772-13.778 GHz.

Automatic power control may be used to increase the e.i.r.p. density ~~above 71 dBW~~ in ~~any~~the 6 MHz band in this frequency range to compensate for rain attenuation, to the extent that the power-flux density at the fixed-satellite service space station does not exceed the value resulting from use by an earth station of an e.i.r.p. of 71 dBW or 51 dBW, as appropriate, in ~~any~~the 6 MHz band in clear sky conditions.

Reasons: Footnotes MOD S5.502, ADD S5.502A and MOD S5.503 retain the delicate balance between the space research, fixed-satellite, radiolocation, and radionavigation services agreed to at WARC-92 and confirmed at WRC-95. Since the earlier studies did not account for non-GSO systems, their allocations requirements are redefined. Studies have shown that an e.i.r.p. density limit of 51 dB(W/6 MHz) for an earth station operating with a non-GSO fixed-satellite service system will facilitate co-equal sharing with the space research service.

World Broadcasting Unions - Technical Committee (WBU-TC)*

INFORMATION DOCUMENT

WBU POSITION ON
WRC-2000 AGENDA ITEMS 1.6.1 AND 1.19

The WBU position on WRC-2000 agenda items 1.6.1 and 1.19 is attached.

* The World Broadcasting Unions Technical Committee (WBU-TC) is the technical arm of the World Broadcasting Unions. This Union is composed of the world's eight Broadcasting Unions:

– Asia Pacific Broadcasting Union (ABU)
– Arab States Broadcasting Union (ASBU)
– Caribbean Broadcasting Union (CBU)
– European Broadcasting Union (EBU)
– International Association of Broadcasters (IAB)
– North American Broadcasters Association (NABA)
– Organisación de Television Ibero-Americana (OTI)
– Union des Radiodiffusions et Télévisions Nationales d'Afrique (URTNA).

WBU POSITION ON
WRC-2000 AGENDA ITEMS 1.6.1 AND 1.19

Agenda item 1.6.1 - review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Current situation in bands used for broadcasting services

In relation to broadcasting service and broadcasting-satellite service (sound), administrations participating in Study Groups 10 and 11 have adopted two Questions seeking studies to assess spectrum requirements for these services in the light of their transition to digital technology. The studies are to be completed by 2003. Actual requirements of radio-frequency spectrum for these services in the transitional and full-digital environments would be known only after the results of the studies become available. In the meanwhile, any assessment for possible candidate bands for IMT-2000 in the bands allocated to broadcasting services would be premature and possibly misleading. It may be noted that Resolution 728 (WRC-97), in *considering i*) indicates increased usage of the relevant bands by analogue and digital television services during the transitional period on account of parallel operation of these services.

Analysis of the results of studies

Limited sharing studies conducted to date within the ITU-R indicate that IMT-2000 systems generally can not share spectrum in the same geographical area with other radio operations in the mobile, mobile-satellite and other services. Use of spectrum on a co-channel basis with other radio operations may be feasible only through geographic separation. Nevertheless, it is recognized that the frequency bands most suitable for IMT-2000 are already heavily utilized by other operations in some geographic areas.

WBU position on candidate bands for additional spectrum for IMT-2000

The WBU views on possible candidate bands for additional terrestrial IMT-2000 spectrum are given in the following:

1 Frequency band 470-806 MHz

This band is allocated to the broadcasting service worldwide. The band is mainly used for analogue broadcasting at the present time. The introduction of digital television is planned in many countries. A transition period of perhaps 10-15 years is foreseen during which both digital and analogue transmissions will occur in parallel.

Due to the nature of analogue television planning, the vacant channels in specific areas have found widespread application of low power services such as wireless microphones and biomedical telemetry.

Studies have been initiated in the ITU-R to establish the future spectrum requirements for digital broadcasting.

Disadvantages

In most countries, the availability of TV spectrum following the phasing out of analogue TV is uncertain. Furthermore, the phasing out of analogue TV will vary between countries and is not expected to occur in many countries until after the 2005-2010 time-frame.

It is expected that spectrum demands for TV broadcasting will be greater during the transitional period and possibly beyond.

2 Frequency band 806-960 MHz

This band is allocated worldwide to the fixed, mobile and broadcasting services on a co-primary basis, with some exceptions in Region 2.

In those countries currently using part of this band for analogue broadcasting (up to 862 MHz), the transition to digital broadcasting may, in the future, allow use of this spectrum for IMT-2000. However, due to the nature of analogue television planning, the vacant channels in specific areas have found widespread application of low power services such as wireless microphones and biomedical telemetry.

Studies have been initiated in the ITU-R to establish the future spectrum requirements for digital broadcasting.

Disadvantages

Parts of this band are already used in some countries by other services and such use may continue e.g. TETRA, Railway-GSM, ancillary broadcasting services, radiolocation and Tactical Radio Relay.

In some countries, the availability of TV spectrum following the phasing out of analogue TV is uncertain. Furthermore, the phasing out of analogue TV might not occur in the 2005-2010 time-frame.

3 Frequency band 1 429-1 501 MHz

The band 1 452-1 492 MHz is allocated worldwide on a co-primary basis to the broadcasting and broadcasting-satellite services in accordance with No. S5.345, and is the only worldwide allocation identified for digital audio broadcasting.

Disadvantages

The present and planned usage for aeronautical mobile telemetry, FS and digital audio broadcasting, both terrestrial and satellite, may preclude its use for IMT-2000 in many parts of the world. Several countries in Region 3 have notified the ITU-R of their intention to launch satellite DAB systems operating in the L band allocation. Any consideration of the use of the 1 452-1 492 MHz band for IMT-2000 should take into account the following facts, among several others:

- A number of other Region 3 operators have notified an intention to use the 1 467-1 492 MHz part of the BSS(S) allocation. Current studies in JWP 10-11S aim at developing guidelines to facilitate the management of the available BSS (Sound) spectrum prior to a plan being developed.
- The L band is the only "universal" BSS (Sound) allocation. It provides opportunities through satellite applications to bring large area service deliveries, including to the under served rural and remote centres and communities which have been largely dependent upon inferior short wave services.

In general, phasing out of existing services would have serious cost/operational implications.

4 Frequency band 2 520-2 670 MHz

This band is allocated on a co-primary basis to the fixed and mobile (except aeronautical mobile), and broadcast-satellite services in all 3 Regions. FSS (s-E) is allocated in this band in Region 2 and parts of this band, 2 520-2 535 MHz (s-E) and 2 655-2 670 MHz (E-s) in Region 3.

BSS services have been operating in several Region 1 and Region 3 countries for the last two decades, covering large areas in these Regions, and MSS services are used in some Region 3 countries.

This band is used for different services and applications in different countries e.g. for fixed, ENG/OB (Electronic News Gathering/Outside Broadcasting) and multipoint distribution applications.

Disadvantages

The use by countries for BSS television covers large areas of Regions 1 and 3 and provides important broadcasting services to rural and remote communities. These communities and individual consumers have a large investment in the services. The sharing implications for IMT-2000 and BSS have not been examined. Further, the announced plans for BSS sound services in this band will need to be examined for the possible sharing implications for IMT-2000 before identification of the band for that application.

In a number of countries this band is used for multipoint distribution systems (in some countries extensively) that have been deployed in urban as well as rural areas. Licences for this service have been recently granted for extended periods of up to 20 years. Phasing out of these services and BSS and MSS will therefore be very difficult for the foreseeable future. Therefore the use of these bands may be precluded for IMT-2000 in these countries.

The use of this band for IMT-2000, if considered, would conflict with its current use for ENG and outside broadcast applications in several countries, particularly in areas of high population density.

Agenda item 1.19 - to consider the report of the Inter-conference Representative Group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

WBU position

1 Completion of BSS replanning at WRC-2000

1) The WBU considers that the BSS planning process has gone on far too long and it is essential to bring it to a successful conclusion at the earliest possible opportunity.

2) The WBU considers that all major BSS planning issues have either been resolved or are near resolution.

3) Currently, the IRG/GTE planning exercises seem to meet all major requirements enshrined in Resolution 532, including enhanced number of channels for the economical implementation of BSS systems, full digital planning and incorporation of country specific preferences.

4) The only major unresolved issue seems to be that of inclusion in the BSS plan of systems filed under Article 4 modification procedures (since WRC-95). However, several developments have taken place since and the need for such filings may not arise any longer. For instance, modifications seeking only changes in orbital location or beam footprints need not be considered now since the BR has already taken on board country preferences in the GTE exercise.

5) While carrying out the replanning, it should be ensured that the integrity of the Region 2 Plan and its associated provisions is preserved.

In view of the above, the WBU considers that WRC-2000 offers the opportunity to complete the BSS replanning and that this opportunity should be taken without further delay.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 100-E
8 May 2000
Original: French/ English/ Spanish

ISTANBUL, 8 MAY – 2 JUNE 2000
