[8] **S21.16.2** ~~The band 18.6-18.8 GHz is allocated to the earth exploration-satellite (passive) and space research (passive) services. Administrations should endeavour to reduce to a minimum the risks of interference to passive sensors. The interference criteria for satellite passive sensors are contained in Recommendation ITU-R SA.1029.~~ In addition to the limits given in Table **S21-4**, in the band 18.6-18.8 GHz the sharing environment within which the EESS (passive) and SR (passive) services shall operate is defined by the following limitations on the operation of the fixed-satellite service: the power flux-density across the 200 MHz band 18.6-18.8 GHz produced at the surface of the Earth by emissions from a space station under assumed free-space propagation conditions shall not exceed –95 dBW/m^2, except for less than 5% of time when the limit may be exceeded by up to 3 dB. The provisions of No. **S21.17** do not apply in this band.

Reasons: The above proposals reflect those technical solutions suggested in the CPM Report which are acceptable to Europe and are believed to represent a good compromise solution to this subject.

PLENARY MEETING

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

PART 3

AGENDA ITEM 1.13 - NON-GSO FSS

CONTENTS

Proposals submitted by the following administrations

Germany, Austria, Bosnia and Herzegovina, Croatia, Denmark, Estonia, Finland, France, Ireland, Iceland, Liechtenstein, Norway, Netherlands, Portugal, San Marino, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3E

Agenda item 1.13 - Proposed modifications to Article S5

Add the following text at the end of this Part.

EUR/13/134 to EUR/13/137 propose that S5.441, S5.484A, S5.487A and S5.516, the current four footnotes in Article S5 referring to non-GSO FSS operation under the provisions of Resolutions 130 (WRC-97) and 538 (WRC-97) be amended in order to include the relevant provisions currently included in these Resolutions which do not contain transitional or superfluous measures.

Among these superfluous measures is *resolves* 6 of Resolution 130 (WRC-97), which states:

> that, as of 22 November 1997, in the frequency bands specified in No. **S22.29** and Tables 1 and 2 of Annex 1 to this Resolution, non-GSO systems shall not claim protection from GSO networks in the FSS operating in accordance with the Radio Regulations, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO FSS systems and of the complete coordination information for the GSO networks;

In EUR/13/152, it is proposed to suppress this *resolves* 6, on the basis that, with the establishment of minimum constraints on GSO FSS systems, as those proposed to Section VI of Article S22 in EUR/13/108 to 123 for the earth station off-axis power limits, the fact that non-GSO systems cannot claim protection from GSO systems is inherent in the concept of limits as enabled by Article S22.

To satisfy agenda item 1.13.1, great care must be exercised to preserve the balance established by WRC-97 decisions in order to avoid undue constraints on the systems involved in the sharing situations covered by Resolutions 130 (WRC-97) and 538 (WRC-97). As shown hereafter, this balance was established by WRC-97 in linking various provisions contained in these resolutions, in Section VI of Article S22 and in the relevant footnotes of Article S5. The European common proposals relating with these three areas (respectively in Parts 3B, 3E and 3I of these proposals) are intended to preserve this balance, which is critical in satisfying agenda item 1.13.1.

Resolution 130 (WRC-97)

Considering further h) of Resolution 130 (WRC-97) states "that non-GSO FSS systems have been proposed in some of these bands which could meet these limits and would not require specific protection from existing and future GSO FSS systems, provided that minimum constraints are applied to GSO FSS systems, such as off-axis earth station e.i.r.p. limits;"

Based on this consideration, WRC-97 resolved:

- in *resolves* 6 of the same Resolution, "that, as of 22 November 1997, in the frequency bands specified in No. **S22.29** and Tables 1 and 2 of Annex 1 to this Resolution, non-GSO systems shall not claim protection from GSO networks in the FSS operating in accordance with the Radio Regulations"…
- in *resolves* 5 of the same Resolution: "that, as of the end of WRC-99, in the frequency bands specified in No. **S22.29** and § 2.4 of Annex 1 to this Resolution, GSO FSS systems for which complete coordination information has been received by the Bureau after the end of WRC-99 shall be subject to the limits in Article **S22** and in § 2.1, 2.2 and 2.3 of Annex 1 to this Resolution, as revised, if appropriate, by WRC-99;"

Section VI of Article S22

The suspension of the limits mentioned in the current S22.29 (Section VI of Article S22) is consistent with the review foreseen in *resolves* 5, and with the fact that the final limits for GSO earth stations were intended to apply only after the end of WRC-99 (now WRC-2000).

Consistent with WRC-97 decisions, and along with Option 2 of Annex 7 of Chapter 3 of the CPM Report, Europe proposes (EUR/13/108 to 123) to update Section VI of Article S22 (earth station off-axis e.i.r.p. density limits), taking into account the results of the ITU-R studies, and the need for relaxed values for these limits, compared with the ones included in the corresponding ITU-R recommendations. This proposal only addresses limits for GSO earth stations. Further studies are required on the applicability of such limits to earth stations within non-GSO systems.

Footnotes to Article S5

Europe also proposes not to reflect *resolves 6* of Resolution 130 (WRC-97) in the revised RR, since specifying hard limits implies, from a regulatory point of view, that as long as these limits are met by GSO systems (i.e. as long as GSO systems are operated in accordance with the RR), non-GSO systems cannot claim protection from them. This interpretation was recently confirmed by the RRB upon a request from one administration relating to a similar situation in the 13.75-14 GHz band.

Conclusion

From the above, it appears that there are only two ways of fulfilling the decisions of WRC-97 in this respect:

- maintain Section VI mandatory application and deleting the current *resolves* 6 of Resolution 130 (WRC-97). In this case, the existence of hard limits means that non-GSO systems cannot claim protection from GSO systems meeting these limits.
- suppress Section VI of Article S22, or make it non-mandatory, and deleting the current *resolves* 6 of Resolution 130 (WRC-97). In this case, the absence of hard limits means that non-GSOs can claim protection from GSOs. Otherwise, it would mean that non-GSO systems have to accept unlimited interference from GSOs.

An hybrid decision, e.g. suppressing Section VI of Article S22, or, which is equivalent from a regulatory point of view, making its application non-mandatory, while retaining a regulatory provision reflecting the current *resolves* 6 of Resolution 130 (WRC-97), would clearly be in contradiction with WRC-97 decisions.

It should be noted that the inclusion in Section VI of Article S22 of mandatory limits does not imply that BR will request verification of the compliance of GSO earth stations with the limits of Section VI of Article S22. Simply, in case of harmful interference into a non-GSO system, the provisions of Article S15 apply and the earth station may have to reduce its e.i.r.p. if it is demonstrated that it is exceeding these limits.

It should also be noted that, if the current drafting of *resolves* 6 of Resolution 130 (WRC-97) was reflected in the Radio Regulations, the current RRB interpretation of S5.43 may be understood as downgrading non-GSO FSS to less than a secondary status, which is obviously not in line with WRC-97 decisions.

Proposals submitted by the following administrations

Germany, Austria, Bosnia and Herzegovina, Croatia, Denmark, Spain, Estonia, Finland, France, Ireland, Iceland, Liechtenstein, Norway, Netherlands, Portugal, San Marino, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3F

Agenda item 1.13 - Proposed modifications to Articles S9 and S11

Add the following proposals at the end of Part 3F in Addendum 3 to Document WRC2000/13.

1 Framework

Among other studies, Resolutions 130 (WRC-97) and 538 (WRC-97) request ITU-R "to conduct, as a matter of urgency, and complete, in time for consideration by WRC-99, the studies relating to the sharing criteria to be applied for determining the need for coordination between non-GSO FSS systems and the need for coordination between terrestrial services and non-GSO systems in the FSS, with a view to promoting efficient use of spectrum/orbit resources and equitable access to these resources by all countries."

In response to the first of these requests, ITU-R has developed detailed methodologies which are now part of agreed Recommendations in order to specify the level of permissible interference into non-GSO FSS systems. Based on these recommendations, ITU-R is currently developing methodologies to be used under coordination involving non-GSO FSS systems. Although these methodologies are not at this time been fully developed, they are now expected to become part of an ITU-R recommendation within the next study period and will be used in detailed coordinations relating to this sharing situation.

In response to the second request, ITU-R has developed methodologies which are now included in Recommendation [Doc. 1/1004], relating to the coordination area of non-GSO FSS earth stations.

The existence of such Recommendations will help in resolving a long standing lack of harmonization in the provisions of Article S11, which results in a situation where the coexistence between GSO and non-GSO systems and between non-GSO earth stations and terrestrial stations may lead to arbitrary blockage of the recording process by a previous user of the frequency band.

As highlighted in section 7.5.2.7 of the CPM Report, in the cases where the coordination of an assignment under S9.7, S9.17, S9.17A and S9.18 could not be concluded successfully, Article S11 foresees a two-step approach to record this assignment in the Master Register:

- in the first step, the Bureau conducts an examination of the probability of harmful interference (S11.32A for S9.7 and S11.33 for S9.17, S9.17A and S9.18). If this examination is favourable, the assignment is recorded;

- in the second step, should the examination under the first step be unfavourable, the assignment may be resubmitted and recorded if the Bureau is informed that it has been in use, together with the assignment which was the basis for the unfavourable finding, for at least four months without any complaint of harmful interference being made (S11.41). After this second step, the assignment remains under the Damocles of S11.42, i.e. any harmful interference has to be ceased if it occurs into the assignments which was the basis of the unfavourable finding.

This approach, which follows the pattern previously used under Articles 11 and 13 since 1971, ensures that an administration cannot block the recording process, hence the establishment of the rights of other administrations, for undue reasons.

This two-step approach does not exist in the case where coordination under the other entry points in Article S9 could not be successfully concluded. In particular, the entry points corresponding to Resolution 46 (S9.12 to S9.16) are not covered by these provisions. This means that in case of disagreement in the coordination process under any S9.12 to S9.16, recording in the Master Register is not possible.

This is of particular concern in the case of S9.12 and S9.13 (coordination between non-GSO and GSO satellite systems) because the coordination is triggered by bandwidth overlap only, and no coordination threshold or method currently exists in these cases. This means that disagreeing to a coordination request, without any technical reason, is sufficient to prevent the access to frequencies of subsequent satellite systems (GSO or non-GSO), even if in practice no interference would occur.

Given that recommendations also exist on coordination methods relating to S9.14 (e.g. the application of the system specific methodology described in Recommendation ITU-R IS.1143 (see Annex 1 to Appendix S5)) and are under development in relation to S9.11, the proposed modifications to S11 should also include a reference to these provisions.

2 Proposal

It is therefore proposed to harmonize the ways in which recording is conducted under Article S11. To this effect, it would be sufficient to modify S11.32A and S11.33 as follows:

MOD EUR/13/335

S11.32A *c)* with respect to the probability of harmful interference that may be caused to or by assignments recorded with a favourable finding under Nos. **S11.36** and **S11.37** or **S11.38**, or recorded in application of No. **S11.41**, or published under Nos. **S9.38** or **S9.58** but not yet notified, as appropriate, for those cases for which the notifying administration states that the procedure for coordination under Nos. **S9.7**, **S9.7A**, **S9.7B**, **S9.11**, **S9.12**, **S9.13** or **S9.14** could not be successfully completed (see also No. **S9.65**);[10] or

MOD EUR/13/336

S11.33 *d)* with respect to the probability of harmful interference that may be caused to or by other assignments recorded with a favourable finding in application of Nos. **S11.36** and **S11.37** or **S11.38** or in application of No. **S11.41**, as appropriate, for those cases for which the notifying administration states that the procedure for coordination or prior agreement under Nos. **S9.15**[11], **S9.16**[11], **S9.17**[11], **S9.17A** or **S9.18**[11] could not be successfully completed (see also No. **S9.65**);[12] or

MOD EUR/13/337

---

10 **S11.32A.1** The examination of such notices with respect to any other frequency assignment for which a request for coordination under Nos. **S9.7**, **S9.7A**, **S9.7B**, **S9.12** or **S9.13** as appropriate, has been published under No. **S9.38** but not yet notified shall be effected by the Bureau in the order of their publication under the same number using the most recent information available.

MOD EUR/13/338

S11.35 ~~Not used.~~In cases where the Bureau is not in a position to conduct the examination under **S11.32A** (**S11.33**), the Bureau shall immediately inform the notifying administration, which may then resubmit its notice under **S11.41**, under the assumption that the finding under **S11.32A** (**S11.33**) is unfavourable.

NOTE **-** These proposals also reflect proposals EUR/13/129 and 130.

Proposals submitted by the following administrations

Germany, Austria, Bosnia and Herzegovina, Croatia, Denmark, Spain, Estonia, Finland, France, Ireland, Iceland, Italy, Liechtenstein, Norway, Netherlands, Portugal, San Marino, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3J

Agenda item 1.13 - Proposed modifications to Articles S15 and S13

Procedure in a case of unacceptable interference

1 Introduction

Article S15 of the Radio Regulations contains the various provisions dealing with interferences. Section VI of this article contains specific provisions applicable in case of harmful interference (see S1.169). At present, there is no provision applicable in case of unacceptable interference. Unacceptable interference corresponds to levels of interference which are in excess of permissible interference (see S1.167) and shall be reduced to the levels of permissible interference or to a higher level that is acceptable to the affected administration: acceptable interference (see S1.169).

During the preparation of WRC-2000, several attempts have been made to build new procedures from scratch to cover this case in the very specific case of non-GSO FSS systems vs GSO systems in certain bands where power limits have been established. While fully recognizing the benefits of developing such procedures, it is considered more appropriate to:

- develop a generic procedure, based on the existing, well thought and experience proven provisions, which relate to cases of harmful interference. This avoids both to re-invent what already exists in the Radio Regulations, and to put on non-GSO systems more constraints that was considered until now as adequate for S4.4 operations;
- to insert the new procedure as a new Section VII of Article S15, as another case of an infraction to the Radio Regulations;
- to strengthen the current provisions contained in Section I of Article S13, so that some burden is placed on the interfering administration in case of no action.

The following presents proposals for a new Section VII of Article S15, compared in a tabular form the existing Section VI of Article S15, as well as proposed modifications to Section I of Article S13 and to Appendix S10.

2 Proposals

2.1 New Section VII of Article S15

ADD EUR/13/339

Section VII – Procedure in a case of unacceptable interference[2]

---

[2] Unacceptable interference corresponds to levels in excess of:

a) the power and power flux-density limits in Article **S21**; or

b) the off-axis power density limits and aggregate/equivalent power flux-density limits in Article **S22**; or

c) the mandatory power and power flux-density limits specified in footnotes of Article **S5**; or

d) the aggregate equivalent power flux-density levels specified in Resolution **WWW** (WRC-2000); or

e) the levels previously agreed between administrations, as appropriate.

ADD EUR/13/340

S15.47 It is essential that Member States ‡ exercise the utmost goodwill and mutual assistance in the application of the provisions of this section to the settlement of problems of unacceptable interference.

ADD EUR/13/341

S15.48 In the settlement of these problems, due consideration shall be given to all factors involved, including the relevant technical and operating factors, such as: adjustment of frequencies, characteristics of transmitting and receiving antennas, time sharing, change of channels within multichannel transmissions.

ADD EUR/13/342

S15.49 For the purpose of this section, the term “administration” may include the centralizing office designated by the administration, in accordance with No. **S16.3**.

ADD EUR/13/343

S15.50 Administrations shall cooperate in the detection and elimination of unacceptable interference, employing where appropriate the facilities described in Article **S16** and the procedures detailed in this section.

ADD EUR/13/344

S15.51 Where practicable, and subject to agreement by administrations concerned, the case of unacceptable interference may be dealt with directly by their specially designated monitoring stations or by direct coordination between their operating organizations.

ADD EUR/13/345

S15.52 Full particulars relating to unacceptable interference shall, whenever possible, be given in the form indicated in Appendix **S10**.

ADD EUR/13/346

S15.53 In cases of unacceptable interference where rapid action is required, communications between administrations shall be transmitted by the quickest means available and, subject to prior authorization by the administrations concerned in such cases, information may be exchanged directly between specially designated stations of the international monitoring system.

ADD EUR/13/347

S15.54 When a case of such unacceptable interference is reported by a receiving station, it shall give to the transmitting station whose service is being interfered with all possible information which will assist in determining the source and characteristics of the interference.

ADD EUR/13/348

S15.55 If a case of unacceptable interference so justifies, the administration having jurisdiction over the receiving station experiencing the interference shall inform the administration having jurisdiction over the transmitting station whose service is being interfered with, giving all possible information.

ADD EUR/13/349

S15.56 If further observations and measurements are necessary to determine the source and characteristics of and to establish the responsibility for the unacceptable interference, the administration having jurisdiction over the transmitting station whose service is being interfered with may seek the cooperation of other administrations, particularly of the administration having jurisdiction over the receiving station experiencing the interference, or of other organizations.

ADD EUR/13/350

S15.57 When cases of unacceptable interference occur as a result of emissions from space stations, the administrations having jurisdiction over these interfering stations shall, upon request from the administration having jurisdiction over the station experiencing the interference, furnish current ephemeral data necessary to allow determination of the positions of the space stations when not otherwise known.

ADD EUR/13/351

S15.58 Having determined the source and characteristics of the unacceptable interference, the administration having jurisdiction over the transmitting station whose service is being interfered with shall inform the administrations having jurisdiction over the interfering stations, giving all useful information in order that these administrations may take such steps as may be necessary to reduce the interference at the permissible level of interference or at a higher level that is acceptable to the administration having jurisdiction over the transmitting station whose service is being interfered with.

ADD EUR/13/352

S15.59 On being informed that a station over which it has jurisdiction is believed to have been the cause of unacceptable interference, an administration shall, as soon as possible, acknowledge receipt of that information by telegram. Such acknowledgement shall not constitute an acceptance of responsibility.

ADD EUR/13/353

S15.60 Subject to the prior approval of the administration having jurisdiction over the transmitting station whose service is being interfered with, the administration having jurisdiction over the receiving station experiencing the interference may also approach directly the administrations having jurisdiction over the interfering stations.

ADD EUR/13/354

S15.61 When the service rendered by an earth station suffers unacceptable interference, the administration having jurisdiction over the receiving station experiencing such interference may also approach directly the administrations having jurisdiction over the interfering station.

ADD EUR/13/355

S15.62 If the unacceptable interference persists in spite of the action taken in accordance with the procedures outlined above, the administration having jurisdiction over the transmitting station whose service is being interfered with may address to the administrations having jurisdiction over the interfering station a report of irregularity or infraction in accordance with the provisions of Section V.

ADD EUR/13/356

S15.63 If there is a specialized international organization for a particular service, reports of irregularities and of infractions relating to unacceptable interference caused or suffered by stations in this service may be addressed to such organization at the same time as to the administration concerned.

ADD EUR/13/357

S15.64 1) If it is considered necessary, and particularly if the steps taken in accordance with the procedures described above have not produced satisfactory results, the administration concerned shall forward details of the case to the Bureau for its information.

ADD EUR/13/358

S15.65 2) In such a case, the administration concerned may also request the Bureau to act in accordance with the provisions of Section I of Article **S13**; but it shall then supply the Bureau with the full facts of the case, including all the technical and operational details and copies of the correspondence.

ADD EUR/13/359

S15.66 1) In the case where an administration has difficulty in identifying a source of unacceptable interference in the HF bands and urgently wishes to seek the assistance of the Bureau, it shall promptly inform the Bureau.

ADD EUR/13/360

S15.67 2) On receipt of this information, the Bureau shall immediately request the cooperation of appropriate administrations or specially designated stations of the international monitoring system that may be able to help in identifying the source of unacceptable interference.

ADD EUR/13/ 361

S15.68 3) The Bureau shall consolidate all reports received in response to requests under No. **S15.67** and, using such other information as it has available, shall promptly attempt to identify the source of unacceptable interference.

ADD EUR/13/362

S15.69 4) The Bureau shall thereafter forward its conclusions and recommendations to the administration reporting the case of unacceptable interference. These shall also be forwarded to the administrations believed to be responsible for the source of unacceptable interference, together with a request for prompt action.

NOTE **-** The following table provides a detailed justification for the proposed new provisions, by comparison with the current provisions in Section VI of Article **S15**.

Section VI – Procedure in a case of harmful interference	**Section VII – Procedure in a case of ~~harmful~~ unacceptable interference[2]**	**Comments**
S15.22 § 14 It is essential that Member States ‡ exercise the utmost goodwill and mutual assistance in the application of the provisions of Article 45 of the Constitution and of this Section to the settlement of problems of harmful interference.	**S15.47~~22~~** ~~§ 14~~ It is essential that Member States ‡ exercise the utmost goodwill and mutual assistance in the application of the provisions ~~of Article 45 of the Constitution and~~ of this Section to the settlement of problems of ~~harmful~~ unacceptable interference.	**Article 45 of the Constitution covers only harmful interference**
S15.23 § 15 In the settlement of these problems, due consideration shall be given to all factors involved, including the relevant technical and operating factors, such as: adjustment of frequencies, characteristics of transmitting and receiving antennae, time sharing, change of channels within multichannel transmissions.	**S15.48~~23~~** ~~§ 15~~ In the settlement of these problems, due consideration shall be given to all factors involved, including the relevant technical and operating factors, such as: adjustment of frequencies, characteristics of transmitting and receiving antennae, time sharing, change of channels within multichannel transmissions.	**Editorial**

[2] Unacceptable interference corresponds to levels in excess of:

a) the power and power flux-density limits in Article **S21**; or

b) the off-axis power density limits and aggregate/equivalent power flux-density limits in Article **S22**; or

c) the mandatory power and power flux-density limits specified in footnotes of Article **S5**; or

d) the aggregate equivalent power flux-density levels specified in Resolution **WWW** (WRC-2000); or

e) the levels previously agreed between administrations, as appropriate.

S15.24 § 16 For the purpose of this Section, the term “administration” may include the centralizing office designated by the administration, in accordance with No. **S16.3**.	**S15.49~~24~~** ~~§ 16~~ For the purpose of this Section, the term “administration” may include the centralizing office designated by the administration, in accordance with No. **S16.3**.	**Editorial**

S15.28 § 20 Recognizing that transmissions on the distress and safety frequencies (see Article **S31** and Appendix **S13**) require absolute international protection and that the elimination of harmful interference to such transmissions is imperative, administrations undertake to act immediately when their attention is drawn to any such harmful interference.	~~**S15.28** § 20 Recognizing that transmissions on the distress and safety frequencies (see Article **S31** and Appendix **S13**) require absolute international protection and that the elimination of harmful interference to such transmissions is imperative, administrations undertake to act immediately when their attention is drawn to any such harmful interference.~~	**It is proposed to consider that any excess of interference to transmissions on the distress and safety frequencies as harmful interference.**
S15.29 § 21 In cases of harmful interference where rapid action is required, communications between administrations shall be transmitted by the quickest means available and, subject to prior authorization by the administrations concerned in such cases, information may be exchanged directly between specially designated stations of the international monitoring system.	**S15.**<u>**53**</u>~~**29**~~ ~~§ 21~~ In cases of ~~harmful~~ <u>unacceptable</u> interference where rapid action is required, communications between administrations shall be transmitted by the quickest means available and, subject to prior authorization by the administrations concerned in such cases, information may be exchanged directly between specially designated stations of the international monitoring system.	**Editorial**

S15.30 § 22 When a case of such harmful interference is reported by a receiving station, it shall give to the transmitting station whose service is being interfered with all possible information which will assist in determining the source and characteristics of the interference.	**S15.54~~30~~** ~~§ 22~~ When a case of such ~~harmful~~ unacceptable interference is reported by a receiving station, it shall give to the transmitting station whose service is being interfered with all possible information which will assist in determining the source and characteristics of the interference.	**Editorial**
S15.31 § 23 If a case of harmful interference so justifies, the administration having jurisdiction over the receiving station experiencing the interference shall inform the administration having jurisdiction over the transmitting station whose service is being interfered with, giving all possible information.	**S15.55~~31~~** ~~§ 23~~ If a case of ~~harmful~~ unacceptable interference so justifies, the administration having jurisdiction over the receiving station experiencing the interference shall inform the administration having jurisdiction over the transmitting station whose service is being interfered with, giving all possible information.	**Editorial**
S15.32 § 24 If further observations and measurements are necessary to determine the source and characteristics of and to establish the responsibility for the harmful interference, the administration having jurisdiction over the transmitting station whose service is being interfered with may seek the cooperation of other administrations, particularly of the administration having jurisdiction over the receiving station experiencing the interference, or of other organizations.	**S15.56~~32~~** ~~§ 24~~ If further observations and measurements are necessary to determine the source and characteristics of and to establish the responsibility for the ~~harmful~~ unacceptable interference, the administration having jurisdiction over the transmitting station whose service is being interfered with may seek the cooperation of other administrations, particularly of the administration having jurisdiction over the receiving station experiencing the interference, or of other organizations.	**Editorial**
S15.33 § 25 When cases of harmful interference occur as a result of emissions from space stations, the administrations having jurisdiction over these interfering stations shall, upon request from the administration having jurisdiction over the station experiencing the interference, furnish current ephemeral data necessary to allow determination of the positions of the space stations when not otherwise known.	**S15.57~~33~~** ~~§ 25~~ When cases of ~~harmful~~ unacceptable interference occur as a result of emissions from space stations, the administrations having jurisdiction over these interfering stations shall, upon request from the administration having jurisdiction over the station experiencing the interference, furnish current ephemeral data necessary to allow determination of the positions of the space stations when not otherwise known.	**Editorial**

S15.34 § 26 Having determined the source and characteristics of the harmful interference, the administration having jurisdiction over the transmitting station whose service is being interfered with shall inform the administration having jurisdiction over the interfering station, giving all useful information in order that this administration may take such steps as may be necessary to eliminate the interference.	**S15.58~~34~~** ~~§ 26~~ Having determined the source and characteristics of the ~~harmful~~ unacceptable interference, the administration having jurisdiction over the transmitting station whose service is being interfered with shall inform the administrations having jurisdiction over the interfering stations, giving all useful information in order that ~~this~~ these administrations may take such steps as may be necessary to ~~eliminate~~ reduce the interference at the permissible level of interference or at a higher level that is acceptable to the administration having jurisdiction over the transmitting station whose service is being interfered with.	**Editorial** **Covers the case of single-entry or aggregate interference, by adding a "s" to administration.**
S15.35 § 27 On being informed that a station over which it has jurisdiction is believed to have been the cause of harmful interference, an administration shall, as soon as possible, acknowledge receipt of that information by telegram. Such acknowledgement shall not constitute an acceptance of responsibility.	**S15.59~~35~~** ~~§ 27~~ On being informed that a station over which it has jurisdiction is believed to have been the cause of ~~harmful~~ unacceptable interference, an administration shall, as soon as possible, acknowledge receipt of that information by telegram. Such acknowledgement shall not constitute an acceptance of responsibility.	**Editorial**
S15.36 § 28 When a safety service suffers harmful interference the administration having jurisdiction over the receiving station experiencing the interference may also approach directly the administration having jurisdiction over the interfering station. The same procedure may also be followed in other cases with the prior approval of the administration having jurisdiction over the transmitting station whose service is being interfered with.	**S15.60~~36~~** ~~§ 28 When a safety service suffers harmful interference the administration having jurisdiction over the receiving station experiencing the interference may also approach directly the administration having jurisdiction over the interfering station. The same procedure may also be followed in other cases with~~Subject to the prior approval of the administration having jurisdiction over the transmitting station whose service is being interfered with, the administration having jurisdiction over the receiving station experiencing the interference may also approach directly the administrations having jurisdiction over the interfering stations.	**Make it more general. Furthermore, interference to safety services are viewed as harmful interference.**

S15.37 § 29 An administration receiving a communication to the effect that one of its stations is causing harmful interference to a safety service shall promptly investigate the matter and take any necessary remedial action.	~~**S15.37** § 29 An administration receiving a communication to the effect that one of its stations is causing harmful interference to a safety service shall promptly investigate the matter and take any necessary remedial action.~~	**Not relevant as it is proposed to consider that any excess of interference to transmissions on the distress and safety frequencies as harmful interference.**
S15.38 § 30 When the service rendered by an earth station suffers harmful interference, the administration having jurisdiction over the receiving station experiencing such interference may also approach directly the administration having jurisdiction over the interfering station.	**S15.61~~38~~** ~~§ 30~~ When the service rendered by an earth station suffers ~~harmful~~ unacceptable interference, the administration having jurisdiction over the receiving station experiencing such interference may also approach directly the administrations having jurisdiction over the interfering station.	**Editorial** **Covers the case of single-entry or aggregate interference (see Resolution WWW (WRC-2000)), by adding a "s" to administration.**
S15.39 § 31 If the harmful interference persists in spite of the action taken in accordance with the procedures outlined above, the administration having jurisdiction over the transmitting station whose service is being interfered with may address to the administration having jurisdiction over the interfering station a report of irregularity or infraction in accordance with the provisions of Section V.	**S15.62~~39~~** ~~§ 31~~ If the ~~harmful~~ unacceptable interference persists in spite of the action taken in accordance with the procedures outlined above, the administration having jurisdiction over the transmitting station whose service is being interfered with may address to the administrations having jurisdiction over the interfering station a report of irregularity or infraction in accordance with the provisions of Section V.	**Editorial** **NOTE - S15.21 applies. It indicates that** if an administration has information of an infringement of the Convention or Radio Regulations, committed by a station over which it may exercise authority, it shall ascertain the facts, fix the responsibility and take the necessary action.
S15.40 § 32 If there is a specialized international organization for a particular service, reports of irregularities and of infractions relating to harmful interference caused or suffered by stations in this service may be addressed to such organization at the same time as to the administration concerned.	**S15.63~~40~~** ~~§ 32~~ If there is a specialized international organization for a particular service, reports of irregularities and of infractions relating to ~~harmful~~ unacceptable interference caused or suffered by stations in this service may be addressed to such organization at the same time as to the administration concerned.	**Editorial**

S15.41 § 33 1) If it is considered necessary, and particularly if the steps taken in accordance with the procedures described above have not produced satisfactory results, the administration concerned shall forward details of the case to the Bureau for its information.	**S15.64~~41~~** ~~§ 33~~ 1) If it is considered necessary, and particularly if the steps taken in accordance with the procedures described above have not produced satisfactory results, the administration concerned shall forward details of the case to the Bureau for its information.	**Editorial**
S15.42 2) In such a case, the administration concerned may also request the Bureau to act in accordance with the provisions of Section I of Article **S13**; but it shall then supply the Bureau with the full facts of the case, including all the technical and operational details and copies of the correspondence.	**S15.65~~42~~** 2) In such a case, the administration concerned may also request the Bureau to act in accordance with the provisions of Section I of Article **S13**; but it shall then supply the Bureau with the full facts of the case, including all the technical and operational details and copies of the correspondence.	**Editorial** **There is a need for a consequential editorial modification to S13.2 to cover the case of unacceptable interference.** **There is a need to strengthen the current wording of Section I, so that some burden is placed on the interfering administrations.**
S15.43 § 34 1) In the case where an administration has difficulty in identifying a source of harmful interference in the HF bands and urgently wishes to seek the assistance of the Bureau, it shall promptly inform the Bureau.	**S15.66~~43~~** ~~§ 34~~ 1) In the case where an administration has difficulty in identifying a source of ~~harmful~~ unacceptable interference in the HF bands and urgently wishes to seek the assistance of the Bureau, it shall promptly inform the Bureau.	**Editorial** **Specific to HF. It may not be relevant in case of unacceptable interference.**
S15.44 2) On receipt of this information, the Bureau shall immediately request the cooperation of appropriate administrations or specially designated stations of the international monitoring system that may be able to help in identifying the source of harmful interference.	**S15.67~~44~~** 2) On receipt of this information, the Bureau shall immediately request the cooperation of appropriate administrations or specially designated stations of the international monitoring system that may be able to help in identifying the source of ~~harmful~~ unacceptable interference.	**Editorial** **Specific to HF. It may not be relevant in case of unacceptable interference.**

S15.45 3) The Bureau shall consolidate all reports received in response to requests under No. **S15.44** and, using such other information as it has available, shall promptly attempt to identify the source of harmful interference.	**S15.68~~45~~** 3) The Bureau shall consolidate all reports received in response to requests under No. **S15.67~~44~~** and, using such other information as it has available, shall promptly attempt to identify the source of ~~harmful~~ unacceptable interference.	**Editorial** **Specific to HF. It may not be relevant in case of unacceptable interference.**
S15.46 4) The Bureau shall thereafter forward its conclusions and recommendations to the administration reporting the case of harmful interference. These shall also be forwarded to the administration believed to be responsible for the source of harmful interference, together with a request for prompt action.	**S15.69~~46~~** 4) The Bureau shall thereafter forward its conclusions and recommendations to the administration reporting the case of ~~harmful~~ unacceptable interference. These shall also be forwarded to the administrations believed to be responsible for the source of ~~harmful~~ unacceptable interference, together with a request for prompt action.	**Editorial** **Specific to HF. It may not be relevant in case of unacceptable interference.**

2.2 Modifications to Section I of Article S13

MOD EUR/13/363

S13.2 When an administration has difficulty in resolving a case of harmful interference or a case of unacceptable interference and seeks the assistance of the Bureau~~,~~: ~~the latter shall, as appropriate, help in identifying the source of the interference and seek the cooperation of the responsible administration in order to resolve the matter, and prepare a report for consideration by the Board, including draft recommendations to the administrations concerned.~~

ADD EUR/13/364

S13.2A the latter shall, as appropriate, help in identifying the source of the interference and seek the cooperation of the responsible administration as well as of other administrations, particularly of the administration having jurisdiction over the receiving station experiencing the interference, or of other organizations to do so;

ADD EUR/13/365

S13.2B having determined the source and characteristics of the interference, the Bureau shall inform the administrations having jurisdiction over the interfering stations, giving all useful information in order that these administrations may take such steps as may be necessary to eliminate the case of harmful, or unacceptable as appropriate, interference;

ADD EUR/13/366

S13.2C on being informed that a station over which it has jurisdiction is believed to have been the cause of harmful, or unacceptable as appropriate, interference, an administration shall, as soon as possible, acknowledge receipt of that information by telegram. Such acknowledgement shall not constitute an acceptance of responsibility;

ADD EUR/13/367

S13.2D the Bureau shall then publish in a special section to the Weekly Circular stating that the use of the frequency assignment(s) is subject to an unresolved complaint of harmful, or unacceptable as appropriate, interference;

ADD EUR/13/368

S13.2E if, within [one month] of the date of publication of the Weekly Circular under No. **S13.2D**, an administration which may exercise authority over the interfering station using a frequency assignment listed in the special section referred in No. **S13.2D**, has not taken the necessary actions, the following statement shall be entered, immediately or at the appropriate time, in the remark column of the MIFR for the above-mentioned frequency assignment: "this frequency assignment is subject of an unresolved complaint of harmful, or unacceptable as appropriate, interference with respect of the frequency assignment(s) [details on these frequency assignments]";

ADD EUR/13/369

S13.2F when an administration which may exercise authority over the interfering station using a frequency assignment listed in the special section referred in No. **S13.2D**, has taken the necessary actions after the application of No. **S13.2E**, the statement entered in the remark column of the MIFR for the above-mentioned frequency assignment shall be removed.

2.3 Modifications to Appendix S10

Proposals submitted by the following administrations

[Albania, Germany, Andorra, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Cyprus, Vatican, Croatia, Denmark, Spain, Estonia, Finland, France, Greece, Hungary, Ireland, Iceland, Italy, Latvia, The Former Yugoslav Republic of Macedonia, Liechtenstein, Lithuania, Luxembourg, Malta, Moldova, Monaco, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, San Marino, Slovenia, Sweden, Switzerland, Turkey, Ukraine]

PART 3D

Agenda item 1.13 - Proposed provisions for earth stations with very large antennas

Please replace proposal EUR/13/133 by the following. As anticipated, this issue has been successfully completed during the February 2000 meeting of ITU-R WP 4A, and a complete set of values agreed in relation to the $epfd_{down}$ levels that should be included in Appendix S5 as part of the coordination thresholds to be used for the protection of very large antennas under S9.7A and S9.7B. Europe supports the agreement reached at that meeting.

APPENDIX S5

ADD EUR/13/133

TABLE S5-1 (*continued*)

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.7A** GSO earth station/ non-GSO system	A specific earth station in a geostationary-satellite network in the fixed-satellite service in respect of a non-geostationary-satellite system in the fixed-satellite service	The following frequency bands: 10.7-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 17.8-18.6 GHz (space-to-Earth), and 19.7-20.2 GHz (space-to-Earth)	Conditions: i) the frequency bands overlap; and ii) the satellite network using the geostationary-satellite orbit has specific receive earth stations and meets all of the following conditions: a) Earth station antenna maximum isotropic gain greater than or equal to 64 dBi for the frequency bands 10.7-12.75 GHz or 68 dBi for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; b) G/T_1 of 44 dB/K or higher; c) space station emission bandwidth of 250 MHz or higher for the frequency bands 10.7-12.75 GHz or 800 MHz or higher for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; iii) the $epfd_{down}$ from the satellite system using the non-geostationary orbit exceeds:	i) compare frequency bands; ii) use the maximum antenna gain of the specific receive earth station (Appendix **S4** C.10 *c)* 2)), the lowest equivalent satellite link noise temperature (Appendix **S4** C.10 *c)* 5)), and the space station emission bandwidth (Appendix **S4** C.7 *a)*) in the geostationary-satellite network as given in Appendix **S4** data; and iii) use the $epfd_{down}$ radiated by the non-GSO FSS system into the earth station employing the very large antenna when this antenna is pointed towards the wanted GSO satellite	The threshold/ condition for coordination do not apply to typical receive earth stations operating in satellite networks using the geostationary-satellite orbit

			a) either –174.5 dB(W/(m^2 · 40 kHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or –202 dB(W/(m^2 · 40 kHz)) for any percentage of time for non-GSO systems with any satellites operating above 2 500 km altitude, in the frequency band 10.7-12.75 GHz; b) either –157 dB(W/(m^2 · MHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or –185 dB(W/(m^2 · MHz)) for any percentage of time for non-GSO systems with any satellites operating above 2 500 km altitude, in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz		
No. **S9.7B** non-GSO system/ GSO earth station/	A non-geostationary-satellite system in the fixed-satellite service in respect of a specific earth station in a geostationary-satellite network in the fixed-satellite service.	The following frequency bands: 10.7-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 17.8-18.6 GHz (space-to-Earth), and 19.7-20.2 GHz (space-to-Earth)	Conditions: i) the frequency bands overlap; and ii) the satellite network using the geostationary-satellite orbit has specific receive earth stations and meets all of the following conditions: a) Earth station antenna maximum isotropic gain greater than or equal to 64 dBi for the frequency bands 10.7-12.75 GHz or 68 dBi for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; b) G/T_1 of 44 dB/K or higher;	i) compare frequency bands; ii) use the maximum antenna gain of the specific receive earth station (Appendix **S4** C.10 *c)* 2)), the lowest equivalent satellite link noise temperature (Appendix **S4** C.10 *c)* 5)), and the space station emission bandwidth (Appendix S4 C.7 *a)*) in the geostationary-satellite network as given in Appendix **S4** data; and	The threshold/ condition for coordination do not apply to typical receive earth stations operating in satellite networks using the geostationary-satellite orbit.

			c) space station emission bandwidth of 250 MHz or higher for the frequency bands 10.7-12.75 GHz or 800 MHz or higher for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; iii) the epfd_{down} from the satellite system using the non-geostationary orbit exceeds: a) either –174.5 dB(W/($m^2 \cdot$ 40 kHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or –202 dB(W/($m^2 \cdot$ 40 kHz)) for any percentage of time for non-GSO systems with any satellites operating above 2 500 km altitude, in the frequency band 10.7-12.75 GHz; b) either –157 dB(W/($m^2 \cdot$ MHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or –185 dB(W/($m^2 \cdot$ MHz)) for any percentage of time for non-GSO systems with any satellites operating above 2 500 km altitude, in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz.	iii) use the epfd_{down} radiated by the non-GSO FSS system into the earth station employing the very large antenna when this antenna is pointed towards the wanted GSO satellite.	

Reasons: This is consequential to ADD **S9.7A** and **S9.7B**.

PLENARY MEETING

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

PART 3

Agenda item 1.13 - Non-GSO FSS

CONTENTS

Introduction

The ITU-R studies have addressed the issue of the power limits for non-GSO FSS and came to clear conclusions with respect to the appropriate levels of these limits to ensure coexistence of the various systems and services allocated in the frequency bands covered by Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97).

Europe supports the conclusions of the CPM on this issue, and accordingly, propose the following to WRC-2000, regarding modifications to Articles S5, S9, S11, S21, S22, Appendices S4 and S5 and Resolutions 130 (WRC-97) and 538 (WRC-97). Resolution 131 (WRC-97) is proposed for suppression. Concerning several items where several possible options were identified by the CPM, the following proposals are made:

- Along with Option 2 of Annex 7 of Chapter 3 of the CPM Report, a proposal is made to update Section VI of Article S22 (earth station off-axis e.i.r.p. density limits), taking into account the results of the ITU-R studies, and the need for relaxed values for these limits, compared with the ones included in the corresponding ITU-R recommendations. Depending on the outcome of the ITU-R studies prior to WRC-2000 on the applicability of such limits to earth stations within non-GSO systems, this proposal may need to be updated.
- The proposals under Article S5 and Article S22 reflect the incorporation in these Articles of provisions currently appearing in Resolutions 130 (WRC-97) and 538 (WRC-97), and the suppression in these resolutions of transitional measures, which are no longer considered relevant after WRC-2000, as highlighted in Annex 5 of Chapter 3 of the CPM Report.
- Along with Option 2C of Section 2 of Annex 6 of Chapter 3 of the CPM Report, it is also proposed to exempt from the national or subregional restrictions appearing in S5.488 and S5.491 both GSO and non-GSO systems.
- Along with Section 3 of Annex 6 of Chapter 3 of the CPM Report, and in view of the results of the ITU-R studies reported in Section 3.2 of the CPM Report, it is proposed, in order to minimize the constraints on the development of the BSS in the 17.3-17.7 GHz band in Region 2, to restrict the use of non-GSO FSS uplinks in this band and Region to antennas of more than 4.5 metre in diameter. The $epfd_{up}$ limits proposed in this band and Region to protect BSS feeder links are the same as in the other Regions.

On the limits to enable coexistence between GSO FSS, non-GSO FSS, radiolocation, radionavigation and space research in the 13.75-14 GHz band, Europe proposes the suppression of the minimum e.i.r.p. limit of 68 dBW currently included in S5.502. It is also proposed that, in line with the information provided in Recommendation ITU-R S.1068, the e.i.r.p. density limit specified in S5.502 be extended to all directions of space. Europe also proposes the introduction in S5.503 of a maximum e.i.r.p. density limit for non-GSO earth stations operating in the band 13.772-13.778 GHz.

In addition, improvements are proposed to the CPM example text in four areas:

- As agreed within ITU-R, but not currently reflected in the CPM example text, the validation limits included in Tables S22-1A, S22-1B, S22-1C and S22-1D for a given GSO earth station antenna diameter should be specified as continuous curves, by straight line interpolation between the points corresponding to the same GSO earth station antenna, in the appropriate scale (linear scale for the epfd expressed in decibels and logarithmic scale for the percentage of time).

- The operational limit which applies for the protection of the 2.4 m BSS antennas in a part of Region 2 towards some orbital locations in the Region 2 BSS Plan is proposed to be moved to Table S22-4, and S22.5I (S22.5G in the CPM Report) is proposed to be slightly amended in order to give this limit a regulatory status.
- In the draft resolution relating to the limits on the aggregate interference from all non-GSO FSS systems, it should be made clear that these limits only apply for GSO orbital inclination of up to 2.5°, with a 3 dB relaxation for orbital inclinations between 2.5 and 4.5°.
- In the proposed modifications to Resolutions 130 (WRC-97) and 538 (WRC-97), the *requests the Radiocommunication Bureau* to review the findings previously made with respect to the compliance with the provisional limits are proposed to be suppressed, since, in the absence of a verification tool, the BR could not have been in a position to make such a finding.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3A

Agenda item 1.13 - Proposed modifications to Article S21

Introduction

Resolution 131 (WRC-97) requested ITU-R to study the appropriate pfd values to be applied to non-geostationary networks in the 10.7-12.75 GHz and 17.7-19.3 GHz bands to ensure protection of the fixed service without unduly constraining the development of either type of network.

This proposal reflects the conclusions included in Annex 4 to Chapter 3 of the CPM Report.

MOD EUR/13/79

TABLE **S21-4** *(continued)*

Frequency band	**Service***	**Limit in dB(W/m²) for angle of arrival (δ) above the horizontal plane**			**Reference bandwidth**

17.7-19.3 GHz[7, 8]	Fixed-satellite (space-to-Earth) Meteorological-satellite (space-to-Earth)	–115[12bis] or ~~–125 12~~ –115 – X[12]	–115 + 0.5 (δ – 5)[12bis] or ~~–125 + (δ – 5) 12~~ –115 – X((10 + X)/20) (δ – 5)[12]	–105 or –105 [12]	1 MHz
19.3-19.7 GHz 22.55-23.55 GHz 24.45-24.75 GHz 25.25-27.5 GHz	Fixed-satellite (space-to-Earth) Earth exploration-satellite (space-to-Earth) Inter-satellite	–115	–115 + 0.5(δ – 5)	–105	1 MHz

MOD EUR/13/80

[12] **S21.16.6** ~~These values shall apply provisionally only to emissions of space stations on non-geostationary satellites in networks operating with a large number of satellites, that is systems operating with more than 100 satellites (see Resolution **131 (WRC-97)**).~~ The function X is defined as a function of the number, N, of satellites in the non-GSO FSS constellation as follows:

– for N ≤ 50 $X = 0$ (dB)

– for 50 < N ≤ 288 $X = \frac{5}{119}(N - 50)$ (dB)

– for N > 288 $X = \frac{1}{69}(N + 402)$ (dB)

In the band 18.8-19.3 GHz, these limits apply to emissions of a space station on a non-geostationary FSS satellite for which complete coordination or notification information, as appropriate, has been received by the Radiocommunication Bureau after 17 November 1995, and which was not operational by that date.

ADD EUR/13/81

[12bis] **S21.16.6*bis*** These limits apply to emissions of a space station on a meteorological-satellite and on a geostationary FSS satellite. These limits also apply to emissions of a space station on a non-geostationary FSS satellite in the bands 18.8-19.3 GHz for which complete coordination or notification information has been received by the Radiocommunication Bureau by 17 November 1995, or are in operation by that date.

Reasons: The above regulatory text reflects the date-specific provisions currently in Resolution 131 (WRC-97). It maintains the original limits for non-GSO FSS systems in the band 18.8-19.3 GHz that were notified or operational prior to the end of WRC-95 per the decision in Resolution 131 (WRC-97). In the band 17.7-18.8 GHz, the new limits would apply to all non-GSO systems irrespective of the date of receipt of information or date of bringing into operation.

PART 3B

Agenda item 1.13 - Proposed modifications to Article S22

Introduction

Resolution 130 (WRC-97) requested ITU-R to conduct, the appropriate technical, operational and regulatory studies to review the regulatory conditions relating to the coexistence of non-GSO and GSO systems in the FSS, in order to ensure that they do not impose undue constraints on the development of non-GSO and GSO FSS systems.

Resolution 538 (WRC-97) requested ITU-R to conduct the appropriate technical, operational and regulatory studies to review the regulatory provisions concerning the operation of non-GSO FSS systems in the frequency bands covered by Appendices S30 and S30A in order to ensure that these provisions ensure appropriate protection of the Plans and their future modifications and do not place unreasonable constraints on the development of non-GSO systems in these bands.

The above-mentioned administrations support the conclusions of the studies undertaken by the ITU-R in response to these two resolutions, as indicated in the CPM Report (Annex 1 to Chapter 3 and Option 2 of Annex 7 to Chapter 3). In order to reflect these conclusions, the following modifications are proposed to Article S22.

In addition, improvements are proposed to the CPM example text in two areas:

- As agreed within ITU-R, but not currently reflected in the CPM example text, the validation limits included in Tables S22-1A, S22-1B, S22-1C and S22-1D for a given GSO earth station antenna diameter should be specified as continuous curves, by straight line interpolation between the points corresponding to the same GSO earth station antenna, in the appropriate scale (linear scale for the epfd expressed in decibels and logarithmic scale for the percentage of time).
- The operational limit which applies for the protection of the 2.4 m BSS antennas in a part of Region 2 towards some orbital locations in the Region 2 BSS Plan is proposed to be moved to Table S22-4, and S22.5I (S22.5G in the CPM Report) is proposed to be slightly amended in order to give this limit a regulatory status.

ARTICLE S22

Space services[1]

Section II – Control of interference to geostationary-satellite systems

NOC EUR/13/85

S22.2 § 2 1) Non-geostationary-satellite systems shall not cause unacceptable interference to geostationary-satellite systems in the fixed-satellite service and the broadcasting-satellite service operating in accordance with these Regulations.

S22.3 2) Whenever the emissions from geostationary satellites in the inter-satellite service are directed towards space stations at distances from Earth greater than that of the geostationary-satellite orbit, the boresight of the antenna mainbeam of the geostationary satellite shall not be pointed within 15° of any point on the geostationary-satellite orbit.

S22.4 § 3 In the frequency band 29.95-30 GHz space stations in the earth exploration-satellite service on board geostationary satellites and operating with space stations in the same service on board non-geostationary satellites shall have the following restriction:

Whenever the emissions from the geostationary satellites are directed towards the geostationary-satellite orbit and cause unacceptable interference to any geostationary-satellite space system in the fixed-satellite service, these emissions shall be reduced to a level at or less than accepted interference.

S22.5 § 4 In the frequency band 8 025-8 400 MHz, which the Earth exploration-satellite service using non-geostationary satellites shares with the fixed-satellite service (Earth-to-space) or the meteorological-satellite service (Earth-to-space), the maximum power flux-density produced at the geostationary-satellite orbit by any Earth exploration-satellite service space station shall not exceed –174 dB(W/m^2) in any 4 kHz band.

S22.5A § 5 In the frequency band 6 700-7 075 MHz, the maximum aggregate power flux-density produced at the geostationary-satellite orbit and within ±5° of inclination around the geostationary-satellite orbit by a non-geostationary-satellite system in the fixed-satellite service shall not exceed –168 dB(W/m^2) in any 4 kHz band. The maximum aggregate power flux-density shall be calculated in accordance with Recommendation ITU-R S.1256.

SUP EUR/13/86

S22.5B

MOD EUR/13/87

S22.5C § ~~5~~6 1) The equivalent power flux-density[2], epfd$_{down}$ at any point on the Earth's surface visible from the geostationary-satellite orbit, produced by emissions from all the space stations of a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Tables **~~S22-1~~S22-1A** to **S22-1D**, including emissions from a reflecting satellite, for all conditions and for all methods of modulation, shall not exceed the limits given in Tables **~~S22-1~~** **S22-1A** to **S22-1D** for the given percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Tables **~~S22-1~~S22-1A** to **S22-1D**, for all pointing directions towards the geostationary-satellite orbit.

MOD EUR/13/87*bis*

---

2 **S22.5C.1, D.1, F.1** The equivalent power flux-density is defined as the sum of the power flux-densities produced at a ~~point~~GSO receive station on the Earth's surface or in the geostationary orbit, as appropriate, by all ~~space~~the transmit stations within a non-geostationary-satellite system, taking into account the off-axis discrimination of a reference receiving antenna assumed to be pointing ~~towards the geostationary-satellite orbit~~in its nominal direction. The equivalent power flux-density is calculated using the following formula:

$$\cancel{epfd = 10 \cdot \log_{10} \left[\sum_{i=1}^{N_s} 10^{pfd_i/10} \cdot \frac{G_r(\theta_i)}{G_{max}} \right]}$$

$$epfd = 10 \cdot \log_{10} \left[\sum_{i=1}^{N_a} 10^{\frac{P_i}{10}} . \frac{G_t(\theta_i)}{4.\pi d_i^2} . \frac{G_r(\phi_i)}{G_{r,\max}} \right]$$

where:

~~N_s: number of non-geostationary space stations visible from the point considered at the Earth's surface, within an elevation angle greater than or equal to 0°;~~

~~i: index of the non-geostationary space station considered;~~

~~pfd_i: power flux-density produced at the point considered on the Earth's surface in dB(W/m^2) in the reference bandwidth;~~

~~θ_i: angle between the direction considered towards the geostationary-satellite orbit and the direction of the interfering space station in the non-geostationary-satellite system;~~

~~$G_r(\theta_i)$: gain (as a ratio) of the receive reference antenna to be considered as part of a geostationary-satellite network;~~

~~G_{max}: maximum gain (as a ratio) of the above receive reference antenna;~~

~~*epfd*: computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.~~

N_a: is the number of transmit stations in the non-geostationary-satellite system that are visible from the GSO receive station considered on the Earth's surface or in the geostationary orbit, as appropriate;

i: is the index of the transmit station considered in the non-geostationary-satellite system;

P_i: is the RF power at the input of the antenna of the transmit station, considered in the non-geostationary satellite system in dBW in the reference bandwidth;

θ_i: is the off-axis angle between the boresight of the transmit station considered in the non-geostationary satellite system and the direction of the GSO receive station;

$G_t(\theta_i)$: is the transmit antenna gain (as a ratio) of the station considered in the non-geostationary satellite system in the direction of the GSO receive station;

d_i: is the distance in metres between the transmit station considered in the non-geostationary satellite system and the GSO receive station;

ϕ_i: is the off-axis angle between the boresight of the antenna of the GSO receive station and the direction of the ith transmit station considered in the non-geostationary satellite system;

$G_r(\phi_i)$: is the receive antenna gain (as a ratio) of the GSO receive station in the direction of the ith transmit station considered in the non-geostationary satellite system;

$G_{r,max}$: is the maximum gain (as a ratio) of the antenna of the GSO receive station;

epfd: is the computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.

~~NOTE – Tables **S22-1** to **S22-4** and Nos. **S22.26** to **S22.29** contain provisional limits corresponding to an interference level caused by one non-geostationary fixed-satellite service system in the frequency bands to be applied in accordance with Resolutions **130 (WRC-97)** and **538 (WRC-97)**. These provisional limits are subject to review by ITU-R and are subject to confirmation by WRC-99.~~

MOD EUR/13/93

S22.5D 2) The ~~aggregate~~equivalent power flux-density~~[3]~~[2], $epfd_{up}$, produced at any point in the geostationary-satellite orbit by emissions from all the earth stations in a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Table **S22-2**, for all conditions and for all methods of modulation, shall not exceed the limits given in Table **S22-2** for the specified percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Table **S22-2**, for all pointing directions towards the Earth's surface visible from any given location in the geostationary-satellite orbit.

~~[3] **S22.5D.1** The aggregate power flux-density is defined as the sum of the power flux- densities produced at a point in the geostationary-satellite orbit by all the earth stations of a non-geostationary-satellite system. The aggregate power flux-density is computed by means of the following formula:~~

$$\cancel{apfd = 10 \cdot \log_{10}\left[\sum_{i=1}^{N_e} 10^{P_i/10} \cdot \frac{G_t(\theta_i)}{4 \pi d_i^2}\right]}$$

~~where:~~

~~N_e: number of earth stations in the non-geostationary-satellite system with an elevation angle greater than or equal to 0°, from which the point considered in the geostationary-satellite orbit is visible;~~

~~i: index of the earth station considered in the non-geostationary-satellite system;~~

~~P_i: RF power at the input of the transmitting antenna of the earth station considered in the non-geostationary-satellite system in dBW in the reference bandwidth;~~

~~θ_i: off-axis angle between the boresight of the earth station considered in the non-geostationary-satellite system and the direction of the point considered in the geostationary-satellite orbit;~~

~~$G_t(\theta_i)$: transmit antenna gain (as a ratio) of the earth station considered in the non-geostationary-satellite system in the direction of the point considered in the geostationary-satellite orbit;~~

~~d_i: distance in metres between the earth station considered in the non-geostationary-satellite system and the point considered in the geostationary-satellite orbit;~~

~~*apfd*: aggregate power flux-density in dB(W/m^2) in the reference bandwidth.~~

~~NOTE – Tables **S22-1** to **S22-4** and Nos. **S22.26** to **S22.29** contain provisional limits corresponding to an interference level caused by one non-geostationary fixed-satellite service system in the frequency bands to be applied in accordance with Resolutions **130 (WRC-97)** and **538 (WRC-97)**. These provisional limits are subject to review by ITU-R and are subject to confirmation by WRC-99.~~

MOD EUR/13/94

TABLE **S22-2**

~~**Frequency band (GHz)**~~	~~**Aggregate pfd dB(W/m²/4 kHz)**~~	~~**Percentage of time during which aggregate pfd level may not be exceeded**~~
~~17.3-18.1 in Regions 1 and 3 and 17.8-18.1 in Region 2~~	~~–163~~	~~100%~~

Limits to the $epfd_{up}$ radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	**$epfd_{up}$ dB(W/m^2)**	**Percentage of time $epfd_{up}$ level may not be exceeded**	**Reference bandwidth (kHz)**	**Reference antenna beamwidth and reference radiation pattern**[16]
12.50-12.75 12.75-13.25 13.75-14.5	–160	100	40	4 degrees Rec. ITU-R S.672, Ls = –20[17]
17.3-18.1 *	–160	100	40	4 degrees Rec. ITU-R S.672, Ls = –20[17]
27.5-28.6	–162	100	40	1.55 degrees Rec. ITU-R S.672, Ls = –10[17]
29.5-30.0	–162	100	40	1.55 degrees Rec. ITU-R S.672, Ls = –10[17]

16 Reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO FSS systems.

17 For the case of Ls = –10, the values a = 1.83 and b = 6.32 should be used in the equations in Annex 1 of Recommendation ITU-R S.672 for single-feed circular beams. In all cases of Ls, the parabolic main beam equation should start at zero.

* This $epfd_{up}$ limit applies to the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.8-18.1 GHz (Region 2). It is also applicable to the frequency band 17.3-17.8 GHz (Region 2), in order to protect BSS feeder links in Region 2 from non-GSO FSS uplinks in Regions 1 and 3.

NOTE - Part 3H of these proposals contains a proposal to modify this table under WRC-2000 agenda item 1.13.2.

MOD EUR/13/98

S22.5G The limits given in Tables **S22-1A** to **S22-1D**~~ and **S22-3**~~ may be exceeded on the territory of any country whose administration has so agreed.

ADD EUR/13/99

S22.5H The limits specified in Nos. **S22.5C** to **S22.5D** and **S22.5F** apply to non-GSO FSS systems for which complete coordination or notification information, as appropriate, has been received after 22 November 1997.

Reasons: Reflect the "*instructs the Radiocommunication Bureau*" in Resolutions 130 (WRC-97) and 538 (WRC-97), and *resolves* 2 of Resolution 130 (WRC-97). Review of the findings by the Bureau under "*instructs the Radiocommunication Bureau*" in Resolution 130 (WRC-97) and Resolution 538 (WRC-97) should be kept in an updated version of these resolutions to cover transitional aspects. It was noted that no notification was received prior to 22 November 1997 for non-GSO FSS systems (Earth-to-space) in the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.8-18.1 GHz (Region 2).

ADD EUR/13/100

S55.5I An administration operating a non-GSO FSS system which is in compliance with the limits in Nos. **S22.5C**, **S22.5D** and **S22.5F** (see also Resolution **WWW**) shall be considered as having fulfilled its obligations under No. **S22.2** with respect to any GSO network, irrespective of the dates of receipt by the Bureau of the complete coordination or notification information, as appropriate, for the non-GSO system and of the complete coordination information for the GSO network, provided that the $epfd_{down}$ radiated by the non-GSO FSS system into any operating GSO FSS earth station does not exceed the operational limits given in Tables **S22-4A** to **S22-4C**, when the gain, or the diameter, as appropriate, of this earth station is equal to or greater than the corresponding value given in Tables **S22-4A** to **S22-4C** for the corresponding orbital inclination of the GSO FSS satellite as given in Tables **S22-4A** to **S22-4C**. Except as otherwise agreed between concerned administrations, an administration operating a non-GSO FSS system that is subject to the limits in Nos. **S22.5C**, **S22.5D** and **S22.5F** and which radiates $epfd_{down}$ into any operating GSO FSS earth station at levels in excess of the operational limits given in Tables **S22-4A** to **S22-4C**, when the gain or the diameter, as appropriate, of this earth station is equal to or greater than the corresponding value given in Tables **S22-4A** to **S22-4C** for the corresponding orbital inclination of the GSO FSS satellite as given in Tables **S22-4A** to **S22-4C**, shall be considered to be in violation of its obligations under No. **S22.2**.

Reasons: Reflect the *resolves* 4 and 1.4 of Resolutions 130 (WRC-97) and 538 (WRC-97), and the principles provided in section 3.1.2.1.4.2 c). Other additions to the provision correct the language, and make explicit the intention that any non-GSO FSS system that exceeds the validation or operational limits, as applicable, shall, except otherwise agreed between concerned administrations be deemed to be in violation of its obligations under No. S22.2. This proposal also includes the operational limits for BSS protection.

19.7-20.2	–143 –143 –141	100 100 100	1 000 1 000 1 000	≥ 49 ≥ 43[24] ≥ 49	≤ 2.5 ≤ 2.5 > 2.5 and ≤ 4.5
17.8-18.6	–164 –162	100 100	40 40	≥ 49 ≥ 49	≤ 2.5 > 2.5 and ≤ 4.5
17.8-18.6	–150 –148	100 100	1 000 1 000	≥ 49 ≥ 49	≤ 2.5 > 2.5 and ≤ 4.5

23 For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

24 The operational limit applies to non-GSO systems operating at altitudes of 7 000 km or above in order to protect GSO FSS systems employing adaptive coding.

ADD EUR/13/106

TABLE **S22-4C**[25]

Operational limits to the $epfd_{down}$ radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	$epfd_{down}$ dB(W/m^2)	Percentage of time during which $epfd_{down}$ may not be exceeded	Reference bandwidth (kHz)	Receive GSO earth station antenna diameter (m)	Orbital inclination of GSO satellite (degrees)
12.2-12.7 GHz in Region 2	–167	100	40	2.4	≤ 0.5

25 These limits apply into GSO earth stations located in Region 2 west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.]*

* Comment: This transitional regime would be applicable only if the pfd limits in section 5c of Annex 1 to Appendix S30 are sufficiently relaxed. It is expected that WRC-2000 will decide such a relaxation.

ADD EUR/13/107

S22.5J In case of *force majeure*, telecommand and ranging carriers transmitted to non-geostationary satellites in the fixed-satellite service are not subject to the limits given in Table **S22-2**.

Reasons: Specific provision needed to cover emergency situations.

MOD EUR/13/108

Section VI – GSO ~~E~~earth station off-axis power limitations in the fixed-satellite service~~[11]~~

MOD EUR/13/109

S22.26 § 9 The level of equivalent isotropically radiated power (e.i.r.p.) emitted by an earth station shall within a geostationary-satellite network not exceed the following values for any off-axis angle φ which is ~~2.5~~3° or more off the main-lobe axis of an earth station antenna:

Off-axis angle	*Maximum e.i.r.p.*
~~2.5~~3° ≤ φ ≤ 7°	(~~39~~42 – 25 log φ) dB(W/40 kHz)
7° < φ ≤ 9.2°	~~18~~21 dB(W/40 kHz)
9.2° < φ ≤ 48°	(~~42~~45 – 25 log φ) dB(W/40 kHz)
48° < φ ≤ 180°	~~0~~3 dB(W/40 kHz)

MOD EUR/13/110

S22.27 For FM-TV emissions with energy dispersal, the limits in No. **S22.26** above may be exceeded by up to 3 dB provided that the off-axis total e.i.r.p. of the transmitted FM-TV carrier does not exceed the following values:

Off-axis angle	*Maximum e.i.r.p.*
~~2.5~~3° ≤ φ ≤ 7°	(~~53~~56 – 25 log φ) dBW
7° < φ ≤ 9.2°	~~32~~35 dBW
9.2° < φ ≤ 48°	(~~56~~59 – 25 log φ) dBW
48° < φ ≤ 180°	~~14~~17 dBW

MOD EUR/13/111

S22.28 FM-TV carriers which operate without energy dispersal should be modulated at all times with programme material or appropriate test patterns. In this case, the off-axis total e.i.r.p. of the emitted FM-TV carrier shall not exceed the following values:

Off-axis angle	*Maximum e.i.r.p.*
~~2.5~~3° ≤ φ ≤ 7°	(~~53~~56 – 25 log φ) dBW
7° < φ ≤ 9.2°	~~32~~35 dBW
9.2° < φ ≤ 48°	(~~56~~59 – 25 log φ) dBW
48° < φ ≤ 180°	~~14~~17 dBW

~~[11] **S22.VI.1** The provisions of this section are suspended pending the review of the values in Nos. **S22.26**, **S22.27** and **S22.28** by WRC-99.~~

NOC EUR/13/112

S22.29

ADD EUR/13/113

S22.30 The e.i.r.p. limits given in Nos. **S22.26, S22.27** and **S22.28** do not apply to earth station antennas ready to be in service[12] prior to 2 June 2000 nor to earth stations associated with a satellite network in the fixed-satellite service for which complete coordination or notification information has been received before 2 June 2000.

ADD EUR/13/114

[12] **S22.30.1** "Ready to be in service" relates to the case where antennas have been installed but the start of service has been delayed due to *force majeure*.

ADD EUR/13/115

S22.31 Telecommand and ranging carriers transmitted to geostationary satellites in the fixed-satellite service in normal mode of operation (i.e. earth station transmitting telecommand and ranging carriers to a directive receiving antenna on the space station) may exceed the levels given in **S22.26** by no more than 16 dB in the frequency bands 12.75-13.25 and 13.75-14.5 GHz. In all other modes of operation, and in case of *force majeure*, telecommand and ranging carriers transmitted to geostationary satellites in the fixed-satellite service are exempted from the levels given in **S22.26**.

ADD EUR/13/116

S22.32 § 10 The level of equivalent isotropically radiated power (e.i.r.p.) density emitted by an earth station within a geostationary-satellite network in the 29.5-30.0 GHz frequency band shall not exceed the following values for any off-axis angle φ which is 3° or more off the main-lobe axis of an earth station antenna:

Off-axis angle	*Maximum e.i.r.p. density*
$3° \le \varphi \le 7°$	$(28 - 25 \log \varphi)$ dB(W/40 kHz)
$7° < \varphi \le 9.2°$	7 dB(W/40 kHz)
$9.2 < \varphi \le 48°$	$(31 - 25 \log \varphi)$ dB(W/40 kHz)
$48° < \varphi \le 180°$	-1 dB(W/40 kHz)

ADD EUR/13/117

S22.33 The e.i.r.p. limits given in **S22.32** do not apply to earth station antennas ready to be in service prior to [XXXX] nor to earth stations associated with satellite networks in the fixed-satellite service which have been brought into use before 2 June 2000.

ADD EUR/13/118

S22.34 Telecommand and ranging[***] carriers transmitted to geostationary satellites in the fixed-satellite service in normal mode of operation (i.e. earth station transmitting telecommand and ranging carriers to a directive receiving antenna on the space station) may exceed the levels given in **S22.32** by no more than 10 dB[**] in the frequency band 29.5-30.0 GHz.

[***] Measurement of the distance to the satellite.

[**] Further studies are required to confirm the value of 10 dB.

In all other modes of operation, and in case of *force majeure*, telecommand and ranging carriers transmitted to geostationary satellites in the fixed-satellite service are exempted from the levels given in **S22.32**.

ADD EUR/13/119

S22.35 For GSO systems in which the earth stations are expected to transmit simultaneously in the same 40 kHz band, e.g. for the GSO systems employing CDMA, the maximum e.i.r.p., values in **S22.32** should be decreased by 10*log(N) dB, where N is the number of earth stations which are in the receive satellite beam of the satellite to which these earth stations are communicating and which are expected to transmit simultaneously on the same frequency.

ADD EUR/13/120

S22.36 Earth stations operating in the 29.5-30 GHz frequency band should be designed in such a manner that 90% of the their peak off-axis e.i.r.p. density levels do not exceed the values given in **S22.32**. Further study is needed to determine the off-axis angular range over which these exceedances would be permitted, taking into account the interference level into adjacent satellites. The statistical processing of the off-axis e.i.r.p. density peaks should be dealt with using the method given in Recommendation ITU-R S.732.

ADD EUR/13/121

S22.37 The values given in **S22.32** are maximal values under clear-sky conditions. In case of systems employing uplink power control, these levels include any additional margins above the minimum clear-sky level necessary for the implementation of uplink power control. During rain faded conditions, the levels in **S22.32** may be exceeded by earth stations when implementing uplink power control.

ADD EUR/13/122

S22.38 FSS earth stations operating in the 29.5-30 GHz band, which have lower elevation angles to the GSO will require higher e.i.r.p. levels relative to the same terminals at higher elevation angles to achieve the same power flux-densities at the GSO due to the combined effect of increased distance and atmospheric absorption. Earth stations with low elevation angles may exceed the levels given in **S22.32** by the following amount:

Elevation angle to GSO (ε)	*Increase in e.i.r.p. density (dB)*
$\varepsilon \leq 5°$	2.5
$5 < \varepsilon \leq 30°$	$0.1(25 - \varepsilon) + 0.5$

ADD EUR/13/123

S22.39 The values in **S22.32** applicable to the off-axis angle range from 48° to 180° is intended to account for spillover effects.

NOTE - The above proposal to restrict the application of Section VI of Article S22 to earth stations within GSO systems is based on the need for further studies within ITU-R on the applicability of this section to earth stations within non-GSO systems. Depending on the outcome of these studies prior to WRC-2000, this proposal may need to be updated.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3C

Agenda item 1.13 - Proposed resolution on aggregate non-GSO interference

ADD EUR/13/124

PROPOSED RESOLUTION [EUR/13/6] (WRC-2000)

Protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where epfd limits have been adopted

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-97 has adopted, in Article **S22**, provisional epfd limits to be met by non-GSO FSS systems in order to protect GSO FSS and GSO BSS networks in parts of the frequency range 10.7-30 GHz;

b) that WRC-2000 has revised these limits to ensure that they provide adequate protection to GSO systems without causing undue constraints to any of the systems and services sharing these frequency bands;

c) that Article **S22** includes single entry epfd limits which apply to non-GSO FSS systems in these bands;

d) that these single-entry limits have been derived from aggregate equivalent power flux-density (epfd) masks that are intended to protect GSO networks, assuming a maximum effective number of non-GSO FSS systems of 3.5;

e) that the aggregate interference caused by all co-frequency non-GSO FSS systems in these bands into GSO FSS systems should not exceed the maximum interference levels that are necessary to protect these GSO systems;

f) that WRC-97 decided, and WRC-2000 confirmed, that non-GSO FSS systems in these bands are to coordinate the use of these frequencies between themselves under the provisions of No. **S9.12** of the Radio Regulations;

g) that the orbital characteristics of such systems are likely to be inhomogeneous;

h) that as a result of this likely inhomogeneity, the aggregate epfd levels from multiple non-GSO FSS systems are not directly related to the number of actual systems sharing a frequency band, and the number of such systems operating co-frequency is likely to be small;

i) that the possible misapplication of single entry limits should be avoided,

recognizing

a) that non-GSO FSS systems are likely to need to implement interference mitigation techniques to share frequencies among themselves;

b) that because the use of such interference mitigation techniques will likely keep the number of non-GSO systems small, the aggregate interference caused by non-GSO FSS systems into GSO systems will also likely be small;

c) that notwithstanding *considering d)*, there may be instances where the aggregate interference from non-GSO systems could exceed the interference levels given in Annex 1;

d) that administrations operating GSO systems may wish to ensure that the aggregate epfd produced by all operating co-frequency non-GSO FSS systems in the frequency bands referred to in *considering a)* above into GSO FSS and/or GSO BSS networks does not exceed the aggregate interference levels given in Annex 1,

resolves

1 that administrations operating or planning to operate non-GSO FSS systems in the frequency bands referred to in *considering a)* above, individually or in collaboration, take all possible steps, including by means of appropriate modifications to their systems if necessary, to ensure that the actual aggregate interference into GSO FSS and GSO BSS networks caused by such systems operating co-frequency in these frequency bands does not exceed the aggregate power levels shown in Annex 1;

2 that, in the event that the aggregate interference levels in Annex 1 are exceeded into an operational GSO earth station, administrations operating non-GSO FSS systems in these frequency bands shall expeditiously take all necessary measures to reduce the aggregate epfd levels to those in Annex 1 or to reduce such interference to higher levels that are acceptable to the affected GSO administration,

requests ITU-R

1 to develop, as a matter of urgency, and complete, in time for consideration by the next WRC, a methodology for calculating the aggregate epfd produced by all non-GSO FSS systems operating or planning to operate co-frequency in the frequency bands referred to in *considering a)* above into GSO FSS and GSO BSS networks and for comparing the calculated levels with the aggregate power levels shown in Annex 1;

2 to continue its studies on the accurate modelling of interference from non-GSO FSS systems into GSO FSS and GSO BSS networks in the frequency bands referred to in *considering a)* above in order to assist the administrations planning or operating non-GSO FSS systems in their efforts to limit the aggregate epfd levels produced by their systems into GSO networks,

requests the Director of the Radiocommunication Bureau

to assist in the development of the methodology referred to in *requests ITU-R* 1 above.

ANNEX 1 (TO RESOLUTION [EUR/13/6])

This Annex contains tables of interference levels concerning aggregate interference from multiple non-GSO FSS systems, which individually meet the Table **S22-1A** limits, into GSO FSS and GSO BSS systems.

These levels relate to the $epfd_{down}$ into any operational antenna within a GSO FSS or GSO BSS system with an orbital inclination of up to 2.5°. Into GSO FSS or GSO BSS systems with an orbital inclination between 2.5° and 4.5°, these levels are relaxed by 3 dB (e.g. –167 dB(W/m^2/40 kHz) instead of –170 dB(W/m^2/40 kHz)).

TABLE **1A**[1, 3]

Limits to the aggregate $epfd_{down}$ radiated by non-GSO FSS systems in certain frequency bands

1 Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO BSS systems.

2 For BSS antenna diameters 180 cm, 240 cm and 300 cm, in addition to the aggregate limit shown in Table **1D**, the following aggregate 100% of the time $epfd_{down}$ limit also applies:

TABLE **1D'**

Aggregate $epfd_{down}$ radiated by non-GSO FSS systems at certain latitudes

100% of the time $epfd_{down}$ dB(W/(m^2 · 40 kHz))	**Latitude (North or South) (°)**
–160.0	0 ≤ |latitude| ≤ 57.5
–160.0 + 3.4 * (57.5 – |latitude|)/4	57.5 ≤ |latitude| ≤ 63.75
–165.3	63.75 ≤ |latitude|

For BSS antenna diameter 240 cm, in addition to the above aggregate 100% of the time $epfd_{down}$ limit, a –167 dB(W/(m^2 · 40 kHz)) aggregate 100% of the time operational $epfd_{down}$ limit also applies to receive antennas located in Region 2, west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.][*]

* Comment: This transitional regime would be applicable only if the pfd limits in section 5c of Annex 1 to Appendix S30 are sufficiently relaxed.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3D

Agenda item 1.13 - Proposed provisions for earth stations with very large antennas

This part contains proposals for regulatory and procedural text for coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antennas, including additions and/or modifications to Articles S9, S11 and S22 and Appendices S4 and S5.

ARTICLE S9

Sub-Section IIA – Requirement and request for coordination

ADD EUR/13/125

S9.7A *a1)*[12*bis*, 13*bis*] for a specific earth station within a geostationary-satellite network in the fixed-satellite service in certain frequency bands in respect of a non-geostationary-satellite system in the fixed-satellite service;

ADD EUR/13/126

S9.7B *a2)*[12*bis*, 13*bis*] for a non-geostationary-satellite system in the fixed-satellite service in certain frequency bands in respect of a specific earth station within a geostationary-satellite network in the fixed-satellite service;

ADD EUR/13/127

[12*bis*] **S9.7.A.1** and **S9.7.B.1** The coordination of a specific earth station under **S9.7A** or **S9.7B** shall remain within the authority of the administration having this station located on its territory.

ADD EUR/13/128

[13*bis*] **S9.7.A.2** and **S9.7.B.2** Coordination information relating to a specific earth station received by the Bureau prior to [date to be established by WRC-2000] is considered as complete **S9.7A** or **S9.7B** information from the date of receipt of complete information of the associated satellite network under **S9.7** provided that the characteristics of the specific earth stations are within the parameters of any typical earth station included in the GSO FSS network coordination request.

Reasons: GSO FSS earth stations with very large antennas may not be adequately protected by the $\mathrm{epfd}_{\mathrm{down}}$ limits contained in Table MOD S22-1 and case-by-case coordination of systems operating co-frequency, co-directional links in the space-to-Earth direction would then be required. The proposed ADD S9.7A and ADD S9.7B would require coordination between non-GSO FSS transmit satellites and GSO FSS receive earth stations with very large antennas. By referring to coordination provisions under S9.7A and S9.7B, the request for coordination would be sent by the requesting administration to the Bureau under S9.30. The Bureau would act under S9.34 to identify administrations with which coordination may need to be effected and publish the information in the Weekly Circular. Since coordination between a non-GSO FSS space station and very large GSO FSS earth stations is a new type of coordination that does not currently exist in Article S9, it is necessary to add two new entry points in Article S9:

1) One entry point to enable the non-GSO space station administration to request coordination with administrations having specific very large earth station antennas located on their territory.

2) Another entry point to enable the reciprocal coordination to take place, i.e. the possibility for an administration planning to implement a specific very large GSO earth station stations located on their territory to request coordination with administrations having non-GSO FSS transmit space.

ARTICLE S22

Space services[1]

Section II – Control of interference to geostationary-satellite systems

It is proposed that a footnote referring to S9.7A and S9.7B be inserted in the tables of Section II of Article S22 relating to the protection of GSO FSS earth stations. This proposal is made under Part 3B above.

ARTICLE S11

Notification and recording of frequency assignments[1, 2, 3]

Section II – Examination of notices and recording of frequency assignments in the Master Register

MOD EUR/13/129

S11.32A *c)* with respect to the probability of harmful interference that may be caused to or by assignments recorded with a favourable finding under Nos. **S11.36** and **S11.37** or **S11.38**, or recorded in application of No. **S11.41**, or published under Nos. **S9.38** or **S9.58** but not yet notified, as appropriate, for those cases for which the notifying administration states that the procedure for coordination under Nos. **S9.7**, **S9.7A** or **S9.7B** could not be successfully completed (see also No. **S9.65**);[10] or

MOD EUR/13/130

---

[10] **S11.32A.1** The examination of such notices with respect to any other frequency assignment for which a request for coordination under Nos. **S9.7**, **S9.7A** or **S9.7B** has been published under No. **S9.38** but not yet notified shall be effected by the Bureau in the order of their publication under the same number using the most recent information available.

Reasons: The insertion of a coordination trigger related to $epfd_{down}$ level radiated by the non-GSO FSS system into the earth station employing the very large antenna considered when this earth station is pointed to the wanted GSO satellite provides a mechanism to examine the notice with respect to the probability of harmful interference that may be caused to or by the above-listed assignments, and therefore S11.38 and S11.41 are applicable.

APPENDIX S4

ANNEX 2B

Table of characteristics to be submitted for space and radio astronomy services

The required characteristics for coordinating specific very large GSO earth stations with non-GSO FSS transmit space stations could be items for "Notification or coordination of a GSO network (including Appendix S30B)" or "Notification or coordination of an earth station".

(The modifications in either column two or column three need to be incorporated into the full table.)

MOD EUR/13/131

X Mandatory information.

O Optional information.

C This information need only be furnished when it has been used as a basis to effect coordination with another administration.

[9] Information mandatory for coordination under No. ADD **S9.7A**.

NOTE - Additional characteristics to be provided may include A.4.c, A.1.e.1, A.1.e.2, C.4, B.5 and C.5.b. As a result of decisions that may be made at WRC-2000, these additional characteristics may replace C.10.a, C.10.b, C.10.c.1, C.10.c.2 and C.10.c.5 in the notification or coordination of an earth station column.

Reasons: This is consequential to ADD S9.7A and ADD S9.7B. Administrations will need to submit specific earth station information for earth stations associated with geostationary-satellite networks in the fixed-satellite service meeting the conditions in the proposed addition to Appendix S5.

MOD EUR/13/132

[9] Information mandatory for coordination under No. ADD **S9.7A**.

Reasons: This is consequential to ADD S9.7A and ADD S9.7B and will be required when simple frequency-changing transponders are used on the space station.

APPENDIX S5

ADD EUR/13/133

TABLE S5-1 (*continued*)

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.7A** GSO earth station/ non-GSO system	A specific earth station in a geostationary-satellite network in the fixed-satellite service in respect of a non-geostationary-satellite system in the fixed-satellite service	The following frequency bands: 10.7-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 17.8-18.6 GHz (space-to-Earth), and 19.7-20.2 GHz (space-to-Earth)	Conditions: i) the frequency bands overlap; and ii) the satellite network using the geostationary-satellite orbit has specific receive earth stations and meets all of the following conditions: a) Earth station antenna maximum isotropic gain greater than or equal to 64 dBi for the frequency bands 10.7-12.75 GHz or 68 dBi for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; b) G/T_1 of 44 dB/K or higher; c) space station emission bandwidth of 250 MHz or higher for the frequency bands 10.7-12.75 GHz or 800 MHz or higher for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; iii) the $epfd_{down}$ from the satellite system using the non-geostationary orbit exceeds:	i) compare frequency bands; ii) use the maximum antenna gain of the specific receive earth station (Appendix **S4** C.10 *c)* 2)), the lowest equivalent satellite link noise temperature (Appendix **S4** C.10 *c)* 5)), and the space station emission bandwidth (Appendix **S4** C.7 *a)*) in the geostationary-satellite network as given in Appendix **S4** data; and iii) use the $epfd_{down}$ radiated by the non-GSO FSS system into the earth station employing the very large antenna when this antenna is pointed towards the wanted GSO satellite	The threshold/ condition for coordination do not apply to typical receive earth stations operating in satellite networks using the geostationary-satellite orbit

			a) either –174.5 dB(W/($m^2 \cdot$ 40 kHz)) for any percentage of time or [x] dB(W/($m^2 \cdot$ 40 kHz)) for [y]% of the time in the frequency band 10.7-12.75 GHz;(*) b) either –151 dB(W/($m^2 \cdot$ MHz)) for any percentage of time or [x'] dB(W/($m^2 \cdot$ MHz)) for [y']% of the time in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz(*)		
No. **S9.7B** non-GSO system/ GSO earth station/	A non-geostationary-satellite system in the fixed-satellite service in respect of a specific earth station in a geostationary-satellite network in the fixed-satellite service.	The following frequency bands: 10.7-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 17.8-18.6 GHz (space-to-Earth), and 19.7-20.2 GHz (space-to-Earth)	Conditions: i) the frequency bands overlap; and ii) the satellite network using the geostationary-satellite orbit has specific receive earth stations and meets all of the following conditions: a) Earth station antenna maximum isotropic gain greater than or equal to 64 dBi for the frequency bands 10.7-12.75 GHz or 68 dBi for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; b) G/T_1 of 44 dB/K or higher;	i) compare frequency bands; ii) use the maximum antenna gain of the specific receive earth station (Appendix **S4** C.10 *c)* 2)), the lowest equivalent satellite link noise temperature (Appendix **S4** C.10 *c)* 5)), and the space station emission bandwidth (Appendix **S4** C.7 *a)*) in the geostationary-satellite network as given in Appendix **S4** data; and	The threshold/ condition for coordination do not apply to typical receive earth stations operating in satellite networks using the geostationary-satellite orbit.

			c) space station emission bandwidth of 250 MHz or higher for the frequency bands 10.7-12.75 GHz or 800 MHz or higher for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; iii) the $epfd_{down}$ from the satellite system using the non-geostationary orbit exceeds: a) either –174.5 dB(W/(m^2 · 40 kHz)) for any percentage of time or [x] dB(W/(m^2 · 40 kHz)) for [y]% of the time in the frequency band 10.7-12.75 GHz;(*) b) either –151 dB(W/(m^2 · MHz)) for any percentage of time or [x'] dB(W/(m^2 · MHz)) for [y']% of the time in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz.(*)	iii) use the $epfd_{down}$ radiated by the non-GSO FSS system into the earth station employing the very large antenna when this antenna is pointed towards the wanted GSO satellite.	

Reasons: This is consequential to ADD S9.7A and S9.7B.

(*) NOTE - These epfd thresholds require further refinement. A corrigendum to this proposal will be submitted taking into account the results of the discussions which are expected to take place on this issue in ITU-R before WRC-2000.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Croatia, Denmark, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3E

Agenda item 1.13 - Proposed modifications to Article S5

Introduction

It is proposed that the current four footnotes in Article S5 referring to non-GSO FSS operation under the provisions of Resolutions 130 (WRC-97) and 538 (WRC-97) be amended in order to include the relevant provisions currently included in these resolutions which do not contain transitional or superfluous measures. These proposals do not include any additional frequency bands in which WRC-2000 may decide to add limits to facilitate sharing between non-GSO FSS and GSO as a result of the studies carried out by ITU-R on this issue (e.g. the band 17.3-17.8 GHz (Earth-to-space) in Region 2). This issue is addressed in Part 3H under agenda item 1.13.2.

A Rule of Procedure was adopted by the RRB in April 1998, in relation to S5.488 and S5.491, which currently restrict the use of some of the 12 GHz FSS allocations in Regions 2 and 3 to national and subregional systems. The Board considered that these provisions should be waived in the case of non-GSO FSS systems in order to align them with the decisions of WRC-97 allowing the development of such systems in these bands. The discussions at the CPM also concluded that keeping these limitations would maintain significant burden to the administrations and the Bureau, and unnecessary constraints on the development of global, regional and subregional GSO and non-GSO FSS systems in Regions 2 and 3, without clear advantage. It is therefore proposed to amend S5.488 and S5.491 according to Option 2C of the CPM Report, i.e. to waive these constraints for both GSO and non-GSO systems.

Finally, proposals are made to modify footnotes S5.502 and S5.503 to reflect the conclusions of the CPM, while preserving the delicate balance currently existing between the services allocated in the 13.75-14 GHz band.

MOD EUR/13/134

S5.441 The use of the bands 4 500-4 800 MHz (space-to-Earth), 6 725-7 025 MHz (Earth-to-space) by the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by geostationary-satellite systems in the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by non-geostationary-satellite systems in the fixed-satellite service ~~shall be in accordance with the provisions of Resolution **130 (WRC-97)**~~is subject to the application of the provisions of No. **S9.12** for the coordination with other non-geostationary-satellite systems in the fixed-satellite service. The provisions of Resolution **130 (Rev.WRC-2000)** apply.

MOD EUR/13/135

S5.484A The use of the bands 10.95-11.2 GHz (space-to-Earth), 11.45-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 13.75-14.5 GHz (Earth-to-space), 17.8-18.6 GHz (space-to-Earth), 19.7-20.2 GHz (space-to-Earth), 27.5-28.6 GHz (Earth-to-space), 29.5-30 GHz (Earth-to-space) by non-geostationary~~- and geostationary-~~satellite systems in the fixed-satellite service is subject to application of the provisions of ~~Resolution **130 (WRC-97)**. The use of the band 17.8-18.1 GHz (space-to-Earth) by non-geostationary fixed-satellite service systems is also subject to the provisions of Resolution **538 (WRC-97)**~~No. **S9.12** for the coordination with other non-geostationary-satellite systems in the fixed-satellite service. The provisions of Resolutions **130 (Rev.WRC-2000)** and **538 (Rev.WRC-2000)** apply.

MOD EUR/13/136

S5.487A *Additional allocation:* in Region 1, the band 11.7-12.5 GHz, in Region 2, the band 12.2-12.7 GHz and, in Region 3, the band 11.7-12.2 GHz, are also allocated to the fixed-satellite service (space-to-Earth) on a primary basis, limited to non-geostationary systems and subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~No. **S9.12** for the coordination with other non-geostationary-satellite systems in the fixed-satellite service. The provisions of Resolution **538 (Rev.WRC-2000)** apply.

MOD EUR/13/137

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) in Regions 1 and 3 and 17.8-18.1 GHz (Earth-to-space) in Region 2 by non-geostationary-satellite systems in the fixed-satellite service is subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~No. **S9.12** for the coordination with other non-geostationary-satellite systems in the fixed-satellite service. The provisions of Resolution **538 (Rev.WRC-2000)** apply.

MOD EUR/13/138

S5.488 The use of the band~~s 11.7-12.2 GHz by the fixed-satellite service~~ in ~~Region 2 and~~ 12.2-12.7 GHz by the broadcasting-satellite service in Region 2 is limited to national and subregional systems. The use of the band 11.7-12.2 GHz by geostationary-satellite systems in the fixed-satellite service in Region 2 is subject to previous agreement between the administrations concerned and those having services, operating or planned to operate in accordance with the Table, which may be affected (see Articles **S9** and **S11**). For the use of the band 12.2-12.7 GHz by the broadcasting-satellite service in Region 2, see Appendix **S30**.

MOD EUR/13/139

S5.491 *Additional allocation:* in Region 3, the band 12.2-12.5 GHz is also allocated to the fixed-satellite (space-to-Earth) service on a primary basis~~, limited to national and sub-regional systems~~. The power flux-density limits in Article **S21**, Table **S21-4** shall apply to this frequency band. The introduction of the service in relation to the broadcasting-satellite service in Region 1 shall follow the procedures specified in Article 7 of Appendix **S30**, with the applicable frequency band extended to cover 12.2-12.5 GHz.

Reasons: The RRB considered that the restrictions included in these provisions in relation to the national and subregional systems should be waived in the case of non-GSO FSS systems in order to align them with the decisions of WRC-97 allowing the development of such systems in these bands. The discussions at the CPM also concluded that keeping these limitations would maintain a significant burden on the administrations and the Bureau, and unnecessary constraints on the development of global, regional and subregional GSO and non-GSO FSS systems in Regions 2 and 3, without clear advantage. It is therefore proposed to amend S5.488 and S5.491 according to Option 2C of the CPM Report, i.e. to waive these constraints for both GSO and non-GSO systems.

MOD EUR/13/140

S5.502 In the band 13.75-14 GHz, the e.i.r.p. of any emission from an earth station in the fixed-satellite service~~ shall be at least 68 dBW, and~~ should not exceed 85 dBW, ~~with~~and a minimum antenna diameter of 4.5 m shall be used. In addition the e.i.r.p., averaged over one second, radiated by a station in the radiolocation or radionavigation services towards ~~the geostationary-satellite orbit~~any direction of space shall not exceed 59 dBW.

MOD EUR/13/141

S5.503 In the band 13.75-14 GHz, geostationary space stations in the space research service for which information for advance publication has been received by the Bureau prior to 31 January 1992 shall operate on an equal basis with stations in the fixed-satellite service; after that date, new geostationary space stations in the space research service will operate on a secondary basis. The e.i.r.p. density of emissions from any earth station in the fixed-satellite service shall not exceed 71 dBW in any 6 MHz band for GSO networks and 51 dBW in any 6 MHz band for non-GSO networks, in the frequency range 13.772-13.778 GHz until those geostationary space stations in the space research service for which information for advance publication has been received by the Bureau prior to 31 January 1992 cease to operate in this band. Automatic power control may be used to increase the e.i.r.p. density above ~~71 dBW in any 6 MHz band~~these limits in this frequency range to compensate for rain attenuation, to the extent that the power-flux density at the fixed-satellite service space station does not exceed the value resulting from use of ~~an~~these e.i.r.p. ~~of 71 dBW in any 6 MHz band~~density levels in clear sky conditions.

Reasons: Support is given to the CPM Report conclusion that the minimum e.i.r.p. of 68 dBW could be suppressed, and the apportionment of interference from GSO and non-GSO FSS systems into space research could be done in such a way as to maintain the current earth station e.i.r.p. density limit in S5.503 for GSO FSS (71 dBW/6 MHz) and include another, more stringent limit, for non-GSO FSS earth stations, so as to maintain the aggregate interference into space research at the appropriate level set forth in Recommendation ITU-R SA.1071. It is also proposed that, in line with the information provided in Recommendation ITU-R S.1068, the e.i.r.p. density limit specified in S5.502 be extended to all directions of space.

NOTE - It is recognized that the current limits in S5.502 or the proposed limits in MOD S5.502 constrain the operation of FSS in the 13.75-14 GHz band to larger earth stations. It is proposed, under WRC-2000 agenda item 7.2, that the WRC-03 agenda include the review of these limits and that this issue be studied by ITU-R.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3F

Agenda item 1.13 - Proposed modifications to Articles S9 and S11

As indicated in the CPM Report, the ITU-R studies have concluded on the levels of epfd limits which are considered appropriate to protect the Appendices S30, S30A and S30B Plans and their future modifications. If these limits were included in Article S22, there would therefore be no need for non-GSO FSS systems to coordinate their use of frequencies with assignments/allotments in these Plans.

The following modifications are proposed to Articles S9 and S11 to clarify that the provisions of Appendices S30, S30A and S30B are not applicable to non-GSO FSS systems. In the absence of such modifications, the provisions of Appendices S30, S30A and S30B may be understood as applying to non-GSO FSS systems, which would be in contradiction with the above-mentioned conclusions.

It is also proposed to enable in Article S9 the application of S9.12 for the coordination between non-GSO FSS systems, when this coordination requirement is referred to in Article S5, as proposed in Part 3E of this document.

ARTICLE S9

Procedure for effecting coordination with or obtaining agreement of other administrations[1, 2, 3, 4, 5]

PART 3G

Agenda item 1.13 - Proposed modifications to Appendix S4

Additional data items required in Appendix S4 for the epfd calculations

It is proposed to include the following additions to the current text of Appendix S4.

1 Section A.4 *b)*

ADD EUR/13/145

In addition, if the stations operate in a frequency band subject to the provisions of Resolution **130 (Rev.WRC-2000)** or Resolution **538 (Rev.WRC-2000)**:

6) new data elements required to characterize properly the orbital operation of the non-GSO satellite systems:

a) for each range of latitudes provide:

– the maximum number of non-GSO satellites operating their downlinks co-frequency to any location; and

– the associated latitude range;

b) the minimum height of the space station above the surface of the Earth at which any satellite will be used to provide a service;

c) where the space station uses station-keeping to maintain a repeating ground track, the time in seconds that it takes for the constellation to return to its starting position, i.e. such that all satellites are in the same location with respect to the Earth and each other;

d) an indicator identifying if the space station should be modelled with a specific precession rate of the ascending node of the orbit instead of the J_2 term;

e) for a space station that is to be modelled with a specific precession rate of the ascending node of the orbit instead of the J_2 term, the precession rate in degrees/day, measured counter-clockwise in the equatorial plane;

f) the longitude of the ascending node for the *j*-th orbital plane, measured counter-clockwise in the equatorial plane from Greenwich meridian to the point where the satellite makes its south-to-north crossing of the equatorial plane ($0° \leq \Omega_j < 360°$) (NOTE 1);

g) the time at which the satellite is at the location defined by Ω_j (NOTE 1);

h) the longitudinal tolerance of the longitude of the ascending node.

NOTE 1 - Currently non-GSO space stations are referenced by the "right ascension of ascending node" (A.4b5 Ω_j) to the first point of Aries. However, for the evaluation of epfd a reference to a point on the Earth is used and hence the "longitude of the ascending node" is required.

2 Section A.4 *b)*

ADD EUR/13/146

7) new data elements required to characterize properly the performance of the non-GSO satellite systems:

a) the maximum number of non-GSO satellites receiving simultaneously at the same frequency from the associated earth stations within a given cell;

b) the average number of associated earth stations operating co-frequency per square kilometre within a cell;

c) the average distance between co-frequency cells;

d) for the exclusion zone about the geostationary orbit provide:

– the type of zone;

– the width of the zone in degrees.

3 Section A.14

ADD EUR/13/147

A.14 Spectrum masks

For stations operating in a frequency band subject to the provisions of Resolution **130 (Rev.WRC-2000)** or Resolution **538 (Rev.WRC-2000)**:

a) for each e.i.r.p. mask used by the non-GSO space station provide:

– the type of mask;

– the mask identification code;

– the mask pattern defined in terms of the power in the reference bandwidth for a series of off-axis angles with respect to a specified reference point;

– the lowest frequency for which the mask is valid;

– the highest frequency for which the mask is valid;

b) for each earth station e.i.r.p. mask provide:

– the type of mask;

– the mask identification code;

– the mask pattern defined in terms of the power in the reference bandwidth for a series of off-axis angles with respect to a specified reference point;

– the lowest frequency for which the mask is valid;

– the highest frequency for which the mask is valid;

– the minimum elevation angle at which any earth station can transmit to a non-GSO satellite;

– the minimum separation angle between the GSO arc and the earth station beam-axis at which the earth station can transmit towards a non-GSO satellite;

c) for each pfd mask used by the non-GSO space station provide:

– the mask identification code;

– the mask pattern of the power flux-density defined in three dimensions;

– the lowest frequency for which the mask is valid;

– the highest frequency for which the mask is valid.

4 Section C.9

ADD EUR/13/148

d) For stations operating in a frequency band subject to the provisions of Resolution **130 (Rev.WRC-2000)** or Resolution **538 (Rev.WRC-2000)**, provide:

– the type of mask;

– the mask identification code.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 3H

Agenda item 1.13

Agenda item 1.13.2 - Proposed modifications to Articles S5 and S22 to include limits in other frequency bands

On the basis of the results of the studies undertaken by ITU-R and reported in the CPM Report, this section contains proposals for modifications to Articles S5 and S22 to facilitate sharing between non-GSO FSS (Earth-to-space) and BSS in Region 2 in the band 17.3-17.8 GHz.

To minimize the sharing constraints imposed by non-GSO FSS uplinks in Region 2, it is proposed that non-GSO FSS (Earth-to-space) use in Region 2 be limited to gateway operation, by introducing in S5.516 a minimum antenna size of 4.5 metres for such use.

Proposed modifications to Article S5

MOD EUR/13/149

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) in Regions 1, 2 and 3 ~~and 17.8-18.1 GHz (Earth-to-space) in Region 2~~ by non-geostationary-satellite systems in the fixed-satellite service is subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~No. **S9.12** for the coordination with other non-geostationary-satellite systems in the fixed-satellite service. The use of the 17.3-17.8 GHz band by non-GSO FSS (Earth-to-space) in Region 2 is limited to a minimum earth station antenna diameter of 4.5 metres. The provisions of Resolution **538 (Rev.WRC-2000)** apply.

Proposed modifications to Article S22

MOD EUR/13/150

MOD EUR/13/152

RESOLUTION 130 (Rev.WRC-~~97~~2000)

Use of non-geostationary systems in the fixed-satellite service in certain frequency bands

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that the International Telecommunication Union has, among its purposes, “to promote the extension of the benefit of the new telecommunication technologies to all the world’s inhabitants” (No. 6 of the Constitution of the International Telecommunication Union (Geneva, 1992));

b) that it is desirable, in this respect, to promote systems capable of providing universal service;

c) that new telecommunication services need advanced and reliable networks permitting high-capacity communications;

d) the need to encourage the development and implementation of new technologies;

e) that systems based on the use of new technologies associated with both geostationary (GSO) and non-geostationary (non-GSO) satellite constellations are capable of providing the most isolated regions of the world with high-capacity and low-cost means of communication;

f) that there should be equitable access to the radio-frequency spectrum and orbital resources in a mutually acceptable manner that allows for new entrants in the provision of services;

g) that all Member States [‡] would benefit from the implementation of proposed systems in the allocated spectrum and from avoidance of monopolization or exclusive use of an allocation by a single system;

h) that the operation of such systems requires a suitable amount of spectrum in appropriate frequency bands;

i) that decisions on this matter should permit the operation of as many systems as possible;

j) that~~, in spite of the urgency attached to the development of such systems,~~ technical, operational and regulatory issues should be studied in order to achieve the most efficient use of the spectrum that may be available for these systems;

k) that there is a need for the provision of services on a competitive basis between GSO fixed-satellite service (FSS) and non-GSO FSS systems as well as between non-GSO FSS and non-GSO FSS systems;

l) that the Radio Regulations must be sufficiently flexible to accommodate the introduction and implementation of innovative technologies as they evolve, and allow the further development and implementation of any proposed system in conformity with their provisions,

considering further

a) that ~~further~~ITU-R has conducted technical, operational and regulatory studies~~ are required~~ in order to determine~~ further~~ the conditions under which sharing of the frequency bands 10-30 GHz which are allocated to the FSS and where ~~Resolution **46 (Rev.WRC-97)**~~No. **S9.11A** does not apply is feasible between GSO and non-GSO systems, between non-GSO systems and between non-GSO and terrestrial systems and other space systems;

~~*b)* that it is likely that non-GSO FSS systems communicated to the Radiocommunication Bureau will not be brought into use before the WRC-99;~~

~~c~~b) that the diverging interpretations arising from No. **S22.2** result in an ambiguous regulatory status for both existing and future GSO and non-GSO systems in the FSS in the bands where this provision applies, with consequential risks for both types of systems;

~~d~~c) that the harmonious development of non-GSO and GSO systems in the FSS requires that these ambiguities be resolved with no further delay in all bands subject to this provision;

~~e~~d) that in resolving these ambiguities in the bands referred to in *resolves* 1 below, the GSO arc must be protected to ensure continued use of existing FSS systems and the development of new GSO technologies and systems in both non-planned bands and bands where plans exist;

~~f~~e) that these ambiguities ~~may~~can be resolved in certain frequency bands by adopting power flux-density (pfd) limits which ~~would~~ apply to non-GSO FSS systems to protect GSO FSS systems, and by including in Article **S22** limits on the power radiated by non-GSO FSS systems in order adequately to protect GSO FSS systems in the frequency bands and sharing situations where ~~Resolution **46 (Rev.WRC-97)**~~No. **S9.11A** does not apply;

~~g~~f) that in certain frequency bands which are currently used or planned to be used extensively by GSO FSS systems, ~~provisional~~ power flux-density limits applicable to non-GSO FSS systems have been developed;

~~h~~g) that non-GSO FSS systems have been proposed in some of these bands which could meet these limits and would not require specific protection from existing and future GSO FSS systems, provided that minimum constraints are applied to GSO FSS systems, such as off-axis earth station e.i.r.p. limits;

~~i~~h) that in the bands where the limits referred to in *considering further ~~f~~e), ~~g~~f)* and *~~h~~g)* ~~would~~ apply, there ~~would be~~is no need for a coordination procedure between non-GSO FSS and GSO systems, with the exception of coordination between earth stations operating in opposite directions of transmission and coordination with earth stations using very large antennas;

~~j~~i) that there ~~would be~~is a need for a coordination procedure between non-GSO systems in the FSS and between non-GSO FSS systems and non-GSO systems in other services and for specific sharing criteria associated with this procedure, taking into consideration various types of non-GSO systems, including those in highly elliptical orbits;

~~k~~j) the need to protect other co-primary services having allocations in the frequency bands referred to in *considering further a)* above and the need to assess further the sharing conditions between non-GSO FSS systems and these services;

~~l~~k) that there is a need for further studies on sharing conditions in frequency bands other than the 10-30 GHz frequency bands, where ~~Resolution **46 (Rev.WRC-97)**~~No. **S9.11A** does not apply and Article **S22** does not include limits for non-GSO FSS systems, ~~may also be necessary~~ on the basis of the requirements that may emerge,

noting

1 that information relating to GSO and non-GSO systems in the FSS in the 10-30 GHz bands has been communicated to the Bureau;

2 that some of these systems are in operation and others will be operated in the near future and, consequently, difficulties may be experienced in modifying their characteristics;

3 the need to protect existing and future terrestrial and space services and systems;

4 that No. **S22.2** is an operational provision which is to be applied between administrations, and does not require any specific action or finding by the Bureau,

recognizing

that the geostationary-satellite orbit and its associated spectrum are a uniquely valuable resource and that equitable access to this resource needs to be protected for all countries in the world,

resolves

~~1~~ that, as of 22 November 1997, in the frequency bands specified in Tables ~~**S22-3** and **S22-4**~~**S22-1A**, **S22-1B**, **S22-1C** and **S22-2** of Article **S22**~~, and in Tables 1 and 2 in Annex 1 to this Resolution,~~ non-GSO FSS systems ~~shall apply the procedures of Section I of Article **S9**, Nos. **S9.17** and **S9.17A**/Sections I and III of Article **11** and the procedures of Article **S11**/**13**, and the non-GSO FSS systems~~ for which complete notification or coordination information, as appropriate, has been received by the Bureau after 21 November 1997 shall be subject to the ~~provisional~~ power limits in Article **S22** ~~and in Annex 1 to this Resolution~~, as revised by this Conference;

Reasons:

1 Articles 11 and 13 have been suppressed.

2 Sections I and II of S9, S9.17 and S9.17A apply to all non-GSO FSS not subject to S9.11A.

3 The limits in Article S22 are enabled by the fact they appear in Article S22 itself.

~~2 that these limits shall be applied provisionally until the end of WRC-99, and that non-GSO FSS systems for which complete notification information has been received by the Bureau after 21 November 1997 shall be subject to the power limits in Article **S22**, as revised, if appropriate, by WRC-99;~~

Reasons: *Resolves* 2 appears to be a transitional measure until WRC-2000 and is therefore no longer required after WRC-2000.

~~3 that, as of 22 November 1997, in applying No. **S22.2,** administrations may consider these provisional power limits as corresponding to permissible levels of interference from a non-GSO system into a GSO system, irrespective of the dates of receipt by the Bureau of the complete notification information relating for the non-GSO system and of the complete coordination information for the GSO network;~~

Reasons: *Resolves* 3 appears to be a transitional measure until WRC-2000 and is therefore no longer required after WRC-2000.

~~4 that, as of the end of WRC-99, an administration operating a non-GSO FSS system which is in compliance with the limits in Article **S22**, as revised, if appropriate, by WRC-99, shall be considered as having fulfilled its obligations under No. **S22.2** with respect to any GSO network, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO system and of the complete coordination information for the GSO network;~~

Reasons: This fundamental provision is proposed to be moved to Article S22, hence *resolves* 4 is proposed to be suppressed.

~~5 that, as of the end of WRC-99, in the frequency bands specified in No. **S22.29** and § 2.4 of Annex 1 to this Resolution, GSO FSS systems for which complete coordination information has been received by the Bureau after the end of WRC-99 shall be subject to the limits in Article **S22** and in § 2.1, 2.2 and 2.3 of Annex 1 to this Resolution, as revised, if appropriate, by WRC-99;~~

Reasons: *Resolves* 5 is no longer required after WRC-2000 because the limits in Article S22 are enabled by the fact they appear in Article S22 itself.

~~6 that, as of 22 November 1997, in the frequency bands specified in No. **S22.29** and Tables 1 and 2 of Annex 1 to this Resolution, non-GSO systems shall not claim protection from GSO networks in the FSS operating in accordance with the Radio Regulations, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO FSS systems and of the complete coordination information for the GSO networks;~~

Reasons: *Resolves* 6 may be suppressed, with the establishment of minimum constraints on GSO FSS systems (such as earth station off-axis power limits) to protect non-GSO FSS systems. The fact that non-GSO systems cannot claim protection from GSO systems is inherent in the concept of limits as enabled by Article S22.

~~6.1 that, between 22 November 1997 and the end of WRC-99, if an administration operating or bringing into use a GSO FSS system before the end of WRC-99 considers that a non-GSO FSS system proposed by another administration might cause unacceptable interference into its GSO system, then:~~

~~6.1.1 the administration operating the GSO system shall send to the administration operating the non-GSO FSS system the technical details upon which its disagreement is based,~~

~~6.1.2 in the bands from 10.7 GHz to 14.5 GHz, the administration operating the non-GSO FSS system shall resolve the difficulties,~~

~~6.1.3 in the bands 17.8-18.6 GHz (space-to-Earth), 19.7-20.2 GHz (space-to-Earth), 27.5-28.6 GHz (Earth-to-space) and 29.5-30.0 GHz (Earth-to-space), the administrations concerned shall make every possible effort to resolve the difficulties by means of mutually acceptable adjustments to their networks;~~

Reasons: *Resolves* 6.1, 6.1.1, 6.1.2, and 6.1.3 are transitional measures until WRC-2000, and are therefore not required after WRC-2000.

~~7 that, if an administration bringing into use a GSO FSS system after the end of WRC-99 considers that a non-GSO FSS system proposed by another administration and which complies with the limits in Article **S22**, as revised, if appropriate, by WRC-99, might cause unacceptable interference into its GSO system, the administrations concerned shall make every possible effort to resolve the difficulties by means of mutually acceptable adjustments to their networks;~~

Reasons: *Resolves* 7 is adequately covered by RR No. S9.4.

~~8 that, as of 22 November 1997, non-GSO systems in the FSS in the frequency bands referred to in *resolves* 1 above, shall, for coordination with other non-GSO FSS systems, be subject to application of the provisions of § 2.1 of Section II of Resolution **46 (Rev.WRC-97)**/No. **S9.12**,~~

Reasons: This fundamental provision is proposed to be moved to Article S5, hence *resolves* 8 may be suppressed.

requests ITU-R

1~~[1]~~ taking into account *considering further a)*, to conduct, as a matter of urgency, and complete, in time for consideration by WRC-~~99~~02/03~~:~~, the studies relating to the sharing criteria to be applied during the coordination between non-GSO FSS systems, with a view to promoting efficient use of spectrum/orbit resources and equitable access to these resources by all countries;

~~[1] See Annex 2 for further details concerning specific aspects of these studies in relation to frequency sharing between systems in the non-GSO FSS and the GSO FSS.~~

~~1.1 the appropriate technical, operational and regulatory studies to review the regulatory conditions relating to the coexistence of non-GSO and GSO systems in the FSS, in order to ensure that they do not impose undue constraints on the development of non-GSO and GSO FSS systems;~~

~~1.2 the development of a methodology for calculating the power levels produced by non-GSO FSS systems and the compliance of these levels with the limits referred to in *resolves* 1 and 2 above;~~

~~1.3 the studies relating to the sharing criteria to be applied for determining the need for coordination between non-GSO FSS systems and the need for coordination between terrestrial services and non-GSO systems in the FSS and in other space services, with a view to promoting efficient use of spectrum/orbit resources and equitable access to these resources by all countries;~~

Reasons: Following completion of the studies requested by WRC-97 in the frequency bands where WRC-97 established provisional limits, it is proposed to reduce the scope of the studies to be carried out by ITU-R under this "*requests ITU-R* 1" to the criteria for sharing between non-GSO systems. It is recognized that studies are continuing within ITU-R on this subject and that they might be completed before WRC-2000. In this case, this provision might be suppressed.

2~~1~~ taking into account *considering further* ~~*l*~~*k)*, to ~~undertake the development~~conduct the appropriate technical, operational and regulatory studies towards the possible adoption of power limits or other frequency sharing mechanisms among GSO, non-GSO and terrestrial systems in the frequency bands other than those referred to in *resolves* 1 above and where non-GSO FSS systems are likely to be implemented and GSO systems are used or expected to be used extensively~~,~~.

Reasons: Following completion of the studies requested by WRC-97 in the frequency bands where WRC-97 established provisional limits, it is proposed to reduce the scope of the studies to be carried out by the ITU-R to bands where such limits do not exist.

~~*instructs the Radiocommunication Bureau*~~

~~as of the end of WRC-99, to review and, if appropriate, revise, any finding previously made on the compliance with the limits contained in Article **S22** of a non-GSO FSS system for which notification information has been received between 22 November 1997 and the end of WRC-99. This review shall be based on the values in Article **S22**, as revised, if appropriate, by WRC-99.~~

Reasons: Review the findings previously made with respect to the compliance with the provisional limits is not required since, in the absence of a verification tool, the BR could not have been in a position to make such a finding.

MOD EUR/13/153

RESOLUTION 538 (Rev.WRC-~~97~~2000)

Use of the frequency bands covered by Appendices S30/30 and S30A/30A by non-geostationary-satellite systems in the fixed-satellite service

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that provisional limits have been ~~established~~revised and included in Article **S22** ~~and in the Annex to this Resolution~~ to ensure that the interference caused by non-geostationary-satellite (non-GSO) systems in the fixed-satellite service (FSS) into assignments operated in conformity with the Appendices **S30** and **S30A** Plans is maintained within negligible levels;

b) that the integrity of the above-mentioned Plans and their future modifications is to be ensured;

c) that non-GSO systems should not be entered into those Plans and therefore should not apply the procedures associated with the Plans and should not be protected by those procedures;

d) that ~~this Conference~~WRC-97 has decided to introduce in Article **S5** a new allocation to the FSS in the frequency bands 11.7-12.5 GHz in Region 1, 12.2-12.7 GHz in Region 2 and 11.7-12.2 GHz in Region 3, limited to non-GSO FSS systems,

resolves

~~1~~

~~1.1~~ that, as of 22 November 1997, a non-GSO FSS system operating in the frequency bands covered by Appendices **S30** and **S30A** shall comply with the ~~provisional limits specified in Article **S22** and in the Annex to this Resolution;~~

~~1.2 that such a system shall, as of the end WRC-99, comply with the~~ limits specified in Article **S22**, as revised~~, if appropriate,~~ by WRC-~~99~~2000, irrespective of the date of receipt of the complete notification information relating to the non-GSO FSS system~~;~~.

~~1.3 that as of 22 November 1997, in applying No. **S22.2**, administrations may consider these provisional power limits as corresponding to permissible levels of interference from a non-GSO system into a GSO system, irrespective of the dates of receipt by the Radiocommunication Bureau of the complete notification information for the non-GSO system and for the GSO network;~~

Reasons: *Resolves* 1.3 is a transitional measure until WRC-2000, and is therefore no longer required after WRC-2000.

~~1.4 that as of the end of WRC-99, an administration operating a non-GSO FSS system in the band 17.8-18.1 GHz (space-to-Earth) which is in compliance with the limits appearing in Article **S22** as revised, if appropriate, by WRC-99, shall be considered as having fulfilled its obligations under No. **S22.2** with respect to any GSO network operating in the Earth-to-space direction, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO system and of the complete coordination or notification information, as appropriate, for the GSO network;~~

Reasons: This fundamental provision is proposed to be moved to Article S22, hence *resolves* 1.4 may be suppressed. It is also proposed to extend this provision to all the bands subject to Resolution 538 (WRC-97), since RR No. S22.2 now applies to both GSO FSS and GSO BSS protection from non-GSO systems.

~~1.5 that between 22 November 1997 and the end of WRC-99, if an administration operating or bringing into use a GSO system before the end of WRC-99 considers that a non-GSO FSS system proposed by another administration might cause unacceptable interference into its GSO system, then:~~

- ~~the administration operating the GSO system shall send to the administration operating the non-GSO FSS system the technical details upon which its disagreement is based;~~
- ~~the administration operating the non-GSO FSS system shall resolve the difficulties, taking into account especially degradation of picture and sound quality or signal availability with regard to GSO systems in operation;~~

Reasons: *Resolves* 1.5 is a transitional measure until WRC-2000, hence may be suppressed.

~~1.6 that, as of 22 November 1997, a non-GSO FSS system operating in the frequency bands covered by Appendices **S30** and **S30A** shall apply the procedures of Section I of Article **S9**, and Nos. **S9.17** and **S9.17A** Sections I and III of Article **11,** and the procedures of Article **S11/13**;~~

Reasons: *Resolves* 1.6 is no longer required after WRC-2000 because:

1 Articles 11 and 13 have been suppressed; and

2 Sections I and III of S9, S9.17 and S9.17A apply to all non-GSO FSS not subject to S9.11A.

~~1.7 that, as of 22 November 1997, such a system shall be subject, for the coordination with non-GSO systems, to the application of the provisions of § 2.1 of Section II of Resolution **46 (Rev.WRC-97)**/No. **S9.12**;~~

Reasons: This fundamental provision is proposed to be moved to footnotes of Article S5, hence it may be suppressed.

~~1.8 that, as of 22 November 1997, such a system shall apply, using an equivalent power flux-density threshold of –185.3 dB(W/m²/4 kHz) for 99.7% of the time, calculated with the reference 90 cm diameter antenna pattern provided in Annex 5 of Appendix **S30** for Regions 1 and 3, the provisions of No. **S9.8**/Article 7 of Appendix **S30** with respect to assignments which appear in Article 11 of Appendix **S30** with the symbols AE or PE;~~

Reasons: *Resolves* 1.8 is no longer required after WRC-2000 because this provision was intended to provide the protection of 90 cm antennas corresponding to the "old" assignments in the pre-1997 Appendix S30 Plan in Regions 1 and 3. Since the antenna diagram used to protect BSS antennas is now expected to be the same for all Regions and diameters, this specific provision is no longer required.

~~2 that non-GSO FSS systems in the frequency bands referred to in *resolves* 1 above shall not be operated before the end of WRC-99,~~

Reasons: *Resolves* 2 is a transitional measure until WRC-2000, hence is no longer required after WRC-2000.

~~*requests ITU-R*~~

~~*a)* to conduct, as a matter of urgency and in time for consideration by WRC-99, the appropriate technical, operational and regulatory studies to review the regulatory provisions concerning the operation of non-GSO FSS systems in the frequency bands referred to in *resolves* 1.1 above in order to ensure that these provisions ensure appropriate protection of the Plans and their future modifications and do not place unreasonable constraints on the development of non-GSO systems in these bands;~~

~~*b)* to undertake and complete the development of a methodology for calculating the power levels produced by non-GSO FSS systems and the compliance of these levels with the limits referred to in *resolves* 1.1 and 1.2 above;~~

~~*c)* to complete the studies relating to the sharing criteria to be applied for determining the need for coordination between non-GSO FSS systems, with a view to promoting efficient use of spectrum/orbit resources and equitable access to these resources by all countries;~~

~~*d)* to report to the 1999 Conference Preparatory Meeting (CPM-99) on the conclusion of these studies,~~

Reasons: The studies requested by WRC-97 under this resolution have been completed.

~~*instructs the Radiocommunication Bureau*~~

~~as of the end of WRC-99, to review and, if appropriate, revise, any finding previously made on the compliance with the limits contained in Article **S22** of a non-GSO FSS system for which notification information has been received between 22 November 1997 and the end of WRC-99. This review shall be based on the values in Article **S22**, as revised, if appropriate, by WRC-99.~~

Reasons: Review the findings previously made with respect to the compliance with the provisional limits is not required since, in the absence of a verification tool, the BR could not have been in a position to make such a finding.

EUROPEAN COMMON PROPOSALS FOR THE
WORK OF THE CONFERENCE

PART 2

MOBILE-SATELLITE AND RADIONAVIGATION-SATELLITE SERVICES

CONTENTS

Proposals submitted by the following administrations

Denmark, Spain, Estonia, Finland, France, Ireland, Italy, Liechtenstein, Norway, Netherlands, San Marino, Slovenia, Sweden, Turkey

PART 2A

Agenda item 1.9 - Feasibility of an MSS (space-to-Earth) allocation at 1 559-1 567 MHz (Resolutions 213 (Rev.WRC-95) and 220 (WRC-97))

Please add the following at the end of Part 2A of the European common proposals.

Additional proposals relating to MSS allocations in the 1.5-1.7 GHz range

1 Introduction

a) In the introduction to Chapter 2 of the CPM Report to WRC-2000 the issue of MSS spectrum shortage is reported. This draws on conclusions about congestion in the MSS reached by ITU-R in preparation for WARC-92, WRC-95 and WRC-97.

b) Studies in ITU-R have demonstrated that sharing between the MSS (Earth-to-space) and Met-Sat is considered feasible in the band 1 675-1 690 MHz if an appropriate separation distance is kept between Met-Sat receivers and MSS mobile earth stations. ITU-R studies, reported by the CPM state that sharing in the band 1 690-1 698 MHz is not feasible and sharing should not be considered in the band 1 698-1 710 MHz owing to the expected growth in Met-Sat services and unpractical coordination burden.

c) The CPM Report concludes that segmentation of the band 1 675-1 690 MHz on a national or regional basis, may be a method of providing MSS spectrum. Based on current and expected future use of the band 1 675-1 690 MHz, the sub-band 1 683-1 690 MHz is considered most suitable for MSS operation since future METAIDS operations are planned to be limited to the band 1 675-1 683 MHz in many countries. In Regions 2 and 3 meteorological GVAR/S-VISSR satellite earth stations operate in many countries in the band 1 683-1 690 MHz.

d) ITU-R studies reported by the CPM also state that sharing in the sub-band 1 683-1 690 MHz may not be possible in those countries in Regions 2 and 3 where there are large numbers of meteorological GVAR/S-VISSR satellite earth stations. However, the number of countries with large numbers of GVAR/S-VISSR stations is small.

e) To respond to the intention of agenda item 1.9 of WRC-2000, Europe proposes that the sub-band 1 683-1 690 MHz be allocated to the MSS (Earth-to-space) in Regions 1 and 3. Subsequently, Europe also proposes the deletion of the MSS allocation in Region 2 in the bands 1 675-1 683 MHz and 1 690-1 710 MHz.

f) A matching downlink for MSS is proposed in the band 1 518-1 525 MHz. This proposal is intended to give the mobile-satellite service access to the spectrum where possible and harmonize allocations between ITU Regions taking into account relevant sharing conclusions as discussed in the CPM Report. Subsequently, the above-mentioned countries also propose deletion of the MSS allocation in Region 2 in the band 1 492-1 518 MHz.

g) A number of ITU-R Recommendations are available to facilitate the coordination between MSS (space-to-Earth) and the FS in the frequency range 1-3 GHz. Guidance for the use of these Recommendations is given in Recommendation ITU-R M.[8/43].

S5.XXX In the band 1 683-1 690 MHz in Regions 1 and 3, stations in the mobile-satellite service shall not cause harmful interference to stations in the fixed or mobile service.

ADD EUR/13/325

S5.YYY Mobile-satellite systems using the band 1 683-1 690 MHz shall not cause harmful interference to nor constrain the development of the meteorological-satellite service. To avoid causing harmful interference, mobile earth stations shall not operate, except in a non-interfering signalling channel, within the exclusion zones around the meteorological earth stations defined in Recommendation ITU-R SA.1158-1. The mobile-satellite system shall have position determination capabilities to ensure compliance with this provision and the use of this band is subject to coordination under No. **S9.11A**.

SUP EUR/13/326

S5.377

Reasons:

1 Sharing between meteorological aids, fixed service and the mobile-satellite service (uplink) is considered not practicable. It is expected that meteorological aids use can be concentrated in the frequency band 1 675-1 683 MHz in many countries.

2 Recommendation ITU-R SA.1158 concludes that sharing between the meteorological-satellite service and the mobile-satellite service is feasible in the band 1 675-1 690 MHz if protection of the earth stations is guaranteed.

3 ITU-R studies have shown that MSS would not be able to share with meteorological aids in the band 1 683-1 690 MHz and with the meteorological-satellite service in the band 1 690-1 710 MHz.

4 The proposed uplink allocation in 1 683-1 690 MHz also takes into account:

- the need for some administrations to continue to operate terrestrial systems in the band 1 683-1 690 MHz and the need to protect these systems;
- the need for additional MSS allocations.

S5.ZZZ In the band 1 518**-**1 525 MHz, stations in the mobile**-**satellite service shall not cause harmful interference to, or claim protection from, stations of the fixed or mobile service. The use of the band 1 518-1 525 MHz by the mobile**-**satellite service is subject to coordination under No. **S9.11A**. However, no coordination threshold in Article **S21** for space stations of the mobile-satellite service with respect to terrestrial services shall apply to the situation referred to in No. **S5.343**. With respect to the situation referred to in No. **S5.343**, the requirement for coordination in the band 1 518-1 525 MHz will be determined by band overlap.

Reasons:

1 **Other services, including analogue and digital fixed services, in the band 1 518-1 525 MHz are protected from the MSS (including both GSO and non-GSO services) by pfd thresholds as prescribed in Table S5-2 of Appendix S5.**

2 **High-density mobile applications for one country in Region 3 are protected from MSS transmissions as prescribed in Table S5-2 of Appendix S5 as referenced in footnote S5.348A.**

3 Material from S5.348 concerning the applicability of coordination thresholds has been included in this footnote.

4 These proposals contribute to alleviate the spectrum shortage for MSS and also to harmonize allocations between ITU Regions.

SUP EUR/13/329

S5.348

MOD EUR/13/330

S5.348A In the band ~~1 492~~1 518**-**1 525 MHz, the coordination threshold in terms of the power flux-density levels at the surface of the Earth in application of No. **S9.11A** for space stations in the mobile-satellite (space-to-Earth) service, with respect to the land mobile service use for specialized mobile radios or used in conjunction with public switched telecommunication networks (PSTN) operating within the territory of Japan, shall be –150 dB(W/m^2) in any 4 kHz band for all angles of arrival, instead of those given in Table S5-2 of Appendix **S5**. The above threshold level of the power flux-density shall apply until it is changed by a competent world radiocommunication conference.

SUP EUR/13/331

RESOLUTION 220 (WRC-97)

Studies to consider the feasibility of use of a portion of the band 1 559-1 610 MHz by the mobile-satellite service (space-to-Earth)

Reasons: A new MSS downlink allocation in the band 1 518-1 525 MHz is providing an alternative to the band 1 559-1 567 MHz. It is therefore unnecessary to continue the studies in this band.

SUP EUR/13/332

RESOLUTION 213 (Rev.WRC-95)

Sharing studies concerning possible use of the band 1 675-1 710 MHz by the mobile-satellite service

Reasons:

1 Studies in the band 1 675-1 710 MHz have been concluded and lead to the proposed new uplink MSS allocation in the band 1 683-1 690 MHz.

2 A suitable downlink band for MSS (1 518-1 525 MHz) is proposed.

MOD EUR/13/333

APPENDIX S5

ANNEX 1

MOD EUR/13/334

1.2.3.1 Method for the determination of the need for coordination between MSS space stations (space-to-Earth) and other terrestrial services sharing the same frequency band in the 1 to 3 GHz range

Coordination of assignments for transmitting space stations of the MSS with respect to terrestrial services is not required if the pfd produced at the Earth's surface or the FDP of a station in the fixed service does not exceed the threshold values shown in the following table.

TABLE S5-2

Frequency band (MHz)	**Terrestrial service to be protected**	**Coordination threshold values**				
		GSO space stations		**Non-GSO space stations**		
		pfd (per space station) calculation factors (NOTE 2)		**pfd (per space station) calculation factors (NOTE 2)**		**% FDP (in 1 MHz) (NOTE 1)**
		P	***r* dB/ degrees**	***P***	***r* dB/ degrees**	
~~1 492~~1 518~~-~~ 1 525	Analogue FS telephony (NOTE 5)	–146 dB(W/m^2) in 4 kHz and –128 dB(W/m^2) in 1 MHz	0.5	–146 dB(W/m^2) in 4 kHz and –128 dB(W/m^2) in 1 MHz	0.5	
	All other cases (NOTE 4)	–128 dB(W/m^2) in 1 MHz	0.5	–128 dB(W/m^2) in 1 MHz	0.5	25

NOTE 4 – Exceptions for the band ~~1 492~~1 518-1 525 MHz are as follows:
4.1 For the land mobile service on the territory of Japan (No. **S5.348A**): –150 dB(W/m^2) in 4 kHz at all angles of arrival is applicable to all satellite space-to-Earth emissions.
4.2 For the aeronautical mobile service for telemetry (No. **S5.343**), the requirement for coordination is determined by frequency overlap (No. **S5.~~348~~ZZZ**).

Formatted

Reasons: The proposed modifications to Appendix S5 are consequences of the deletion of MSS from the band 1 492-1 518 MHz, 1 675-1 683 MHz and 1 690-1 710 MHz in Region 2.

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

PART 2

MOBILE-SATELLITE AND RADIONAVIGATION-SATELLITE SERVICES

CONTENTS

Proposals submitted by the following administrations

[Albania, Germany, Andorra, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Cyprus, Vatican, Croatia, Denmark, Spain, Estonia, Finland, France, Greece, Hungary, Ireland, Iceland, Italy, Latvia, The Former Yugoslav Republic of Macedonia, Liechtenstein, Lithuania, Luxembourg, Malta, Moldova, Monaco, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, San Marino, Slovenia, Sweden, Switzerland, Turkey, Ukraine]

PART 2D

Agenda item 1.15.1 - Addition of RNSS (space-to-space) to RNSS (space-to-Earth)

Please add the following in the introduction and in the corresponding sub-parts of Part 2D of the European common proposals.

Introduction

Under agenda item 1.15.2, the compatibility of RNSS (space-to-space) use of radionavigation-satellite systems with other services in the bands 1 215-1 260 MHz and 1 559-1 610 MHz has been demonstrated, primarily on the basis that space reception of RNSS signals will be less susceptible to interference than terrestrial reception of these same signals.

It is considered that this conclusion may be extended to the bands for which new RNSS allocations are proposed.

The above-mentioned administrations therefore propose the following additions to the European common proposals in Parts 2D1, 2D2, 2D3 and 2D4 contained in Addendum 2 to Document CMR2000/13.

These additions have no impact on the original proposals.

PART 2D1

RNSS (space-to-Earth) (space-to-space) 960-1 215 MHz

In proposal EUR/13/63

In **S5.328A**, line 2, add the words “(space-to-space)” after the words “(space-to-Earth)”.

PART 2D2

RNSS (space-to-Earth) (space-to-space) 1 260-1 300 MHz

In proposal EUR/13/65

In the Table of Frequency Allocations, add “(space-to-space)” after “(space-to-Earth) ”, as follows:

MOD

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 260-1 300	EARTH EXPLORATION-SATELLITE (active) RADIOLOCATION SPACE RESEARCH (active) RADIONAVIGATION-SATELLITE (space-to-Earth) (space-to-space) MOD S5.329 Amateur S5.282 S5.330 S5.331 S5.332 S5.334 S5.335	

PART 2D3

Proposal for a new resolution - Use of RNSS in the bands 1 151-1 300 MHz

In proposal EUR/13/67

1) In the title of Resolution YYY [EUR/13/5] (WRC 2000), add “(space-to-space)” after “(space-to-Earth)”.

2) In *considering d)*, in line 2 and again in line 4, add “and (space-to-space)” after “(space-to-Earth)”.

3) In *resolves* 1 line 1 and in *resolves* 2 line 3, add “or (space-to-space)” after “RNSS (space-to-Earth)”.

4) In *resolves* 2 line 1 and line 6, add “and/or (space-to-space)” after “RNSS (space-to-Earth)”.

5) In *requests ITU-R* 1, in line 3 and again in line 4, add “and (space-to-space)” after “RNSS (space-to-Earth)”.

In *instructs the Radiocommunication Bureau*, line 2, add “and/or (space-to-space)” after “RNSS (space-to-Earth)”.

PART 2D4

RNSS (space-to-Earth) (space-to-space) and RNSS (Earth-to-space) in the band 5 000-5 030 MHz

In proposal EUR/13/70

In **S5.444B**, line 2, add “(space-to-space)” after “radionavigation-satellite service (space-to-Earth)” and in line 6 add “or (space-to-space)” after “RNSS (space-to-Earth)”.

Reasons: To propose primary allocations to RNSS (space-to-space) in the bands 1 151-1 215 MHz, 1 260-1 300 MHz and 5 010-5 030 MHz.

PLENARY MEETING

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

PART 2

Mobile-satellite and radionavigation-satellite services

CONTENTS

Proposals submitted by the following administrations

Germany, Austria, Belgium, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 2A

Agenda item 1.9 - Feasibility of an MSS (space-to-Earth) allocation at 1 559-1 567 MHz (Resolutions 213 (Rev.WRC-95) and 220 (WRC-97))

Introduction

Studies in ITU-R have demonstrated that the frequency band 1 559-1 567 MHz can not be shared co-frequency with radionavigation-satellite service (RNSS) systems. On the other hand, as reported in the CPM text, some studies have shown that the existing RNSS systems would be protected against interference. Considering the development of new RNSS systems which are planned to be introduced in this band, Europe proposes no change in the frequency band 1 559-1 567 MHz at this WRC.

In order to answer to Resolution 213, consideration is being given to a European common proposal proposing an alternative downlink allocation for MSS.

It should be noted that the frequency band 1 559-1 567 MHz is also dealt with under agenda items 1.15.2 and 1.15.3.

ARTICLE S5

NOC EUR/13/37

1 525-1 610 MHz

Allocation to services

1 559-1 610	AERONAUTICAL RADIONAVIGATION RADIONAVIGATION-SATELLITE (space-to-Earth) S5.341 S5.355 S5.359 S5.363	

Reasons: There should be no new allocation to MSS in this band at this WRC since new RNSS/ARNS systems are planned to be introduced in the near future in the band 1 559-1 567 MHz.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 2B

Agenda item 1.10 - Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

Introduction

In its agenda item 1.10, WRC-2000 is invited to consider the results of ITU-R studies carried out in accordance with Resolution 218 (WRC-97), "Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service", and take appropriate action on this subject.

The main objective of Resolution 218 (WRC-97) is to achieve the most flexible and practical use of the generic allocations in 1.5/1.6 GHz, while satisfying the requirements of distress, urgency and safety communications. Although Resolution 218 (WRC-97) has specifically requested studies on spectrum requirements and inter-system pre-emption, all alternatives which may satisfy this main objective were explored.

ITU-R WP 8D studies could not conclude on future spectrum requirements for GMDSS distress, urgency and safety communications and for AMS(R)S communications. Furthermore, no study has been carried out regarding the feasibility of prioritizing and pre-empting between different MSS networks. However, the coordination process satisfactorily provides spectrum for GMDSS and AMS(R)S today. In the future, to ensure that spectrum will be made available, as required, to satisfy the spectrum requirements of AMS(R)S communications with priority 1 to 6 of Article S44 and of distress, urgency and safety GMDSS communications, Europe proposes that a new resolution (Resolution [EUR/13/4]) be incorporated by reference to the present footnotes. Europe also proposes the suppression of Resolution 218 (WRC-97). In addition, Europe proposes to extend the frequency range of S5.357A to the bands 1 555-1 559 MHz and 1 656.5-1 660.5 MHz.

Resolutions

SUP EUR/13/43

RESOLUTION 218 (WRC-97)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

ADD EUR/13/44

RESOLUTION [EUR/13/4] (WRC-2000)

Assignment of frequencies for maritime distress, urgency and safety communications of the GMDSS and communications of priority 1 to 6 of the AMS(R)S services in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the World Radiocommunication Conference 1997 allocated the bands 1 525-1 559 MHz (space-to-Earth) and 1 626.5-1 660.5 MHz (Earth-to-space) to the mobile-satellite service (MSS);

b) that prior to WRC-97 these bands were segmented between the maritime, aeronautical and land mobile-satellite service;

c) that the World Radiocommunication Conference 1997 adopted footnotes **S5.353A** and **S5.357A** giving priority in the application of the procedure of **S9.11A** to accommodating the spectrum requirements for distress, urgency and safety communications of the global maritime distress and safety system (GMDSS) and the aeronautical mobile-satellite (R) service communications with priority 1 to 6 of Article **S44**,

considering also

a) that global and regional mobile-satellite systems are being coordinated in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz and that Article **S9** provides the international framework for coordination agreements;

b) that such coordination agreements are currently based on the capacity planning approach, under which several administrations periodically coordinate access to the amount of spectrum needed to accommodate their validated requirements;

c) that the GMDSS and AMS(R)S spectrum requirements are currently satisfied through the capacity planning approach;

d) that in the long term, to ensure that the spectrum requirements of GMDSS and AMS(R)S are met, it might become necessary to enforce the coordination priority provided to distress, urgency and safety communications under footnotes **S5.353A** and **S5.357A**;

e) that the GMDSS distress, urgency and safety communications traffic and the AMS(R)S communications traffic with priority 1 to 6 of Article **S44** in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz is expected to increase over time,

recognizing

a) that Table **S15-2** of Appendix **S15** to the Radio Regulations identifies the bands 1 530-1 544 MHz (space-to-Earth) and 1 626.5-1 645.5 MHz (Earth-to-space) for distress and safety purposes in the maritime mobile-satellite service as well as for routine non-safety purposes;

b) that priority access and immediate availability of spectrum for maritime distress, urgency and safety communications of the GMDSS and AMS(R)S communications with priority 1 to 6 of Article **S44** is of vital importance for the safety of life,

recognizing also

a) that maritime general communications is defined under the International Convention for the Safety of Life at Sea (SOLAS) as operational and public correspondence, other than distress, urgency and safety, conducted by radio;

b) that some parts of maritime general communications, such as communications on medical advice, maritime assistance, navigational and meteorological message are related to safety at sea;

c) that maritime distress, urgency and safety communications of the GMDSS in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz include communications with priority 1 to 3 and safety related communications carried under priority 4 of Article **S53**;

d) that the ICAO has adopted standards and recommended practices (SARPs) addressing satellite communications equipment in aircraft in accordance with the Convention on International Civil Aviation;

e) that all air traffic communications as defined in the ICAO Annex 10 fall within categories 1 to 6 of Article **S44**;

f) that aircraft flying along international air routes must maintain watch and carry out continuous safety communications as required by the appropriate authority,

resolves

that in frequency coordination agreements for the mobile-satellite services in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz, administrations shall ensure accommodation of the spectrum requirements for all distress, urgency and safety communications of the global maritime distress and safety system (GMDSS) as defined in Articles **S32** and **S33** in the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz and the aeronautical mobile-satellite (R) service communications with priority 1 to 6 of Article **S44** in the bands 1 545-1 559 MHz and 1 646.5-1 660.5 MHz.

Reasons: The coordination process satisfactorily provides spectrum for GMDSS and AMS(R)S today and is expected to continue to do so in the future. Strengthening of current provisions would ensure that spectrum will be made available in the future, as required, to satisfy the spectrum requirements of AMS(R)S communications with priority 1 to 6 of Article S44 and of distress, urgency and safety GMDSS communications. The best way to strengthen the provisions and achieving the most flexible and practical use of the generic allocations in 1.5/1.6 GHz would be in the form of a resolution (Resolution [EUR/13/4]) to be incorporated by reference to the present footnotes. This would avoid the need to modify the footnotes and allows all the relevant background information to be explained.

As a result, Resolution 218 is no longer required since the effectiveness of the coordination process, appropriately reinforced by the proposed Resolution [EUR/13/4], eliminates the need to determine the future spectrum requirements of GMDSS and AMS(R)S or to further study the feasibility of inter-system prioritization and pre-emption.

Extension of S5.357A is expected to improve the long-term assurance that spectrum will be available for the AMS(R)S and may enable the suppression of S5.362A.

The protection of the radio astronomy service in ensured by S5.376A.

The applicable procedures to be referenced in the two footnotes are those of Section II of Article S9 instead of S9.11A to take into account the coordination of GSO systems vis-à-vis other GSO systems.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 2C

Agenda item 1.11

PART 2C1

Non-GSO MSS under 1 GHz - Resolution 214 (Rev.WRC-97)

1 Introduction

Resolution 214 (Rev.WRC-97) “Sharing studies relating to consideration of the allocation of bands below 1 GHz to the non-geostationary mobile-satellite service”.

Calls for studies on operational and technical means to facilitate sharing between non-GSO MSS and other radiocommunication services having allocations below 1 GHz.

WRC-2000 is invited to consider additional allocations on a worldwide basis for the non-GSO below 1 GHz and to review the constraints on non-GSO MSS allocations in the bands below 1 GHz.

ITU-R is requested to review the operating constraints on the mobile earth stations (MES) necessary to protect the existing and planned terrestrial services, as well as any mitigation technique which can improve compatibility and permit the continued development of all of the services to which the bands are allocated.

2 Proposals

Europe proposes no changes to the existing provisions in the Radio Regulations regarding the allocations to the MSS in the bands 137-138 MHz, 148-149.9 MHz, 149.9-150.05 MHz, 312-315 MHz, 387-390 MHz, 399.9-400.05 MHz and 400.15-401 MHz.

APPENDIX S5

Identification of administrations with which coordination is to be effected or agreement sought under the provisions of Article S9

ANNEX 1

NOC EUR/13/59

1 Coordination thresholds for sharing between MSS (space-to-Earth) and terrestrial services in the same frequency bands and between non-GSO MSS feeder links (space-to-Earth) and terrestrial services in the same frequency bands

1.1 Below 1 GHz*

1.1.1 In the bands 137-138 MHz and 400.15-401 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to terrestrial services (except aeronautical mobile (OR) service networks operated by the administrations listed in Nos. **S5.204** and **S5.206** as of 1 November 1996) is required only if the pfd produced by this space station exceeds –125 dB (W/m^2/4 kHz) at the Earth's surface.

1.1.2 In the band 137-138 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to the aeronautical mobile (OR) service is required only if the pfd produced by this space station at the Earth's surface exceeds:

– –125 dB (W/m^2/4 kHz) for networks for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996;

– –140 dB (W/m^2/4 kHz) for networks for which complete Appendix **S4**/**3** coordination information has been received by the Bureau after 1 November 1996 for the administrations referred to in § 1.1.1 above.

1.1.3 In the band 137-138 MHz, coordination is also required for a space station on a replacement satellite of a MSS network for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996 and the pfd exceeds −125 dB(W/m^2/4 kHz) at the Earth's surface for the administrations referred to in § 1.1.1 above.

NOTE - Section 3.2 and Table 1 of Appendix S5 contain provisions regarding coordination distances for earth stations operating at frequencies below 1 GHz.

Europe proposes to NOC such provisions but, under agenda item 1.3, to move them in Appendix S7, in order to have in one place in the Radio Regulations all the provisions related to the coordination distance.

* These provisions apply only to the MSS.

Reasons: The bands below 1 GHz are heavily used by many different systems of various services, and therefore the protection of the existing and planned systems from MSS interference, as afforded by the existing provisions in the Radio Regulations, shall continue to be ensured.

Europe has reviewed the constraints in the bands already allocated to MSS and has agreed to propose no changes in the bands 137-138 MHz, 148-149.9 MHz, 149.9-150.05 MHz, 312-315 MHz, 387-390 MHz, 399.9-400.05 MHz, 400.15-401 MHz, as the existing regulatory constraints allow the use of these bands by MSS, while fully protecting the existing and planned systems and services.

This has been demonstrated by MSS systems already in operation.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 2C2

Non-GSO/MSS below 1 GHz - Resolution 219 (WRC-97)

1 Introduction

WRC-2000 agenda item 1.11 invites the Conference "to consider constraints on existing allocations and to consider additional allocations on a worldwide basis for non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions 214 (Rev.WRC-97) and Resolution 219 (WRC-97)".

Resolution 219 "Studies relating to consideration of the allocation to the non-geostationary mobile-satellite service in the meteorological aids band 405-406 MHz and the impact on primary services allocated in the adjacent bands"

invites ITU-R, in cooperation with WMO, to study for WRC-2000 the current and future requirement of the meteorological aids service (MetAids) and a possible transition plan of the same service out of the bands 405-406 MHz in order to introduce MSS, since sharing between the two services is considered not feasible.

Based on the assessment invoked by Resolution 219 (WRC-97), Europe considers that the band 405-406 MHz is needed in future for MetAids. Consequently, transition plans are not appropriate and the suppression of Resolution 219 is proposed.

RESOLUTION 219 (WRC-97)

Studies relating to consideration of the allocation to the non-geostationary mobile-satellite service in the meteorological aids band 405-406 MHz and the impact on primary services allocated in the adjacent bands

Reasons: MetAids, allocated in the frequency band 400.15-406 MHz, are essential for making upper air measurements for weather forecasting and other applications: environmental monitoring, protection of life and property, space operations, research, and industry. There has been increasing usage of MetAids in the past decade.

MetAids now has only 3 MHz primary usable spectrum at 400 MHz since WARC-92 allocated the 400.15-401 MHz portion of band to MSS and WRC-97 upgraded the MetSat service and EESS in the band 401-403 MHz to primary status.

MetAid industry and users continuously apply new technology to improve the characteristics of the consumable radiosondes which enables new users to find more free channels in the band 401-406 MHz in order to respond to the increased demand.

The use of new crystal-controlled radiosondes reduces the frequency drift and increases the number of available channels in the band. This facilitates the increasing usage of the MetAids service in those countries which can bear the additional annual cost of new radiosondes, but has a negative impact on the service expansion in other countries with a very limited budget.

Furthermore, all the receivers from all manufacturers have been designed for the current electromagnetic environment. If MSS were be allocated in the band 405-406 MHz most of the existing MetAids receivers would need to be replaced in order to ensure continuation of the operations. The cost of this change would be high compared to the funds available and beyond the service financial resources.

Because all of the band 403-406 MHz is needed to secure the existing and future radiosondes operations, allocation of band 405-406 MHz to MSS is not advisable.

As a reply to the assessment invoked by Resolution 219 (WRC-97), Europe considers that the band 405-406 MHz is needed in the foreseeable future for MetAids. Consequently, transition plans are not appropriate and suppression of Resolution 219 is proposed.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Denmark, Spain, Estonia, Finland, France, Hungary, Iceland, Italy, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Turkey, Ukraine

PART 2D

Agenda item 1.15

PART 2D1

Agenda item 1.15.1 - RNSS (space-to-Earth) 960-1 215 MHz

Introduction

1 In accordance with the Radio Regulations the band 960-1 215 MHz is allocated on a primary basis to the aeronautical radionavigation service in all ITU regions.

2 In accordance to footnote S5.328 the band 960-1 215 MHz is reserved on a worldwide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based facilities. The 1 151-1 215 MHz portion of that band is used by ground DME and TACAN transponders.

3 New allocations for the radionavigation-satellite service (RNSS) are required to support developments of systems with higher reliability and accuracy, because the already allocated bands are not wide enough to accommodate the larger bandwidth. In addition the new allocation should be wide enough to accommodate multiple systems without operational constraints.

4 Results of ITU-R studies show that additional radionavigation-satellite service signals in the band 1 151-1 215 MHz can be designed that do not cause harmful interference to existing aeronautical radionavigation service systems (SSR, ACAS, DME, TACAN). In order to ensure protection of the aeronautical radionavigation service systems a provisional pfd limit for the radionavigation-satellite service is proposed subject to revision by WRC-03 in accordance with Resolution YYY [EUR/13/5].

5 Results of ITU-R studies show that radionavigation-satellite service receivers onboard aircraft could be affected by emissions of aeronautical radionavigation service systems on board. ICAO considers any onboard compatibility problems with other aeronautical systems an internal aviation and industry matter.

6 Results of ITU-R studies show that airborne RNSS receivers are not compatible with the existing environment, in which the DME/TACAN constitutes the primary source of interference, in wide geographical areas (e.g., western Europe, parts of the United States, Japan), where a dense DME/TACAN environment is encountered. This is especially true at high altitude, but the problem may also appear at altitudes lower than 10 000 ft in certain areas.

Frequency reassignment of a significant number of ground DME/TACAN transponders would be required if high altitude use of the RNSS signal is desired in those areas and if the RNSS signal is not adapted to cope with this situation. Taking into account the congestion in the European high density areas, studies by European aviation have demonstrated that such reassignment is not feasible for the current and future use of DME/TACAN in Europe.

The incompatibility could be resolved by introduction of operational restrictions on the use of RNSS.

The feasibility of airborne reception of RNSS signal in the current RF environment can also be improved through careful RNSS design, such as the use of an additional narrow-band signal, and is under investigation.

No recoordination or decommissioning of existing aeronautical radionavigation service systems is acceptable for civil aviation authorities and the use of radionavigation-satellite service for civil aviation purposes is depending on system verification and validation. Anyhow a backup system is required for cases of radionavigation-satellite service breakdown. Europe intends to use DME.

Ground-based RNSS receivers will suffer interference only in very small areas because of their limited line-of-sight to existing ARNS transmitters.

7 Sharing of the same spectrum by two or three different RNSS networks would require compatible power levels and signal types in the design and operation of the different networks. Use of independent spectrum by each RNSS network would decrease the chance of a single interference incident affecting more than one network.

960-1 215	AERONAUTICAL RADIONAVIGATION S5.328 ADD S5.328A	

ADD EUR/13/63

S5.328A *Additional allocation:* the band 1 151-1 215 MHz is also allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis. The aggregate power flux-density produced by all the space stations within any radionavigation-satellite system at the Earth's surface shall not exceed –111 dBW/m^2/MHz for all angles of arrival. The provisions of Resolution **YYY** [EUR/13/5] apply. Stations in the radionavigation-satellite service shall not claim protection from stations of the aeronautical-radionavigation service.

Reasons: Radionavigation-satellite service systems will be provided with adequate spectrum while giving priority to the aeronautical-radionavigation service.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Slovenia, Sweden, Switzerland, Turkey

PART 2D2

Agenda item 1.15.1 - RNSS (space-to-Earth) 1 260-1 300 MHz

Introduction

1 In accordance with the Radio Regulations the band 1 260-1 300 MHz is allocated on a primary basis to the Earth exploration-satellite service (active), radiolocation service and the space research service (active) and on a secondary basis to the amateur service in all ITU regions. In addition the band is primary allocated by footnote S5.331 to the radionavigation service in several countries. According to S5.282 the amateur-satellite service (Earth-to-space) may operate in the band 1 260-1 270 MHz subject to not causing interference to other services operating in accordance with the table (see S5.43). The primary allocations are the same as in the band 1 215-1 260 MHz which is already additionally allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis.

2 New allocations for the radionavigation-satellite service (RNSS) are required to support developments of systems with higher reliability and accuracy, because the already allocated bands are not wide enough to accommodate the larger bandwidth. In addition the new allocation should be wide enough to accommodate multiple systems.

3 The sharing scenario in the band 1 260-1 300 MHz is considered to be similar to the band 1 215-1 260 MHz where RNSS systems have been in operation successfully for several years for non-safety of life applications. The use of the band by high powered radars does not allow safety of life applications due to the risk of a RNSS receiver burnout at a distance up to 700 m if mainbeam coupling is assumed. For the protection of the radiolocation and radionavigation systems in the whole of the band 1 215-1 300 MHz a provisional pfd limit of -133 dBW/m^2/MHz per each single satellite for the RNSS is proposed subject to revision by WRC-03 in accordance with Resolution YYY [EUR/13/5].

4 Ground-based radionavigation-satellite service receivers of a suitable design will suffer interference only in small areas around the location of the radars.

ADD EUR/13/67

RESOLUTION YYY [EUR/13/5] (WRC-2000)

Use of the frequency bands between 1 151-1 300 MHz by systems of the radionavigation-satellite service (space-to-Earth)

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that in accordance with the Radio Regulations the band 960-1 215 MHz is allocated on a primary basis to the aeronautical-radionavigation service in all ITU regions;

b) that in accordance to footnote **S5.328** the band 960-1 215 MHz is reserved on a worldwide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based facilities.

c) that in accordance with the Radio Regulations the bands between 1 215-1 300 MHz are allocated on a primary basis to the Earth exploration-satellite service (active), radiolocation service and the space research service (active) and the bands between 1 240-1 300 MHz additionally on a secondary basis to the amateur service in all ITU regions. In addition the bands are primary allocated by footnote **S5.331** to the radionavigation service in several countries. According to **S5.282** the amateur-satellite service (Earth-to-space) may operate in the band 1 260-1 270 MHz subject to not causing interference to other services operating in accordance with the table (see **S5.43**);

d) that this Conference has decided to introduce in Article **S5** of the Radio Regulations a new allocation for the radionavigation-satellite service (space-to-Earth) in the frequency bands 1 151-1 215 MHz and 1 260-1 300 MHz with provisional pfd limits and to introduce a provisional pfd limit also for the RNSS (space-to-Earth) allocation in the band 1 215-1 260 MHz;

e) that a provisional value of limiting pfds for the RNSS service in the new footnotes have been agreed which require verification and possible amendment,

resolves

1 that as of 2 June 2000 a RNSS (space-to-Earth) system operating in the frequency bands 1 151-1 300 MHz shall comply with the provisional limits specified in the relevant sub-band;

2 that such a system shall, as of the end of WRC-03, comply with the limits specified in the relevant sub-band, as revised, if appropriate, by WRC-03, irrespective of the date of receipt of the complete notification information relating to the RNSS (space-to-Earth) system;

3 that as of the end of WRC-03, an administration operating a RNSS (space-to-Earth) system in the relevant sub-band which is in compliance with the limits appearing in the relevant sub-band as revised, if appropriate, by WRC-03, shall be considered as ensuring the protection of the aeronautical radionavigation, the radionavigation and the radiolocation services from harmful interference irrespective of the dates of receipt by the Bureau of the complete notification information for the RNSS (space-to-Earth) system,

requests ITU-R

1 to conduct, as a matter of urgency and in time for consideration by WRC-03, the appropriate technical, operational and regulatory studies to review the provisional pfd limits concerning the operation of RNSS (space-to-Earth) systems in the frequency bands 1 151-1 300 MHz in order to ensure that the RNSS (space-to-Earth) will not cause harmful interference to the aeronautical radionavigation, the radionavigation and the radiolocation services;

2 to conduct, as a matter of urgency and in time for consideration by WRC-03, the appropriate technical, operational and regulatory studies on the overall compatibility between RNSS and ARNS in the band 960-1 215 MHz;

3 to report to CPM-03 on the conclusions of these studies,

instructs the Radiocommunication Bureau

as of the end of WRC-03, to review and, if appropriate, revise, any finding previously made on the compliance with the limits contained in relevant sub-bands of a RNSS (space-to-Earth) system for which notification information has been received before the end of WRC-03. This review shall be based on the values in the relevant sub-bands, as revised, if appropriate, by WRC-03,

requests the Secretary-General

to communicate the contents of this Resolution to the ICAO for such actions as they may consider appropriate.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey

PART 2D4

Agenda item 1.15.1 - RNSS (space-to-Earth) and RNSS (Earth-to-space) in the band 5 000-5 030 MHz

Introduction

1 In accordance with the Radio Regulations the band 5 000-5 150 MHz is allocated on a primary basis to the aeronautical-radionavigation service in all ITU regions.

2 In accordance to footnote S5.444 the band 5 000-5 150 MHz is to be used for the operation of the international standard system (microwave landing system, MLS) for precision approach and landing. The requirements of this system shall take precedence over other uses of this band. For the use of the band 5 091-5 150 MHz, No. S5.444A and Resolution 114 (WRC-95) apply. In the first phase MLS will only be introduced in the band 5 030-5 091 MHz. Due to the development and utilization of the radionavigation-satellite service in the longer term MLS might not be introduced to the extent originally planned. However in the short to medium term the use of MLS could increase due to constraints on other landing aids.

3 In accordance to footnote S5.444A the band 5 091-5 150 MHz is also allocated to the FSS (Earth-to-space) for use by MSS feeder links under certain conditions, which are related to the optional MLS extension above 5 091 MHz.

4 The band 5 000-5 030 MHz is not used for nor intended to be used for the international standard MLS system. It is used very lightly for a ship borne landing system (~ 5 systems worldwide).

5 New allocations for the radionavigation-satellite service are required to support developments of systems with higher reliability and accuracy, because the already allocated bands are not wide enough to accommodate the larger bandwidth. Proposals for radionavigation-satellite service systems have been made in which the satellites are need to be synchronized to terrestrial radio beacons (~ 50 beacons worldwide). For these systems radionavigation-satellite service (Earth-to-space) allocations are needed.

6 Results of ITU-R studies show that additional radionavigation-satellite service (space-to-Earth) signals in the band 5 000-5 150 MHz:

a) need a guardband of at least 10 MHz to protect the RAS band immediately below 5 000 MHz;

b) can accommodate the protection requirements of the RAS contained in Recommendation ITU-R RA.769-1 within the RAS allocated bands. In order not to cause harmful interference to the radio astronomy service in the band 4 990-5 000 MHz, the aggregate power flux-density radiated in the 4 990-5 000 MHz band by all the space stations within any RNSS (space-to-Earth) system operating in the 5 010-5 030 MHz band shall not exceed the level of –171 dB(W/m^2) in a 10 MHz bandwidth into any radio astronomy observatory site for more than 2% of the time;

c) are compatible with MLS operations in the band 5 030-5 150 MHz if its power flux-density at the surface of the Earth does not exceed the level of –124.5 dB(W/m^2) in a 150 kHz band, as specified by ICAO;

d) can not share co-frequency with MLS in the band 5 030-5 150 MHz due to unacceptable interference from MLS into airborne radionavigation-satellite service receivers up to the radio horizon; and

e) can not share co-frequency with MSS feeder links in the band 5 091-5 150 MHz due to unacceptable interference from feeder links into radionavigation-satellite service receivers up to the radio horizon.

7 The results of the ITU-R studies show that additional radionavigation-satellite service (Earth-to-space) signals in the band 5 000-5 030 MHz can protect the RAS allocation immediately below 5 000 MHz and the MLS usage above 5 030 MHz by careful location of the beacons.

8 It should be noted that use of the band 5 000-5 030 MHz for terrestrial beacons would preclude the worldwide use of the band for a radionavigation-satellite service (space-to-Earth) application.

9 If the allocation to the RNSS (space-to-Earth) in the band 5 010-5 030 MHz is not done, the allocation to the RNSS (Earth-to-space) could be extended to the band 5 000-5 030 MHz.

MOD EUR/13/68

4 800-5 830 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
5 000-5 150	AERONAUTICAL RADIONAVIGATION S5.367 MOD S5.444 S5.444A ADD S5.444B	

MOD EUR/13/69

S5.444 The band ~~5 000~~5 030-5 150 MHz is to be used for the operation of the international standard system (microwave landing system) for precision approach and landing. The requirements of this system shall take precedence over other uses of this band. For the use of this band, No. **S5.444A** and Resolution **114 (WRC-95)** apply.

ADD EUR/13/70

S5.444B *Additional allocation:* The band 5 010-5 030 MHz is also allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis. The band 5 000-5 010 MHz is also allocated to the radionavigation-satellite service (Earth-to-space) on a primary basis. In order not to cause harmful interference to the radio astronomy service in the band 4 990-5 000 MHz, the aggregate power flux-density radiated in the 4 990-5 000 MHz band by all the space stations within any RNSS (space-to-Earth) system operating in the 5 010-5 030 MHz band shall not exceed the level of –171 dB(W/m^2) in a 10 MHz bandwidth into any radio astronomy observatory site for more than 2% of the time.

Reasons: The radionavigation-satellite service would be provided with only 20 MHz which may not be wide enough to accommodate the RNSS requirement but would not constrain the use of the bands above 5 030 MHz by other services. The possibility of an adjacent upper extension of this allocation could be considered when the outcome of the studies required by Resolution 114 is made available.

This also provides additional spectrum for the RNSS (Earth-to-space).

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey

PART 2D5

Agenda item 1.15.1 - RNSS (Earth-to-space) 1 300-1 350 MHz

Introduction

1 In accordance with the Radio Regulations the band 1 300-1 350 MHz is allocated on a primary basis to the aeronautical radionavigation service and on a secondary basis to the radiolocation service in all ITU regions.

2 New allocations to the radionavigation-satellite service are required to support developments of systems with higher reliability and accuracy, because the already allocated bands are not wide enough to accommodate the larger bandwidth. Proposals for radionavigation-satellite service systems have been made in which the satellites are need to be synchronized to terrestrial radio beacons (~ 50 beacons worldwide). For these systems radionavigation-satellite service (Earth-to-space) allocations are needed.

3 Results of ITU-R studies show that additional radionavigation-satellite service (Earth-to-space) signals in the band 1 300-1 350 MHz:

a) can protect the aeronautical radionavigation service and radiolocation service between 1 300-1 350 MHz by careful location of the beacons. The required separation distance between the radar and the beacon is less then 60 km;

b) are compatible with the emissions of the radars between 1 300-1 350 MHz with an adequate tuning of the AGC loop in the receiver.

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 2D6

Agenda item 1.15.2 - RNSS (space-to-Earth) at 1 215-1 260 MHz and 1 559-1 610 MHz

Introduction

Two radionavigation-satellite systems, GPS and GLONASS, currently use the bands 1 215-1 260 MHz and 1 559-1 610 MHz. GPS signals are already being received by orbiting satellites (e.g. TOPEX/Poseidon, AMSAT-3D, Orbcomm, Globalstar and IKONOS-1) and both GPS and GLONASS are planned to be used for a range of space applications of navigation, localization and timing.

The use of RNSS signals is presently protected only through a space-to-Earth allocation in these bands. The addition of the space-to-space direction, which is proposed in this ECP, would give protection to navigation systems on board scientific satellites, Earth-observation satellites, communications satellites and manned spacecraft.

However, provisions should be taken to ensure that this new allocation will not put burden on the operating and notified systems, which have been proved to create only limited and short-term interference to spaceborne RNSS receivers.

Also, interference protection of new RNSS (space-to-space) services should not be allowed to place new constraints on other existing services (e.g. MSS in adjacent bands). In particular, studies have demonstrated that constraint might exceed those defined in Recommendation ITU-R M.1343 for MSS uplink transmission in case where protection would be required for an RNSS carrier above 1 607 MHz.

PART 2D7

Agenda item 1.15.3 - Status of allocations to services other than RNSS at 1 559-1 610 MHz

Introduction

1 In accordance with the Radio Regulations the band 1 559-1 610 MHz is allocated on a primary basis to the aeronautical radionavigation and the radionavigation-satellite service in all ITU regions.

2 In accordance with footnotes RR S5.355 and S5.359 some administrations additionally allocate the band 1 559-1 610 MHz on the primary and secondary basis to the fixed service.

3 RR provision No. S4.10 recognized that radionavigation services require special measures to ensure freedom from harmful interference and provision No. S4.5 states that the frequency assignment to a station of a given service shall be separated from the limits of the band allocated to this service in such a way, taking account of the frequency band assigned to a station, no harmful interference is caused to services to which frequency bands immediately adjoining are allocated.

4 The results of the ITU-R studies have shown that sharing between RNSS and FS the frequency band 1 559-1 610 MHz is not recommended.

5 It is expected, that in most cases lifetime end of existing fixed systems will be 1 January 2005.

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

PART 1

IMT-2000, maritime and aeronautical issues

CONTENTS

PART 1A

Agenda item 1.6 - IMT-2000

Issues

The need to identify global additional frequency bands for the terrestrial component of IMT-2000, beyond those identified in S5.388, to satisfy future spectrum requirements which have been based on projected market demand.

The need to identify additional frequency bands for the satellite component of IMT-2000 beyond those identified in S5.388.

Introduction

1 WARC-92 identified, in footnote S5.388, the frequency bands 1 885-2 025 MHz and 2 110-2 200 MHz for IMT-2000, including 1 980-2 010 MHz (uplink) and 2 170-2 200 MHz (downlink) for the satellite component. This is reflected in Resolution 212, which was drafted at WARC-92 and amended at WRC-95 and WRC-97. Further developments at WRC-95 led to the allocation in Region 2 of the frequency bands 2 010-2 025 MHz (uplink) and 2 160-2 170 MHz (downlink), from within the IMT-2000 range, for MSS.

2 The CPM Report concludes on total spectrum requirements for the terrestrial element of IMT-2000 for the three Regions[1], which are based on the sum of the spectrum currently identified for IMT-2000 in S5.388, the spectrum currently identified in the three Regions for existing second generation systems and an additional spectrum requirement to meet the forecasted traffic volume in geographic areas where the traffic is the highest. This additional spectrum is estimated to be 160 MHz in all three Regions by 2010. Europe fully supports these conclusions.

3 With respect to satisfying the future spectrum requirements for IMT-2000, WRC-2000 agenda item 1.6.1 addresses the need to consider “spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component…”.

In line with the wording of the agenda item, Europe places priority on the spectrum requirements of the terrestrial component of IMT-2000 over those of the satellite component.

4 The CPM text concludes on the spectrum requirements given in Table 1 for the MSS, including the satellite component of IMT-2000. These figures are the forecast requirements in geographical areas where the traffic is the highest. Presently, approximately 2×115 MHz are allocated to the MSS worldwide and is assumed to be made available in those geographical areas where the traffic is the highest. Thus, the additional global MSS spectrum requirements are 2×8 MHz by 2005 and 2×30 MHz by 2010.

TABLE 1

Global mobile-satellite spectrum requirements, including the IMT-2000 satellite component (MHz)

	Year 2005	**Year 2010**
IMT-2000 satellite component	2×31.5	2×67
MSS (including IMT-2000 satellite component)	2×123	2×145

[1] 555 MHz in Region 1, 390 MHz in Region 2 and 480 MHz in Region 3.

Europe does not however, consider it necessary to propose additional spectrum to satisfy MSS requirements under agenda item 1.6, but seeks identification of the existing MSS bands below 3 GHz for possible IMT-2000 applications. The proposed method of identification is one element of a proposed new resolution.

5 For the terrestrial component, the purpose of the WRC-2000 Conference should be to find global bands for all three Regions to meet the requirement of 160 MHz of additional spectrum. Globally harmonized spectrum will facilitate worldwide roaming and reduce cost and complexity of IMT-2000 implementation. To this end, Europe is proposing to identify the band 2 500-2 690 MHz as the new global additional band for IMT-2000, with the band 2 520-2 670 MHz specifically for the terrestrial component.

6 The bands 2 500-2 520 MHz and 2 670-2 690 MHz are used today by a number of non-MSS services, thereby making these bands unavailable for MSS use in most parts of the world. Transitional arrangements in these bands, similar to those introduced in the 2 GHz MSS allocations would enhance the usability of these MSS spectrum allocations. Also, the CPM Report to WRC-2000 identifies all existing MSS allocations in the 1 to 3 GHz range as possible candidate bands for identification for the satellite component of IMT-2000. These bands are not providing additional MSS spectrum. The requirements for additional MSS allocation at WRC-2000 is addressed *inter alia* by agenda item 1.9.

7 For the terrestrial component, the identification of the additional bands should be done through (a) new footnote(s) in Article S5, referring to a supporting resolution. It is believed that this approach, whereby the identification of spectrum is made by a footnote in association with a RR Resolution, rather than the use of a RR Resolution alone which is generally considered to apply to transitional matters, gives the most stable identification of spectrum for IMT-2000. This is important to facilitate global roaming and global economies of scale in the manufacture of equipment, and is particularly important for developing countries to gain the greatest benefit from IMT-2000. This approach also underlines the importance of the IMT-2000 project within ITU, and the significant efforts both within ITU and external standardization bodies in the development of harmonized radio standards for IMT-2000.

8 The CPM text states that at least a portion of the global band satisfying the 160 MHz additional spectrum for the terrestrial component could be used in a harmonized way to facilitate global roaming.

9 Europe also proposes that WRC-2000 should also identify for IMT-2000 spectrum that is currently used on a large scale in the various Regions for existing (second generation) cellular/mobile systems within which IMT-2000 may be implemented in the longer term. Because the location of existing second generation spectrum is not common to the three Regions, the location of additional spectrum for IMT-2000 may similarly vary. As a result, some flexibility in the identification of additional spectrum for IMT-2000 may be needed.

10 Second generation mobile systems will continue to operate in the short and medium term so that their bands could be available for IMT-2000 only in the longer term. Also as the second generation spectrum was already taken into account and it cannot be part of the 160 MHz additional spectrum requirement, that means that the global additional spectrum satisfying the additional 160 MHz spectrum requirement is to be identified outside the second generation mobile band.

11 In relation to frequency bands currently used for second generation mobile systems, future frequency arrangements should aim to achieve compatibility with the existing frequency arrangements in operation, including the current duplex spacing and direction employed (for instance, in the GSM1800 band, 1 710-1 785 MHz paired with 1 805-1 880 MHz).

12 Europe recognizes that high altitude platform stations (HAPS) could provide a platform to support base stations for the terrestrial component of IMT-2000 in appropriate situations. Regulatory action is required to enable HAPS to fulfil this role.

13 This proposal is divided into five parts:

– the first part addresses that no change is needed for the current footnote S5.388;

– the second part addresses spectrum which is proposed to satisfy the additional global requirement and particularly the regulatory provisions relating to the band 2 500-2 690 MHz;

– the third part addresses spectrum which is currently identified for second generation mobile systems and which is proposed, under certain conditions, to be identified globally for IMT-2000. In Europe, it is worth noting that second generation systems (GSM900 and GSM1800) are widely deployed and hence refarming of this spectrum is envisaged only in the longer term;

– the fourth part introduces new resolutions to be introduced at WRC-2000;

– Resolution ZZZ [EUR/13/1] concerning the extension bands for the implementation of IMT-2000;

– Resolution TTT [EUR/13/2] dealing with frequency bands for the satellite component of IMT-2000 and appropriate transitional arrangements;

– the fifth part addresses the possible implementation of high altitude platform stations (HAPS) in an IMT-2000 system.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 1A1

Agenda item 1.6 - Proposals on initial IMT-2000 spectrum identified in S5.388

NOC EUR/13/1

For allocations at 1 885-2 200 MHz

NOC EUR/13/2

S5.388 The bands 1 885-2 025 MHz and 2 110-2 200 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these bands by other services to which they are allocated. The bands should be made available for IMT-2000 in accordance with Resolution **212 (Rev.WRC-97)**.

Reasons: Implementation of IMT-2000 in the bands identified in the Radio Regulations at WARC-92 is already planned in many countries, including the transitional arrangement of existing services. It is therefore essential to maintain the existing provisions within the Radio Regulations relating to these frequency bands.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Liechtenstein, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., United Kingdom, Slovenia, Sweden, Switzerland, Turkey

PART 1A2

Agenda item 1.6 - Proposals for bands to meet additional spectrum requirement for IMT-2000

The following bands are proposed to be identified for IMT-2000 with the primary objective, to satisfy the requirement for additional terrestrial IMT-2000 spectrum referred to in the CPM Report. Some additional regulatory provisions for the satellite component are proposed.

ADD EUR/13/4

S5.AAA The band 2 500-2 690 MHz is intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of this band for other services to which the band is allocated. This band should be made available for IMT-2000 in accordance with Resolution **ZZZ** [EUR/13/1]. Transitional arrangements between existing services and the mobile-satellite service (including satellite component of IMT-2000) in the bands 2 500-2 520 MHz and 2 670-2 690 MHz shall be in accordance with Resolution **TTT** [EUR/13/2].

Reasons:

1 The CPM Report concludes that there is a requirement for 160 MHz of additional spectrum for the terrestrial component of IMT-2000, beyond the spectrum already identified in RR No. S5.388 and beyond the spectrum used in the three Regions for second generation mobile systems.

2 This band offers the potential to contribute a significant portion of the additional spectrum requirement for IMT-2000. Geographical sharing (urban/rural) might facilitate the transition or possibly enable, in the longer term, the remaining operation of other services.

NOTE 1 - As stated in Resolution TTT [EUR/13/2], the bands 2 500-2 520 MHz and 2 670-2 690 MHz are intended to be used for the satellite component of IMT-2000. However, depending on market developments it may be possible in the longer term for these bands to be used by the terrestrial component.

NOTE 2 - The need to make available a total of 160 MHz globally for the terrestrial component may reveal the necessity to identify frequencies in addition to the 2 500-2 690 MHz band. Europe is investigating the best possibilities to comply with the primary objective of meeting the 160 MHz spectrum requirement for the terrestrial component on a global basis by the year 2010. In this context the current and future usage of the band 2 700-2 900 MHz is being considered, and studies are being carried out to assess the feasibility of sharing between radars and IMT-2000 applications.

Europe is requesting ITU-R in the proposed Resolution ZZZ [EUR/13/1] to study the feasibility of sharing in the band 2 700-2 900 MHz between the aeronautical radionavigation service and the mobile services (for example, for the identification of additional spectrum for IMT-2000), and to report to WRC-03 on the results of these studies.

The discussions on 2 700-2 900 MHz do not affect the need to identify the band 2 500-2 690 MHz at WRC-2000.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Iceland, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., United Kingdom, Slovenia, Sweden, Switzerland, Turkey

PART 1A3

Agenda item 1.6 - Proposals for identification of bands already used for second generation systems for terrestrial IMT-2000

The following bands are already used extensively for second generation mobile systems in Europe and elsewhere. They do not therefore provide additional spectrum in these areas, and hence the 160 MHz requirement must be found from other bands. Nevertheless, they are proposed to be identified on a global basis for IMT-2000 to facilitate transition in the longer term, based on market demand.

ADD EUR/13/6

S5.DDD Sub-bands used for second generation mobile systems as identified in Resolution **ZZZ** [EUR/13/1] are intended for use by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these sub-bands for other services to which they are allocated. The sub-bands should be made available for IMT-2000 in accordance with Resolution **ZZZ** [EUR/13/1].

Reasons:

1 The band 862-960 MHz in Region 1, 806-902 MHz in Region 2 and 806-960 MHz in Region 3 is allocated on a primary basis to the mobile service, and is currently already used for second generation mobile systems in many countries according to national frequency plans. The band 862-960 MHz is therefore an obvious candidate for terrestrial IMT-2000 extension, based on market demand, for use in the longer term where and when the use by existing systems is decreasing.

2 As indicated in the CPM Report, the band 1 710-1 885 MHz is allocated worldwide to the fixed and mobile services on a primary basis and large parts of this band are used in many countries for second generation mobile systems. This band is therefore an obvious candidate for identification for terrestrial IMT-2000 extension, based on market demand, for use in the longer term when and where the use by existing systems is decreasing.

3 Second generation mobile systems are only implemented in portions of these bands.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Estonia, Finland, France, Hungary, Liechtenstein, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey

PART 1A4

Agenda item 1.6 - Proposal for a resolution regarding the implementation of IMT-2000

Introduction

The CPM text states that at least a large portion of the additional spectrum could be used in a harmonized way to facilitate global roaming. It is therefore proposed that a new Resolution ZZZ [EUR/13/1] should be developed to implement the additional IMT-2000 spectrum identified at WRC-2000, and that this Resolution should ensure that harmonized frequency arrangements are developed to facilitate coordinated global deployment of IMT-2000. Where necessary, consideration should be given to compatibility with current usage and transition of existing services.

In relation to frequency bands currently used for second generation mobile systems, future frequency arrangements should aim to achieve compatibility with the existing frequency arrangements in operation, including the current duplex spacing and direction employed (for instance, 1 710-1 785 MHz paired with 1 805-1 880 MHz).

For the 900 MHz frequency band, where a variety of existing second generation arrangements are currently in operation, the studies undertaken should consider the possibility to limit the number of future frequency plans used in the longer term for IMT-2000 deployment in these bands.

In relation to the frequency bands for the satellite component of IMT-2000, it is proposed that a new Resolution TTT [EUR/13/2] be developed.

ADD EUR/13/7

RESOLUTION ZZZ (WRC-2000) [EUR/13/1]

Extension bands for implementation of International Mobile Telecommunications-2000 (IMT-2000)

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that ITU-R has recommended the 1-3 GHz range as the most suitable for IMT-2000;

b) that WARC-92 identified the bands 1 885-2 025 MHz and 2 110-2 200 MHz, intended for use on a worldwide basis for IMT-2000, including the bands 1 980-2 010 MHz and 2 170-2 200 MHz for the satellite component of IMT-2000 in RR **S5.388** and under the provisions of Resolution **212**;

c) that ITU-R studies concluded that global additional spectrum of 160 MHz for the terrestrial component, in addition to the initial IMT-2000 bands in **S5.388** and in addition to bands used for second generation mobile systems in the various Regions, is required for identification to provide IMT-2000 in those areas where the traffic is the highest;

d) that ITU-R studies concluded that the bands used by second generation mobile systems in the various regions are required for identification for IMT-2000, to be implemented when the use of these bands by second generation terrestrial systems has decreased;

e) that, in **S5.AAA** of the Radio Regulations, this Conference has identified additional spectrum for IMT-2000, in order to meet the additional spectrum requirement;

f) that, in **S5.DDD** of the Radio Regulations, this Conference has identified further spectrum for the terrestrial component of IMT-2000 which is currently used for second generation mobile systems, to meet the total spectrum requirement;

g) that existing band plans for second generation mobile systems in the range 806-960 MHz are:

810-828 MHz and 860-885 MHz	paired with	915-958 MHz;
838-840 MHz	paired with	893-895 MHz;
843-846 MHz	paired with	898-901 MHz;
824-849 MHz	paired with	869-894 MHz
880-915 MHz	paired with	925-960 MHz

with mobile transmitting in the lower band;

h) that existing band plans for second generation mobile systems in the band 1 710-1 885 MHz are:

- 1 710-1 785 MHz paired with 1 805-1 880 MHz;
- 1 850-1 885 MHz: portion of the band 1 850-1 910 MHz paired with 1 930-1 990 MHz;
- 1 880-1 885 MHz: portion of the band 1 880-1 900 MHz;

i) that based on Resolution **722 (WRC-97)** the preliminary agenda for WRC-03 under agenda item 2.6 will consider the status of allocations to radiolocation service in the bands around 3 GHz and around 5 GHz,

noting

a) that harmonized use of the additional global bands identified in **S5.AAA** will facilitate, by offering possibilities of global roaming, the worldwide success of IMT-2000 to the benefit of consumers, manufacturers and operators;

b) that, in the frequency bands identified in **S5.DDD**, harmonization to the greatest extent practicable should be aimed for, noting however that frequency arrangements should be compatible with existing band plans for second generation mobile systems;

c) that not all administrations may need, or be able to implement, all of the IMT-2000 extension bands identified at this Conference due to the existing services,

d) that, in addition to the bands identified for the satellite component of IMT-2000 in Resolution **212**, the bands 2 500-2 520 MHz and 2 670-2 690 MHz, identified in **S5.AAA** for IMT-2000, allocated to MSS and addressed in Resolution **TTT** [EUR/13/2], are intended to be used for the satellite component of IMT-2000;

e) that, depending on market developments it may be possible in the longer term for the bands 2 500-2 520 MHz and 2 670-2 690 MHz to be used by the terrestrial component of IMT-2000,

recognizing

a) that the frequency band 880-915/925-960 MHz will be available only in the long term in countries having implemented second generation mobile systems in this band, when and where the use by existing systems has decreased, based on market demand for IMT-2000;

b) that the frequency band 1 710-1 785/1 805-1 880 MHz will be available only in the long term in countries having implemented second generation mobile systems in this band, when and where the use by existing systems has decreased, based on market demand for IMT-2000;

c) that the frequency band 1 880-1 885 MHz will be available only in the long term in countries having implemented second generation mobile systems in this band, when and where the use by existing systems has decreased, based on market demand for IMT-2000,

resolves to invite administrations

to make available, based on market demand, extension bands identified in **S5.AAA** for the terrestrial component of IMT-2000 to meet the forecasted growth of these systems. Due consideration should be given to the benefits of harmonized utilization of the spectrum for the terrestrial component of IMT-2000 as indicated in *noting a)* and *b)* above, taking into account the use of these bands by other existing radio services,

requests ITU-R

1 to develop harmonized frequency arrangements for operation of the terrestrial component of IMT-2000 in the expansion spectrum identified in **S5.AAA** of this Conference, taking account as necessary of the current usage and/or transition of existing services currently operating in this band, and identification of the band 2 500-2 520 MHz/2 670-2 690 MHz for both components of IMT-2000;

2 to develop frequency arrangements for operation of IMT-2000 in the spectrum identified in *considering g)* and *h),* aiming to achieve compatibility with existing frequency arrangements in use by second generation mobile systems;

3 to continue to study the feasibility of sharing in the band 2 700-2 900 MHz between the aeronautical radionavigation service and the mobile service (for example, for the identification of additional spectrum for IMT-2000), taking into account the technical, operational and regulatory aspects of sharing, and to report to WRC-03 on the results of this study,

further resolves

1 that studies should be commenced forthwith;

2 that these frequency arrangements should be published by ITU-R in one or more recommendations.

ADD EUR/13/8

RESOLUTION TTT (WRC-2000) [EUR/13/2]

Frequency bands for the satellite component of IMT-2000 and appropriate transitional arrangements

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the bands 1 980-2 010 MHz and 2 170-2 200 MHz are identified for use by the satellite component of IMT-2000 through RR **S5.388** and Resolution **212**;

b) that the band 2 500-2 690 MHz is identified for use by IMT-2000 through RR **S5.AAA**;

c) that the bands 1 525-1 544 MHz, 1 545-1 559 MHz, 1 610-1 626.5 MHz, 1 626.5-1 645.5 MHz, 1 646.5-1 660.5 MHz and 2 483.5-2 500 MHz are allocated on a primary basis to the mobile-satellite service;

d) that the bands 2 500-2 520 MHz and 2 670-2 690 MHz are allocated to the mobile-satellite service, these allocations being co-primary with fixed and mobile service allocations in all three Regions and with the fixed-satellite service in Regions 2 and 3,

resolves

1 that the bands 2 500-2 520 MHz and 2 670-2 690 MHz, identified in **S5.AAA** for IMT-2000 and allocated to the mobile-satellite service, are intended to be used for the satellite component of IMT-2000, however, depending on market developments it may be possible in the longer term for these bands to be used by the terrestrial component of IMT-2000;

2 that, in addition to the frequency bands indicated in *considering a)* and *resolves* 1, the frequency bands 1 525-1 544 MHz, 1 545-1 559 MHz, 1 610-1 626.5 MHz, 1 626.5-1 645.5 MHz, 1 646.5-1 660.5 MHz and 2 483.5-2 500 MHz may be used by the satellite component of IMT-2000, subject to the provisions related to the mobile-satellite service in these frequency bands,

further resolves

1 that taking into account **S5.AAA**, to facilitate the introduction and future use of the frequency bands 2 500-2 520 MHz and 2 670-2 690 MHz by the satellite component of IMT-2000, (not precluding the use of these bands for other MSS applications):

a) administrations are urged to ensure that frequency assignments to new fixed service systems, to be brought into operation after [1 January 2002], do not overlap with the frequency bands 2 500-2 520 MHz and 2 670-2 690 MHz;

b) administrations are encouraged, where practicable, to draw up plans for the gradual transfer of the frequency assignments to their fixed service stations in the frequency bands 2 500-2 520 MHz and 2 670-2 690 MHz to non-overlapping bands, giving priority to the transfer of their frequency assignments from the MSS uplink band 2 670-2 690 MHz, considering the technical, operational and economic aspects.

Reasons:

1 The bands 1 525-1 544 MHz, 1 545-1 559 MHz, 1 610-1 626.5 MHz, 1 626.5-1 645.5 MHz, 1 646.5-1 660.5 MHz, 2 483.5-2 500 MHz, 2 500-2 520 MHz and 2 670-2 690 MHz are already allocated globally on a primary basis to the mobile-satellite service.

2 The bands 2 500-2 520 MHz and 2 670-2 690 MHz are currently used by other services, making the bands in practice effectively unavailable for MSS use.

3 The difficulty of finding new MSS allocations increases the importance of facilitating the effective usage by MSS of the existing MSS allocations.

4 By encouraging administrations not to implement new FS systems in the bands 2 500-2 520 MHz and 2 670-2 690 MHz, the bands will over time become easier to use for the satellite component of IMT-2000.

5 The use of the bands 1 544-1 545 MHz and 1 645.5-1 646.5 MHz is limited to distress and safety communications (see Article S31) and therefore not suitable for IMT-2000.

6 These bands are used and will continue to be used also by non-IMT-2000 MSS systems. By identifying all these bands for the satellite component of IMT-2000, administrations are given maximum flexibility for accommodating the deployment of satellite IMT-2000 systems.

7 Since existing deployment of non-IMT-2000 MSS systems in some or all parts of these bands is extensive, availability of these bands for the satellite component may only be possible in the longer term.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 1A5

Agenda item 1.6 - Use of high altitude platform stations in IMT-2000 systems

Issue

This part addresses the option to use the high altitude platform stations (HAPS) for the delivery of terrestrial IMT-2000, within the bands identified for terrestrial IMT-2000 in S5.388 subject to licensing, coordination and sharing requirements of administrations.

This part deals with regulatory issues relating to HAPS in the context of IMT-2000, and is not related to the issue of providing more spectrum for the terrestrial component of IMT-2000.

The use of HAPS for this purpose does not deal with the issues involved in the consideration of the use of HAPS in the fixed service in the 47.2-47.5 GHz and 47.9-48.2 GHz bands, nor do they affect the European proposals on other proposals for the use of HAPS at frequencies above 3 GHz which may be considered under agenda item 1.5.

Introduction

1 A high altitude platform station (HAPS) is defined in S1.66A as “a station located on an object at an altitude of 20 to 50 km and at a specified, nominal, fixed point relative to the Earth”. Each HAPS deploys a multibeam antenna capable of projecting numerous spot beams within its coverage area. The role of HAPS is equivalent to the terrestrial IMT-2000 base station.

Each HAPS will be positioned above commercial airspace at an altitude that is high enough to provide service to a large footprint but that is low enough to provide dense coverage. HAPS can offer a new means of providing IMT-2000 with minimal ground network build out.

2 The Radio Regulations, under S4.15A, state that “transmissions to or from high altitude platform stations shall be limited to bands specifically identified in RR S5”. The only identification currently in Article S5 is the footnote S5.552A which states that “the allocation to the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz is designated for use by high altitude platform stations. The use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz is subject to the provisions on Resolution 122 (WRC-97)”.

The use of HAPS as an option to provide IMT-2000 in the frequency bands identified for terrestrial IMT-2000 in RR S5.388 is proposed to be enabled via a new footnote in RR S5 with a reference to a new resolution in the Radio Regulations.

3 Draft new Recommendation ITU-R M.[8/115], as agreed by ITU-R Study Group 8 for adoption by correspondence, considers the sharing and coordination requirements associated with the use of HAPS as part of a terrestrial IMT-2000 system.

It would seem appropriate that, if HAPS operation within a terrestrial IMT-2000 is to be permitted, some consideration will be needed as to how to ensure the minimum performance characteristics of the HAPS in Recommendation ITU-R M.[8/115] and in particular the antenna patterns and operational spfd limits for coordination purposes and to ensure protection of adjacent band operations.

4 The use of HAPS in the terrestrial IMT-2000 frequency bands shall be optional for administrations. Each administration shall retain its individual authority over technical and regulatory matters pertaining to the sharing, coordination and implementation of HAPS in these bands.

5 RR S11.26 states that notification for HAPS in the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz shall not reach the Bureau earlier than five years before the assignments are brought into use. No. S11.26 is not relevant for the IMT-2000 situation. The requirement for notification in case of IMT-2000 is considered necessary in order to inform all administrations about assignments potential to cause interference and an additional provision S11.8A may be required.

Proposals

Concerning the possible implementation of HAPS in an IMT-2000 system, the following regulatory changes are proposed:

S5.BBB In Regions 1 and 3, the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz, and in Region 2, the bands 1 885-1 980 MHz and 2 110-2 160 MHz, may be used by high altitude platform stations as base stations to provide IMT-2000, in accordance with Resolution **HAPS** [EUR/13/3].

ADD EUR/13/11

RESOLUTION HAPS (WRC-2000) [EUR/13/3]

Use of high altitude platform stations providing IMT-2000 in the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 MHz in Region 2

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WARC-92 identified the bands 1 885-2 025 MHz and 2 110-2 200 MHz, intended for use on a worldwide basis for IMT-2000, including the bands 1 980-2 010 MHz and 2 170-2 200 MHz for the satellite component of IMT-2000, in RR **S5.388**;

b) that a high altitude platform station (HAPS) is defined in **S1.66A** as "a station located on an object at an altitude of 20 to 50 km and at a specified, nominal, fixed point relative to the Earth";

c) that HAPS may offer a new means of providing IMT-2000 services with minimal network build out as it is capable to provide service to a large footprint together with a dense coverage;

d) that HAPS is proposed to be used as a base station of terrestrial IMT-2000 and should not have any priority over other terrestrial IMT-2000 use,

resolves

that HAPS implemented within a terrestrial IMT-2000 system shall conform to the minimum performance characteristics and operational conditions given in Recommendation ITU-R M.[8/115], in particular:

a) that for the purpose of protecting stations operated in neighbouring countries from co-channel interference countries, where HAPS is used for base stations to provide IMT-2000 shall use antennas that comply with the following antenna pattern:

$$G(\psi) = G_m - 3(\psi/\psi_b)^2 \quad \text{dBi} \quad \text{for} \quad 0 \le \psi \le \psi_1$$

$$G(\psi) = G_m + L_N \quad \text{dBi} \quad \text{for} \quad \psi_1 < \psi \le \psi_2$$

$$G(\psi) = X - 60\log(\psi) \quad \text{dBi} \quad \text{for} \quad \psi_2 < \psi \le \psi_3$$

$$G(\psi) = L_F \quad \text{dBi} \quad \text{for} \quad \psi_3 < \psi \le 90^\circ$$

where:

$G(\psi)$ gain at the angle ψ from the main beam direction (dBi)

G_m maximum gain in the main lobe (dBi)

ψ_b one-half the 3 dB beamwidth in the plane of interest (3 dB below G_m) (degrees)

L_N near-in-side-lobe level in dB relative to the peak gain required by the system design, and has a maximum value of –25 dB

L_F = G_m – 73 dBi far side-lobe level (dBi)

Error! Objects cannot be created from editing field codes.	degrees
Error! Objects cannot be created from editing field codes.	degrees
Error! Objects cannot be created from editing field codes.	dB
Error! Objects cannot be created from editing field codes.	degrees

The 3 dB beamwidth ($2\psi_b$) is again estimated by:

$$(\psi_b)^2 = 7442/(10^{0.1G_m}) \text{ (in degrees}^2)$$

where G_m is the peak aperture gain (dBi);

b) that a HAPS operated as a base station to provide IMT-2000 shall not exceed a co-channel spectral power flux-density (spfd) level of –121.5 dB(W/(m^2 · MHz)) on the Earth's surface outside country borders unless agreed otherwise with the affected neighbouring administration;

c) that a HAPS operated as a base station to provide IMT-2000, in order to protect mobile earth stations of the satellite component of IMT-2000 from interference, shall not exceed an out-of-band spfd level of –165 dB(W/(m^2 · 4 kHz)) on the Earth's surface in the bands 2 160-2 200 MHz in Region 2 and 2 170-2 200 MHz in Regions 1 and 3;

d) that a HAPS operated as a base station to provide IMT-2000, in order to protect fixed stations from interference, shall not exceed an out-of-band spfd level on the Earth's surface in the band 2 025-2 110 MHz of:

1) –165 dB(W/(m^2 · MHz)) for angles of arrival (θ) less than 5° above the horizontal plane;

2) –165 + 1.75 (θ – 5) dB(W/(m^2 · MHz)) for angles of arrival between 5° and 25° above the horizontal plane; and

3) –130 dB(W/(m^2 · MHz)) for angles of arrival between 25° and 90° above the horizontal plane

Reasons:

1 RR S4.15A (WRC-97) limits transmission to and from HAPS to bands specifically identified in the Table of Frequency Allocations. So far, the only bands which are identified as such by RR S5.552A are 47.2-47.5 GHz and 47.9-48.2 GHz. The option to use HAPS to provide IMT-2000 is proposed to be enabled via a new footnote in Article S5 with a reference to a new resolution referring to the terrestrial IMT-2000 bands identified in S5.388.

2 ITU-R Study Group 8 has agreed the draft new Recommendation M.[8/115] on "minimum performance characteristics and operational conditions for HAPS providing IMT-2000 in the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 MHz in Region 2" for adoption by correspondence.

3 However, the option to use HAPS in IMT-2000 should be limited to those bands currently identified for terrestrial IMT-2000 in RR S5, since new frequency bands to be identified for IMT-2000 under agenda item 1.6.1 may have to share with various co-primary and secondary services, and sharing has been investigated only in the existing bands identified in S5.388 so far.

Proposals submitted by the following administrations

Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Spain, Estonia, Finland, France, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Slovakia, Czech Rep., Romania, United Kingdom, Russia, Slovenia, Sweden, Switzerland, Turkey, Ukraine

PART 1B

Agenda item 1.7 - Use of HF bands by AM(R)S and MMS

Introduction

These proposals contain the minimum modifications required in the Radio Regulations and its Appendices in order to convert the HF radiotelephony distress and safety frequencies to exclusive.

The method chosen has been to divide the existing distress and calling channels in two separate frequencies, one exclusive distress and safety frequency and one international radiotelephony calling frequency.

With a view to consistency, also those calling channels that are not used for distress and safety, have been converted into simplex frequencies.

Instead of voice calling, ships and coast stations should use digital selective calling. If voice calling is required, it should in the first instance be done on the coast station working channel and only secondarily on the international radiotelephony calling frequency.

Proposals

Entry into force of these modifications should be 30 June 2005 in order to allow sufficient time for ship stations to implement the necessary technical changes. Article S52, Appendix S13 and Appendix S17 should be modified as shown below.

NOC

S52.216 to S52.218

MOD EUR/13/12

S52.219 3) Coast stations employing class J3E or J2D emissions in accordance with No. **S52.217** in the bands between 4 000 kHz and 27 500 kHz shall use the minimum power necessary to cover their service area and shall at no time use a peak envelope power in excess of 10 kW per channel. <u>On the radiotelephony calling frequencies 4 417 kHz and 6 516 kHz coast stations should limit their peak envelope power to 1.5 kW.</u>

C2 – Call and reply

ADD EUR/13/13

S52.220A Administrations should encourage the coast stations and ships under their jurisdiction to utilize the digital selective calling techniques for call and reply.

ADD EUR/13/14

S52.220B When calling by radiotelephony is necessary, it should be done (in the order of preference):

ADD EUR/13/15

S52.220C 1) on the working frequencies assigned to the coast station in question; or

ADD EUR/13/16

S52.220D 2) when this is not possible, on the international calling frequencies listed under **S5.221** below.

MOD EUR/13/17

S52.221 § 97 1) Coast and ~~S~~ship stations may use the following carrier frequencies for calling in radiotelephony[1A]:

~~4 125~~4 417 kHz~~[3, 4, 5]~~
~~6 215~~6 516 kHz~~[4, 5]~~
~~8 255~~8 779 kHz
~~12 290~~13 137 kHz~~[5]~~
~~16 420~~17 302 kHz~~[5]~~
~~18 795~~19 770 kHz
~~22 060~~22 756 kHz
~~25 097~~26 172 kHz

ADD EUR/13/17*bis*

[1A] **S52.221.1A** These frequencies may also be used by coast stations with class H2B emission, when using the selective calling system defined in Recommendation ITU-R M.257-3.

APPENDIX S13*

Distress and safety communications (non-GMDSS)

Part A2 – Frequencies for distress and safety

Section I – Availability of frequencies

E – 4 125 kHz

MOD EUR/13/25

§ 4 1) The carrier frequency 4 125 kHz is used to supplement the carrier frequency 2 182 kHz for distress and safety purposes ~~and for call and reply~~ (see also No. **S5.130**). This frequency is also used for distress and safety traffic by radiotelephony (see also Appendix **S15** and Resolution **331 (Rev.WRC-97)**).

2) The carrier frequency 4 125 kHz may be used by aircraft stations to communicate with stations of the maritime mobile service for distress and safety purposes, including search and rescue (see Part A1 § 9, 9 *a)* and 9 *b)*).

G – 6 215 kHz

MOD EUR/13/26

§ 6 The carrier frequency 6 215 kHz is used to supplement the carrier frequency 2 182 kHz for distress and safety purposes ~~and for call and reply~~ (see also No. **S5.130**). This frequency is also used for distress and safety traffic by radiotelephony (see also Appendix **S15** and Resolution **331 (Rev.WRC-97)**).

APPENDIX S17

Frequencies and channelling arrangements in the high-frequency bands for the maritime mobile service

(See Article **S52**)

PART A – Table of subdivided bands

In the table, where appropriate[1], the assignable frequencies in a given band for each usage are:

– indicated by the lowest and highest frequency, in heavy type, assigned in that band;

– regularly spaced, the number of assignable frequencies (*f.*) and the spacing in kHz being indicated in italics.

MOD EUR/13/27

– 4 417 kHz (Channel No. 421 in the 4 MHz band~~;~~)

– 6 516 kHz (Channel No. 606 in the 6 MHz band~~;~~)

– 8 779 kHz (Channel No. 821 in the 8 MHz band~~;~~)

– 13 137 kHz (Channel No. 1221 in the 12 MHz band~~;~~)

– 17 302 kHz (Channel No. 1621 in the 16 MHz band~~;~~)

– 19 770 kHz (Channel No. 1806 in the 18 MHz band~~;~~)

– 22 756 kHz (Channel No. 2221 in the 22 MHz band~~;~~)

– 26 172 kHz (Channel No. 2510 in the 25 MHz band)~~.~~

The remaining frequencies in Sub-Sections A, B, C-1 and C-2 are working frequencies.

MOD EUR/13/31

5A For the use of the carrier frequencies:

4 125 kHz (Channel No. ~~421~~400)

6 215 kHz (Channel No. ~~606~~600)

8 291 kHz (Channel No. ~~833~~800)

12 290 kHz (Channel No. ~~1221~~1200)

16 420 kHz (Channel No. ~~1621~~1600)

in Sub-Section A, by coast and ship stations for distress and safety purposes, see Article **S31** and Appendix **S13**.

NOC

Notes 7 and 8

Sub-Section A

MOD EUR/13/32

Table of single-sideband transmitting frequencies (kHz) for duplex (two-frequency) operation

1 These coast station frequencies may be paired with a ship station frequency from the table of simplex frequencies for ship and coast stations (see Sub-Section B) or with a frequency from the band 4 000-4 063 kHz (see Sub-Section C-1) to be selected by the administration concerned.

2 For the use and notification of these frequencies, see Resolution **325 (Mob-87)***.

3 These channels may also be used for simplex (single frequency) operation.

4 For the conditions of use of the carrier frequency 4 125 kHz, see Nos. **S52.224** and **S52.225**, and Appendix **S15**.

5 For the conditions of use of the carrier frequency 6 215 kHz, see Appendices **S13** and **S15**.

6 These coast station frequencies may be paired with a ship station frequency from the table of simplex frequencies for ship and coast stations (see Sub-Section B) or with a frequency from the band 8 100-8 195 kHz (see Sub-Section C-2) to be selected by the administration concerned.

7 For the conditions of use of the carrier frequency 8 291 kHz, see Appendix **S15**.

8 For the conditions of use of the carrier frequency 12 290 kHz, see Appendix **S15**.

9 For the conditions of use of the carrier frequency 16 420 kHz, see Appendix **S15**.

* The frequencies followed by an asterisk are calling frequencies (see Nos. **S52.221**~~ and **S52.222**~~).

PART 1C

Agenda item 1.18 - Use of digital technology for MMS at 156-174 MHz

Introduction

As a result of both the need to consider the use of new digital technology in the maritime mobile service and the need to solve the problem of congestion in the band 156-174 MHz, a viable solution is proposed. It is based on the identification of several bands in which duplex channels which may be split into simplex channels. The upper leg of these duplex channels may be used by the administrations on a voluntary basis for initial testing and the possible future introduction of new technologies.

It is proposed to modify both Resolution 342 (WRC-97) and Appendix S18.

MOD EUR/13/33

RESOLUTION 342 (Rev.WRC-~~97~~2000)

Review of new technology to provide improved efficiency in the use of the band 156-174 MHz by stations in the maritime mobile service

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that the agenda of ~~WRC-97~~this Conference included the consideration of the use of new digital technology for the maritime mobile service in the band 156-174 MHz and the consequential revision of Appendix **S18** to the Radio Regulations~~ in respect of maritime mobile communications and the use of new technology for maritime radiotelephony channels~~;

b) Recommendation **318 (Mob-87)** particularly *noting b)* and *c)*;

c) that Appendix **S18** identifies frequencies to be used for distress and safety communications on an international basis;

d) that the introduction of new technology in the maritime mobile service shall not disrupt distress and safety communications in the VHF band including those established by the International Convention for the Safety of Life at Sea (SOLAS), 1974, as amended;

e) that the maritime mobile community has recently fully implemented the GMDSS;

~~e~~f) that ITU-R is conducting studies on improving efficiency in the use of this band, and that these studies are still ongoing;

~~f~~g) that changes made in Appendix **S18** should not prejudice the future use of these frequencies or the capabilities of systems or new applications required for use by the maritime mobile service;

~~g~~h) that the congestion on Appendix **S18** frequencies calls for the implementation of efficient new technologies;

~~h~~i) that the use of new digital technology on maritime VHF frequencies will make it possible to better respond to the emerging demand for new services~~,~~;

j) that ITU-R has adopted Recommendation ITU-R M.1312 relating to a long-tem solution for improved efficiency in the use of the band 156-174 MHz by stations in the maritime mobile service;

k) that ITU-R has adopted Recommendation ITU-R M.1371 relating to technical characteristics for a universal shipborne automatic identification system using time division multiple access in the VHF maritime mobile band;

l) that there is a need to maintain some duplex channels for specific applications,

noting

~~that some administrations are considering adopting some of the above changes to their operations within the Appendix **S18** frequencies,~~

a) that the global maritime market may not be of a sufficient size to warrant the development of a new system solely for the maritime service;

b) that digital systems have been successfully implemented in the land mobile service,

noting also

that this Conference has modified Appendix **S18** with the addition of footnote *o)* to permit the possible use on a voluntary basis of various bands created by the conversion of some duplex channels to simplex channels, for initial testing and the possible future introduction of new technologies,

resolves

~~that WRC-99 should consider the use of new technology in the band 156-174 MHz and consequential revision of Appendix **S18**,~~

1 that in order to provide full worldwide interoperability of equipment on ships, there should be one technology or more that one interoperable worldwide technology implemented in Appendix **S18**;

2 that as soon as the ITU-R studies are complete, a future competent conference should consider any additional changes to Appendix **S18** to enable the use of digital communications by the maritime mobile service,

invites ITU-R

to ~~continue~~finalize the following studies~~ on the following with a view to providing a report to WRC-99~~:

a) to identify the future requirements of the maritime mobile service;

b) to identify suitable technical characteristics of the system or interoperable systems to replace existing technology;

c) to identify necessary modifications to the frequency plan contained within Appendix **S18**;

d) to recommend a ~~timetable~~transition plan for the introduction of new technology~~ and the necessary changes~~;

e) to~~ study and~~ recommend how new technology can be introduced ~~without harming~~whilst ensuring compliance with the distress and safety requirements,

instructs the Secretary-General

to communicate this Resolution to the International Maritime Organization and the International Association of Lighthouse Authorities.

APPENDIX S18

Table of transmitting frequencies in the VHF maritime mobile band

(See Article **S52**)

MOD EUR/13/34

NOTE – For assistance in understanding the Table, see notes *a)* to *~~n~~o)* below.

MOD EUR/13/35

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

Add the following country names to the list of signatories to this document:

EUROPEAN COMMON PROPOSALS - PART 1

IMT-2000, maritime and aeronautical issues

Agenda item	**Part of the European contribution**	**European common proposal for WRC-2000** **Subject and supplementary country names**
1.6.1	1A1	Initial IMT-2000 spectrum identified in S5.388 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	1A2	Bands to meet additional spectrum requirement for IMT-2000 **Cyprus, The Former Yugoslav Republic of Macedonia, Romania**
	1A3	Identification of bands already used for second generation systems for terrestrial IMT-2000 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Romania**
	1A4	Resolution regarding the implementation of IMT-2000 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova, Romania**

	1A5	Use of high altitude platform stations in IMT-2000 systems **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova, Romania**
1.7	1B	Use of HF bands by AM(R)S and MMS **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.18	1C	Use of digital technology for MMS at 156-174 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

EUROPEAN COMMON PROPOSALS - PART 2

Mobile-satellite and radionavigation-satellite services

Agenda item	**Part of the European contribution**	**European common proposal for WRC-2000 Subject and supplementary country names**
1.9	2A	Feasibility of an MSS (space-to-Earth) allocation at 1 559-1 567 MHz (Resolutions 213 and 220 (WRC-97)) **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia**
1.10	2B	Use of bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.11	2C1	Non-GSO MSS under 1 GHz Resolution 214 (WRC-97) **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	2C2	Non-GSO/MSS below 1 GHz - Resolution 214 (WRC-97) **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

1.15.1	2D1	RNSS (space-to-Earth) 960-1 215 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	2D2	RNSS (space-to-Earth) 1 260-1 300 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	2D3	Proposal for a new Resolution - Use of RNSS in the bands 1 151-1 300 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	2D4	RNSS (space-to-Earth) and RNSS (Earth-to-space) in the band 5 000-5 030 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	2D5	RNSS (Earth-to-space) 1 300-1 350 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.15.2	2D6	RNSS (space-to-Earth) at 1 215-1 260 MHz and 1 559-1 610 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.15.3	2D7	Status of allocations to services other than RNSS at 1 559-1 610 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

EUROPEAN COMMON PROPOSALS - PART 3

Non-GSO FSS

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.13.1	3A	Modifications to Article S21 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	3B	Modifications to Article S22 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	3C	Resolution on aggregate non-GSO interference **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	3D	Provisions for earth stations with very large antennas **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	3E	Modifications to Article S5 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	3F	Modifications to Articles S9 and S11 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia**
	3G	Modifications to Appendix S4 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.13.2	3H	Modifications to Articles S5 and S22 to include limits in other frequency bands **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.13	3I	Updated Resolutions 130, 131 and 538 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

EUROPEAN COMMON PROPOSALS - PART 4

Space and science services and radio astronomy

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.16	4A	Allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.17	4B	Worldwide allocation for the Earth exploration-satellite (passive) and space research services in the band 18.6-18.8 GHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

EUROPEAN COMMON PROPOSALS - PART 5

Appendices S30 and S30A

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.19*bis*	5A	Scope of the RoP on S23.13 **Cyprus, The Former Yugoslav Republic of Macedonia**
1.20	5B1	Procedures for the use of the guardbands of Appendices S30 and S30A plans to perform space operation functions, also taking into account Resolution 86 (Minneapolis, 1998) **Cyprus, The Former Yugoslav Republic of Macedonia, Moldova**
	5B2	Provisions relating to the suppression of Articles 6 and 7 of Appendices S30 and S30A, also taking into account Resolution 86 (Minneapolis, 1998) **Cyprus, The Former Yugoslav Republic of Macedonia, Moldova**

EUROPEAN COMMON PROPOSALS - PART 6

Fixed services and fixed-satellite services

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.4	6A1	Allocations and regulatory aspects related to the high density fixed service (HDFS): Resolution 133 (WRC-97) - HDFS in the 37-39.5 GHz band **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	6A2	Allocations and regulatory aspects related to the high density fixed service (HDFS): Resolutions 126 and 726 (WRC-97) - HDFS in the 31.8-33.4 GHz, 51.4-52 GHz, 55.78-59 GHz and 64-66 GHz bands **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	6A3	Allocations and regulatory aspects related to the high density fixed service (HDFS) **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia**
1.5	6B	High altitude platform systems (HAPS) **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.8	6C	Earth stations on board vessels in the FSS at 3 700-4 200 MHz and 5 925-6 425 MHz **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.14	6D	Non-GSO MSS feeder links in the 15.43-15.63 GHz band **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

EUROPEAN COMMON PROPOSALS - PART 7

Appendices S3 and S7, Resolutions 28 (WRC-95) and 95 (WRC-97), PP-98 Resolutions

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.1	7A	Deletion of country names in footnotes to Article S5 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia**
1.2	7B	Review of Appendix S3 with respect to spurious emissions for space services **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
1.3	7C	Review of Appendix S7 **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
7.1	7D	Report of the Director BR; Article S13 - Rules of Procedure **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
PP-98 Res.	7E1	PP-98 Resolution 86, Date of bringing into use of satellite network frequencies **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	7E2	PP-98 Resolution 86, Satellite coordination procedures **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	7E3	PP-98 Resolution 87, Role of the notifying administration **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**
	7E4	Resolution 88, Processing charge for satellite networks **Cyprus, Latvia, The Former Yugoslav Republic of Macedonia, Moldova**

7.1	7D2 (Add.2 to Add.7 of CMR2000/13)	Resolution 80 **Latvia, The Former Yugoslav Republic of Macedonia**
	7D3 (Add.2 to Add.7 of CMR2000/13)	S5.488 **Latvia, The Former Yugoslav Republic of Macedonia**
PP-98 Res. 86	7E2 (Add.2 to Add.7 of CMR2000/13)	S5.43 **Latvia, The Former Yugoslav Republic of Macedonia**
7.1 and PP-98 Res. 86	7F (Add.2 to Add.7 of CMR2000/13)	S11.44 (date of bringing into use) **Latvia, The Former Yugoslav Republic of Macedonia**

Agenda item	**Part of the European contribution**	**European common proposal for WRC-2000 Subject and supplementary country names**
7.2	8A (Add.8 of CMR2000/13)	Agendas for 2003 and 2006 **Latvia, The Former Yugoslav Republic of Macedonia**
	8B (Add.8 of CMR2000/13)	Resolutions for future conferences **Latvia, The Former Yugoslav Republic of Macedonia**

Agenda item	**Part of the European contribution**	**European common proposal for WRC-2000 Subject and supplementary country names**
1.9	2A (Add.1 to Add.2 of CMR2000/13)	New MSS allocations **Latvia, The Former Yugoslav Republic of Macedonia**
1.15.1	2D (Corr.1 to Add.2 of CMR2000/13)	Add space to space-to-space RNSS allocation **Latvia, The Former Yugoslav Republic of Macedonia**

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.13	3D Corrigendum (Corr.1 to Add.3 of CMR2000/13)	Very large earth stations **Latvia, The Former Yugoslav Republic of Macedonia**
	3F (Add.1 to Add.3 of CMR2000/13)	Modifications to Article S11 **Latvia, The Former Yugoslav Republic of Macedonia**
	3E (Add.1 to Add.3 of CMR2000/13)	Explanations on coupling between Section VI of Article S22, Article S5 and Resolution 130 **Latvia, The Former Yugoslav Republic of Macedonia**
	3J (Add.1 to Add.3 of CMR2000/13)	Modifications to Article S15 and S13 **Latvia, The Former Yugoslav Republic of Macedonia**

Agenda item	Part of the European contribution	European common proposal for WRC-2000 subject and supplementary country names
1.12	6E (Add.1 to Add.6 of CMR2000/13)	Modifications to Article S11 **Latvia, The Former Yugoslav Republic of Macedonia**

ISTANBUL, 8 MAY – 2 JUNE 2000

Corrigendum 2 to Document 13-E
9 May 2000
Original: English

COMMITTEE 4
COMMITTEE 5
WORKING GROUP 1 OF THE PLENARY
WORKING GROUP 2 OF THE PLENARY

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

Add the following country names to the list of signatories to this document:

EUROPEAN COMMON PROPOSALS - PART 1

IMT-2000, maritime and aeronautical issues

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.6.1	1A1	Initial IMT-2000 spectrum identified in S5.388 **Andorra, Malta**
	1A2	Bands to meet additional spectrum requirement for IMT-2000 **Andorra, Malta**
	1A3	Identification of bands already used for second generation systems for terrestrial IMT-2000 **Andorra, Malta**
	1A4	Resolution regarding the implementation of IMT-2000 **Malta**
	1A5	Use of high altitude platform stations in IMT-2000 systems **Andorra, Malta**
1.7	1B	Use of HF bands by AM(R)S and MMS **Andorra, Malta**
1.18	1C	Use of digital technology for MMS at 156-174 MHz **Andorra, Malta**

EUROPEAN COMMON PROPOSALS - PART 2

Mobile-satellite and radionavigation-satellite services

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.9	2A	Feasibility of an MSS (space-to-Earth) allocation at 1 559-1 567 MHz (Resolutions 213 and 220 (WRC-97)) **Andorra, Malta**
1.10	2B	Use of bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service **Andorra, Malta**
1.11	2C1	Non-GSO MSS under 1 GHz Resolution 214 (WRC-97) **Andorra, Malta**
	2C2	Non-GSO/MSS below 1 GHz - Resolution 214 (WRC-97) **Andorra, Malta**
1.15.1	2D1	RNSS (space-to-Earth) 960-1 215 MHz **Andorra, Malta**
	2D2	RNSS (space-to-Earth) 1 260-1 300 MHz **Andorra, Malta**
	2D3	Proposal for a new Resolution - Use of RNSS in the bands 1 151-1 300 MHz **Andorra, Malta**
	2D4	RNSS (space-to-Earth) and RNSS (Earth-to-space) in the band 5 000-5 030 MHz **Andorra, Malta**
	2D5	RNSS (Earth-to-space) 1 300-1 350 MHz **Andorra, Malta**
1.15.2	2D6	RNSS (space-to-Earth) at 1 215-1 260 MHz and 1 559-1 610 MHz **Andorra, Malta**
1.15.3	2D7	Status of allocations to services other than RNSS at 1 559-1 610 MHz **Andorra**

EUROPEAN COMMON PROPOSALS - PART 3

Non-GSO FSS

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.13.1	3A	Modifications to Article S21 **Andorra, Malta**
	3B	Modifications to Article S22 **Andorra, Malta**
	3C	Resolution on aggregate non-GSO interference **Andorra, Malta**
	3D	Provisions for earth stations with very large antennas **Andorra, Malta**
	3E	Modifications to Article S5 **Malta**
	3F	Modifications to Articles S9 and S11 **Andorra, Malta**
	3G	Modifications to Appendix S4 **Andorra, Malta**
1.13.2	3H	Modifications to Articles S5 and S22 to include limits in other frequency bands **Andorra, Malta**
1.13	3I	Updated Resolutions 130, 131 and 538 **Andorra, Malta**

EUROPEAN COMMON PROPOSALS - PART 4

Space and science services and radio astronomy

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.16	4A	Allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 **Andorra, Malta**
1.17	4B	Worldwide allocation for the Earth exploration-satellite (passive) and space research services in the band 18.6-18.8 GHz **Andorra, Malta**

EUROPEAN COMMON PROPOSALS - PART 5

Appendices S30 and S30A

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.19*bis*	5A	Scope of the RoP on S23.13 **Andorra, Malta**
1.20	5B1	Procedures for the use of the guardbands of Appendices S30 and S30A plans to perform space operation functions, also taking into account Resolution 86 (Minneapolis, 1998) **Andorra, Malta**
	5B2	Provisions relating to the suppression of Articles 6 and 7 of Appendices S30 and S30A, also taking into account Resolution 86 (Minneapolis, 1998) **Andorra, Malta**

EUROPEAN COMMON PROPOSALS - PART 6

Fixed services and fixed-satellite services

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.4	6A1	Allocations and regulatory aspects related to the high density fixed service (HDFS): Resolution 133 (WRC-97) - HDFS in the 37-39.5 GHz band **Andorra, Malta**
	6A2	Allocations and regulatory aspects related to the high density fixed service (HDFS): Resolutions 126 and 726 (WRC-97) - HDFS in the 31.8-33.4 GHz, 51.4-52 GHz, 55.78-59 GHz and 64-66 GHz bands **Malta**
	6A3	Allocations and regulatory aspects related to the high density fixed service (HDFS) **Malta**
1.5	6B	High altitude platform systems (HAPS) **Andorra, Malta**
1.8	6C	Earth stations on board vessels in the FSS at 3 700-4 200 MHz and 5 925-6 425 MHz **Andorra, Malta**
1.14	6D	Non-GSO MSS feeder links in the 15.43-15.63 GHz band **Andorra, Malta**

EUROPEAN COMMON PROPOSALS - PART 7

Appendices S3 and S7, Resolutions 28 (WRC-95) and 95 (WRC-97), PP-98 Resolutions

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.1	7A	Deletion of country names in footnotes to Article S5 **Andorra, Malta**
1.2	7B	Review of Appendix S3 with respect to spurious emissions for space services **Andorra, Malta**
1.3	7C	Review of Appendix S7 **Andorra, Malta**
7.1	7D	Report of the Director BR; Article S13 - Rules of Procedure **Andorra, Malta**
PP-98 Res.	7E1	PP-98 Resolution 86, Date of bringing into use of satellite network frequencies **Andorra, Malta**
	7E2	PP-98 Resolution 86, Satellite coordination procedures **Andorra, Malta**
	7E3	PP-98 Resolution 87, Role of the notifying administration **Andorra, Malta**
	7E4	Resolution 88, Processing charge for satellite networks **Andorra**
7.1	7D2 (Add.2 to Add.7 of CMR2000/13)	Resolution 80 **Cyprus, Lithuania, Romania**
	7D3 (Add.2 to Add.7 of CMR2000/13)	S5.488 **Cyprus, Lithuania, Romania**

PP-98 Res. 86	7E2 (Add.2 to Add.7 of CMR2000/13)	S5.43 **Andorra, Cyprus, Romania**
7.1 and PP-98 Res. 86	7F (Add.2 to Add.7 of CMR2000/13)	S11.44 (date of bringing into use) **Andorra, Cyprus, Romania**

Agenda item	**Part of the European contribution**	**European common proposal for WRC-2000 Subject and supplementary country names**
7.2	8A (Add.8 of CMR2000/13)	Agendas for 2003 and 2006 **Andorra, Cyprus, Lithuania, Romania**
	8B (Add.8 of CMR2000/13)	Resolutions for future conferences **Andorra, Cyprus, Lithuania, Romania**

Agenda item	**Part of the European contribution**	**European common proposal for WRC-2000 Subject and supplementary country names**
1.9	2A (Add.1 to Add.2 of CMR2000/13)	New MSS allocations **Andorra, Cyprus, Romania**
1.15.1	2D (Corr.1 to Add.2 of CMR2000/13)	Add space to space-to-space RNSS allocation **Andorra, Cyprus, Romania**

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.13	3D Corrigendum (Corr.1 to Add.3 of CMR2000/13)	Very large earth stations **Andorra, Cyprus, Lithuania**
	3F (Add.1 to Add.3 of CMR2000/13)	Modifications to Article S11 **Andorra, Cyprus**
	3E (Add.1 to Add.3 of CMR2000/13)	Explanations on coupling between Section VI of Article S22, Article S5 and Resolution 130 **Cyprus**
	3J (Add.1 to Add.3 of CMR2000/13)	Modifications to Article S15 and S13 **Andorra, Cyprus**

Agenda item	Part of the European contribution	European common proposal for WRC-2000 subject and supplementary country names

PLENARY MEETING

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

1 Add the following country names to the list of signatories to this document:

EUROPEAN COMMON PROPOSALS - PART 1

IMT-2000, Maritime and aeronautical issues

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.6.1	1A1	Initial IMT-2000 spectrum identified in S5.388 **Bosnia and Herzegovina**, **Greece**
	1A2	Bands to meet additional spectrum requirement for IMT-2000 **Bosnia and Herzegovina**, **Liechtenstein**
	1A3	Identification of bands already used for second generation systems for terrestrial IMT-2000 **Bosnia and Herzegovina**, **Greece**
	1A4	Resolution regarding the implementation of IMT-2000 **Austria, Bosnia and Herzegovina**, **Liechtenstein**
	1A5	Use of high altitude platform stations in IMT-2000 systems **Bosnia and Herzegovina**
1.7	1B	Use of HF bands by AM(R)S and MMS **Bosnia and Herzegovina**
1.18	1C	Use of digital technology for MMS at 156-174 MHz **Bosnia and Herzegovina**

EUROPEAN COMMON PROPOSALS - PART 2

Mobile-satellite and radionavigation-satellite services

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.9	2A	Feasibility of an MSS (space-to-Earth) allocation at 1 559-1 567 MHz (Resolutions 213 and 220 (WRC-97)) **Bosnia and Herzegovina**, **Greece**
1.10	2B	Use of bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service **Bosnia and Herzegovina**, **Greece**
1.11	2C1	Non-GSO MSS under 1 GHz Resolution 214 (WRC-97) **Bosnia and Herzegovina, Greece**
	2C2	Non-GSO/MSS below 1 GHz - Resolution 214 (WRC-97) **Bosnia and Herzegovina**, **Greece**
1.15.1	2D1	RNSS (space-to-Earth) 960-1 215 MHz **Austria, Bosnia and Herzegovina**, **Greece**
	2D2	RNSS (space-to-Earth) 1 260-1 300 MHz **Austria, Bosnia and Herzegovina**, **Greece**
	2D3	Proposal for a new Resolution - Use of RNSS in the bands 1 151-1 300 MHz **Austria, Bosnia and Herzegovina**, **Greece**
	2D4	RNSS (space-to-Earth) and RNSS (Earth-to-space) in the band 5 000-5 030 MHz **Bosnia and Herzegovina, Greece**
	2D5	RNSS (Earth-to-space) 1 300-1 350 MHz **Bosnia and Herzegovina**, **Greece**
1.15.2	2D6	RNSS (space-to-Earth) at 1 215-1 260 MHz and 1 559-1 610 MHz **Bosnia and Herzegovina**, **Greece**
1.15.3	2D7	Status of allocations to services other than RNSS at 1 559-1 610 MHz **Bosnia and Herzegovina**, **Greece**

EUROPEAN COMMON PROPOSALS - PART 3

Non-GSO FSS

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.13.1	3A	Modifications to Article S21 **Bosnia and Herzegovina**
	3B	Modifications to Article S22 **Bosnia and Herzegovina, Greece**
	3C	Resolution on aggregate non-GSO interference **Bosnia and Herzegovina, Greece**
	3D	Provisions for earth stations with very large antennas **Bosnia and Herzegovina, Greece**
	3E	Modifications to Article S5 **Bosnia and Herzegovina, Greece**
	3F	Modifications to Articles S9 and S11 **Bosnia and Herzegovina, Greece**
	3G	Modifications to Appendix S4 **Bosnia and Herzegovina, Greece**
1.13.2	3H	Modifications to Articles S5 and S22 to include limits in other frequency bands **Bosnia and Herzegovina, Greece**
1.13	3I	Updated Resolutions 130, 131 and 538 **Bosnia and Herzegovina, Greece**

EUROPEAN COMMON PROPOSALS - PART 4

Space and science services and radio astronomy

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.16	4A	Allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 **Bosnia and Herzegovina, Greece**
1.17	4B	Worldwide allocation for the Earth exploration-satellite (passive) and space research services in the band 18.6-18.8 GHz **Bosnia and Herzegovina, Greece**

EUROPEAN COMMON PROPOSALS - PART 5

Appendices S30 and S30A

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.19*bis*	5A	Scope of the RoP on S23.13 **Bosnia and Herzegovina**, **Greece**
1.20	5B1	Procedures for the use of the guardbands of Appendices S30 and S30A plans to perform space operation functions, also taking into account Resolution 86 (Minneapolis, 1998) **Bosnia and Herzegovina**
	5B2	Provisions relating to the suppression of Articles 6 and 7 of Appendices S30 and S30A, also taking into account Resolution 86 (Minneapolis, 1998) **Bosnia and Herzegovina**

EUROPEAN COMMON PROPOSALS - PART 6

Fixed services and fixed-satellite services

Agenda item	Part of the European contribution	European common proposal for WRC-2000 Subject and supplementary country names
1.4	6A1	Allocations and regulatory aspects related to the high density fixed service (HDFS): Resolution 133 (WRC-97) - HDFS in the 37-39.5 GHz band **Bosnia and Herzegovina**
	6A2	Allocations and regulatory aspects related to the high density fixed service (HDFS): Resolutions 126 and 726 (WRC-97) - HDFS in the 31.8-33.4 GHz, 51.4-52 GHz, 55.78-59 GHz and 64-66 GHz bands **Bosnia and Herzegovina**
	6A3	Allocations and regulatory aspects related to the high density fixed service (HDFS) **Bosnia and Herzegovina**
1.5	6B	High altitude platform systems (HAPS) **Bosnia and Herzegovina**, **Greece**
1.8	6C	Earth stations on board vessels in the FSS at 3 700-4 200 MHz and 5 925-6 425 MHz **Bosnia and Herzegovina**
1.14	6D	Non-GSO MSS feeder links in the 15.43-15.63 GHz band **Bosnia and Herzegovina**

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 13-E
21 January 2000
Original: French/ English/ Spanish

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

EUROPEAN COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

This contribution presents the European common proposals for WRC-2000. These have been developed by the CEPT Conference Preparatory Group (CPG). As in past conferences, the intent of these proposals is to provide timely and effective response to emerging radiocommunication needs while maximizing efficient use of the spectrum, protecting current services and their expected development, and enabling equitable access to frequencies by all countries and systems.

The European administrations welcome the opportunity offered by WRC-2000 for in-depth discussions with the other ITU administrations on the issues included in this conference agenda. To this effect, coordinators have been designated for each agenda item to act as point of contact with the other administrations to contribute to the efforts of the Conference in arriving at decisions that can be supported by all ITU countries. Annex 1 to this contribution provides the list of European coordinators for each of the WRC-2000 agenda items.

The main part of this contribution contains a summarized presentation of the European common proposals. The detailed proposals are provided in eight addenda to this contribution, which parallel the structure adopted in the CPM Report to WRC-2000. The table of contents for these addenda and the cross-references to WRC-2000 agenda items are provided in Annex 2.

1.1 Agenda item 1.1 - Deletion of country names from footnotes of Article S5

Considering the evolution of the intended use of frequencies by the civil aviation community since WARC Mob-87, the European countries appearing in footnotes S5.181, S5.197 and S5.259 propose the suppression of their names from these footnotes.

1.2 Agenda item 1.2 - Review of Appendix S3 (Spurious emissions for space services)

This agenda item covers the finalization of the spurious emission limits for space services in Appendix S3 to the Radio Regulations. Currently, the limits for space services are design objectives only, but will become hard limits for space service transmitters installed after 1 January 2003, and for all space service transmitters after 1 January 2012, after further review by WRC-2000.

The ITU-R studies have agreed to the deletion of the "design objectives" text, with no changes to the spurious emission limits or reference bandwidth for space services. In addition a number of proposed modifications to Appendix S3 have been agreed on the following issues:

- the limiting case of a very narrow-band or unmodulated signal in a wideband amplifier operating particularly in the space services;
- the special case of spurious emission limits applying at frequencies used by adjacent transponders within the same transmitting system;
- amateur earth stations operating below 30 MHz;
- spurious emission limits for deep-space satellites.

Europe supports the conclusions of these studies. The European proposal for transponders within the same transmitting system also addresses the case of two transponders spaced far apart.

These studies have also identified a further item requiring modifications to Appendix S3 which, although not directly related to agenda item 1.2, may be considered in order to bring attention to one particular WRC-97 decision that may be misunderstood. The modifications relate to clarifications on the applicability of the limits in Appendix S3 to radar emissions.

Additional proposals are made, which relate to:

- a further splitting of the space services categories "space services (space stations)" and "space services (earth stations)" in Table II of Appendix S3 to the ITU Radio Regulations into a larger number of categories based on definitions existing in the Radio Regulations to permit clear identification/differentiation and allow the use of different limits if deemed appropriate at any future point;
- to request the modification of WRC-03 agenda item 2.3 (see Resolution 722 (WRC-97)) to include consideration of the results of the studies pursuant to Recommendation 66, *recommends* 7 and 8.

1.3 Agenda item 1.3 - Revision of Appendix S7 (Earth station coordination area)

This agenda item is to review the earth station coordination procedures of Appendix S7, including the scope of the systems covered, the methodologies employed, the frequency range of applicability, the time percentage range of applicability, the propagation aspects and the tables of system parameters.

Europe supports the revision of Appendix S7 based on:

- replacement of the current text of Appendix S7 by essential regulatory material taken from Recommendation ITU-R SM.[Document 1/1004]. Europe does not support incorporation of this Recommendation by reference into the Radio Regulations;
- in order to provide a single text dealing with coordination distances in the Radio Regulations, relocation of material relating to pre-determined coordination distances from Appendix S5 to the revised Appendix S7;
- provision of a mechanism (via a new resolution) for updating the tables of system parameters within the revised Appendix S7. Method 3 as described in § 7.2.3 of the CPM Report is the proposed method;
- consequential changes elsewhere in the Radio Regulations (Articles S1 and S9; Appendices S4 and S5; Resolutions 27, 60 and 712; Recommendations 105 and 711).

1.4 Agenda item 1.4 - High-density fixed service (HDFS)

1.4.1 Conditions of use by HDFS of the frequency bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz (Resolutions 126 (WRC-97) and 726 (WRC-97))

Europe supports the use of HDFS in the bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz.

Band 31.8-33.4 GHz

Europe supports the CPM conclusion that sharing between FS and other services is possible with some constraints, and therefore proposes that WRC-2000 confirm the FS allocation in this band.

Europe supports the CPM conclusion that sharing between FS and the inter-satellite service (ISS) in the band 32-33 GHz is possible provided that adequate pfd limits are met by the ISS.

Europe also supports the CPM conclusion that sharing between FS and receiving earth stations in the space research service (SRS) in the band 31.8-32.3 GHz is feasible on a geographical basis (a coordination zone around the earth station would be necessary). Europe has concluded that sharing between SRS and FS receivers is also feasible with an adequate pfd limit on the SRS emissions.

Band 51.4-52.6 GHz

Europe supports the CPM conclusion that out-of-band emissions from FS complying with the spurious emission limits shown in Tables I and II of RR Appendix S3 do not exceed the protection criteria of EESS within the 50.2-50.4 GHz band, as given in Recommendation ITU-R SA.1029.

Europe also considers that sharing is feasible with the few radio astronomy sites in remote places.

Band 55.78-59 GHz

Based on technical parameters for the fixed service as given in Recommendation ITU-R SA.1259, compatibility studies have shown that sharing between FS and EESS in the 55.78-59 GHz band is feasible.

Europe proposes to limit the ISS use to GSO satellites and LEO satellites with a pfd limit of –147 dB(W/m^2/100 MHz).

In the band 55.78-56.26 GHz, Europe supports that the output power density of stations in the FS be limited to –21.5 dB(W/MHz), and that the e.i.r.p. density in the zenith direction be limited to –31 dBW/MHz (option 2 of the CPM Report).

Band 64-66 GHz

Europe supports HDFS.

1.4.2 Spectrum requirements for HDFS at 37-40 GHz (Resolution 133 (WRC-97))

Europe supports the use of HDFS in the 37-39.5 GHz band, which is already heavily used in Europe, and the inclusion of such use into S5.547. Europe also supports the use of the band 39.5-40.5 GHz for FSS, so that both FS and FSS have the opportunity to use the 38 GHz range.

Europe supports the pfd limits defined in option A of section 6.1.2.3.2 of the CPM Report in order to adequately protect the fixed service from FSS systems.

Europe also supports that the pfd limits proposed for FSS in option A be applied as well to SRS in the band 37.5-38 GHz and to GSO SRS in the band 37-37.5 GHz. For non-GSO SRS in the band 37-37.5 GHz, Europe proposes to keep the existing pfd mask.

1.4.3 Interference to the radio astronomy service (Resolution 128 (WRC-97)), and use of the band 40.5-42.5 GHz by the fixed service (Resolutions 129 (WRC-97) and 134 (WRC-97))

In this band, WRC-97 added a primary allocation to the fixed-satellite (space-to-Earth) service in Regions 2 and 3, and in certain non-European countries in Region 1. This allocation is subject to discussions at WRC-2000, according to the resolutions mentioned above. WRC-97 also upgraded the fixed service to primary.

The band will be used in many countries including Europe to provide fixed wireless access directly to the end user for multimedia services, and such use is expected to grow in the future. In Europe, terrestrial multimedia wireless systems (MWS) have priority in this band. The band 42.5-43.5 GHz is used by the radio astronomy service in many countries.

Europe is concerned about coexistence between MWS terminals and uncoordinated FSS and BSS earth stations in the band 40.5-42.5 GHz. Therefore, the introduction of FSS in Region 1 is opposed and the BSS allocation is proposed for deletion in Region 1. It is also proposed to introduce adequate pfd limits to protect terrestrial services from space services allocated in Regions 2 and 3, and in many countries in Region 1.

1.5 Agenda item 1.5 - High altitude platform stations (HAPS), (Resolution 122 (WRC-97))

Since further studies are being undertaken on interference mitigation, and since the first HAPS systems are not yet operational, Europe proposes to extend the time-frame of Resolution 122 (WRC-97) until WRC-03. A revision of Resolution 122 is proposed to this effect.

The possible use of HAPS in the IMT-2000 context is addressed under agenda item 1.6.

Proposals have been made in ITU for the use of HAPS in the fixed service in frequency bands other than 47.2-47.5 GHz and 47.9-48.2 GHz, however there are difficulties due to general sharing problems and these proposals are not supported. Europe believes that it is not appropriate at this stage to make additional allocations or designations for services using HAPS, apart from a consideration of the use of HAPS in the terrestrial component of IMT-2000.

It is suggested however, that studies be undertaken by ITU-R in order to assess the feasibility of using HAPS in the fixed service in other frequency bands.

1.6 Agenda item 1.6 - IMT-2000

1.6.1 Agenda item 1.6.1 - Review of spectrum and regulatory issues for IMT-2000 and adjustments to the Table of Frequency Allocations

With respect to satisfying the future spectrum requirements for IMT-2000, WRC-2000 agenda item 1.6.1 addresses the need to consider "spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component…".

In line with the wording of the agenda item, Europe has decided to place a clear priority on the spectrum requirements of the terrestrial component of IMT-2000 over those of the satellite component.

The CPM Report concludes on total spectrum requirements for the terrestrial element of IMT-2000 for the three Regions[1], which are based on the sum of the spectrum currently identified for IMT-2000 in S5.388, the spectrum currently identified in the three Regions for existing second generation systems and an additional spectrum requirement to meet the forecasted traffic volume in geographic areas where the traffic is the highest. This additional spectrum is estimated to be 160 MHz in all three Regions by 2010. Europe fully supports these conclusions.

The CPM Report also concludes on spectrum requirements for the MSS, including the satellite component of IMT-2000. Europe does not consider it necessary to propose additional spectrum to satisfy MSS requirements under agenda item 1.6, but seeks identification of the existing MSS bands below 3 GHz for possible IMT-2000 applications. The proposed method of identification is one element of a proposed new resolution.

For the terrestrial component, the purpose of the WRC-2000 Conference should be to find global bands for all three regions to meet the requirement of 160 MHz of additional spectrum. Globally harmonized spectrum will facilitate worldwide roaming and reduce cost and complexity of IMT-2000 implementation. To this end, Europe is proposing to identify the band 2 500-2 690 MHz as the new global additional band for IMT-2000, with the band 2 520-2 670 MHz specifically for the terrestrial component.

The bands 2 500-2 520 MHz and 2 670-2 690 MHz are used today by a number of non-MSS services, thereby making these bands unavailable for MSS use in most parts of the world. Transitional arrangements in these bands, similar to those introduced in the 2 GHz MSS allocations would enhance the usability of these MSS spectrum allocations.

The identification of the additional bands should be done through a new footnote(s) in Article S5, referring to a supporting resolution. It is believed that this approach, whereby the identification of spectrum is made by a footnote in association with a WRC Resolution, rather than the use of a WRC Resolution alone which is generally considered to apply to transitional matters, gives the most stable identification of spectrum for IMT-2000. For this reason, Europe is proposing a **NOC** to footnote S5.388. This is important to further facilitate global roaming and global economies of scale in the manufacture of equipment, and is particularly important for developing countries to gain the greatest benefit from IMT-2000. This approach also underlines the importance of the IMT-2000 project within ITU, and the significant efforts both within ITU and external standardization bodies in the development of harmonized radio standards for IMT-2000.

Europe also proposes that WRC-2000 should identify for IMT-2000 spectrum that is currently used on a large scale in the various regions for existing (second generation) cellular/mobile systems within which IMT-2000 may be implemented in the longer term. Because the location of existing second generation spectrum is not common to the three Regions, the location of additional spectrum for IMT-2000 may similarly vary. As a result, some flexibility in the identification of additional spectrum for IMT-2000 may be needed.

Future frequency arrangements for these bands should aim to achieve compatibility with the existing frequency arrangements in operation, including the current duplex spacing and direction employed (for instance, in the GSM1800 band, 1 710-1 785 MHz paired with 1 805-1 880 MHz).

Europe recognizes that High Altitude Platform Stations (HAPS) could provide a platform to support base stations for the terrestrial component of IMT-2000 in appropriate situations. Regulatory action is required to enable HAPS to fulfil this role.

---

[1] 555 MHz in Region 1, 390 MHz in Region 2 and 480 MHz in Region 3.

To fulfil the requirements outlined above, Europe is presenting a comprehensive set of proposals divided into five parts:

- the first part addresses that no change is needed for the current footnote S5.388;
- the second part addresses spectrum which is proposed to satisfy the additional global requirement and particularly the regulatory provisions relating to the band 2 500-2 690 MHz;
- the third part addresses spectrum which is currently identified for second generation mobile systems and which is proposed, under certain conditions, to be identified globally for IMT-2000. In Europe, it is worth noting that second generation systems (GSM900 and GSM1800) are widely deployed and hence refarming of this spectrum is envisaged only in the longer term;
- the fourth part introduces new resolutions to be considered at WRC-2000:
  - Resolution ZZZ [EUR/13/1] concerning the extension bands for the implementation of IMT-2000;
  - Resolution TTT [EUR/13/2] dealing with frequency bands for the satellite component of IMT-2000 and appropriate transitional arrangements;
- the fifth part addresses the possible implementation of High Altitude Platform Stations (HAPS) in an IMT-2000 system.

1.6.2 Agenda item 1.6.2 - Identification of a global radio control channel

The interest of having a control channel is to enable a terminal to gather all appropriate information on availability of frequencies (rasters, TDD/FDD, public/private…), operators, radio interfaces, services, (etc…) which are available in its area. In line with the conclusions of ITU-R on this issue, Europe considers that facilitation of multimode terminal operation and worldwide roaming of IMT-2000 is possible without a specific physical global control channel. Hence no proposals are made by Europe in the context of this agenda item.

1.7 Agenda item 1.7 - Use of the HF bands by the aeronautical mobile (R) and maritime-mobile services

Europe does not propose re-allocation of maritime and aeronautical HF bands and considers that this agenda item can be satisfied through the following modifications of the maritime procedures and HF channelling tables:

- conversion of the maritime HF distress and safety frequencies to be exclusive, interlinked with a transition period;
- encouraging the use of digital selective calling instead of calling by radiotelephony;
- arranging the residual radiotelephony routine calling on frequencies other than those used for distress and safety.

1.8 Agenda item 1.8 - Earth stations on board vessels

Agenda item 1.8 requests to consider regulatory and technical provisions to enable earth stations located on board vessels (ESV) to operate in fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands.

Both bands are heavily used by the fixed service throughout Europe and significant growth is expected in the future, in order to satisfy the fixed service spectrum requirements for long haul high capacity systems which could not be accommodated in other bands.

The ESV operation bears a great potential of interference to the fixed service applications in the 5 925-6 425 MHz band and could constraint the FS development in the 3 700-4 200 MHz band if protection from the FS were to be requested. Therefore, a change to the Radio Regulations which would permit use of ESVs could not be supported if it had the potential to allow harmful interference to the FS, or if it introduced additional constraints on the development of the fixed service.

Considering that the studies of the technical and regulatory environment of the use of the ESV have not been completed within ITU-R, Europe proposes to make no change to the existing Radio Regulations and that further studies be conducted to resolve the technical, regulatory and legal uncertainties before a future possible recognition of the ESV in the Radio Regulations.

1.9 Agenda item 1.9 - MSS downlinks at 1 559-1 567 MHz (Resolutions 213 (Rev.WRC-95) and 220 (WRC-97))

The studies in ITU-R have demonstrated that the frequency band 1 559-1 567 MHz can not be shared co-frequency with RNSS systems. On the other hand, as indicated in the CPM Report, some studies have shown that the existing RNSS systems would be protected against interference. Considering the development of new RNSS systems which are planned to be introduced in this band, Europe proposes no change in the frequency band 1 559-1 567 MHz at this WRC.

In order to respond to Resolution 213, consideration is being given to a proposal for an alternative downlink allocation to MSS.

It should be noted that the frequency band 1 559-1 567 MHz is also dealt with under agenda items 1.15.2 and 1.15.3.

1.10 Agenda item 1.10 - Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

Europe supports keeping generic MSS allocations in these bands and would oppose any proposals to return to segmented allocations.

Strengthening of current provisions is proposed to ensure that spectrum will be made available, as required, to satisfy the spectrum requirements of AMS(R)S communications with priority 1 to 6 of Article S44 and of distress, urgency and safety GMDSS communications. Towards this, a new Resolution [EUR/13/4] is proposed to be referenced in the present footnotes (S5.383A and S5.357A). Europe would be cautious about any modification to the current footnotes since it could have an unpredictable outcome.

Europe is proposing extension of S5.357A to the bands 1 555-1 559 MHz and 1 656.5-1 660.5 MHz. However, it was felt premature to further extend the frequency range since it would lead to GMDSS and AMS(R)S having equal priority in the same bands, the consequences of which need to be evaluated before the WRC, in cooperation with IMO and ICAO.

The coordination process satisfactorily provides spectrum for GMDSS and AMS(R)S today and is expected to continue to do so in the future, with the proposed Resolution [EUR/13/4]. This also means there would be no need to determine the future spectrum requirements of GMDSS and AMS(R)S or to further study the feasibility of inter-system prioritization and pre-emption. Resolution 218 (WRC-97) is therefore proposed to be suppressed.

Clarification of the current provisions on the issue of GMDSS safety related communications carried under priority 4 of Article S53 is required. This clarification is achieved by referring to Articles S32 and S33 through appropriate provisions in the proposed Resolution [EUR/13/4].

1.11 Agenda item 1.11 - Non-GSO/MSS below 1 GHz (Resolutions 214 (Rev.WRC-97) and 219 (WRC-97))

Concerning Resolution 214, Europe considers that the protection of the existing and planned systems from MSS interference must be ensured. Europe also supports the continued protection of the MetSS in the sub-bands 137.025-137.175 MHz and 137.825-138.000 MHz, and opposes any proposal for upgrading the MSS to primary status in these two bands.

Europe strongly opposes the identification of any portion of the bands 410-430 MHz and 440-470 MHz, and in particular the extension to Region 1 of the existing allocation in Region 2 for the bands 454-456 MHz and 459-460 MHz. Europe does not consider that there is any need for further allocation to MSS below 1 GHz.

Concerning Resolution 219, Europe believes that all of the band 403-406 MHz is needed to secure the existing radiosonde operations, and as there is an increase in radiosonde operations, allocation of MSS in the band 405-406 MHz to MSS is opposed.

1.13 Agenda item 1.13 - Review of the power limits on non-GSO FSS systems (Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97))

1.13.1 Review of the limits in the frequency band covered by Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97)

WRC-97 decided to include power limits in Articles S21 and S22 in order to ensure coexistence among non-GSO FSS, GSO FSS, GSO BSS, space science and terrestrial systems in several frequency bands in the 10-18 GHz ("Ku-band") and 18-30 GHz ("Ka-band") range. WRC-97 adopted the concept of "hard limits" in these bands, and the regulatory conditions associated to these limits, subject to review and possible revision of the levels of these limits at WRC-2000.

Europe supports the introduction of new services such as non-GSO FSS and competition in the provision of telecommunication services while ensuring the protection of GSO FSS, GSO BSS, space sciences and terrestrial systems in operation and their future evolution and growth.

The ITU-R studies relating to the non-GSO FSS issue have validated the technical and regulatory proposals that formed the basis of WRC-97 decisions, with unanimous agreement reached at the CPM on the equivalent power flux-density (epfd) levels specifying the limits on non-GSO FSS emissions in all cases. Europe supports the agreement which was unanimously reached at the CPM, in particular on the following aspects:

- the modifications proposed to Article S21, concerning the limits on non-GSO FSS systems to protect the fixed service and the suppression of Resolution 131 (WRC-97);
- the modifications proposed to Section II of Article S22, concerning the "validation", "operational" and "additional operational" limits on non-GSO FSS systems to protect the GSO FSS and GSO BSS systems;
- the need to control the aggregate interference caused into operational GSO earth stations by all the non-GSO FSS systems, through a resolution.

On the limits to enable coexistence between GSO FSS, non-GSO FSS, radiolocation, radionavigation and space research in the 13.75-14 GHz band, Europe proposes the suppression of the minimum e.i.r.p. limit of 68 dBW currently included in S5.502. It is also proposed that, in line with the information provided in Recommendation ITU-R S.1068, the e.i.r.p. density limit specified in S5.502 be extended to all directions of space. Europe also proposes the introduction in S5.503 of a maximum e.i.r.p. density limit for non-GSO earth stations operating in the band 13.772-13.778 GHz.

Modifications are also proposed to Articles S9 and S11 to clarify that the provisions of Appendices S30, S30A and S30B are not applicable to non-GSO FSS systems. In the absence of such modifications, the provisions of Appendices S30, S30A and S30B may be understood as applying to non-GSO FSS systems, which would be in contradiction with the conclusions of the ITU-R studies.

Concerning several items where several possible options were identified by the CPM, the following proposals are made:

- Along with option 2 of Annex 7 of Chapter 3 of the CPM Report, a proposal is made to update Section VI of Article S22 (earth station off-axis e.i.r.p. density limits), taking into account the results of the ITU-R studies, and the need for relaxed values for these limits, compared with the ones included in the corresponding ITU-R recommendations. Depending on the outcome of the ITU-R studies prior to WRC-2000 on the applicability of such limits to earth stations within non-GSO systems, this proposal may need to be updated.
- The proposals under Article S5 and Article S22 reflect the incorporation in these Articles of provisions currently appearing in Resolutions 130 (WRC-97) and 538 (WRC-97), and the suppression in these resolutions of transitional measures, which are no longer considered relevant after WRC-2000, as highlighted in Annex 5 of Chapter 3 of the CPM Report.
- Along with option 2C of Section 2 of Annex 6 of Chapter 3 of the CPM Report, it is also proposed to exempt from the national or subregional restrictions appearing in S5.488 and S5.491 both GSO and non-GSO systems.

In addition, improvements are proposed to the CPM example text in four areas:

- As agreed within ITU-R, but not currently reflected in the CPM example text, the validation limits included in Tables S22-1A, S22-1B, S22-1C and S22-1D for a given GSO earth station antenna diameter should be specified as continuous curves, by straight line interpolation between the points corresponding to the same GSO earth station antenna, in the appropriate scale (linear scale for the epfd expressed in decibels and logarithmic scale for the percentage of time).
- The operational limit which applies for 2.4 m BSS in a part of Region 2 towards some orbital locations in the Region 2 BSS Plan is proposed to be moved to Table S22-4, and S22.5I (S22.5G in the CPM Report) is proposed to be slightly amended in order to give this limit a regulatory status.
- In the draft resolution relating to the limits on the aggregate interference from all non-GSO FSS systems, it should be made clear that these limits only apply for GSO orbital inclination of up to 2.5°, with a 3 dB relaxation for orbital inclinations between 2.5 and 4.5°.
- In the proposed modifications to Resolutions 130 (WRC-97) and 538 (WRC-97), the *requests the Radiocommunication Bureau* to review the findings previously made with respect to the compliance with the provisional limits are proposed to be suppressed, since, in the absence of a verification tool, the BR could not have been in a position to make such a finding.

1.13.2 Inclusion in other frequency bands of similar limits in Articles S21 and S22, or other regulatory approaches to be applied in relation to sharing situations

Europe supports the extension to Region 2 of the $epfd_{up}$ limits applying in Regions 1 and 3 in the 17.3-17.8 GHz band. In line with the conclusions of the CPM Report, Europe supports the limitation of the use of that band by non-GSO FSS (Earth-to-space) in Region 2 to non-GSO gateway operation. It is proposed that this be ensured by including in S5.516 a limitation on the minimum antenna size of 4.5 metres for non-GSO FSS transmit earth stations. The $epfd_{up}$ limits proposed in this band and region to protect BSS feeder links are the same as in the other regions.

1.14 Agenda item 1.14 - Issues relating to non-GSO MSS feeder links (space-to-Earth) at 15 GHz

Europe considers that there is no need to modify the current allocation to FSS in the 15.43-15.63 GHz band (space-to-Earth) as contained in Article S5.

However No. S5.511A should be modified to state that operation of FSS in the band 15.43-15.63 GHz (space-to-Earth) should be limited to non-GSO MSS feeder links for which advanced publication information has been received by the Bureau prior to the end of WRC-2000. In addition, these systems should be required to limit their out-of-band emissions in the band 15.35-15.4 GHz to meet the requirements of Recommendation ITU-R RA.769-1 for 98% of time, which is considered sufficient to ensure protection of the radio astronomy service. These requirements should be clearly stated in S5.511A.

On this basis, Resolution 123 (WRC-97) is proposed to be suppressed, together with the reference to this Resolution in No. S5.511A.

1.15 Agenda item 1.15 - Issues related to the radionavigation-satellite service (RNSS)

1.15.1 New allocations to the RNSS in the range 1-6 GHz

Under this agenda item, WRC-2000 will have to take major decisions for the future of the radionavigation-satellite service. These decisions relate to new allocations to the radionavigation-satellite service (RNSS) in the 1-6 GHz range, which are essential for the development of the European ***Galileo*** system as well as the improvement of the American GPS.

Several frequency bands have been investigated by the ITU-R studies. Sharing frequencies between the new RNSS signals and the services already using the bands under consideration proves to be a difficult problem. One solution to that problem would be to remove the existing services from the bands that may be allocated to RNSS by WRC-2000. This solution is not acceptable by Europe, which proposes the establishment of a regulatory scheme enabling all planned RNSS systems and existing services to coexist by requiring the new RNSS signals to adapt to their environment.

The European proposals on this issue are aimed at allowing a clear regulatory framework enabling the timely development of RNSS in these new allocations, but they also contain the necessary provisions to ensure a fully protected environment to existing services (e.g. DME, radars, radio astronomy).

The European Union initiated the development of a second-generation European radionavigation-satellite system, ***Galileo***, the space segment of which will be implemented by the European Space Agency. It is being designed as an independent, global, civil-controlled system which will be used, together with other RNSS systems, as the basis for the second-generation global navigation-satellite system, GNSS-2. ***Galileo*** will provide open access and two levels of controlled access services. One of these controlled access services will provide a reliable signal for safety purposes, including aeronautical use.

To offer these services, sufficient new allocations supporting at least two independent new wideband signals are required together with related narrow-band signals used to compensate for ionospheric delay. Discussions have already started between the European Union, Russia and the United States in order to set up a global GNSS service by cooperation of all relevant networks.

The limited spectrum in existing allocations imposes restrictions on the signal bandwidth and severe limitations on the achievable performance. Additional allocations are urgently required to allow the full development and enhancement of RNSS systems to be achieved. Wider signal bandwidth (up to 24 MHz for a single downlink signal) would allow higher code rates to provide better navigation accuracy and reduce multipath errors, which would benefit all RNSS applications. To keep the design and operational independence of the different systems, it is essential to allocate sufficient spectrum for independent, non-overlapping links.

In addition, proposals for RNSS systems have been made in which the satellites are required to be synchronized to terrestrial beacon reference stations. Less than 50 beacons are required, distributed worldwide. These would require RNSS (Earth-to-space) allocations.

To satisfy these global RNSS requirements, the following bands are proposed, under regulatory conditions that ensure a fully protected environment to existing services (e.g. DME, radars, radio astronomy), with the view to enable the continued operation and expected development of these services.

a) RNSS (space-to-Earth) in 1 151-1 215 MHz

This spectrum is part of the 960-1 215 MHz band which is currently allocated to the aeronautical radionavigation service. The 1 151-1 215 MHz portion of this band is used for ground-based DME and TACAN. In Europe, DME installations will continue to be used in conjunction with RNSS systems. This may result in an increase in the requirements for DME in Europe and this use is foreseen to extend to 2015 and beyond. The continued operation of current systems is therefore a prime consideration.

Noting that the GNSS will be a combination of at least two independent RNSS systems, adequate spectrum for GNSS in this band should therefore be made available, with provisions that protect the present and expected usage of this band by the ARNS.

It is noted that the United States have proposed to allocate the band 1 164-1 188 MHz for the implementation of a new GPS signal.

The limits of the allocation in a portion of the band 960-1 215 MHz depend on the following factors:

– sharing the same frequency between multiple RNSS systems is likely to be difficult in presence of DME. More importantly, it does not allow to build a true GNSS, due to the lack of independence between the RNSS systems involved. It is therefore essential that WRC-2000 allocate sufficient spectrum for independent, non-overlapping links of different systems;

– although it is already known that the 1 151-1 215 MHz part of the 960-1 215 MHz band is preferred for the implementation of RNSS, the best specific part of 1 151-1 215 MHz is still under investigation.

The studies in ITU-R have shown that interference from existing services into RNSS may be significant, especially at high altitudes. One solution to that problem would be to remove the existing services from the band that may be allocated to RNSS by WRC-2000. This solution is not acceptable by Europe, which proposes the establishment of a regulatory scheme enabling RNSS systems and existing services to coexist by requiring the new RNSS signals to adapt to their environment. In order to protect ARNS, a provisional pfd limit at the Earth's surface is proposed. Preliminary studies showed that a pfd limit of -111 dBW/m^2/MHz per system (allowing up to three systems to share the same frequency) should be sufficient to provide the greatest flexibility to RNSS while adequately protecting ARNS. This value must be confirmed by more detailed studies, with the aim of ensuring an efficient protection to ARNS while leaving as much flexibility as possible to RNSS, so that they can provide the desired reliable service anywhere at any altitude. This pfd value is proposed to be reviewed by WRC-03.

It is therefore proposed to allocate the band 1 151-1 215 MHz to the radionavigation-satellite service (space-to-Earth) under the condition that RNSS shall not claim protection from existing ARNS systems. A provisional pfd limit at the Earth's surface of -111 dBW/m^2/MHz is also proposed to protect the existing ARNS systems from harmful interference from RNSS systems. This value should be subject to review at WRC-03. A related Resolution is proposed to WRC-2000 to ensure that the final value of the pfd limit decided by WRC-03 is met by all RNSS systems using this new allocation, irrespective of their date of entry into use.

b) RNSS (space-to-Earth) in 1 260-1 300 MHz

In principle, there is no difference between the current allocations of 1 215-1 260 MHz and 1 260-1 300 MHz apart from the absence of RNSS from the latter. In addition, these bands are allocated by footnote S5.331 to the radionavigation service in several countries on a primary basis. According to S5.282, the amateur-satellite service (Earth-to-space) may operate in the band 1 260-1 270 MHz subject to not causing harmful interference to other services operating in accordance with the table (see S5.43).

It is considered that the band 1 260-1 300 MHz, as the band 1 215-1 260 MHz, provides scope for non-safety-of-life radionavigation-satellite applications, without operational constraints on radar installations.

A primary allocation is therefore proposed to the radionavigation-satellite service (space-to-Earth) in the band 1 260-1 300 MHz subject to not claiming protection from the radionavigation and the radiolocation services. For the protection of the radiolocation and radionavigation systems in the whole of the band 1 215-1 300 MHz, a provisional pfd limit at the Earth's surface of -133 dBW/m^2/MHz per any satellite of an RNSS system is proposed, subject to review at WRC-03. A related resolution is proposed to WRC-2000 as described in a) above.

c) RNSS (space-to-Earth) and RNSS (Earth-to-space) in 5 000-5 030 MHz

This band is allocated to the aeronautical radionavigation service for the operation (S5.444) of the microwave landing system (MLS), and to the aeronautical mobile-satellite (R) service (S5.367), subject to agreement obtained under No. S9.21. The international standard MLS system uses only frequencies above 5 030 MHz. The only use of the band 5 000-5 030 MHz is by the United Kingdom for an aircraft carrier based landing system that is used only at sea. This use is considered fairly light, below five systems, and no further implementation is expected.

The 5 000-5 030 MHz band is one of the few bands that are fairly lightly used. A 10 MHz guardband is necessary to protect the radio astronomy service below 5 000 MHz from out-of-band emissions of RNSS (space-to-Earth).

It is therefore proposed to allocate the band 5 000-5 010 MHz to the radionavigation-satellite service (Earth-to-space) and the band 5 010-5 030 MHz to the radionavigation-satellite service (space-to-Earth), while protecting the radio astronomy service below 5 000 MHz by an appropriate footnote containing a pfd limit, that would apply to out-of-band emissions from RNSS systems operating in the band 5 010-5 030 MHz falling into the radio astronomy band 4 990-5 000 MHz.

d) RNSS (Earth-to-space) in 1 300-1 350 MHz

In accordance with the Radio Regulations, the band 1 300-1 350 MHz is allocated on a primary basis to the aeronautical radionavigation service and on a secondary basis to the radiolocation service in all ITU regions. Because of the low elevation, the good discrimination found with radar antennas and the pulse modulation of the radar signal, a favourable sharing environment is foreseen. It is believed that in the case of excess interference into a satellite receiver, this would last for only a few seconds and would not be detrimental to the integrity of the system. As far as the interference into radars is concerned, this could be solved by careful location of the 50 worldwide required radio beacons. As stated in the CPM Report, a separation distance of less than 60 km is required between radars and the beacons.

In the band 1 300-1 350 MHz, the interests of the radiolocation and the radionavigation service are proposed to be safeguarded by a footnote proposing no protection for RNSS against radionavigation and a consequential upgrade of the radiolocation service to primary status.

1.15.2 Agenda item 1.15.2 - Allocation to RNSS (space-to-space) at 1 215-1 260 MHz and 1 559-1 610 MHz

This new direction of allocation to RNSS will not interfere into other services. However, the new requirement for protection of spaceborne receivers might constrain other RNSS systems in these bands.

Therefore Europe proposes the addition of the space-to-space direction to RNSS in the bands 1 215-1 260 MHz and 1 559-1 610 MHz with an additional footnote to prevent undue constraints relating to the protection requirements of spaceborne receivers from other radionavigation-satellite systems operating in these bands.

1.15.3 Agenda item 1.15.3 - FS allocation in the band 1 559-1 610 MHz

The band 1 559-1 610 MHz is currently allocated on a primary basis to the aeronautical radionavigation and radionavigation-satellite services in all ITU Regions. S4.10 recognizes that radionavigation services require special measures to ensure freedom from harmful interference. In accordance with footnotes S5.359 and S5.355, the band 1 559-1 610 MHz is additionally allocated to the fixed service on a primary and secondary basis respectively, in a number of countries.

The results of compatibility studies carried out in ITU-R show that FS emissions would cause unacceptable interference to RNSS receivers in the band and exclusion of FS transmitters from the band would protect these receivers.

Based on current and forecast use of the band by the fixed service in Europe and compatibility study results, Europe considers that RNSS should be provided with adequate protection and therefore the fixed service should be phased out. Europe proposes to phase out the FS from the band in two steps:

– FS is primary until 2005 and becomes secondary after this date;

– FS is secondary from 2005 until 2015, and is removed from the band after 2015.

1.16 Agenda item 1.16 - Allocations above 71 GHz

The allocations above 71 GHz should be re-arranged to correspond to the needs of the Earth exploration-satellite service (EESS), the space research service (SR) and the radio astronomy service (RA) with regard to the frequency spectrum and protection requirements.

A re-arranged allocation table should take into account the spectrum requirements and sharing possibilities of active services in order to provide an interference-free sharing environment and usable spectrum for all services to the extent possible.

In order to achieve this goal the following general principles for the revision of the table of allocations above 71 GHz should apply:

- The allocations to the passive services should be in response to physical processes in space or the atmosphere.
- Passive sensors of the EESS are operated on a global basis, and coordination with other services is not practical. The only sharing possibility resides in a strict compliance with the interference threshold of the passive sensors.
- No satellite downlinks within important RA bands or within bands adjacent to those in which an allocation for radio astronomy is foreseen.
- Co-allocation of RA and terrestrial services (except high altitude platforms), if possible, provided there is the necessary coordination around the radio astronomy stations. (The number of mm-wave observatories worldwide is expected to remain very limited, because, *inter alia*, few sites on Earth fulfil the stringent requirements that justify the required investment). Locations of mm-wave radio observatories are selected mostly on the basis of low water vapour content of the atmosphere, and stability of the climate. Preferred locations are, therefore, high mountain tops or plateaux in a desert environment, far from major cities and centres of urbanization. Therefore, this service will be able to share its frequency bands with terrestrial services.) See also Article S29.
- There should be, wherever possible, no difference between the total amount of frequency spectrum allocated to the various services in the present Radio Regulations, and the total amount of frequency spectrum after the re-arrangements, except for those allocations, subject to agenda item 1.16; however, this principle should not be applied at the expense of the usability of spectrum for the individual services allocated to a band due to protection requirements or interference from other allocated services. Thus, unfavourable combinations of allocations in a band should be avoided.
- Wherever there are conflicts between requirements from the different services, the services with a justified need for that specific band will have priority over the others. The other service(s) will then be re-allocated to other bands taking into account general spectrum requirements of the different services. (Although most of the active radio

services are not about to utilize the frequency bands above 71 GHz in the immediate future, adequate spectrum resources must be provided to allow for the development of radio equipment.)

- Taking due account of the convergence of the fixed and mobile services, these two services could have a co-allocation in the various frequency bands concerned, although convergence may not take place in all co-allocated bands.
- Primary allocations should be mentioned in the table of allocations itself, not in footnotes to the table.
- Europe proposes to use this review of the allocations to passive services above 71 GHz, for inclusion of allocations to the EESS (active) in the band 130-130.5 GHz (for high accuracy altimetry) and to the EESS (active) and SR (active) in the band 237.9-238 GHz (for spaceborne cloud radars); this avoids the need to open another agenda item very soon; it has minimal/no effect on other services; the requested allocations are very small; EESS (active) is the only service that has no allocation above 100 GHz, despite the fact that it may be the first active user to enter the range.

Regarding sharing between active and passive services, the European proposals support the conclusions of the CPM. Since little is known about the future characteristics of equipment used within these services, a resolution has been developed, encouraging ITU-R to develop, if appropriate, sharing criteria for these services. Meanwhile, the European proposal to WRC-2000 avoids co-allocation of active and passive services to prevent potential sharing problems.

Noting that the provisional agenda for WRC-03 includes agenda item 3 (results of studies with a view to consider for inclusion in a future agenda: … 3.2 allocations above 275 GHz), Europe has limited its proposals to frequency bands below 275 GHz.

The European view for the spectrum above 275 GHz is to extend the table of allocations until 1 000 GHz, in order to allow the indication in footnote S5.565 that certain frequency bands in this range are of interest for the science services.

1.17 Agenda item 1.17 - Worldwide allocation for EESS and SRS at 18.6-18.8 GHz

In Europe, the 18 GHz band is used extensively for fixed services in many countries and is likely to be used by the fixed-satellite service in the near future. The fixed service uses this band to provide mobile network infrastructure and medium hop links for public telecommunications networks. These requirements are expected to continue with the liberalization of European telecommunications and the introduction of new services.

The European common proposals on this issue are therefore intended to safeguard the future increasing use of the band for all the allocated services and seek to establish within the Radio Regulations the future sharing environment within which the FS, FSS and EESS (passive) must work. These proposals are in line with technical options included in the CPM Report and represent the maximum constraint on the active services in this band which can be accepted by Europe.

If agreement can be reached on the adoption of the technical constraints on the active services as proposed, an upgrade of the EESS (passive) to worldwide primary status can be supported.

1.18 Agenda item 1.18 - Use of new digital technology for the maritime mobile service in the band 156-174 MHz

The European approach under this agenda item is to continue to support the development and introduction of digital technologies to replace existing analogue technology in the VHF maritime mobile service.

To achieve this goal, Europe proposes to modify Resolution 342 (WRC-97), with a view to support the development of a new worldwide technology and to call for the finalization of the ITU-R studies to identify suitable technical characteristics of the system or interoperable systems to replace existing technology.

Europe also proposes a modification of Appendix S18 with the addition of a new footnote to permit the possible use on a voluntary basis of various bands created by the conversion of some duplex channels to simplex channels, for initial testing and the possible future introduction of new technologies. This new footnote would allow these channels to be operated as simplex channels, thus offering the possibility of extending the number of channels for solving local congestion.

1.19*bis* Agenda item 1.19*bis* - RR 2674/S23.13

The issue was first discussed at WRC-95 and WRC-97 adopted Resolution 536. Europe is of the opinion that there is no need to re-open the discussion at WRC-2000.

1.20 Agenda item 1.20 - Procedures for the coordination of unplanned services with Appendices S30 and S30A Plans

Due to lack of time, WRC-97 had to postpone the review of these procedures. ITU-R has reviewed these procedures, identified the current deficiencies in them, and possible options to correct these deficiencies, under three possible approaches:

– Approach A, in which Articles 6 and 7 of Appendix S30 and S30A would be retained and the currently suspended provisions S9.8 and S9.9 would be suppressed.

– Approach B, in which Articles 6 and 7 of Appendices S30 and S30A would be suppressed and replaced by equivalent procedures in Articles S9 and S11, retaining S9.8 and S9.9.

– Approach C, based on separating the modifications to the Plans from the original Plans.

The discussions in ITU-R have highlighted the difficulties arising from the need to update these procedures under Approach A, in order to reflect the improvements made in 30 years of application of the procedures under Articles 11 and 13 (now S9 and S11). Europe therefore continues to favour locating these procedures in Articles S9 and S11 (i.e. Approach B) in order to facilitate the task of the administrations and the Bureau when stations or networks in unplanned services need to be coordinated with the Plans.

Europe also supports the conclusions of the CPM Report taking into account Resolution 86 (Minneapolis, 1998) and considers of primary importance, for the conservation of the Appendices S30 and S30A Plans and the protection of other non-planned services and systems in the frequency bands covered by these Plans, that the deficiencies identified by the CPM regarding the existing provisions relating to the coordination between planned and non-planned services be corrected as a matter of urgency.

7.1 Agenda item 7.1 - Report of the Director, BR - Rules of Procedure

The present structure of Article S13 dealing with the Rules of Procedure of the Radio Regulations Board has resulted in some misunderstanding as to what was intended by WRC-97. The RRB have, on a provisional basis, developed some rules to clarify the application of these provisions. Europe proposes to modify Article S13 in order to clarify the sequence of these various provisions and to improve the transparency of the process.

8 Agenda item - Resolutions from the Plenipotentiary Conference (Minneapolis, 1998)

PP-98 adopted several Resolutions requesting WRC-2000 to take action on a number of items within the mandate of WRCs. These resolutions have the effect of adding to the agenda of WRC-2000.

8.1 Resolution 86 - Improvements to the satellite coordination and notification procedures

Date of bringing into use of satellite frequencies

Europe proposes regulatory amendments to clarify this item.

Separation of uplink and downlink data

It is proposed to separate the uplink and downlink data, which would result in treating the up and down bands separately in identifying the coordination requirements. This would result in there no longer being a need to submit the strapping data to the BR and Appendix S8 would be applied separately to the up and down bands. This would simplify the work of BR and administrations.

Identification of the networks with which coordination is required

Under the present procedures the BR is required to identify administrations with whom coordination is required, but the process of doing this is by satellite networks (Appendix S8). Europe sees many advantages in having the BR identify the specific networks and consequently is proposing this identification.

8.2 Resolution 87 - Role of the notifying administration

Europe proposes to clarify this aspect in the Radio Regulations.

8.3 Resolution 88 - Processing charges for satellite networks

This resolution requests WRC-2000 to consider whether any changes to the RR are necessary in the light of the PP-98 and Council-99 decisions on this matter. Europe is of the view that there must be some consequences of non-payment and that these consequences should be directed to the satellite operator and not the administration. Europe considers that the present CS/CV do not provide any consequences for non-payment of these fees and consequently there should be some changes to the RR to provide some consequences. Such changes are proposed.

Other issues in the WRC-2000 agenda or outstanding items relating to the issues addressed in the following proposals, will be the subject of additional proposals. These will be submitted as addenda to this contribution.

CONTENTS

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

Footnotes S5.487 and S5.490

Background information

In considering issues related to the application of Articles 6 and 7 (or S9) of Appendices S30 and S30A, various sharing situations need to be examined. One of these situations relates to the scope of footnotes S5.487 and S5.490. Footnote S5.487 relates to Regions 1 and 3 and states that other services in the 11.7-12.5 GHz band in Regions 1 and 3 shall not cause harmful interference to BSS operating “in accordance with the provisions of Appendix S30”. Footnote S5.490 relates to Region 2 in the band 12.2-12.7 GHz and states that existing and future terrestrial radiocommunication services shall not cause interference to BSS operating “in conformity with the broadcasting-satellite Plan for Region 2 contained in Appendix S30”.

The question that has been raised in this regard is whether these footnotes apply only to assignments in the Plan or also to assignments that are in operation as a result of successful application of Article 4 procedures. This situation was discussed at the CPM and alternative arguments are presented in section 5.2.3.3.5 of Chapter 5 of the CPM Report. Some views were expressed that these provisions provide a super-primary status to the BSS over other co-primary services in the band, in that it requires the other services not to cause harmful interference to the broadcasting-satellite stations operating in accordance with the provisions of Appendix S30. From this some expressed the view that these footnotes should not apply to modifications to the Plans.

However, when administrations agreed to the BSS Plans they did so with the understanding that modification procedures would be available to provide administrations with the flexibility of modifying their assignments to suit their future needs and/or take advantage of currently available technology. Further, administrations understood and agreed assignments resulting from successful completion of the Article 4 modification procedures would be entitled to the same rights as the original assignments in the Plan. This is clearly stated in section 4.3.17 of Appendix S30 where it states in this regard: “The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan”. The text establishes the link with S5.487 and S5.490 concerning assignments in conformity with the plans or their provisions.

NOC IAP/14/300

S5.487 In the band 11.7-12.5 GHz in Regions 1 and 3, the fixed, fixed-satellite, mobile, except aeronautical mobile, and broadcasting services, in accordance with their respective allocations, shall not cause harmful interference to broadcasting-satellite stations operating in accordance with the provisions of Appendix **S30**.

NOC IAP/14/301

S5.490 In Region 2, in the band 12.2-12.7 GHz, existing and future terrestrial radiocommunication services shall not cause harmful interference to the space services operating in conformity with the broadcasting-satellite Plan for Region 2 contained in Appendix **S30**.

Reasons: Footnotes S5.487 and S5.490 should continue to apply to assignments that are implemented after having successfully completed the Article 4 modification procedure.

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

Possible suppression of Articles 6 and 7 of Appendices S30 and S30A. Modifications to Articles S9, Appendix S5 and Articles 4, 6 and 7 of Appendices S30 and S30A to update these Appendices in relation to non-planned services.

Background information

At present, Appendices S30 and S30A are self-contained insofar as the procedures for coordinating assignments to other services with those in the BSS Plans are concerned. For example, Article 6 of Appendices S30 and S30A covers the coordination, notification and recording of terrestrial stations in the BSS and feeder link bands subject to a Plan, respectively, and Article 7 plays a similar role for FSS assignments. The purpose of agenda item 1.20 is to reopen the WRC-97 issue of whether it would be simpler to use the general coordination procedure of Article S9 and the notification and recording procedures of Article S11 (after appropriate additions) in place of Articles 6 and 7 of Appendices S30 and S30A.

The fundamental issue of WRC-2000 agenda item 1.20 is whether or not to suppress Article 6 and 7 of Appendices S30 and S30A. Upon careful review of the SC Report, it is apparent that suppressing Articles 6 and 7 (or effectively suppressing these articles by simply using them to refer to provisions of Article S9) would result in significant changes to how coordination is conducted between the planned and unplanned services.

CITEL remains unconvinced that suppression of Articles 6 and 7, with the associated complex and significant changes, improves on the current situation. The existing procedures have been used for 20 years and no problems have arisen that cannot be corrected within the Appendices. Further, such significant revisions lead to the risk of unintended consequences associated with revising the still evolving procedures of Articles S9 and S11 to make them applicable to the other services with allocations in the Appendices S30 and S30A bands, in respect of the Plans.

Considering all this, CITEL proposes that Approach “A” of CPM-99 Report (retention of Articles 6 and 7 of Appendices S30 and S30A and corresponding suppression or modification, as appropriate, of provisions in Article S9 and Appendix S5) is the best solution. CITEL notes that Approach “A” includes updating of Appendices S30 and S30A to cover the sharing situations that are not currently addressed in these two Appendices. CITEL, in general, supports the corresponding modifications to the Radio Regulations (Article S9, Appendix S5, Appendices S30 and S30A) as contained in Annex 1 to Chapter 5 of the CPM Report. However, the CPM highlighted several issues in both Approach A and Approach B, as requiring further study. (For example, see the Note on page 37 of the English text regarding ADD 5.1.3A of Appendix S30A, and Note on page 42 of the English text of Approach B regarding ADD 1f*bis*)). Taking into account the items requiring further study, CITEL provides the following proposals as a modification of Approach A.

In addition, CITEL could support changes to the procedures of Article 4 that would facilitate modification of the Plans, and there may be consequential changes to Article 4 under Approach “A”.

ARTICLE S9

Frequency bands

NOC

2.1

ADD IAP/14/313

2.2 The use of the guardbands of the Plans in Appendix **S30**,[1] specifically the frequency bands 11.7-11.714 GHz (Regions 1 and 3), 12.189-12.2 GHz (Region 3), 12.2-12.212 GHz (Region 2), 12.489-12.5 GHz (Region 1), 12.688-12.7 GHz (Region 2), to provide space operations functions for GSO BSS systems in accordance with No. **S1.23** shall be coordinated with the assignments subject to these Plans using the provisions of Article 7 of this Appendix. Coordination among assignments intended to provide space operation functions and services not subject to a Plan shall be effected using the provisions of No. **S9.7** and the associated provisions of Articles **S9** and **S11**. Coordination of modifications to the Plans which extend into the guardbands with assignments intended to provide space operation functions shall be effected using paragraph 4.3.1.5 or 4.3.3.5, as appropriate, of Article 4 of Appendix **S30**.

Reasons: As described in section 5.2.1 of the CPM Report, there is currently no coordination procedure, or associated criteria, for use of the guardbands of the Plans for space operation of BSS satellites. The addition of this provision specifies a coordination process for use of the Appendix S30 guardbands.

Notification, examination and recording in the Master International Frequency Register of frequency assignments to space stations in the broadcasting-satellite service

MOD IAP/14/314

ARTICLE 6

Coordination, notification and recording in the Master International Frequency Register of frequency assignments to terrestrial stations or to earth stations in the fixed-satellite service (Earth-to-space) affecting broadcasting-satellite frequency assignments in the frequency bands 11.7-12.2 GHz (in Region 3), 11.7-12.5 GHz (in Region 1) and 12.2-12.7 GHz (in Region 2)[5]

Reasons: As in the CPM Report, to cover coordination of transmitting earth stations in Region 1 in 12.5-12.7 GHz with planned BSS in Region 2, which is currently not covered by the Radio Regulations.

Section I – Coordination procedure to be applied

MOD IAP/14/315

6.1.1 Before notifying to the Bureau a frequency assignment to a terrestrial transmitting station or to a transmitting earth station in the fixed-satellite service, an administration shall initiate coordination with any other administration having a frequency assignment to a broadcasting-satellite station in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated, and administrations whose territory is included in the service area of such an assignment, if:

– the necessary bandwidths of the two transmissions overlap; *and*

– the power flux-density which would be produced by the proposed terrestrial transmitting station or by the transmitting earth station in the fixed-satellite service exceeds the value derived in accordance with Annex 3 at one or more points on the edge of the service area which is within the coverage area of the broadcasting-satellite station of that administration.

Reasons: As in the CPM Report, to include coordination of transmitting earth stations in Region 1 in 12.5-12.7 GHz with planned BSS, which is currently not covered by the Radio Regulations. Also, additional text is required to include protection of modifications to the Plans from their date of receipt. Adjustments are required to ensure that the administration on whose territory the receiving earth stations are located conducts the coordination.

MOD IAP/14/316

6.1.2 For the purpose of effecting coordination, the administration responsible for the terrestrial station or for the earth station in the fixed-satellite service shall send to the administrations concerned, by the fastest possible means, a diagram drawn to an appropriate scale indicating the location of the terrestrial station or the earth station in the fixed-satellite service and all other data of the proposed frequency assignment and the approximate date on which it is planned to bring the station into use.

Reasons: As in the CPM Report, to include coordination of transmitting earth stations in Region 1 in 12.5-12.7 GHz with planned BSS.

MOD IAP/14/317

6.1.3 An administration with which coordination is sought shall acknowledge receipt of the coordination data immediately by telegram. If no acknowledgement is received within fifteen days of dispatch, the administration seeking coordination may dispatch a telegram requesting acknowledgement of receipt of the coordination data, to which the receiving administration shall reply. Upon receipt of the coordination data, an administration with which coordination is sought shall promptly examine the matter with regard to interference[6] which would be caused to its frequency assignments in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated and shall, within an overall period of two months from dispatch of the coordination data, either notify the administration requesting coordination of its agreement to the proposed assignment or, if this is impossible, indicate the reasons therefor and make such suggestions as it may be able to offer with a view to a satisfactory solution of the problem.

Reasons: Additional text is required to include protection of modifications to the Plans from their date of receipt.

NOC

6.1.4 to 6.1.9

MOD IAP/14/318

6.1.10 Where an administration fails to reply within one month of dispatch of the Bureau's telegram sent under § 6.1.7 requesting an acknowledgement or fails to give a decision on the matter within two months of dispatch of the Bureau's telegram of request sent under § 6.1.8, the administration with which coordination was sought shall be considered to have undertaken that no complaint will be made in respect of any harmful interference which may be caused by the terrestrial station or by the earth station in the fixed-satellite service being coordinated to the service rendered or to be rendered by its satellite-broadcasting station.

---

[6] The criteria to be employed in evaluating interference levels shall be based on the relevant ITU-R Recommendations or, in the absence of such Recommendations, shall be agreed between the administrations concerned.

Reasons: As in the CPM Report, to include coordination of transmitting earth stations in Region 1 in 12.5-12.7 GHz with planned BSS.

NOC

6.1.11 to 6.1.12

Section II – Notification procedure for frequency assignments

MOD IAP/14/319

6.2.1 Any frequency assignment to a fixed, land or broadcasting station or to an earth station in the fixed-satellite service shall be notified to the Bureau if the use of the frequency concerned is capable of causing harmful interference to the service rendered or to be rendered by a broadcasting-satellite station of any other administration, or if it is desired to obtain international recognition of the use of the frequency[7].

Reasons: As in the CPM Report, to include protection of planned BSS from transmitting earth stations in the FSS in the 12.5-12.7 GHz frequency band in Region 1.

MOD IAP/14/320

6.2.2 For this notification, an individual notice for each frequency assignment shall be drawn up as prescribed in Appendix **S4**, Annexes 1A and 1B, or Annexes 2A and 2B, as appropriate, which specifies the basic characteristics to be furnished as required. It is recommended that the notifying administration should also supply the additional data called for in that Appendix, together with such further data as it may consider appropriate.

Reasons: As in the CPM Report, Article 6 is being modified to include protection of planned BSS from transmitting earth stations in the FSS in the 12.5-12.7 GHz frequency band in Region 1. Therefore, Annexes 2A and 2B, characteristics for satellite networks or earth or radio astronomy stations, need to be referenced as well.

NOC

6.2.3 to 6.2.4

Section III – Procedure for the examination of notices and the recording of frequency assignments in the Master Register

MOD IAP/14/321

6.3.1 Whatever the means of communication, including telegram, by which a notice is transmitted to the Bureau, it shall be considered complete if it contains at least the appropriate basic characteristics specified in Appendix **S4**, Annexes 1A and 1B or Annexes 2A and 2B, as appropriate.

Reasons: Same as for MOD 6.2.2 above.

NOC

6.3.2 to 6.3.9

---

[7] The attention of administrations is specifically drawn to the provisions of Section I of this Article.

MOD IAP/14/322

6.3.10 – where appropriate, with respect to the probability of harmful interference to a broadcasting-satellite station whose frequency assignment is in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated.

Reasons: Additional text is required to include protection of modifications to the Plans from their date of receipt.

NOC

6.3.11 to 6.3.32

6.3.33 Change in the basic characteristics of assignments already recorded in the Master Register

MOD IAP/14/323

6.3.34 Any notice of a change in the basic characteristics of an assignment already recorded in the Master Register, as specified in Appendix **S4**, Annexes 1A and 1B or Annexes 2A and 2B, as appropriate (except those entered in Columns 2c, 3 and 4a of the Master Register), shall be examined by the Bureau in accordance with the provisions of § 6.3.8 and 6.3.9 and, where appropriate, § 6.3.10 and the provisions of § 6.3.12 to 6.3.32 inclusive shall be applied. Where the change should be recorded, the original assignment shall be amended according to the notice.

Reasons: Same as for MOD 6.2.2 above.

NOC

6.3.35 to 6.3.41

ARTICLE 7

MOD IAP/14/324

Procedures for coordination, notification and recording in the Master International Frequency Register of frequency assignments to stations in the fixed-satellite service (space-to-Earth) in the frequency bands 11.7-12.2 GHz (in Region 2), 12.2-12.7 GHz (in Region 3) and 12.5-12.7 GHz (in Region 1), and to stations in the broadcasting-satellite service in the frequency band 12.5-12.7 GHz (in Region 3) when frequency assignments to broadcasting-satellite stations ~~in~~ subject to ~~conformity with~~ the Regions 1 and 3 Plan, or the Region 2 Plan, respectively, are involved[8]

Reasons: Deletion of "in conformity with" is required so as not to preclude protection of modifications to the Plans from their date of receipt. As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS.

MOD IAP/14/325

Section I – Procedure for the advance publication of information on planned fixed-satellite (space-to-Earth) or broadcasting-satellite systems

Publication of information

MOD IAP/14/326

7.1.1 An administration which intends to establish a fixed-satellite or broadcasting-satellite system not subject to a Plan shall, prior to the procedure described in § 7.2.1, where applicable, send to the Bureau, not earlier than five years and preferably not later than two years before the date of bringing into service each satellite network of the planned system, the information listed in Appendix **S4**, Annexes 2A and 2B.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS.

NOC

7.1.2 to 7.1.3.1

Comments on published information

MOD IAP/14/327

7.1.4 If, after studying the information published under § 7.1.3, any administration is of the opinion that interference which may be unacceptable may be caused to its frequency assignments in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated, it shall, within ~~three~~ four months after the date of the Weekly Circular publishing the information listed in Appendix **S4**, Annexes 2A and 2B, send its comments to the administration concerned. A copy of these comments shall also be sent to the Bureau. If no such comments are received from an administration within the period mentioned above, it may be assumed that that administration has no basic objections to the planned fixed-satellite or broadcasting-satellite network(s) of that system of which details have been published.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS. In addition, the comment period is updated from three to four months. It is a burden on administrations to have different comment periods for AP30/C Special Sections and other Special Sections.

Resolution of difficulties

NOC

7.1.5 to 7.1.6

Results of advance publication

NOC

7.1.7

Commencement of coordination or notification procedure

MOD IAP/14/328

7.1.8 In complying with the provisions of § 7.1.5 and 7.1.6, an administration responsible for a planned fixed-satellite system in the fixed-satellite service, or in the broadcasting-satellite service not subject to a Plan shall, if necessary, defer its commencement of the coordination procedure of

§ 7.2.1 or, where this is not applicable, the sending of its notices to the Bureau until ~~five~~six months after the date of the Weekly Circular containing the information listed in Appendix **S4**, Annexes 2A and 2B on the relevant satellite network. However, in respect of those administrations with which difficulties have been resolved or which have responded favourably, the coordination procedure, where applicable, may be commenced prior to the expiry of the ~~five~~six months mentioned above.

Reasons: As in the CPM Report. Same as for MOD 7.1.4 above.

Section II – Coordination procedures to be applied in appropriate cases

MOD IAP/14/329

7.2.1 Before an administration notifies to the Bureau or brings into use any frequency assignment to a space station in the fixed-satellite service (space-to-Earth), or in the broadcasting-satellite service not subject to a Plan, it shall seek the agreement of any other administration having a frequency assignment in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated, if:

a) any portion of the necessary bandwidth proposed for the space station in the fixed-satellite or broadcasting-satellite service falls within the necessary bandwidth associated with the frequency assignment to the broadcasting-satellite station; and

b) the power flux-density which would be produced by the proposed fixed-satellite or broadcasting-satellite assignment exceeds the value specified in Annex 4.

For this purpose, the administration seeking agreement shall send to ~~any other such administration~~ the Bureau the information listed in Appendix **S4**, Annexes 2A and 2B.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS. Additional text is required to include protection of modifications to the Plans from their date of receipt. The last paragraph is aligned with the current practice for non-planned services (see S9.30) where this information is only sent to the Bureau (this issue was highlighted in the CPM Report).

NOC

7.2.2

MOD IAP/14/330

7.2.3 ~~An administration seeking coordination under § 7.2.1 shall at the same time send to the Bureau a copy of the request for coordination together with the information listed in Appendix **S4**, Annexes 2A and 2B and the name(s) of the administration(s) whose agreement is sought.~~ The Bureau shall determine on the basis of Annex 4 which frequency assignments in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated are considered to be affected. The Bureau shall include the names of those administrations with the information received from the administration seeking coordination and shall publish this information in a special section of its Weekly Circular, together with a reference to the Weekly Circular in which details of the satellite system were published in accordance with Section I of this Article. When the Weekly Circular contains such information, the Bureau shall so inform all administrations by circular telegram.

Reasons: Consequential to the modification to the last paragraph of section 7.2.1, which now specifies that the Appendix S4 information is only sent to the Bureau.

NOC

7.2.4 to 7.2.13

Section III – Notification of frequency assignments

MOD IAP/14/331

7.3.1 Any frequency assignment to a space station in the fixed-satellite or in the broadcasting-satellite service not subject to a Plan shall be notified to the Bureau:

a) if the use of the frequency concerned is capable of causing harmful interference to a frequency assignment of another administration which is in conformity with the appropriate Regional Plan[10] or for which the corresponding Plan modification procedure has been initiated; *or*

b) if it is desired to obtain international recognition of the use of the frequency.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS. Additional text is required to include protection of modifications to the Plans from their date of receipt.

NOC

7.3.2 to 7.3.5

Section IV – Procedure for the examination of notices and the recording of frequency assignments in the Master Register

NOC

7.4.1 to 7.4.5.1

MOD IAP/14/332

7.4.5.2 where appropriate, with respect to its conformity with the provisions of § 7.2.1, relating to the coordination of the use of the frequency assignment with the other administrations concerned having a frequency assignment in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated;

Reasons: Additional text is required to include protection of modifications to the Plans from their date of receipt.

MOD IAP/14/333

7.4.5.3 where appropriate, with respect to the probability of harmful interference to the service rendered or to be rendered by a broadcasting-satellite station whose frequency assignment is in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated.

NOC

7.4.6 to **7.4.9**

MOD IAP/14/334

7.4.9.1 Where the Bureau finds that the coordination procedures mentioned in § 7.4.5.2 have been successfully completed with all administrations whose frequency assignments in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated may be affected, the frequency assignment shall be recorded in the Master Register. The date of receipt by the Bureau of the notice shall be entered in Column 2d.

---

[10] The attention of administrations is specifically drawn to the application of § 7.2.1 above.

NOC

7.4.9.2 to 7.4.9.3

MOD IAP/14/335

7.4.9.4 Where the notifying administration resubmits the notice and the Bureau finds that the coordination procedure mentioned in § 7.4.5.2 has been successfully completed with all administrations whose frequency assignments in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated may be affected, the frequency assignment shall be recorded in the Master Register. The date of receipt of the original notice by the Bureau shall be entered in Column 2d. The date of receipt by the Bureau of the resubmitted notice shall be entered in the Remarks Column.

NOC

7.4.9.5 to **7.4.12**

MOD IAP/14/336

7.4.12.1 A notice of a change in the basic characteristics of an assignment in the fixed-satellite or broadcasting-satellite service not subject to a Plan already recorded, as specified in Appendix **S4**, Annexes 2A and 2B (except the name of the station or the name of the locality in which it is situated or the date of bringing into use), shall be examined by the Bureau in conformity with § 7.4.5.1 and, where appropriate, § 7.4.5.2 and 7.4.5.3, and the provisions of § 7.4.7 to 7.4.11.3 inclusive shall apply. Where the change should be recorded, the original assignment shall be amended accordingly.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS.

MOD IAP/14/337

7.4.12.2 However, in the case of a change in the characteristics of an assignment which is in conformity with § 7.4.5.1, should the Bureau reach a favourable finding with respect to § 7.4.5.2 and 7.4.5.3, where appropriate, or find that the changes do not increase the probability of harmful interference to frequency assignments in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated, the amended assignment shall retain the original date in Column 2d. The date of receipt of the notice by the Bureau relating to the change shall be entered in the Remarks Column.

Reasons: Additional text is required to include protection of modifications to the Plans from their date of receipt.

NOC

7.4.12.3 to 7.4.12.4

MOD IAP/14/338

7.4.13 Recording of frequency assignments in the fixed-satellite or broadcasting-satellite service not subject to a Plan notified before being brought into use

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS.

NOC

7.4.13.1 to 7.4.13.3

Section V – Recording of findings in the Master Register

NOC

7.5

Section VI – Categories of frequency assignments

NOC

7.6.1

MOD IAP/14/339

7.6.2 If harmful interference is actually caused to the reception of any broadcasting-satellite station whose frequency assignment is in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated, by the use of a frequency assignment to a space radiocommunication station subsequently recorded in the Master Register in accordance with the provisions of § 7.4.11.3, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

Reasons: Additional text is required to include protection of modifications to the Plans from their date of receipt.

MOD IAP/14/340

7.6.3 If harmful interference to the reception of any broadcasting-satellite station whose frequency assignment is in conformity with the appropriate Regional Plan or for which the corresponding Plan modification procedure has been initiated, is actually caused by the use of a frequency assignment which is not in conformity with § 7.4.5.1, the station using the latter frequency assignment must, upon receipt of advice thereof, immediately eliminate this harmful interference.

Section VII – Review of findings

NOC

7.7.1 to 7.7.4

Section VIII – Modification, cancellation and review of entries in the Master Register

NOC

7.8

MOD IAP/14/341

7.8.1 Where the use of a recorded assignment to a station in the fixed-satellite or broadcasting-satellite service not subject to a Plan is suspended for a period of eighteen months, the notifying administration shall, within this eighteen-month period, inform the Bureau of the date on which such use was suspended and of the date on which the assignment is to be brought back into regular use. This later date shall not exceed two years from the date of suspension.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS. In order to align 7.8.1-7.8.3 with the current practice as contained in S11.49 (an issue highlighted in the CPM Report), the last sentence was added.

MOD IAP/14/342

7.8.2 Whenever it appears to the Bureau, whether or not as a result of action under § 7.8.1, that a recorded assignment to a space station in the fixed-satellite or broadcasting-satellite service not subject to a Plan has not been in regular use for more than eighteen months, the Bureau shall inquire of the notifying administration as to when the assignment is to be brought back into regular use.

Reasons: As in the CPM Report, additional text is required to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS.

MOD IAP/14/343

7.8.3 If no reply is received within six months of action by the Bureau under § 7.8.2, or if the reply does not confirm that the assignment to a space station in the fixed-satellite or broadcasting-satellite service not subject to a Plan is to be brought back into regular use within this six-month limit, a mark should be entered against the entry in the Master Register.

NOC

7.8.4 to 7.8.6

APPENDIX S30

ANNEX 4

MOD IAP/14/344

Need for coordination of a transmitting space station in the fixed-satellite service or in the broadcasting-satellite service where this service is not subject to a Plan: in Region 2 (11.7-12.2 GHz) with respect to the Regions 1 and 3 Plan, in Region 1 (12.5-12.7 GHz) and in Region 3 (12.2-12.7 GHz) with respect to the Region 2 Plan

(See Article 7)

NOC

With respect to § 7.2.1 of Article 7, coordination of a space station in the fixed-satellite service of Region 2 is required when, under assumed free-space propagation conditions, the power flux-density on the territory of an administration in Region 1 or Region 3 exceeds the value derived from the expressions given below.

MOD IAP/14/345

With respect to § 7.2.1 of Article 7, coordination of a space station in the fixed-satellite service (space-to-Earth) in Region 1 or 3 or broadcasting-satellite service not subject to a Plan in Region 3 is required when, under assumed free-space propagation conditions, the power flux-density on the territory of an administration in Region 2 exceeds the value derived from the same expressions:

-147 dB(W/m^2/27 MHz)	for $0° \leq \theta < 0.44°$;
$-138 + 25 \log \theta$ dB(W/m^2/27 MHz)	for $0.44° \leq \theta < 19.1°$;
-106 dB(W/m^2/27 MHz)	for $\theta \geq 19.1°$;

where θ is:

– the difference in degrees between the longitude of the interfering fixed-satellite space station in Region 2 and the longitude of the affected broadcasting-satellite space station in Regions 1 and 3, *or*

– the difference in degrees between the longitude of the interfering fixed-satellite space station in Region 1 or 3 or the interfering broadcasting-satellite space station in Region 3 and the longitude of the affected broadcasting-satellite space station in Region 2.

Reasons: As in the CPM Report. The modifications are consequential to the text added in Article 7 of Appendix S30 to include coordination of Region 3 BSS space stations in the 12.5-12.7 GHz band with planned BSS.

APPENDIX S30A

NOC

ARTICLE 1

General definitions

ARTICLE 2

Frequency bands

NOC

2.1

ADD IAP/14/346

2.2 The use of the guardbands of the Plans in Appendix **S30A**,[2*bis*] specifically the frequency bands 14.5-14.5118 GHz (Regions 1 and 3),[*]14.78814-14.8 GHz (Regions 1 and 3), 17.3-17.312 GHz (Region 2), 17.3-17.314 GHz (Regions 1 and 3), 17.788-17.8 GHz (Region 2), 18.089-18.1 GHz (Regions 1 and 3), to provide space operations functions for GSO BSS systems in accordance with No. **S1.23** shall be coordinated with the assignments subject to these Plans using the provisions of Article 7 of this Appendix. Coordination among assignments intended to provide space operation functions and services not subject to a Plan shall be effected using the provisions of No. **S9.7** and the associated provisions of Articles **S9** and **S11**. Coordination of modifications to the Plans which extend into the guardbands with assignments intended to provide space operation functions shall be effected using paragraph 4.2.1.4 or 4.2.3.4, as appropriate, of Article 4 of Appendix **S30A**.

Reasons: As described in section 5.2.1 of the CPM Report, there is currently no coordination procedure, or associated criteria, for use of the guardbands of the Plans for space operation of BSS satellites. The addition of this provision specifies a coordination process for use of the Appendix S30A guardbands.

[2*bis*] As defined in sections 3.1 and 4.1 of Annex 3 to this Appendix.

[*] Region 1, except Europe. See RR No. S5.510.

NOC

ARTICLE 3

Execution of the provisions and associated Plans

ARTICLE 4

Procedure for modifications to the Plans

NOC

4.1 to 4.1.1

NOC

4.2 Proposed modifications to a frequency assignment in conformity with one of the Regional Plans or proposed inclusion in that Plan of a new frequency assignment

For Regions 1 and 3

NOC

4.2.1 to 4.2.1.4

ADD IAP/14/347

4.2.1.4*bis* having a frequency assignment in the band 17.3-17.8 GHz in the broadcasting-satellite service, which is recorded in the Master Register or which has been coordinated or is being coordinated under the provisions of No. **S9.7**, or whose territory is included in the service area of such a frequency assignment, and whose territory is located within the coordination area of the feeder-link fixed-satellite earth station; *or*

ADD IAP/14/348

4.2.1.4*ter* of Region 2 having a frequency assignment in the band 17.8-18.1 GHz to feeder links in the fixed-satellite service (Earth-to-space) with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is recorded in the Master Register or which has been coordinated or is being coordinated under the provisions of No. **S9.7**;

NOC

4.2.1.5 to 4.2.1.6

NOC

4.2.2

For Region 2

NOC

4.2.3 to 4.2.3.4

ADD IAP/14/349

4.2.3.4*bis* having a frequency assignment in the band 17.3-17.8 GHz in the broadcasting-satellite service, which is recorded in the Master Register or which has been coordinated or is being coordinated under the provisions of No. **S9.7**, or whose territory is included in the service area of such a frequency assignment, and whose territory is included within the coordination area of the feeder-link fixed-satellite earth station;

NOC

4.2.3.5 to 4.4.2

Reasons: Unlike "Approach A" in the CPM Report, it is proposed that provisions 4.2.1.2, 4.2.1.3, 4.2.3.2 and 4.2.3.3 are not suppressed. Coordination of feeder-link earth stations should occur during the Plan modification stage. The modifications in Approach A in the CPM Report are unnecessarily sweeping, and limiting on the flexibility of administrations to deploy feeder-link earth stations. CITEL supports maintaining the current situation where an administration can locate feeder-link earth stations anywhere within a coordinated service area. An administration should be able to file for a feeder-link service area or specific feeder-link earth stations, as it chooses, and undertake the appropriate coordination at the Plan modification stage.

In addition, Article 4 provisions are added to cover interference situations not covered in the current Radio Regulations. Specifically, 4.2.1.4*bis* and 4.2.3.4*bis* are added for coordination of modifications to the feeder-link Plans with BSS receive earth stations in Region 2 in 17.3-17.8 GHz, and 4.2.1.4*ter* is added for modifications to the Regions 1 and 3 feeder-link Plan to coordinate with Region 2 feeder links in 17.8-18.1 GHz.

ARTICLE 5

Coordination, notification, examination and recording in the Master International Frequency Register of frequency assignments to feeder-link transmitting earth stations and receiving space stations in the fixed-satellite service

NOC

5.1 to 5.1.2

MOD IAP/14/350

5.1.3 Before an administration in Region 1 or 3 notifies to the Bureau or brings into use any frequency assignment to a transmitting feeder-link earth station in the bands 14.5-14.8 GHz and 17.3~~7~~-18.1 GHz with an e.i.r.p. greater than the sum of the values specified in column~~s~~ 13 ~~and 14~~ of the Plan, it shall effect coordination of this assignment with each administration whose territory lies wholly or partly within the coordination area of the planned earth station using the method detailed in Appendix **S7**.

NOC

5.1.4 to 5.3.2

Reasons: To cover the situation of receiving BSS earth stations in Region 2, the frequency band is extended down to 17.3 GHz. In addition, following the revision of the Regions 1 and 3 feeder-ink Plan by WRC-97, the correct column reference for e.i.r.p is column 13 in the 1998 Edition of the Radio Regulations.

NOC

ARTICLE 6

Procedure concerning coordination, notification and recording in the Master International Frequency Register of frequency assignments to receiving terrestrial stations in Regions 1 and 3 in the bands 14.5-14.8 GHz and 17.7-18.1 GHz, and in Region 2 in the band 17.7-17.8 GHz, when frequency assignments to feeder-link transmitting earth stations for the broadcasting-satellite service in conformity with the Regions 1 and 3 Plan or the Region 2 Plan are involved

MOD IAP/14/351

ARTICLE 7

Procedure concerning coordination, notification and recording in the Master International Frequency Register of frequency assignments to stations in the fixed-satellite service (space-to-E~~e~~arth) in Regions 1, 2 and 3 in the band 17.7-18.1 GHz ~~and in Region 2 in the band 17.7-17.8 GHz~~, to stations in the fixed-satellite service (Earth-to-space) in Region 2 in the band 17.8-18.1 GHz and to stations in the broadcasting-satellite service in Region 2 in the band 17.3-17.8 GHz when frequency assignments to feeder-links for broadcasting-satellite stations ~~appearing~~ subject to ~~in~~ the Regions 1 and 3 Plan or the Region 2 Plan are involved

MOD IAP/14/352

7.1 The provisions of No. **S9.7** and the associated provisions under Articles **S9** and **S11** and Appendi~~x~~ces **S5** and **S8** are applicable to transmitting space stations in the fixed-satellite service in the band 17.7-18.1 GHz, to transmitting earth stations in the fixed-satellite service in Region 2 in the band 17.8-18.1 GHz and the provisions of Resolution **33** **(Rev.WRC-97)** are applicable to transmitting space stations in the broadcasting-satellite service in Region 2 in the band 17.3-17.8 GHz together with the provisions of Annex 4, except that in relation to feeder-link stations, the relevant criteria mentioned in Appendix **S8** are replaced by those given in Section 1 of Annex 4.

MOD IAP/14/353

7.2 Administrations planning to implement assignments for receiving earth stations in Regions 1 and 3 in the 17.7-18.1 GHz band and in Region 2 in the 17.7-17.8 GHz band in the fixed-satellite service (space-to-Earth) or in the 17.3-17.8 GHz band in the broadcasting-satellite service should evaluate the level of interference, assessed on the basis of coordination contours calculated in accordance with ~~Section 3 of Annex 4~~Appendix **S7**, which might be caused by the closest feeder-link earth station which could be located on the border of the territory of another administration.

Should the administration planning receiving earth stations find that interference may be caused by such a feeder-link earth station, it may request the administration responsible for the feeder-link earth stations to indicate the geographical coordinates, the antenna characteristics and the elevation angle of the horizon around its actual and planned feeder-link earth stations.

MOD IAP/14/354

7.3 In the case of Region 2, when the entry in the Plan contains information on specific earth stations this shall be used in the interference calculations mentioned in § 7.2 above. When such information is not contained in the Plan an administration which receives a request under § 7.2 shall, within a period of ~~three~~four months, communicate the details of the feeder-link earth stations to the administration planning the receiving earth station, and to the Bureau in order to update the Plan.

MOD IAP/14/355

7.4 In the case of Regions 1 and 3, an administration which receives a request under § 7.2 shall, within a period of ~~three~~ four months, communicate the details of the feeder-link earth stations to the administration planning the receiving earth station, and to the Bureau for information.

MOD IAP/14/356

7.5 If, at the end of the period of ~~three~~ four months, the administration responsible for the fixed-satellite or broadcasting-satellite receiving earth station(s) does not receive a reply, it may request the assistance of the Bureau.

MOD IAP/14/357

7.6 If the administration responsible for the feeder-link earth stations does not communicate to the Bureau, within a period of ~~three~~ four months, the information requested under § 7.2, this administration shall only implement its feeder-link earth station provided it does not cause harmful interference to the fixed-satellite or broadcasting-satellite earth station(s) under consideration.

NOC

7.7

Reasons: Unlike “Approach A” in the CPM Report, which points one back to provisions in Article S9, this proposal does not suppress sections 7.3-7.7, and it proposes a different modification to section 7.2. This proposal keeps Appendix S30A self-contained. Further, the current modifications in Approach A are unnecessarily sweeping. It is unnecessary to refer to provisions in Article S9, as the text above fully describes the coordination that is necessary.

In addition, as in the CPM Report, modifications are necessary to include coordination with receiving BSS earth stations in Region 2 in the 17.3-17.8 GHz band, and to change the comment period from three to four months. It is a burden on administrations to have different comment periods for AP30/C Special Sections and other Special Sections. Also, the text is modified to refer to Appendix S7, vs. section 3 of Annex 4, as Appendix S7 is the current methodology for calculating the coordination area around an earth station.

ANNEX 1

Limits for determining whether a service of an administration is considered to be affected by a proposed modification to one of the regional Plans or when it is necessary under this Appendix to seek the agreement of any other administration

MOD IAP/14/358

1 Limits applicable to protect a frequency assignment in the band 17.7-18.1 GHz to an earth station in the fixed-satellite service (space-to-Earth) or in the band 17.3-17.8 GHz in the broadcasting-satellite service (see § 4.2.1.2, 4.2.1.4*bis*, ~~and~~ 4.2.3.2 and 4.2.3.4*bis* of Article 4)

An administration shall be considered as being affected if, upon application of the procedures of ~~Section 3 of Annex 4~~Appendix S7, that administration is included in the coordination area of the frequency assignment to a transmitting feeder-link earth station.

For the purpose of this calculation, the feeder-link transmitting earth station parameters notified by the administration, which may differ from those given in Annex 3, are used.

NOC

2 to **5**

Reasons: The maintenance of sections 1 and 2, with the above modifications, is consequential to maintaining provisions 4.2.1.2, 4.2.1.3, 4.2.3.2 and 4.2.3.3 in Article 4, and adding provisions 4.2.1.4*bis* and 4.2.3.4*bis* (for coordination of modifications to the feeder-link Plans with BSS receive earth stations in Region 2 in 17.3-17.8 GHz). Unlike Approach A in the CPM Report, sections 1 and 2 of Annex 1 are not deleted, but simply modified as necessary to include coordination with BSS earth stations in the 17.3-17.8 GHz band in Region 2.

ADD IAP/14/359

6 Limits applicable to protect a frequency assignment in the band 17.8-18.1 GHz (Region 2) to a receiving feeder-link space station in the fixed-satellite service (Earth-to-space)

An administration in Region 2 shall be considered affected by a proposed modification to the Regions 1 and 3 Plan when the power flux-density arriving at the Region 2 receiving space station of a broadcasting-satellite feeder-link station would cause an increase in the noise temperature of the receiving feeder-link space station which exceeds the threshold value of $\Delta T/T$ corresponding to 3%, where $\Delta T/T$ is calculated in accordance with the method given in Appendix **S8**, except that the maximum power densities per hertz averaged over the worst 1 MHz are replaced by power densities per hertz averaged over the total RF bandwidth of the feeder-link carriers.

Reasons: Consequential to the addition of provision 4.2.1.4*ter* in Article 4 (for modifications to the Regions 1 and 3 feeder-link Plan to coordinate with Region 2 feeder links in 17.8-18.1 GHz). Basically the same text as in the CPM Report, except for editorial improvements.

NOTE – The applicability of 3% $\Delta T/T$ criterion for the protection of unplanned feeder links requires further study.

ANNEX 4

Criteria for sharing between services

NOC

1

ADD IAP/14/360

2 Threshold values for determining when coordination is required between transmitting feeder-link earth stations in the fixed-satellite service in Region 2 and a receiving space station in the feeder-link Plans in the frequency bands 17.8-18.1 GHz

With respect to § 7.1, Article 7 of this Appendix, coordination of a transmitting feeder-link earth station in the fixed-satellite service with a receiving space station in a broadcasting-satellite feeder link in the Regions 1 and 3 Plan or the Region 2 Plan is required, when the power flux-density arriving at the receiving space station of a broadcasting-satellite feeder-link station of another administration would cause an increase in the noise temperature of the feeder-link space station which exceeds a threshold value of $\Delta T/T$ corresponding to 3%, where $\Delta T/T$ is calculated in accordance with the method given in Appendix **S8**.

Reasons: As in the CPM Report, because of the addition of protection of the Regions 1 and 3 feeder-link plan from unplanned feeder links in Region 2 in 17.8-18.1 (see MOD section 7.1 in Article 7), it is necessary to add the appropriate criteria to determine affected administrations.

SUP IAP/14/361

3 Method for the determination of the coordination area around a feeder-link transmitting earth station of the Region 2 and Regions 1 and 3 Plans with respect to receiving earth stations in the fixed-satellite service in the frequency band 17.7-18.1 GHz

Reasons: Appendix S7 is the current methodology for calculating the coordination area around an earth station.

108-110	Proposal to identify additional spectrum for IMT-2000	1.6.1		x					x	x	x	x	x		x	x		x					x				x	x				x			x	x
111	Proposal for NOC in the 2 700-2 900 band	1.6.1		x				x	x		x	x	x		x	x		x					x			x		x				x		x	x	x
112-117	Proposal to modify footnotes S5.353A and S5.357A	1.10		x				x		x		x	x		x			x					x			x		x				x		x	x	x
118-123	Resolution 131 (WRC-97): power flux-density limits applicable to non-GSO FSS systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz	1.13.1		x				x	x	x		x	x		x								x					x				x		x	x	
124	Inclusion in other frequency bands of similar limits in Articles S21 and S22, or other regulatory approaches to be applied in relation to sharing situations	1.13.2		x					x	x		x	x		x								x					x				x		x	x	x
125-126	Proposal for RNSS allocation (space-to-Earth) in the upper part of the band 960-1 215 MHz	1.15.1		x				x		x	x	x	x		x	x							x					x				x		x	x	x
127-128	Proposal for RNSS allocation (space-to-Earth) in the upper part of the band 1 260-1 300 MHz	1.15.1						x	x	x	x	x	x		x	x							x									x			x	x

IAP No.	Topic	Agenda item	ATG	ARG	BAH	BRB	BLZ	BOL	B	CAN	CHL	CLM	CTR	DMA	EQA	SLV	GRD	GTM	GUY	HTI	HND	JMC	MEX	NCG	PNR	PRG	PRU	DOM	SCN	LCA	VCT	SUR	TRD	USA	URG	VEN
129-131	Proposal for RNSS (Earth-to-space) 5 000 to 5 010 MHz and (space-to-Earth) 5 010-5 030 MHz	1.15.1		x				x	x	x	x	x	x		x	x							x					x				x			x	x
132-133	Proposal for RNSS (Earth-to-space) in the band 1 300-1 350 MHz	1.15.1		x				x	x	x	x	x	x		x	x							x					x				x			x	x
134-135	Radionavigation-satellite service allocations in the bands 1 215-1 260 and 1 559-1 610 MHz	1.15.2		x					x	x		x	x		x	x							x					x				x		x	x	x
136-228	Proposal to modify the allocations above 71 GHz	1.16		x				x	x	x	x	x	x		x	x		x					x			x		x				x		x	x	x
229	Ensuring the protection of other radiocommunication services and Region 2 BSS against interference from any revisions to the Regions 1 and 3 Plan, and not requiring these services to provide greater protection to Regions 1 and 3 BSS than at present	1.19		x					x	x					x								x					x				x		x	x	x
230	Radio Regulations Board's Rules of Procedure relating to the application of RR 2674/S23.13	1.19 bis		x				x	x	x			x		x			x					x					x				x		x	x	x
231	pfd limits in Annex 1 to Appendix S30 (sections 5 *b)* and 5 *c)*)	1.20		x					x	x						x							x					x				x		x	x	
232-233	Proposals to modify Resolution 27 (Rev.WRC-97) and Resolution 28 (WRC-95)	2		x				x	x	x		x	x		x								x					x				x		x	x	
234	A proposal for the suppression of Resolution 63	4		x				x		x			x		x	x							x					x				x		x	x	
235-236	Footnote S5.488											x	x		x	x		x									x	x				x			x	x
237-241	Additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions 214 (Rev.WRC-97) and 219 (WRC-97)	1.11		x				x		x		x			x	x																x		x	x	x
242-268	Modifications to Section II of Article S22 in relation to the sharing conditions among non-GSO FSS, FSS and GSO BSS services	1.13.1		x				x	x	x		x	x		x	x							x					x				x		x	x[1]	

[1] Supports 245-248 only.

IAP No.	Topic	Agenda item	ATG	ARG	BAH	BRB	BLZ	BOL	B	CAN	CHL	CLM	CTR	DMA	EQA	SLV	GRD	GTM	GUY	HTI	HND	JMC	MEX	NCG	PNR	PRG	PRU	DOM	SCN	LCA	VCT	SUR	TRD	USA	URG	VEN
269-270	Proposed modifications to APS4	1.13.1		x				x	x	x		x			x	x							x					x				x		x	x	
271-276	Revisions to Articles S9, S11 and Appendix S5 for non-GSO systems which are subject to S22.2	1.13.1		x				x	x	x		x			x	x							x					x				x		x	x	
277-286	Additions and/or modifications to Articles S9, S11, S22 and Appendices S4 and S5 to require coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antenna	1.13.1		x				x	x	x		x			x	x							x					x				x		x	x	
287	Protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where epfd limits have been adopted	1.13.1		x				x	x	x		x	x		x	x							x					x				x		x	x	
288	Section VII - Procedures for assuring compliance with operational $epfd_{down}$ and additional operational $epfd_{down}$ limits in Article S22	1.13.1		x				x	x	x		x	x		x	x							x					x				x		x		
289	Proposed suppression of Annex 1 of Resolution 130 (WRC-97)	1.13.1		x				x	x	x		x			x	x							x					x				x		x		
290	Proposed suppression of Annex 1 of Resolution 538 (WRC-97)	1.13.1		x					x	x		x			x	x							x					x				x		x		
291-294	Resolution 87 (Minneapolis, 1998) role of the notifying administration when acting as the notifying administration on behalf of a named group of administrations			x				x								x							x					x				x		x	x	
295-298	Annex 7 to Appendix S30. Ensuring continued future access for Region 2 FSS networks to the GSO arc segment 37° W to 10° E in the band 11.7-12.2 GHz as currently provided by Annex 7 of Appendix S30	1.19		x				x	x	x						x							x					x				x		x	x	
299	pfd limits in Annex 1 to Appendix S30 (section 8 *b)*)	1.20		x					x	x			x			x							x					x				x		x	x

CONTENTS

Page

WRC-2000 agenda item 1.1 - requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

Addition of country names of Region 2 in the footnotes to Tables S5.293 and S5.480 of the ITU Radio Regulations

Background information

Footnote S5.293

In the Table of Frequency Allocations of the Radio Regulations, the frequency ranges 470-512 MHz and 614-806 MHz have been allocated in Region 2, on a primary basis, to broadcasting and, on a secondary basis, to the fixed and mobile services.

Footnote S5.293 indicates that Chile, Colombia, Cuba, the United States, Guyana, Honduras, Jamaica, Mexico and Panama allocated with a different category of service, on a primary basis, in the bands 470-512 MHz and 614-806 MHz to the fixed and mobile services, replacing the secondary category of service, and subject to agreement under S9.21.

In relation to the use of the band, the table incorporates footnote S5.292: Different category of service, indicates that Mexico and Venezuela allocate the band 470-512 MHz to the fixed and mobile services, and Argentina and Uruguay to the mobile service, on a primary basis, subject to agreement under No. S9.21.

Footnote S5.309: Different category of service, indicates that Costa Rica, El Salvador and Honduras allocate the band 614-806 MHz to the fixed service on a primary basis, subject to agreement under No. S9.21.

Footnote S5.311 indicates that, in the frequency band 620-790 MHz, assignments may be made to the television stations with frequency modulation in the broadcasting-satellite service, with prior agreement among the concerned administrations and with those administrations whose services, operating in accordance with the Table of Frequency Allocations, may be affected (see Resolutions 33 (Rev.WRC-97) and 507). These stations will not be able to produce a power flux-density above –129 dB (W/m^2) for angles of arrival below 20° (see Recommendation 705) in other countries' territories.

Footnote S5.480

In the Table of Frequency Allocations, the frequency range 10-10.45 GHz has been allocated in Region 2, on a primary basis, to radiolocation and, on a secondary basis, to the amateur service.

The footnote indicates that Brazil, Costa Rica, Ecuador, Guatemala, Honduras and Mexico have allocated, on a primary basis, the band 10-10.45 GHz to the fixed and mobile services.

MOD IAP/14/74

To request from ITU WRC-2000 to open the footnotes of Tables S5.293 and S5.480 to enable countries of Region 2 to add their names to such footnotes.

Reasons: In preparation for WRC-2000 by the Inter-American Telecommunication Commission (CITEL), countries of Region 2 expressed the need to add their country names to these footnotes, in order to provide their services with the level of protection accorded other services allocated on a primary basis.

In order to satisfy this need, it is requested that WRC-2000 approve the consideration of these footnotes, using the same criteria as was adopted by WRC-97 on this issue, which allowed the addition of country names to the footnotes.

WRC-2000 agenda item 1.2 - to finalize remaining issues in the review of Appendix S3 to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation 66 (Rev.WRC-97) and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services

Modification of Recommendation 66 (Rev.WRC-97)

Background information

Recommendation 66 is being modified to reflect the current status of this document. Work has been completed on space service spurious emissions, so we are proposing the suppression of *considering f)*, and *recommends* 1 and 2. We are editing *considering i)* to conform to the concept that limits may be needed for specific situations. We are proposing the suppression of *recommends* 9 because TG 1/5 has concluded that OOB emission limits are not appropriate at this time.

MOD IAP/14/75

RECOMMENDATION 66 (Rev.WRC-~~97~~2000)

Studies of the maximum permitted levels of unwanted emissions

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that Appendix **S3** specifies the maximum permitted levels of spurious emissions, in terms of the mean power level of any spurious component supplied by a transmitter to the antenna transmission line;

b) that the principal objective of Appendix **S3** is to specify the maximum permitted levels of spurious emissions that, while being achievable, provide protection against harmful interference;

c) that excessive levels of unwanted emissions may give rise to harmful interference;

d) that while out-of-band emissions can also give rise to harmful interference, the Radio Regulations do not provide general limits for these emissions;

e) that while Appendix **S3** applies generally to the mean power of a transmitter and its spurious emissions, it also takes account of a variety of emissions where interpretation of the term “mean power”, and thus its measurement, would be difficult, particularly in the cases of digital modulation broadband systems, pulsed modulation and narrow-band high-power transmitters;

SUP IAP/14/76

f)

Reasons: Work has been completed on space service spurious emissions.

MOD IAP/14/77

~~g~~f) that unwanted emissions from transmitters operating in space stations may cause harmful interference, particularly emissions from wideband amplifiers which cannot be adjusted after launch;

~~h~~g) that unwanted emissions may cause harmful interference to safety services and radio astronomy and space services using passive sensors;

Reasons: Consequential numbering changes.

MOD IAP/14/78

~~i~~h) that, for technical or operational reasons, more stringent spurious emission limits than the general limits in Appendix **S3** may be required to protect specific services, such as safety services and passive services in specific bands or situations;

Reasons: Edited to conform to the concept in the *recommends* that limits may be needed for specific situations.

MOD IAP/14/79

~~j~~i) that broadband digital modulation may cause unwanted emissions at frequencies far from the carrier frequency,

Reasons: Consequential numbering change.

noting

a) that safety services and passive services have in many cases been allocated frequencies adjacent or close to those of services employing high-power transmitters;

b) that some administrations have adopted more stringent limits for spurious emissions than those specified in Appendix **S3**,

recommends that ITU-R

SUP IAP/14/80

SUP IAP/14/81

2

Reasons: Work has been completed on space service spurious emissions.

MOD IAP/14/82

~~3~~1 continue the study of spurious emission levels in all frequency bands, emphasizing the study of those frequency bands, services and modulation techniques not presently covered by Appendix **S3**;

~~4~~2 study the question of unwanted emissions resulting from transmitters of all services and all modulation methods, and, on the basis of those studies, develop a Recommendation or Recommendations for maximum permitted levels of spurious emissions and out-of-band emissions;

~~5~~3 establish appropriate measurement techniques for unwanted emissions, where those techniques do not currently exist, including the determination of reference levels for wideband transmissions as well as the applicability of reference measurement bandwidths;

~~6~~4 study the reasonable boundary of spurious emissions and out-of-band emissions with a view to defining such a boundary in Article **S1**;

~~7~~5 study those frequency bands and instances where, for technical or operational reasons, more stringent spurious emission limits than the general limits in Appendix **S3** may be required to protect safety services and passive services such as radio astronomy, and the impact on all concerned services of implementing or not implementing such limits;

~~8~~6 study those frequency bands and instances where, for technical or operational reasons, out-of-band limits may be required to protect safety services and passive services such as radio astronomy, and the impact on all concerned services of implementing or not implementing such limits;

Reasons: Consequential numbering changes.

SUP IAP/14/83

9

Reasons: Suppressed because TG 1/5 has concluded that OOB emission limits are not appropriate at this time.

MOD IAP/14/84

~~10~~7 report the results of studies under *recommends that ITU-R* ~~6, 7 and 8~~4, 5 and 6 above to a competent world radiocommunication conference(s).

Reasons: Consequential numbering changes.

WRC-2000 agenda item 1.3 - to consider the results of ITU-R studies in respect of Appendix S7/28 on the method for the determination of the coordination area around an earth station in frequency bands shared among space services and terrestrial radiocommunication services, and take the appropriate decisions to revise this Appendix

A proposal for the suppression of Resolution 60

Background information

A proposal for the suppression of Resolution 60 is being submitted because this Resolution is no longer needed.

SUP IAP/14/85

RESOLUTION 60

Relating to information on the propagation of radio waves used in the determination of the coordination area

Reasons: Working Party 3M provided updated propagation material to TG 1/6. Resolution no longer required.

WRC-2000 agenda item 1.4 - to consider issues concerning allocations and regulatory aspects related to Resolutions 126 (WRC-97), 128 (WRC-97), 129 (WRC-97), 133 (WRC-97), 134 (WRC-97) and 726 (WRC-97)

Proposal for the addition of the fixed-satellite service in the 40.5-42.5 GHz band in Region 1, mobile-satellite service in the 40.5-41 GHz band and the broadcasting-satellite service in the 40-40.5 GHz band, and the use of the frequency range 37-43.5 GHz by terrestrial and satellite services

Background information

WRC-97 added co-primary allocations for the fixed-satellite service (space-to-Earth) in Regions 2 and 3 and some countries of Region 1 in the band 40.5-42.5 GHz and upgraded worldwide secondary allocations to the fixed service (FS) to co-primary status. This band is also allocated on a co-primary basis to the fixed service, broadcasting service, and broadcasting-satellite service (BSS).

Resolution 134 (WRC-97) makes the date of the provisional application of the allocation to the FSS in Regions 1 and 3 in the band 40.5-42.5 GHz 1 January 2001, and calls for review of the allocation and provisional application date. On the basis of studies conducted in ITU-R, it is appropriate to advance the date of the application of the FSS allocation in Regions 1 and 3 to 2 June 2000 (upon the conclusion of WRC-2000), and to extend the allocation to all of Region 1 (thereby enabling the removal of RR S5.551C, RR S5.551D and RR S5.551E, and the suppression of Resolution 134 (WRC-97)).

The use of FSS allocations is subject to the ITU-R studies referred to in Resolutions 128 and 129 (both WRC-97). Resolution 133 (WRC-97) deals with sharing of high-density FS applications (HDFS) with other services in the range 37-40 GHz. Since HDFS and ubiquitously deployed FSS and BSS terminals cannot share the same spectrum in the same area, it is necessary to identify regulatory solutions to meet the spectrum requirements for HDFS (both point-to-point and point-to-multipoint), and FSS (both global and regional) in the range 37-51.4 GHz.

HDFS deployments can make sharing difficult with FSS systems, depending on the population of earth station receivers and the nature of the business plan. It is recognized that economy of scale is a key factor in the success of high-density deployments of FS and FSS systems and that this will be enhanced by the degree of global spectrum harmonization.

A number of administrations are actively seeking spectrum for high-density FS and FSS systems in the 37-42.5 GHz frequency range. Given the system characteristics, service requirements and the need to provide global spectrum for FSS systems, it is anticipated that approximately 2 GHz of spectrum is required to meet future needs of high-density FSS systems in this frequency range. Within the frequency range 37-42.5 GHz, it is proposed to use the band 37-40 GHz by high-density FS applications and the band 40-42 GHz for high-density FSS applications. The allocations to FS and FSS are retained in the range 37-42.5 GHz in order to provide flexibility to administrations to implement lower density applications subject to certain constraints. Furthermore, it should be noted that, as a result of this proposal, an appropriate pairing of 2 GHz will be needed for high-density FSS near 50 GHz for Earth-to-space transmissions, taking into account existing allocations in that band. The band 48.2-50.2 GHz appears at this time to be suitable for that purpose.

Since it will no longer be possible to effectively implement MSS in the 39.5-40.0 GHz band given the proposed power flux-density limits in the 37.5-40.0 GHz band, it is necessary to add a secondary MSS allocation to the band 40.5-41.0 GHz.

It should also be noted that high-density FSS applications are similar in nature to BSS systems, particularly in the delivery of multimedia and interactive services. Taking this into account, it is proposed to align the broadcast satellite allocation with the high-density FSS allocation in the 40-42 GHz band. This results in a new allocation to the BSS in the band 40-40.5 GHz. The alignment of FSS and BSS in the 40-42 GHz band also presents an opportunity to make available additional HDFS spectrum in the 42-43.5 GHz band.

It is proposed that the protection of the radio astronomy service in the frequency band 42.5-43.5 GHz be dealt with under the provisions of Resolution 128 (Rev.WRC-2000).

The fixed service continues to evolve, and the fixed-satellite service has a requirement to establish at WRC-2000 the regulatory/procedural certainty that will enable networks that have been on file with ITU's Radiocommunication Bureau since 1997 and earlier to proceed with implementation plans. Rather than continue to study sharing conditions within ITU-R for another cycle, which will have the effect of freezing fixed-service evolution and hampering the ability of fixed-satellite service networks to be established and globally deployed, the following proposals are made for modifications and additions to Article S5, Table S21-4 of Article S21, Resolution 128 (WRC-97), and for the suppression of Resolutions 133 and 129 (both WRC-97). These proposals are intended to be considered as a comprehensive package that would establish on a worldwide basis the regulatory conditions that would permit the establishment and evolution of both the fixed service and the fixed-satellite service in the 37.5-42.5 GHz frequency range.

Reasons:

Elevation of the fixed-satellite service (FSS) to primary allocation in all three Regions in the 40.0-42.5 GHz band

With the exception of sharing issues and studies identified in Resolution 128, studies in ITU-R confirm the feasibility of the fixed-satellite service allocation in the band 40.5-42.5 GHz, and the need for harmonized global allocations. With the elevation of the allocation to full primary status in all three Regions, the footnote allocation for countries in Region 1 can be removed. Those countries that are listed or that have territories listed in S5.551C should give consideration to whether the alternative allocation in certain countries and territories in Regions 2 and 3 can be suppressed. Acceleration of the effective date allows for removal of the reference to Resolution 134 (WRC-97). In advancing this proposal, it is proposed that broadcasting-satellite service and fixed-satellite service systems in the band 42.0-42.5 GHz not be implemented until technical and operational measures have been identified and agreed within ITU-R to protect the radio astronomy service in the band 42.5-43.5 GHz from harmful interference.

Addition of the broadcasting-satellite service (BSS) primary allocation in the 40.0-40.5 GHz band

This consequential allocation is necessary since it may not be possible to implement BSS in the 42.0-42.5 GHz band without causing interference detrimental to radio astronomy observations in the 42.5-43.5 GHz band. Resolution 128 (Rev.WRC-2000) calls for additional study within ITU-R to determine appropriate protection methods for the radio astronomy service (RAS) from BSS in the band 42.0-42.5 GHz.

Addition of the mobile-satellite service (MSS) secondary allocation in the 40.5-41.0 GHz band

This consequential allocation is necessary since it will no longer be possible to effectively implement MSS in the 39.5-40.0 GHz band given the proposed power flux-density limits in the 37.5-40.0 GHz band.

MOD IAP/14/87

S5.547 The bands 31.8-33.4 GHz, 37-40 GHz, 42.0-43.5 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz are available for high-density applications in the fixed service (see Resolution **726 (Rev.WRC-~~97~~2000)**).

Reasons: Many administrations throughout the world have permitted the deployment of high-density fixed systems in various parts of the frequency range 37-40 GHz. The band 42.0-43.5 GHz is very suitable for HDFS applications given the radio astronomy use of the band 42.5-43.5 GHz.

ADD IAP/14/88

S5.HDFS In the bands 37.0-40.0 GHz and 42.0-43.5 GHz, administrations should take the availability of these bands for high-density applications in the fixed service into account when considering the use of other allocated services.

Reasons: To encourage and facilitate fixed service use of the subject bands.

ADD IAP/14/89

S5.SAT Terrestrial radiocommunication services shall not constrain the future use, development and deployment of high-density applications in the fixed-satellite service in the band 40-42 GHz, or of the mobile-satellite service in the band 40.0-40.5 GHz.

Reasons: To encourage and facilitate fixed-satellite service and mobile-satellite service use of the subject bands. The band 40-42 GHz meets the spectrum requirements for high-density applications in the fixed-satellite service in this frequency range. In addition, it is necessary to recognize the global nature of FSS applications in this frequency range, and consequently, the designation should be made to all three Regions. It should be noted that the band 40-42 GHz is also allocated on a primary basis to the BSS. It is anticipated that high-density FSS applications are similar in nature to BSS systems, particularly in the delivery of multimedia and interactive services.

MOD IAP/14/90

S5.551B The use of the band ~~41.5~~42.0-42.5 GHz by the broadcasting-satellite service and fixed-satellite service (space-to-Earth) is subject to Resolution **128 (Rev.WRC-~~97~~2000)**. The limitation on the broadcasting-satellite service shall apply to systems where advanced publication materials are received by the Bureau after 2 June 2000. For non-geostationary fixed-satellite service systems operating in the band 41.5-42.0 GHz, see also Resolution **128 (Rev.WRC-2000)**.

Reasons: It is recognized that the use of adjacent spectrum by the fixed-satellite service below 42.5 GHz and its impact on radio astronomy operations above 42.5 GHz is under study within ITU-R. However, to give timely access to the FSS in the 40-42 GHz range and provide adequate protection to the radio astronomy service while studies are under way, it is reasonable to limit the scope of Resolution 128 to 500 MHz below 42.5 GHz. Studies on the protection of the radio astronomy service from unwanted emissions should also apply to the broadcasting-satellite service in the band 42.0-42.5 GHz.

SUP IAP/14/91

S5.551D

Reasons: With the elevation of the FSS allocation to full primary status in all three Regions, the footnote allocation for countries in Region 1 can be removed.

SUP IAP/14/92

S5.551E

Reasons: Consequential to the suppression of Resolution 134, and with the elevation of the allocation to full primary status in all three Regions, the footnote allocation for countries in Region 1 can be removed.

SUP IAP/14/93

S5.551F

Reasons: With the separation of the Table of Frequency Allocations into three Regions, as opposed to the current table where Regions 2 and 3 are joined, it is appropriate to suppress No. S5.551F from Region 2, as it applies exclusively to Region 3.

ADD IAP/14/94

S5.551X Use of the band 42.0-42.5 GHz by the fixed-satellite service shall be limited as noted in the *resolves* of Resolution **128 (Rev.WRC-2000)**.

Reasons: To reduce the potential harmful interference caused to the radio astronomy service in the 42.5-43.5 GHz band.

MOD IAP/14/95

MOD IAP/14/96

---

[10] **S21.16.4** The values given in this box shall apply ~~until such time as modified by a competent world radiocommunication conference~~to emissions of space stations of non-geostationary satellites in networks operating with 99 or fewer satellites. Further study concerning the applicability of these values is necessary in order to apply them to networks operating with 100 or more satellites.

ADD IAP/14/97

---

[16] **S21.16.10** The pfd limit in this table entry may be exceeded by not more than 13.5 dB under fade conditions, and the Radiocommunication Bureau's examination under Nos. **S9.35** and/or **S11.31** shall be based on the levels in this table entry plus 13.5 dB. In order to operate in excess of the levels in this table entry, the agreement of all administrations whose territory is within the half-power beamwidth of the satellite antenna beam shall have been obtained. The percentage of time that the values in this table entry may be exceeded shall be determined by reference to an appropriate ITU-R Recommendation (see Resolution **JJJ (WRC-2000)**).

ADD IAP/14/98

---

[17] **S21.16.11** During the launch and deployment phase of deep-space facilities, the values in this box may be exceeded for short periods of time.

Reasons: The pfd-review objectives of Resolutions 133 (WRC-97) and 129 (WRC-97) have been met. The values stated above for FSS systems are consistent with the Report of the Conference Preparatory Meeting for WRC-2000 and those included in a draft new Recommendation approved by ITU-R. See draft new Recommendation [4-9S/AH1], Maximum allowable values of power flux-density at the surface of the Earth produced by non-geostationary satellites in the fixed-satellite service operating in the 37.5-40.5 GHz and 40.5-42.5 GHz bands to protect the fixed service. The studies under Resolution 129 were done with respect to the fixed service, but are assumed to be adequate for protecting the co-primary terrestrial broadcasting service as well. In addition, studies have demonstrated the suitability for application to FSS systems of higher pfd limits in the 40.5-42.5 GHz band.

RESOLUTION 128 (Rev.WRC-~~97~~2000)

Allocation to the ~~fixed-~~satellite services (space-to-Earth) in the ~~41.5~~42-42.5 GHz band, use of the 41.5-42.0 GHz band by non-geostationary fixed-satellite service systems, and protection of the radio astronomy service in the 42.5-43.5 GHz band

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ~~this Conference has~~WRC-97 added a primary allocation to the fixed-satellite service (space-to-Earth) in the band ~~41.5~~42-42.5 GHz in Regions 2 and 3 and in certain countries in Region 1, that this Conference expanded this allocation to include all of Region 1, and that this band is adjacent to the band 42.5-43.5 GHz which is allocated, *inter alia,* to the radio astronomy service for both continuum and spectral line observations;

b) that there is also a worldwide primary allocation to the broadcasting-satellite service in the 42-42.5 GHz band;

~~b~~c) that unwanted emissions from space stations in the broadcasting-satellite service and fixed-satellite service (space-to-Earth) in the band ~~41.5~~42-42.5 GHz may result in harmful interference to the radio astronomy service in the band 42.5-43.5 GHz;

d) that aggregate unwanted emissions from space stations in the non-geostationary fixed-satellite service (space-to-Earth) in the band 41.5-42.0 GHz may result in harmful interference to the radio astronomy service in the band 42.5-43.5 GHz;

~~c~~e) that various technical means may be used to reduce these unwanted emissions from space stations in the broadcasting-satellite and fixed-satellite service;

~~d~~f) that a limited number of radio astronomy stations worldwide require protection, and that there may be means to limit the susceptibility of radio astronomy receivers to interference,

taking into account

the relevant provisions of the Radio Regulations,

resolves

that administrations shall not implement broadcasting-satellite service systems where advanced publication materials are received by the Bureau after 2 June 2000 and fixed-satellite systems in the band ~~41.5~~42-42.5 GHz until technical and operational measures have been identified and agreed within ITU-R to protect the radio astronomy service from harmful interference in the band 42.5-43.5 GHz,

invites ITU-R

1 to study, as a matter of urgency, the harmful interference that space stations in the broadcasting-satellite service where advanced publication materials are received by the Bureau after 2 June 2000 and fixed-satellite service (space-to-Earth) operating in the band ~~41.5~~42-42.5 GHz may cause to stations in the radio astronomy service operating in the band 42.5-43.5 GHz;

2 to identify technical and operational measures that may be taken to protect stations in the radio astronomy service operating in the band 42.5-43.5 GHz, including geographical separation and out-of-band emission limits to be applied to space stations operating in the broadcasting-satellite service where advanced publication materials are received by the Bureau after 2 June 2000 and fixed-satellite service in the band ~~41.5~~42-42.5 GHz, as well as measures that may be implemented to reduce the susceptibility of stations in the radio astronomy service to harmful interference;

3 to report on the results of ~~these~~the studies in *invites* 1 and 2 to the Conference Preparatory Meeting for WRC-~~99~~02/03~~,~~;

4 to complete the ongoing ITU-R studies on aggregate unwanted emissions from non-geostationary fixed-satellite service systems operating in the band 41.5-42.0 GHz for protection of the radio astronomy service in the band 42.5-43.5 GHz,

urges administrations

1 to participate actively in the aforementioned studies by submitting contributions to ITU-R, and;

2 when implementing non-geostationary fixed-satellite service systems, to take into account the results of the studies identified in *invites* ITU-R 4,

requests

WRC-~~99~~02/03 to take appropriate action based on those studies.

Reasons: Consequential to the change of the FSS allocation to primary status and the required ITU-R studies have not been completed.

ADD IAP/14/103

RESOLUTION JJJ (WRC-2000)

Determination of the percentage of time during which the fixed-satellite service (space-to-Earth) links in the 37.5-40.0 GHz and 42.0-42.5 GHz band may increase power to overcome fade conditions, while taking into account the impact on the performance of fixed systems

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that this Conference established power flux-density limits for the fixed-satellite service (space-to-Earth) in the 37.5-40.0 GHz and 42.0-42.5 GHz bands;

b) that this Conference determined that the power flux-density limits in the 37.5-40.0 GHz and 42.0-42.5 GHz bands on the fixed-satellite service may be exceeded by not more than 13.5 dB under fade conditions;

c) that there is a need for further study to determine the percentage of time during which fade conditions will require the use of increased power on fixed-satellite service links in the 37.5-40.0 GHz and 42.0-42.5 GHz bands,

recognizing

that the percentage of time during which fade conditions will exist on fixed-satellite service links in the 37.5-40.0 and 42.0-42.5 GHz bands will likely be small for significant fade depths, and is expected to be in the range of between one per cent and five per cent of the time; however, further study is needed,

recognizing further

that operation of fixed-satellite service links with increased power to overcome fade may affect the performance of fixed service links operating in unfaded conditions in the same frequency band,

resolves to invite ITU-R

1 taking into account the *recognizing* and *recognizing further* above, to conduct studies as a matter of urgency toward the development of an appropriate recommendation that establishes the relationship between the percentage of time and the amount of increased power with which fixed-satellite service links in the 37.5-40.0 GHz and 42.0-42.5 GHz bands may operate at increased power levels to overcome fade conditions, taking into account the impact on the performance of fixed systems;

2 to report on the results of these studies to the Conference Preparatory Meeting for WRC-02/03,

requests

WRC-02/03 to take appropriate action based on the results of those studies.

Reasons: To determine the appropriate percentage of time during which fade conditions exist on FSS links in the 37.5-40.0 and 42.0-42.5 GHz bands pursuant to Note 16 to Table S21-4.

MOD IAP/14/104

RESOLUTION 726 (Rev.WRC-~~97~~2000)

Frequency bands above 30 GHz available for high-density applications in the fixed service

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that there is a dramatically increasing demand for high-density applications in the fixed service resulting from the deployment of new mobile networks and from the rapid worldwide deregulation in the provision of local broadband services, including multimedia;

b) that the frequency range from 30 GHz to about 50 GHz is the range preferred to satisfy initial requirements, as indicated in *considering a)*, while the bands above about 50 GHz are preferred for similar applications but which take technical advantage of high atmospheric absorption;

c) that the lower part of the spectrum above 30 GHz has advantages for the fixed service in areas where longer path lengths are necessary;

d) that the 38 GHz band is already heavily used by many administrations for high-density applications in the fixed service;

e) that the needs of other services to which the relevant frequency bands are already allocated must be taken into account;

f) that the band 37-37.5 GHz is being planned for use by the space research service (space-to-Earth) to provide moon-to-Earth and planetary communication links;

g) that the band 37-38 GHz is being planned for use by the space research service to provide space based very long baseline interferometry;

h) that the deployment of high-density applications in the fixed service in some bands potentially presents sharing difficulties with other primary services allocated to the same band, e.g. the fixed-satellite service;

i) that operations in the space services, such as in the fixed-satellite service, in those bands used by high-density applications in the fixed service may lead to sharing difficulties;

j) that there is a need for global harmonization of new and existing allocations of radio frequency bands to facilitate coordination between administrations and encourage development of competitive products, through economies of scale, and the worldwide introduction of new telecommunication services, including the provision of reliable global information infrastructure access at an affordable cost,

MOD IAP/14/105

resolves

that administrations should take into account that the bands 31.8-33.4 GHz*, 37-40 GHz, 42.0-43.5 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz are available for high-density applications in the fixed service, when considering allocations or other regulatory provisions in relation to these bands,

MOD IAP/14/106

requests ITU-R

1 to undertake studies leading to the identification of system characteristics of high-density systems in the fixed service in ~~the~~certain bands listed in the *resolves*;

2 to ~~undertake~~develop, as a matter of urgency, ~~studies of~~ITU-R recommendations addressing technical and operational criteria and of methods to facilitate sharing between high-density systems in the fixed service and other services in the bands listed in the *resolves*,

urges administrations

to participate actively in the aforementioned studies by submitting contributions to ITU-R.

Reasons: Consequential.

* ~~The date of provisional application of this allocation shall be in conformity with Resolution **126 (WRC-97)**.~~

WRC-2000 agenda item 1.5 - to consider regulatory provisions and possible additional frequency allocations for services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution 122 (WRC-97)

Proposal to modify Resolution 122, high altitude platform stations in the fixed service

Background information

Resolution 122 (WRC-97), "Use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz by high altitude platform stations in the fixed service and by other services", instructs the Director of the Radiocommunication Bureau, that from 22 November 1997, to accept notices in the bands 47.2-47.5 GHz and 49.2-48.2 GHz only for high altitude platform stations in the fixed service and for feeder links for the broadcasting-satellite services pending review of sharing studies between co-primary services in the band. On the basis of studies conducted in ITU-R, it is appropriate to modify Resolution 122 (WRC-97) to take account of draft new Recommendation [4-9S/AAX] that establishes the performance parameters for certain FSS antennas that can share with the HAPS system and to take account of the need for continued studies.

MOD IAP/14/107

RESOLUTION 122 (Rev.WRC-~~97~~2000)

Use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz by high altitude platform stations in the fixed service and by other services

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that the band 47.2-50.2 GHz is allocated to the fixed, mobile and fixed-satellite services on a co-primary basis;

b) that ~~this Conference has~~WRC-97 made provision for operation of high altitude platform stations, also known as stratospheric repeaters, within the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz;

c) that ITU has among its purposes "to promote the extension of the benefit of the new telecommunication technologies to all the world's inhabitants" (No. 6 of the Constitution of the ITU (Geneva, 1992));

d) that systems based on new technologies using high altitude platforms in the bands 47.2-47.5 and 47.9-48.2 GHz will be able to provide high-capacity, competitive services to urban and rural areas;

e) that high altitude platform systems are in an advanced stage of development and some countries have notified such systems to ITU;

f) that WRC-97 adopted a new definition of high altitude platform stations in Article **S1**, modified No. **S11.24** and added No. **S11.26** in the Radio Regulations providing for notices relating to assignments for high altitude platform stations in the bands 47.2-47.5 GHz and 47.9-48.2 GHz and that the Radio Regulations Board issued a provisional rule of procedure concerning notification periods in No. **S11.24/1228** in February 1997;

g) that ~~in spite of the urgency attached to the development of such systems, technical, sharing and regulatory issues should be studied in order to achieve the most efficient use of the spectrum available for these systems~~ITU-R has confirmed that in certain cases sharing is feasible between high altitude platform stations and the FSS;

h) that technical studies are still required in order to ascertain the extent to which sharing of the bands 47.2-47.5 GHz and 47.9-48.2 GHz is feasible between systems using high altitude platforms in the fixed service and systems in the fixed, fixed-satellite (other than the specific deployment FSS scenario referenced in draft new Recommendation [4-9S/AAX]) and mobile services, and to ascertain the requirements to protect radio astronomy services in adjacent bands from spurious emissions;

i) that the radio astronomy service has primary allocations in the bands 42.5-43.5 GHz and 48.94-49.04 GHz;

j) that ITU-R studies are already under way on the preferred characteristics of systems using high altitude platforms and the feasibility of sharing between these systems and systems of other services and between these systems and other systems in the fixed service (Questions ITU-R 212/9, ITU-R 218/9 and ITU-R 251/4) and that although draft new Recommendations [4-9S/AAX] and [9B/HAPS2] have been developed, further studies are required to fully assess the implications of these scenarios and to consider the effect of mitigation techniques on increasing shared use of these bands by HAPS and other systems;

k) that No. **S5.552** urges administrations to reserve fixed-satellite service use of the band 47.2-49.2 GHz for feeder links for the broadcasting-satellite service, and that preliminary ITU-R studies indicate that high altitude platform stations in the fixed service may share with broadcasting-satellite feeder links;

l) that the development of services using high altitude platform stations in these bands requires major investment and that manufacturers and operators should be given the confidence to make the necessary investment in these applications,

resolves

1 to urge administrations to facilitate coordination between high altitude platform stations in the fixed service operating in the bands 47.2-47.5 GHz and 47.9-48.2 GHz and other co-primary services in their territory and adjacent territories;

2 that, on a provisional basis, the procedures of Article **S9** shall be used for coordination between satellite systems and high altitude platform systems;

3 to request ITU-R to ~~carry out urgently~~continue studies on the appropriate technical sharing criteria for the situations referred to in *considering h)*, with priority given to the sharing with other systems in the fixed and fixed-satellite services~~, in particular the determination of the appropriate geographical separation from feeder links in the broadcasting-satellite service~~;

4 that WRC-~~99~~03 should review the results of these studies and consider refinement of the regulatory provisions ~~that might facilitate a broader application of these~~for high altitude platform technologies,

instructs the Director of the Radiocommunication Bureau

1 that notices concerning high altitude platform stations that were received by the Bureau prior to 22 November 1997, and provisionally recorded in the Master International Frequency Register in accordance with the provisional rule of procedure issued by the Board, shall be maintained;

2 that from 22 November 1997, and pending review of the sharing studies in *considering h)* and review of the notification process by WRC-~~99~~03, the Bureau shall accept notices in the bands 47.2-47.5 GHz and 47.9-48.2 GHz only for high altitude platform stations in the fixed service and for feeder links for the broadcasting-satellite service, shall continue to process notices for fixed-satellite service networks (except for feeder links for the broadcasting-satellite service) for which complete information for advance publication has been received prior to 27 October 1997, and shall inform the notifying administrations accordingly.

Reasons: To further develop possible sharing criteria among high altitude platform stations and other services in the 47.2-47.5 GHz and 47.9-48.2 GHz bands.

WRC-2000 agenda item 1.6.1 - review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Proposal to identify additional spectrum for IMT-2000

Background information

In the Americas, cellular and PCS services are experiencing significant growth, and there is strong interest in the evolution of these services towards IMT-2000. In view of the present PCS use of the 2 GHz band and the MSS allocations in the frequency spectrum currently identified for IMT-2000 by RR S5.388, there is limited clear spectrum available for the implementation of IMT-2000.

In order to consider additional requirements for the terrestrial component of IMT-2000, current PCS and cellular services should be able to evolve to IMT-2000 in existing bands to the extent possible. ITU-R Task Group 8/1 (TG 8/1) efforts towards global harmonization of technology and spectrum and, in particular, the forecast of 160 MHz of additional spectrum beyond that currently in the bands used for first and second generation mobile systems (e.g. cellular and PCS in Region 2) to implement IMT-2000 should be supported.

Proposals to identify frequency bands to accommodate the additional forecasted requirements should take into account the principles of placing priority on the selection of bands already allocated to the mobile service and of taking into consideration the impact on existing uses of the spectrum. Also, consideration should be given to the possibility of achieving harmonization through all or parts of the identified band(s) with other regions of the world. Globally harmonized spectrum will greatly assist in the success of IMT-2000 system deployment and enhance roaming services.

The band 1 710-1 850 MHz has the advantages of being immediately adjacent to the spectrum currently identified for IMT-2000 and it is also used today in parts of the world for PCS, increasing the possibility of harmonization with other regions.

The frequency range 1 710-1 885 MHz should be identified worldwide for additional spectrum for advanced mobile applications in the context of IMT-2000 through a modification of footnote S5.388.

MOD IAP/14/108

1 710-2 170 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 710-1 930	FIXED MOBILE S5.380 S5.149 S5.341 S5.385 S5.386 S5.387 S5.388 MOD S5.388	

MOD IAP/14/109

S5.388 The bands 1 710-1 885 MHz, 1 885-2 025 MHz and 2 110-2 200 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these bands by other services to which they are allocated. The bands should be made available for IMT-2000 in accordance with Resolution **212 (Rev.WRC-~~97~~2000)**.

Reasons: The frequency range 1 710-1 885 MHz has, in many parts of the world, already been impacted by the introduction of earlier generation personal mobile systems (for example, the introduction of GSM1800 in Europe and other parts of the world in the frequency range 1 710-1 785/1 805-1 880 MHz and PCS in the Americas in 1 850-1 990 MHz). These pre-IMT-2000 systems are expected to have the capability to evolve to IMT-2000. In addition, this frequency range, 1 710-1 885 MHz is adjacent to the spectrum currently identified for IMT-2000, thus providing a large block of contiguous spectrum for future IMT-2000 systems. These attributes will facilitate cost-effective expansion of existing systems to meet advanced mobile applications in the context of IMT-2000 requirements.

MOD IAP/14/110

RESOLUTION 212 (Rev.WRC-~~97~~2000)

Implementation of International Mobile Telecommunications-2000 (IMT-2000)*

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ITU-R has recommended the 1-3 GHz band as the most suitable for IMT-2000;

b) ~~that ITU-R has recommended approximately 60 MHz for use by personal stations and approximately 170 MHz for use by mobile stations~~that WARC-92 identified 230 MHz for IMT-2000 by regulatory provision of **S5.388**;

c) ~~that ITU-R has recognized that space techniques are an integral part of IMT-2000~~that ITU-R identified a further requirement of 160 MHz in addition to the spectrum identified in **S5.388** and also the spectrum currently used by earlier generations of personal communications;

d) ~~that, in No. **S5.388**, this Conference has identified bands to accommodate this future service~~that ITU-R has recognized that space techniques are an integral part of IMT-2000;

e) that WARC-92 identified the worldwide allocations for the mobile-satellite service as part of the satellite component of IMT-2000;

f) that ITU-R has completed the development of recommendations on detail specifications of the radio interface of IMT-2000;

g) that harmonized worldwide bands for IMT-2000 is desirable to achieve benefits of economies of scale,

considering further

~~*a)* that ITU-R has not completed its studies regarding duplexing methods, modulation techniques, channelling arrangements, signalling or communication protocols;~~

~~*b)* that no worldwide intersystem numbering plan currently exists that would facilitate worldwide roaming,~~

h) that WRC-2000 identified XXX MHz of additional spectrum for the terrestrial component of IMT-2000;

i) that WRC-2000 identified the bands for the satellite component of IMT-2000,

* IMT-2000 was previously known as Future Public Land Mobile Telecommunication Systems (FPLMTS).

noting

a) that the implementation of the terrestrial component of IMT-2000 ~~in the bands 1 885-2 025 MHz and 2 110-2 200 MHz~~ is expected to commence around the year 2000, subject to market and technical considerations;

b) that the availability of the satellite component of IMT-2000 ~~in the bands 1 980-2 010 MHz and 2 170-2 200 MHz simultaneously with the terrestrial component of IMT-2000 in the bands identified in No. **S5.388**~~ would improve the overall implementation and the attractiveness of IMT-2000 to both developed and developing countries~~,~~;

c) that ITU-R has identified additional work to address further developments in advanced mobile systems including IMT-2000 applications and applications beyond IMT-2000,

~~*invites administrations*~~

~~to give due consideration to the accommodation of other services currently operating in these bands when implementing IMT-2000,~~

invites ITU-R

to continue its studies ~~with a view to developing suitable and acceptable technical characteristics for IMT-2000 that will facilitate worldwide use and roaming,~~on further enhancements of IMT-2000 including the provision of Internet Protocol (IP) based applications and optimized arrangements for the harmonized use of spectrum identified for IMT-2000, and ensure that IMT-2000 can also meet the telecommunication needs of the developing countries and rural areas,

invites ITU-T

a) to complete its studies of signalling and communication protocols;

b) to develop a common worldwide intersystem numbering plan and associated network capabilities that will facilitate worldwide roaming,

resolves

that administrations which implement IMT-2000:

a) should make the necessary ~~frequencies~~spectrum available for system development;

b) should use those frequencies when IMT-2000 is implemented;

c) should use the relevant international technical characteristics, as identified by ITU-R and ITU-T Recommendations.

Reasons: Resolution 212 was modified to make it generally applicable to any band designated for IMT-2000 systems under RR S5.388.

WRC-2000 agenda item 1.6.1 - review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Proposal for NOC in the 2 700-2 900 MHz band

Background information

CITEL proposes NOC for the band 2 700-2 900 MHz. This band is used extensively throughout the world for meteorological radars and other radionavigation and radiolocation systems. The impact of an allocation for mobile service use by IMT-2000 on these critical radar operations has not been studied by ITU-R.

The 2 700-2 900 MHz band is used for aeronautical radionavigation radars providing essential safety-of-life related terminal approach guidance for commercial aircraft. The NEXRAD weather radar system, operating at 2 700-2 900 MHz, also provides weather location and prediction information critical for public safety. Studies made during the implementation of NEXRAD have shown that air traffic control and weather radar cannot operate in the same band and in the same vicinity of marine radars and racons without causing interference.

Working Party 8B, in a liaison statement to Task Group 8/1, expressed serious concerns that TG 8/1 was recommending critical radionavigation and radiolocation bands via CPM text to WRC-2000 for possible reallocation to the mobile service exclusively without consulting the responsible working party.

The CPM text concludes that, given the technical characteristics of the radionavigation, radiolocation and meteorological radars (e.i.r.p. in the order of 1 GW in some systems and the trend towards high duty cycles), and the need to operate in accordance with the protection criteria contained in ITU-R recommendations, sharing with IMT-2000 systems is considered to be feasible only when explicitly confirmed by ITU-R sharing studies.

Reasons: The band 2 700-2 900 MHz is used worldwide by radar systems critical for flight safety and weather reporting.

WRC-2000 agenda item 1.10 - to consider results of ITU-R studies carried out in accordance with Resolution 218 (WRC-97) and take appropriate action on this subject

Proposal to modify footnotes S5.353A and S5.357A

Background information

In order to accommodate AMS(R)S traffic, it would be necessary that all MSS systems using this spectrum, within a certain geographical area, be technically able to release all, or parts, of the spectrum to any MSS operator that has a requirement for priority 1 to 6 AMS(R)S traffic. The technical and operational requirements for achieving such transfer of AMS(R)S spectrum resources would have to be developed by ICAO and the MSS system operators, and then implemented by MSS operators according to agreed upon specifications. Only MSS systems compliant with these requirements should have access to the 10 MHz identified in S5.357A of paired generic MSS spectrum to ensure the availability of this spectrum to satisfy AMS(R)S priority 1 to 6 communications.

The proposed Resolution is intended to replace Resolution 218 and calls for ITU-R to study and develop the technical and operational requirements and specifications for intra-system and inter-system prioritization and pre-emption methods.

RESOLUTION 218 (WRC-97)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

Reasons: Consequential to adding Resolution XXX (WRC-2000).

ADD IAP/14/117

RESOLUTION XXX (WRC-2000)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-97 allocated the bands 1 525-1 559 MHz (space-to-Earth) and 1 626.5-1 660.5 MHz (Earth-to-space) to the mobile-satellite service (MSS) to facilitate the assignment of spectrum to multiple mobile-satellite systems in a flexible and efficient manner;

b) that prior to WRC-97 there was a generic allocation by footnote provisions in some countries for the use of the bands 1 530-1 544 MHz and 1 631.5-1 645.5 MHz by the MSS, on condition that maritime mobile-satellite distress and safety communications have priority access over all other communications;

c) that in the bands 1 525-1 559 MHz (space-to-Earth) and 1 626.5-1 660.5 MHz (Earth-to-space) allocated to the mobile-satellite service (MSS), footnotes **S5.353A** and **S5.357A** give priority to the spectrum requirements for distress, urgency and safety communications of GMDSS and for transmission of messages with priority 1 to 6 of Article **S44** of AMS(R)S and provides protection to GMDSS and AMS(R)S from harmful interference by other mobile-satellite services;

d) that the results of the studies conducted by ITU-R pursuant to WRC-97 Resolution **218** provide for spectrum estimates for the requirement of AMS(R)S traffic;

e) that the spectrum prioritization and pre-emption methods identified in the ITU-R studies can provide for the long-term spectrum requirements of GMDSS and AMS(R)S;

f) that the technical standards which would provide for prioritization and real-time pre-emptive capabilities in future MSS systems in order to meet the long-term requirements of GMDSS and AMS(R)S services need to be developed by ITU-R;

g) that technical considerations for sharing satellite network resources between MSS (other than the aeronautical mobile-satellite (R) service) and the aeronautical mobile-satellite (R) service have been developed by and are included in ITU-R Recommendation ITU-R M.1233;

h) that global and regional mobile-satellite systems are being multilaterally coordinated in the bands 1 525-1 559 MHz (space-to-Earth) and 1 626.5-1 660.5 MHz (Earth-to-space) and that the ITU Radio Regulations provide the international framework for multilateral agreements,

further considering

i) that the Convention on International Civil Aviation requires that stations of the aeronautical mobile-satellite (R) service shall be in compliance with the internationally agreed Standards and Recommended Practices and Procedures for Air Navigation Services;

j) that the ICAO has developed a global Air Traffic Management system which requires interoperability between stations operating in accordance with the ICAO Convention for those mobile-satellite systems providing aeronautical mobile-satellite (R) service communications with the priority message structure of Article **S44**;

k) that WRC-97 modified provisions for the operational use of the GMDSS which is fully defined in the International Convention for the Safety of Life at Sea (SOLAS), 1974, as amended (see MOD No. **S30.1**);

l) that in these bands GSO satellite system operators presently use a capacity planning approach at multilateral coordination meetings, with the guidance and support of their administrations, to periodically coordinate access to the spectrum needed to accommodate their requirements. However, outside the multilateral process, coordination problems have occurred in some cases;

m) that in the bands to which RR Nos. **S5.353A** or **S5.357A** applies, the capacity planning approach, and other methods such as intra- and inter-system prioritization, pre-emption and interoperability may assist to accommodate the expanding spectrum requirements of GMDSS and AMS(R)S;

n) that the feasibility of prioritization, real-time pre-emptive access and interoperability between different mobile-satellite systems and systems providing GMDSS and AMS(R)S has yet to be adequately determined,

recognizing

a) that Table **S15-2** of Appendix **S15** identifies the bands 1 530-1 544 MHz (space-to-Earth) and 1 626.5-1 645.5 MHz (Earth-to-space) for distress and safety purposes in the maritime MSS as well as for routine non-safety purposes;

b) that the coordination process currently allows for the orderly development of MSS systems and applications while meeting the requirements for distress, urgency and safety communications of GMDSS and for the transmission of messages with priority 1 to 6 of Article **S44** of AMS(R)S;

c) that in the future there may be a need for more flexible sharing methodologies to accommodate more systems and applications, and that ITU-R has identified two possible sharing methodologies;

d) that such methodologies shall comply with the safety and regularity of flight requirements of ICAO and the safety at sea requirements of IMO,

resolves

that technical and operational standards be developed to allow prioritization and real-time pre-emptive access both within a single MSS system offering AMS(R)S communications, and between MSS systems which may or may not offer AMS(R)S communications,

requests ITU-R

to develop the technical standards which would enable the use of prioritization and real-time pre-emption, within a single system and pre-emption between MSS systems, in order to achieve the most flexible and practical use of the MSS allocation, *requests the next [competent] world radiocommunication conference*

to take into account the outcome of ITU-R studies and take appropriate action on this subject,

invites

ICAO, IMO, IATA and administrations concerned to participate in the studies identified in *requests ITU-R*.

Reasons: This Resolution calls for ITU-R to study and develop the technical and operational requirements and specifications for intra-system and inter-system prioritization and pre-emption methods.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Resolution 131 (WRC-97) - Power flux-density limits applicable to non-GSO FSS systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz

Background information

WRC-97 provisionally adopted pfd limits to be applied to non-GSO FSS systems operating in these bands. In the 10.7-12.75 GHz band, WRC-97 applied the existing limits to both GSO and non-GSO systems, subject to further study by ITU-R under Resolution 131 (WRC-97). In the 17.7-19.3 GHz band, WRC-97 adopted more stringent pfd limits for non-GSO FSS systems with more than 100 satellites.

Many studies were performed in Working Party 4-9S and by the Joint Task Group 4-9-11 to determine the appropriate pfd limits to be applied to non-GSO FSS systems in the aforementioned bands. The intent was to find suitable pfd limits that would ensure protection of the fixed service without unduly constraining the development of either service.

At the most recent meeting of the Joint Task Group 4-9-11, the experts present agreed to limits for both frequency bands.

In the 10.7-12.75 GHz range, the JTG concluded that the current limits in Article S21 are sufficient to protect the FS on the basis of the assumptions used in the studies. The JTG also recommended the use of a 1 MHz reference bandwidth for non-GSO system. The conclusions of the JTG 4-9-11 are summarized below.

The current RR Article S21 per satellite pfd limits, as defined below and as discussed more fully in draft new Recommendation ITU-R SF.[Doc. 4-9S/AI] (submitted to RA-2000 for approval), are adequate for the protection of the FS in the 10.7-12.75 GHz band from aggregate interference from three assumed non-homogeneous, non-GSO FSS systems. Moreover, the contribution of GSO interference to the sharing has been shown as not being significant. Studies support and validate this conclusion. These results would remain valid if the number of non-GSO FSS systems were in the range 3 to 5.

- in the 10.7-11.7 GHz band:

–126	dB(W/m^2) per 1 MHz	for $0° \le \delta < 5°$
–126 + (δ-5)/2	dB(W/m^2) per 1 MHz	for $5° \le \delta < 25°$
–116	dB(W/m^2) per 1 MHz	for $25° \le \delta < 90°$

where δ is the angle of arrival above the horizontal plane.

- in the 11.7-12.75 GHz band:

–124	dB(W/m^2) per 1 MHz	for $0° \le \delta < 5°$
–124 + (δ-5)/2	dB(W/m^2) per 1 MHz	for $5° \le \delta < 25°$
–114	dB(W/m^2) per 1 MHz	for $25° \le \delta < 90°$

where δ is the angle of arrival above the horizontal plane.

In the 17.7-19.3 GHz range, the conclusion of the JTG was that a tightening of the original Article S21 pfd limits for non-GSO FSS with large constellations (over 50 satellites) would ensure protection of the fixed service while not unduly constraining the development of non-GSO FSS systems. The JTG conclusion was:

The following per satellite pfd limits (also described in draft new Recommendation ITU-R SF.[Doc. 4-9S/TEMP/94]) (submitted to RA-2000 for approval) are adequate for the protection of the FS in the 17.7-19.3 GHz band from aggregate interference from three assumed non-homogeneous non-GSO FSS systems. Moreover, the contribution of GSO interference to the sharing has been shown as not being significant. Studies support and validate this conclusion. These results would remain valid if the number of non-GSO FSS systems were in the range 3 to 5.

–115 - X	dB(W/m^2) per MHz	for $0° \le \delta < 5°$
–115 - X +((10 + X)/20)(δ-5)	dB(W/m^2) per MHz	for $5° \le \delta < 25°$
–105	dB(W/m^2) per MHz	for $25° \le \delta < 90°$

where δ is the angle of arrival above the horizontal plane and X is defined as a function of the number of satellites in the non-GSO FSS constellation, N, as follows:

– for $N \le 50$ $X = 0$ (dB)

– for $50 < N \le 288$ $X = \frac{5}{119}(N - 50)$ (dB)

– for $N > 288$ $X = \frac{1}{69}(N + 402)$ (dB)

The scaling function, X, was developed on the basis of non-GSO FSS constellations with 96, 288 and 840 satellites. Further simulations with different non-GSO FSS constellations comprising a wide range in the number of satellites (63, 126, 189, 252 and 504 satellites) and using the conservative pfd mask simulation method have confirmed the adequacy of this scaling function.

Further studies by some CITEL Administrations have shown that the interference levels obtained using the simple pfd mask methodologies used in the ITU-R studies are higher than those obtained using a more realistic modelling of the pfd entries. CITEL Administrations support the above pfd limits while noting that because of the operational characteristics of the non-GSO networks, interference margins will be present.

CITEL objective

CITEL's objective is to ensure that the pfd limits in the bands 10.7-12.75 GHz and 17.8-19.3 GHz will provide adequate protection of the terrestrial services while not unduly constraining the design of non-GSO FSS networks. Since the studies conducted in ITU-R indicate that both objectives have been achieved with the masks proposed by the JTG 4-9-11, these limits should be adopted in Article S21 of the Radio Regulations.

Proposals

1) It is proposed to retain the current S21 pfd limits in the 10.7-12.75 GHz range, but scaling to a 1 MHz reference bandwidth for non-GSO systems and remove references to further studies.

2) It is proposed to adopt the compromise S21 pfd limits in the 17.7-19.3 GHz band agreed to by the JTG 4-9-11 and remove references to further studies.

3) As a consequence, it is proposed to delete Resolution 131 (WRC-97).

4) Changes in the frequency band column referring to S5.494 and S5.496 is required because the FS is allocated in all countries of Region 3.

MOD IAP/14/118

TABLE **S21-4** *(continued)*

NOTE - Only the portions of the table that were changed were reproduced.

MOD IAP/14/120

---

[12] **S21.16.6** ~~These values shall apply provisionally only to emissions of space stations on non-geostationary satellites in networks operating with a large number of satellites, that is systems operating with more than 100 satellites (see Resolution **131 (WRC-97)**).~~The function X is defined as a function of the number, N, of satellites in the non-GSO FSS constellation as follows:

– for N ≤ 50 $X = 0$ (dB)

– for 50 < N ≤ 288 $X = \frac{5}{119}(N - 50)$ (dB)

– for N > 288 $X = \frac{1}{69}(N + 402)$ (dB)

In the band 18.8-19.3 GHz, these limits apply to emissions of a space station on a non-geostationary FSS satellite for which complete coordination or notification information, as appropriate, has been received by the Radiocommunication Bureau after 17 November 1995, and which were not operational by that date.

Reasons: The above regulatory text (as contained in the CPM Report) maintains the original limits for non-GSO FSS systems in the band 18.8-19.3 GHz that were notified or operational prior to the end of WRC-95 per the decisions in Resolution 131 (WRC-97). In the band 17.7-18.8 GHz, the new limits would apply to all non-GSO systems irrespective of the date of receipt of information or date of bringing into operation.

ADD IAP/14/119

[12*bis*] **S21.16.6*bis*** These limits apply to emissions of a space station on a meteorological-satellite and on a geostationary FSS satellite. These limits also apply to emissions of a space station on a non-geostationary FSS satellite in the band 18.8-19.3 GHz for which complete coordination or notification information has been received by the Radiocommunication Bureau by 17 November 1995, or are in operation by that date.

Reasons: The above regulatory text (as contained in the CPM Report) reflects the date-specific provisions currently in Resolution 131.

SUP IAP/14/123

RESOLUTION 131 (WRC-97)

Power flux-density limits applicable to non-geostationary fixed-satellite service systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz

Reasons: Replaces the provisional pfd limits in Table S21-4 with the values that, as a result of extensive ITU-R studies, were agreed by Working Party 4-9S and JTG 4-9-11. ADD [12*bis*].

S21.16.6*bis*, and a corresponding change in MOD [12] S21.16.6, specify the dates of application of the pfd limits in conformance with the dates established in Resolution 131. Footnotes S21.16.8, S21.16.9 and Resolution 131 are no longer required.

WRC-2000 agenda item 1.13.2 - to consider the inclusion in other frequency bands of similar limits in Articles S21 and S22, or other regulatory approaches to be applied in relation to sharing situations

IAP/14/124

There have been no technical studies carried out in frequency bands other than those considered under agenda item 1.13.1. Consequently, there should not be any limits adopted in Article S22 for frequency bands other than those identified in Resolutions 130 (WRC-97) and 538 (WRC-97) per agenda item 1.13.1.

WRC-2000 agenda item 1.15.1 - to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Proposal for RNSS allocation (space-to-Earth) in the upper part of the band 960-1 215 MHz

Background information

Additional radionavigation-satellite service (RNSS) signals will greatly enhance the accuracy, reliability and robustness of the civil Global Positioning System (GPS) by enabling more effective corrections to be made for the time delay effects of the ionosphere on the signals from space. The International Civil Aviation Organization (ICAO) has stated the requirement for an additional civil signal to support Global Navigation Satellite System (GNSS) requirements and for space-based augmentation systems. A requirement for aeronautical users is to have the protected signal operate within radio spectrum allocated to the Aeronautical Radionavigation Service (ARNS), which would also include the possibility of terrestrial augmentation systems.

However, studies show that airborne RNSS receivers at altitudes of 10 000 feet and above may not be compatible with the existing environment in certain geographic areas. The band 1 151-1 215 MHz has been identified to accommodate additional spectrum for an international civil aviation safety-of-life service. The DME/TACAN constitutes the primary source of interference, but because of its importance to civil aviation navigation it must be protected for continued use for the foreseeable future. Recoordination of some DME/TACAN could be considered, if required, in order for GPS to be used in North America for civil aviation safety-of-life services.

Sharing of the same spectrum by two or three different RNSS networks would require compatible power levels and signal types in the design and operation of the different networks. Use of independent spectrum by each RNSS network would decrease the chance of a single interference incident affecting more than one network. Therefore, the allocation should accommodate the spectrum requirement of two or three different RNSS systems.

CITEL supports a new allocation to RNSS in the band 1 164-1 212 MHz with appropriate regulatory measures to protect the current use and the development of airborne electronic aids to air navigation and any directly associated ground-based facilities.

CITEL Members States recognize that discussions continue regarding the total amount of spectrum required to support several RNSS systems.

MOD IAP/14/125

Allocation to services		
Region 1	**Region 2**	**Region 3**
960-1 215	AERONAUTICAL RADIONAVIGATION MOD S5.328	

MOD IAP/14/126

S5.328 The band 960-1 215 MHz is reserved on a worldwide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based and satellite-borne (1 164-1 212 MHz only) facilities. The band 1 164-1 212 MHz is also allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis. Stations of the radionavigation-satellite service shall not cause harmful interference to nor claim protection from stations of the aeronautical radionavigation service.

Reasons: Radionavigation-satellite service systems will be provided with adequate spectrum while giving priority to the aeronautical radionavigation service.

WRC-2000 agenda item 1.15.1 - to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Proposal for RNSS allocation (space-to-Earth) in the upper part of the band 1 260-1 300 MHz

Background information

The band 1 260-1 300 MHz is allocated on a primary basis to the radiolocation, to the Earth exploration-satellite (active) and to the space research (active) services. Domestic footnotes allocate this band on a primary basis in several countries to the fixed and mobile services and to the radionavigation service. In Canada and the United States, the band 1 240-1 300 MHz is also allocated to the aeronautical radionavigation service on a primary basis. The band 1 260-1 300 MHz is also allocated to the amateur service on a secondary basis.

Footnote S5.282 allows the use of the amateur-satellite service (Earth-to-space) on a non-protection no-interference basis with respect to other services operating in this band in accordance with the table (see No. S5.43). The usage of this band by the amateur-satellite service is expected to increase.

Similar to the band 1 215-1 260 MHz, the band 1 260-1 300 MHz is used by radars. Furthermore, this band is used for high-power wind profiler radars. It is not suitable for safety-of-life applications, similar to the RNSS usage in the band 1 215 to 1 260 MHz.

CITEL supports a new allocation in the band 1 260-1 300 MHz (space-to-Earth) for RNSS non-safety-of-life applications.

CITEL Members States recognize that discussions continue regarding the total amount of spectrum required to support several RNSS systems.

MOD IAP/14/127

ADD IAP/14/128

S5.329A Use of the radionavigation-satellite service in the band 1 260-1 300 MHz shall be subject to the condition that no harmful interference is caused to and no protection is claimed from the radionavigation service authorized under **S5.331**.

Reasons: RNSS will be provided with adequate spectrum for non-safety-of-life applications while safeguarding the development and protection of the radionavigation services.

WRC-2000 agenda item 1.15.1 - to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Proposal for RNSS (Earth-to-space) 5 000-5 010 MHz and (space-to-Earth) 5 010-5 030 MHz

Background information

In accordance with the ITU Radio Regulations, the band 5 000-5 250 MHz is allocated on a primary basis to the aeronautical radionavigation service in all three ITU Regions. The band 5 000-5 030 MHz is not used nor intended to be used for the international standard MLS system.

Results of ITU-R studies show that with the 10 MHz of separation and the use of adequate and existing filter technology by the RNSS, the protection requirements of the RAS as contained in Recommendation ITU-R RA.769-1 are met.

The use of RNSS (space-to-Earth) is compatible with the MLS operations in the band 5 030-5 150 MHz if the pfd at the surface of the Earth does not exceed –124.5 dB(W/m^2), in a 150 kHz band, as specified by ICAO. The use of RNSS (Earth-to-space) is compatible with the MLS operations through careful location of the radiobeacons.

The usage of the band 5 010-5 030 MHz by RNSS (space-to-Earth) and (Earth-to-space) are mutually exclusive. If the allocation to the RNSS (space-to-Earth) in the band 5 010 to 5 030 MHz is not implemented, then the allocation to the RNSS (Earth-to-space) could be extended to the band 5 030 MHz.

CITEL supports the allocation to RNSS in the band 5 010-5 030 MHz (space-to-Earth), and the allocation to RNSS in the band 5 000-5 010 MHz (Earth-to-space).

MOD IAP/14/129

The requirements of this system shall take precedence over other uses of this band. For the use of this band, see No. **S5.444A** and Resolution **114 (Rev.WRC-~~95~~2000)** ~~apply~~.

Reasons: To indicate that the 5 000-5 030 MHz band is no longer intended to be used for MLS.

ADD IAP/14/131

S5.444B *Additional allocation:* the band 5 010–5 030 MHz is also allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis. The band 5 000-5 010 MHz is also allocated to the radionavigation-satellite service (Earth-to-space) on a primary basis. Harmful interference shall not be caused to stations of the radio astronomy service using the band 4 990-5 000 MHz by stations of the radionavigation-satellite service (see No. **S29.13**).

Reasons: To enable RNSS uplink and downlink operations while protecting radio astronomy observations.

WRC-2000 agenda item 1.15.1 - to consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Proposal for RNSS (Earth-to-space) in the band 1 300-1 350 MHz

Background information

The band 1 300-1 350 MHz is allocated worldwide on a primary basis to the aeronautical radionavigation service and on a secondary basis to the radiolocation service. New allocations for RNSS are required to support developments and some proposed RNSS systems would require a limited number of terrestrial radio beacons for synchronization. Footnote S5.149 indicates spectral line observations by the radio astronomy service and that precautions should be taken to protect the RA service from harmful interference.

Careful location of the radio beacons should protect the radio astronomy service.

Results of ITU-R studies show that the required separation distance between radars and terrestrial beacons would be less than 60 km to protect the radars.

By making the radiolocation allocation primary, equal status would be given to both the RNSS (Earth-to-space) and the radiolocation radars, which would need to be coordinated. A footnote would preserve the higher status of the aeronautical radionavigation service.

CITEL supports the allocation to RNSS (Earth-to-space) in the band 1 300-1 350 MHz.

Reasons: To enable use of the band for RNSS uplinks, while protecting other aeronautical radionavigation services.

WRC-2000 agenda item 1.15.2 - to consider the addition of the space-to-space direction to the radionavigation-satellite service allocations in the bands 1 215-1 260 MHz and 1 559-1 610 MHz

Background information

Radionavigation-satellite service (RNSS) systems such as the Global Positioning System and Global Navigation Satellite System are primarily being used in the space-to-Earth direction to provide service to terrestrial users. These systems are, however, also increasingly being used in the space-to-space direction by spaceborne users for such applications as spacecraft three-dimensional positioning and velocity determination; three-axis attitude control; precise time synchronization; precision orbit determination, and atmospheric science. The use of RNSS signals is presently protected only through a space-to-Earth allocation in the 1 215-1 260 MHz and 1 559-1 610 MHz bands. Recognizing current and future operational usage of spaceborne RNSS receivers for scientific and commercial applications, it is important to add the space-to-space direction to the existing RNSS allocations so that these uses can be taken into consideration when changes to the use of these bands are contemplated.

Interference studies have been conducted to assess the sensitivity of spaceborne RNSS receivers to interference from radiolocation, Earth exploration-satellite (active), space research (active), fixed, mobile and aeronautical radionavigation services in the 1 215-1 260 MHz band; from the aeronautical radionavigation and fixed services in the 1 559-1 610 MHz band; and also their sensitivity to intra-service interference between radionavigation-satellite service systems in these two bands.

ITU-R has concluded that the addition of a space-to-space direction to the 1 215-1 260 MHz and 1 559-1 610 MHz RNSS bands will not cause any additional interference to other services since it involves no change to the space-to-Earth transmissions.

Studies demonstrate that RNSS spaceborne receivers can operate satisfactorily in the presence of interference caused by systems in other services as well as other RNSS systems. Potential interference from services in adjacent bands was also examined.

Existing coordination procedures are adequate for space-to-space operations and no additional protection will be required.

WRC-2000 agenda item 1.16 - to consider allocations of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 (WRC-97)

Proposal to modify the allocations above 71 GHz

Background information

The following proposals modify many of the allocation tables above 71 GHz to accommodate the requirements of the radio astronomy and Earth exploration-satellite (passive) services, while giving consideration to the needs of other services. The modifications to the allocation tables maintain the aggregate amount of spectrum allocated to the displaced services (including the fixed-satellite service), provide frequency blocks 5-9 GHz wide to accommodate future wideband multimedia systems while taking into account differences in atmospheric attenuation, and provide appropriate separation between services.

Resolutions XXX (WRC-2000) and YYY (WRC-2000) address the need for future study between co-allocated active services and between active and passive services at such a time when the technical characteristics of the active services become known.

MOD IAP/14/136

66-86 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
71-74	FIXED FIXED-SATELLITE ~~(Earth-to-space)~~(space-to-Earth) MOBILE MOBILE-SATELLITE ~~(Earth-to-space)~~(space-to-Earth) ~~S5.149 S5.556~~	

Reasons: MSS and FSS uplinks and downlinks in 71-74 GHz and 81-84 GHz bands have been interchanged to avoid satellite downlinks in bands needed by RAS. Atmospheric absorption is only slightly higher in the 71-74 GHz band than in the 81-84 GHz band. The RAS footnotes S5.149 and S5.556 have been deleted in favour of allocations above 76 GHz. The reference to the 72.77-72.91 GHz band in footnotes S5.149 and S5.556 has been deleted.

MOD IAP/14/137

66-86 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
74-75.5	FIXED FIXED-SATELLITE ~~(Earth-to-space)~~(space-to-Earth) MOBILE BROADCASTING-SATELLITE Space research (space-to-Earth) MOD S5.561

75.5-76	~~AMATEUR~~ ~~AMATEUR-SATELLITE~~ FIXED FIXED-SATELLITE (space-to-Earth) MOBILE BROADCASTING-SATELLITE Space research (space-to-Earth) MOD S5.561 ADD S5.EEE

Reasons: BSS, which is currently allocated to the 84-86 GHz band, has been relocated to this band to protect RAS above 76 GHz. Atmospheric absorption is only slightly higher in the 74-76 GHz band than in the 84-86 GHz band. Amateur and amateur-satellite allocations have been shifted to 80.5-81 GHz. The new footnote S5.EEE protects existing amateur and amateur-satellite operations in the 75.5-76 GHz band until the year 200[X]. The FSS (Earth-to-space) allocation has been moved to the 84-86 GHz band. The proposed allocations in the 74-84 GHz range preserve a contiguous 10 GHz space research downlink (secondary), which is required for space VLBI purposes. Footnote S5.561 has been modified to recognize the change in BSS allocation.

MOD IAP/14/139

MOD IAP/14/141

78-81	RADIO ASTRONOMY RADIOLOCATION Amateur Amateur-satellite Space research (space-to-Earth) S5.560 MOD S5.149	

Reasons: The existing 76-81 GHz band has been divided into three sub-bands. The addition of a radio astronomy allocation and RES RAS satisfies the requirements for radio astronomy spectral line and wideband continuum observations from remote locations worldwide in both the 76-77.5 GHz and 78-81 GHz bands. Radio astronomy is added as a secondary allocation in the 77.5-78 GHz band. Amateur and amateur-satellite services are shifted by 0.5 GHz, to accommodate BS, FSS and MSS downlinks at the lower portion of atmospheric window, and to avoid sharing with vehicular radars, which some administrations have authorized to operate in the 76-77 GHz band. There is no change in sharing between services, except for introduction of RAS allocation in the upper and lower sub-bands. These bands have been added to those listed under S5.149. Footnote S5.560 is deleted from the 76-77.5 and 77-78 GHz sub-bands, where it does not apply.

MOD IAP/14/142

66-86 GHz

Allocation to services

Reasons: The 105-116 GHz range has been divided into four sub-bands to make additional spectrum available for other services and to adjust other passive allocations to areas of the spectrum that are more appropriate to meet scientific needs. Passive sensors have no known use for, and do not need the band 105-109.5 GHz, so they have been deleted. Fixed and mobile services have been added, relocated from the 116-122.5 GHz band, where deletion of these services is needed to protect essential passive sensor operations. Since this band is no longer passive in nature, footnote S5.340 should be deleted. This band is added to those included under S5.149, to reflect the need to protect radio astronomy in a band that is no longer passive. Footnote S5.CCC is added to limit space research (passive) allocation to space-based radio astronomy in this band.

MOD IAP/14/152

86-119.98 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
109.5-111.8	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340 S5.341	

Reasons: It is essential to maintain this passive band. The MOD refers to the band limits only; no change (NOC) is proposed to the allocations within this sub-band. This band contains an ozone line at 110.8 GHz, which is used for microwave limb sounding. The entire band is of vital importance to radio astronomy for observations of the CO lines at 109.8 and 110.2 GHz, and continuum observations.

MOD IAP/14/153

86-119.98 GHz

Allocation to services

120.02-~~126~~122.25	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ INTER-SATELLITE ADD S5.XXX ~~MOBILE S5.558~~ SPACE RESEARCH (passive) S5.138

Reasons: This band is of crucial importance for passive sensing, as it is comprised of the majority of the necessary 114.25-122.25 GHz band, the oxygen absorption band, with its peak at 118.75 GHz. The fixed and mobile services have been moved down to 105-109.5 GHz and 111.8-114.25 GHz, as sharing with passive sensors would severely restrict these services in this portion of the spectrum. The inter-satellite service needs to be limited by footnote S5.XXX to links between GSO satellites only, with pfd limits as specified in sharing studies in order to share the band 116-122.25 GHz with passive sensors. The secondary allocation to amateur services in the band 119.98-120.02 GHz is also moved to the 122.5-123 GHz band to avoid interference to passive sensors.

MOD IAP/14/170

151-~~156~~151.5	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ ~~FIXED-SATELLITE (space-to-Earth)~~ ~~MOBILE~~ RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340	

Reasons: The current passive allocation of 150-151 GHz has insufficient bandwidth for remote sensing observations and is not adequately protected from potential interference. The scientific requirement is for a 3 GHz band centred at 150 GHz for use in conjunction with water vapour observations around 183 GHz. Also, the 150.74 GHz nitrous oxide line is required for microwave limb sounding applications. All active services are relocated from this band to meet these requirements. Since the 148.5-151.5 GHz band is now purely passive, it is added to those listed under S5.340. For the same reason, there is no need to include the band 150-151 GHz in S5.149, and it is deleted from this footnote. Footnotes S5.385 (150-151 GHz band) and S5.555 (148.5-149 GHz band) are no longer needed and are deleted from these bands.

MOD IAP/14/171

Region 1	**Region 2**	**Region 3**
158-~~164~~158.5	EARTH EXPLORATION-SATELLITE (passive) ADD S5.AAA FIXED ~~FIXED-SATELLITE (space-to-Earth)~~ MOBILE RADIO ASTRONOMY SPACE RESEARCH (passive) ADD S5.CCC MOD S5.149 ADD S5.BBB	

Reasons: The scientific requirement is for a 3 GHz band centred at 157 GHz for use in conjunction with water vapour observations around 183 GHz. This allocation is only required until 2018 since current planned and operational instruments are already in this band. By 2018, all of these applications will have transitioned to the 148.5-151.5 GHz band. The FSS downlink allocation is incompatible with radio astronomy requirements and is relocated. The addition of a radio astronomy allocation and RES RAS satisfies the requirements for radio astronomy spectral line and wideband continuum observations from remote locations worldwide. These sub-bands are added to those listed under S5.149. EES operations in the band 155.5-158.5 GHz need to be protected until 1 January 2018. After this date the fixed and mobile services need to coordinate with radio astronomy sites only. The space research (passive) allocation is limited to space-based radio astronomy in this band.

Allocation to services		
Region 1	**Region 2**	**Region 3**
158.5-164	FIXED FIXED-SATELLITE (space-to-Earth) MOBILE MOBILE-SATELLITE (space-to-Earth)	

Reasons: Mobile-satellite allocation has been added to partially compensate for the loss of the 134-142 GHz band.

MOD IAP/14/176

158-202 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
164-~~168~~167	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340	

Reasons: Passive sensors require only this 3 GHz band from the current 164-168 GHz passive allocation. It is essential to maintain the 164-167 GHz portion of the band passive. The MOD refers to the band limits and addition of the band to footnote S5.340 only, no change (NOC) is proposed to the allocations within this sub-band. This band, along with the band 148.5-151.5 GHz will become the harmonized reference window for passive sensor observations of the 183.31 GHz water vapour line. The band is also used for microwave limb sounding of the 164.38 GHz ClO line. This passive band has been added to those listed under S5.340; the 164-168 GHz band had been omitted from S5.340.

MOD IAP/14/177

Reasons: Passive services do not need the 167-168 GHz band and this band is yielded to displaced active services. Fixed, mobile and inter-satellite services are added to the 167-174.8 GHz band as well as fixed-satellite downlinks to the 167-174.5 GHz band to compensate for deletions in other bands. Passive sensor allocations are deleted from the 174.5-174.8 GHz band to properly adjust the band edge for the 183.3 GHz remote sensing requirement. Footnotes S5.149 and S5.385 are deleted from these bands and are appropriately modified. Footnote S5.558 is added next to mobile allocations in this band and the footnote is modified to include the 167-174.8 GHz band due to sharing with the inter-satellite service.

MOD IAP/14/181

MOD IAP/14/184

185-190	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ INTER-SATELLITE ADD S5.YYY ~~MOBILE S5.558~~ SPACE RESEARCH (passive) ~~S5.149 S5.385~~	

MOD IAP/14/185

190-~~200~~191.8	EARTH EXPLORATION-SATELLITE (passive) ~~MOBILE S5.553~~ ~~MOBILE-SATELLITE~~ ~~RADIONAVIGATION~~ ~~RADIONAVIGATION-SATELLITE~~ ~~S5.341 S5.554~~MOD S5.340

Reasons: The band 174.8-191.8 GHz is of crucial importance for passive sensing of the water vapour absorption line whose peak is at 183.31 GHz. Sharing with fixed and mobile services is not practical, so these services are relocated. The inter-satellite service needs to be limited to links between GSO satellites and to a pfd limit as specified in sharing studies. Footnote S5.YYY is added to reflect this requirement. The entire band is deleted from those listed under S5.149, S5.385 (secondary radio astronomy allocation). All applicable footnotes are appropriately modified. Since no terrestrial radio astronomy use of the band 182-185 GHz is possible due to high atmospheric absorption, the radio astronomy allocation is deleted. Active services are moved from the 190-191.8 GHz band to make room for the addition of passive sensor allocations. Footnote S5.554 is deleted from this band, to reflect removal of active services, and modified to reflect this change. S5.341 does not apply to this band and is deleted. Footnote S5.340 has been modified to include this band.

MOD IAP/14/186

MOD IAP/14/192

231-~~235~~231.5	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ ~~FIXED-SATELLITE (space-to-Earth)~~ ~~MOBILE~~ RADIO ASTRONOMY SPACE RESEARCH (passive) ~~Radiolocation~~ MOD S5.340	

Reasons: It is essential to maintain the 226-231.5 GHz band passive. The MOD refers to the band limits only; no change (NOC) is proposed to the allocations within this sub-band. Passive sensors require exclusive use of only the 226-231.5 GHz portion of the 217-231 GHz band for microwave limb sounding of atmospheric constituents. In addition, this band contains a 4 GHz reference window for higher frequency water vapour measurements. This band is of vital importance to the radio astronomy service for observations of the 230.5 GHz CO line. Footnote S5.340 is modified to take into account that the 217-226 GHz band is no longer passive, while adding the 231-231.5 GHz band. The fixed and mobile services, as well as the fixed-satellite downlinks, have been deleted from the 231-231.5 GHz portion to allow passive observations in this band.

MOD IAP/14/193

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
231.5-235	FIXED FIXED-SATELLITE (space-to-Earth) MOBILE Radiolocation	

Reasons: The only required change in this band is the 500 MHz upward adjustment of the lower band edge (see the previous modification).

MOD IAP/14/194

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
235-238	EARTH EXPLORATION-SATELLITE (passive) FIXED ~~FIXED-SATELLITE (space-to-Earth)~~ MOBILE RADIO ASTRONOMY SPACE RESEARCH (passive)	

Reasons: Passive sensors are limited to microwave limb sounding in the band 235-238 GHz and can share with terrestrial services due to the absorption characteristics of this band. The fixed-satellite downlink is not compatible with the radio astronomy requirement for this band and is reallocated elsewhere. The addition of a radio astronomy allocation and RES RAS satisfies the requirements for radio astronomy spectral line and wideband continuum observations from remote locations worldwide.

MOD IAP/14/195

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
238-241	FIXED FIXED-SATELLITE (space-to-Earth) MOBILE RADIOLOCATION RADIONAVIGATION RADIONAVIGATION-SATELLITE ~~Radiolocation~~	

Reasons: Additional allocations to the radiolocation, radionavigation and radionavigation-satellite services, to compensate for allocation changes in the 150-160 GHz frequency range.

MOD IAP/14/196

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
241-248	RADIOLOCATION RADIO ASTRONOMY Amateur Amateur-satellite S5.138 MOD S5.149	

Reasons: The addition of a radio astronomy allocation and RES RAS satisfies the requirements for radio astronomy spectral line and wideband continuum observations from remote locations worldwide. This band is added to those listed under footnote S5.149. There is no change in sharing between existing services, except for the introduction of the radio astronomy service allocation in band.

MOD IAP/14/197

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
248-250	AMATEUR AMATEUR-SATELLITE Radio astronomy	

Reasons: The radio astronomy service allocation is added on a secondary basis.

MOD IAP/14/198

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
250-252	EARTH EXPLORATION-SATELLITE (passive) SPACE RESEARCH (passive) RADIO ASTRONOMY ~~S5.149 S5.555~~MOD S5.340	

Reasons: Microwave limb sounding of nitrous oxide near 251 GHz defines the passive-sensing requirement for this band. Radio astronomy is added to the other passive services. The addition of another passive service does not alter sharing scenario. Footnotes S5.149 and S5.555 are consequentially deleted and band lists in these footnotes are appropriately modified. Footnote S5.340 is added to reflect the passive nature of the band.

MOD IAP/14/199

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
252-265	FIXED MOBILE MOBILE-SATELLITE (Earth-to-space) RADIONAVIGATION RADIONAVIGATION-SATELLITE RADIO ASTRONOMY MOD S5.149 ~~S5.385~~ MOD S5.553 S5.554 ~~S5.555 S5.564~~	

Reasons: The fixed service is relocated to this band due to other allocation actions in other bands. The addition of a radio astronomy allocation, along with RES RAS, satisfies requirements for radio astronomy spectral line (current secondary allocation to radio astronomy at 257.5-258 GHz deleted) and wideband continuum observations from remote locations worldwide. The directional indicator added to mobile-satellite service allocation, which is paired with the allocation in the 190-200 GHz band. Atmospheric absorption in the 252-265 GHz band is relatively constant and somewhat higher than in the paired downlink band. This entire band is added to those listed under footnote S5.149, and the band is deleted from S5.385 and S5.555. Footnotes S5.385 and S5.555 have been modified to reflect the changes. Footnote S5.564 is no longer needed in this band due to the worldwide nature of the radio astronomy allocation.

MOD IAP/14/200

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
265-275	FIXED FIXED-SATELLITE (Earth-to-space) MOBILE RADIO ASTRONOMY MOD S5.149	

MOD IAP/14/201

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
275-~~400~~1 000	(Not allocated) MOD S5.565	

Reasons: The change of the upper limit for applicability of footnote MOD S5.565 is to account for various passive service needs above 275 GHz that have been identified by administrations. Many lines and windows required for radio astronomy observations and passive remote sensing of the Earth exist above 275 GHz.

MOD IAP/14/202

NOC IAP/14/204

S5.341 In the bands 1 400-1 727 MHz, 101-120 GHz and 197-220 GHz, passive research is being conducted by some countries in a programme for the search for intentional emissions of extraterrestrial origin.

Reasons: This informational footnote is still accurate.

MOD IAP/14/205

S5.385 *Additional allocation:* the band~~s~~ 1 718.8-1 722.2 MHz~~, 150-151 GHz, 174.42-175.02 GHz, 177-177.4 GHz, 178.2-178.6 GHz, 181-181.46 GHz, 186.2-186.6 GHz and 257.5-258 GHz are~~ is also allocated to the radio astronomy service on a secondary basis for spectral line observations.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD IAP/14/206

S5.553 In the bands 43.5-47 GHz, 66-71 GHz, 95-100 GHz, ~~134-142 GHz, 190~~191.8-200 GHz and 252-265 GHz, stations in the fixed and land mobile service may be operated subject to not causing harmful interference to the space radiocommunication services to which these bands are allocated (see No. **S5.43**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD IAP/14/207

S5.554 In the bands 43.5-47 GHz, 66-71 GHz, 95-100 GHz, ~~134-142~~126-134 GHz, 190-200 GHz and 252-265 GHz, satellite links connecting land stations at specified fixed points are also authorized when used in conjunction with the mobile-satellite service or the radionavigation-satellite service.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD IAP/14/208

S5.555 *Additional allocation:* the band~~s~~ 48.94-49.04 GHz~~, 97.88-98.08 GHz, 140.69-140.98 GHz, 144.68-144.98 GHz, 145.45-145.75 GHz, 146.82-147.12 GHz, 250-251 GHz and 262.24-262.76 GHz are~~ is also allocated to the radio astronomy service on a primary basis.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD IAP/14/209

S5.556 In the bands 51.4-54.25 GHz, 58.2-59 GHz~~,~~ and 64-65 GHz, ~~72.77-72.91 GHz and 93.07-93.27 GHz,~~ radio astronomy observations may be carried out under national arrangements.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD IAP/14/210

S5.558 In the bands 55.78-58.2 GHz, 59-64 GHz, 66-71 GHz, ~~116-134 GHz,~~125-126 GHz, ~~170-182~~167-174.8 GHz and 185-190 GHz, stations in the aeronautical mobile service may be operated subject to not causing harmful interference to the inter-satellite service (see No. **S5.43**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocation.

MOD IAP/14/211

S5.559 In the band~~s~~ 59-64 GHz ~~and 126-134 GHz,~~ airborne radars in the radiolocation service may be operated subject to not causing harmful interference to the inter-satellite service (see No. **S5.43**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocation. The radiolocation and inter-satellite services are no longer co-allocated in this spectral region.

NOC IAP/14/212

S5.560 In the band 78-79 GHz radars located on space stations may be operated on a primary basis in the Earth exploration-satellite service and in the space research service.

Reasons: No change is required to this footnote.

MOD IAP/14/213

S5.561 In the band ~~84-86~~74-76 GHz, stations in the fixed~~,~~ and mobile ~~and broadcasting~~ services shall not cause harmful interference to broadcasting-satellite stations operating in accordance with the decisions of the appropriate frequency assignment planning conference for the broadcasting-satellite service.

Reasons: The broadcasting-satellite allocation has been transferred to the 74-76 GHz band and the broadcasting and broadcasting-satellite services are no longer co-allocated.

NOC IAP/14/214

S5.562 The use of the band 94-94.1 GHz by the Earth exploration-satellite (active) and space research (active) services is limited to spaceborne cloud radars.

Reasons: This footnote was the result of allocation decisions made at WRC-97 and no change is needed.

SUP IAP/14/215

S5.564

Reasons: The radio astronomy allocation is now worldwide in the 261-265 GHz band, therefore a country footnote is no longer needed.

MOD IAP/14/216

S5.565 The frequency band 275-~~400~~1 000 GHz may be used by administrations for experimentation with, and development of, various active and passive services. In this band a need has been identified for the following spectral line measurements for passive services:

- radio astronomy service: ~~278-280 GHz and 343-348 GHz~~275-323 GHz, 327-371 GHz, 388-434 GHz, 426-442 GHz, 453-510 GHz, 623-711 GHz and 795-909 GHz;
- Earth exploration-satellite service (passive) and space research service (passive): 275-277 GHz, ~~300~~294-30~~2~~6 GHz, 3~~24~~16-3~~26~~34 GHz, 34~~5~~2-34~~7~~9 GHz, 363-365 GHz, ~~and~~ 37~~9~~1-38~~1~~9 GHz, 416-434 GHz, 442-444 GHz 496-506 GHz, 546-568 GHz, 624-629 GHz, 634-654 GHz, 659-661 GHz, 684-692 GHz, 730-732 GHz, 851-853 GHz and 951-956 GHz.

Future research in this largely unexplored spectral region may yield additional spectral lines and continuum bands of interest to the passive services. Administrations are urged to take all practicable steps to protect these passive services from harmful interference until the next competent world radiocommunication conference.

Reasons: These additional bands have been identified by various administrations as bands that will also be used for radio astronomy observations and spaceborne passive remote sensing.

ADD IAP/14/217

S5.AAA In the band 155.5-158.5 GHz, the allocation to the Earth exploration-satellite (passive) and space research (passive) services shall terminate on 1 January 2018.

Reasons: This allocation will not be needed by passive sensors after the termination date. By the termination date, all passive sensors will have transitioned to the 148.5-151.5 GHz band.

ADD IAP/14/218

S5.BBB The date of entry for the allocation to the fixed and mobile services in the band 155.5-158.5 GHz shall be 1 January 2018.

Reasons: Passive sensors require the use of this band until 1 January 2018.

ADD IAP/14/219

S5.CCC Use of this allocation is limited to space-based radio astronomy only.

Reasons: This band is a likely candidate for a future space-based radio astronomy mission. No other space research use is contemplated.

ADD IAP/14/220

S5.DDD The 81-81.5 GHz band is also allocated to the amateur and amateur-satellite services on a secondary basis.

Reasons: Amateur allocation.

ADD IAP/14/221

S5.EEE The band 75.5-76 GHz is also allocated to the amateur and amateur-satellite services on a primary basis until the year 200[6].

Reasons: Amateur allocation.

ADD IAP/14/222

S5.YYY Use of the band 174.5-182 GHz by the inter-satellite service is limited to satellites in the geostationary-satellite orbit. The single-entry power flux-density, at all altitudes from 0 km to 1 000 km above the Earth's surface and in the vicinity of all geostationary orbital positions occupied by passive sensors, produced by a station in the inter-satellite service, for all conditions and for all methods of modulation, shall not exceed –144 dBW/m^2/MHz for all angles of arrival.

Reasons: This footnote is required to protect passive sensors operating in this band.

ADD IAP/14/223

S5.XXX Use of the band 116-123 GHz by the inter-satellite service is limited to satellites in the geostationary-satellite orbit. The single-entry power flux-density, at all altitudes from 0 km to 1 000 km above the Earth's surface and in the vicinity of all geostationary orbital positions occupied by passive sensors, produced by a station in the inter-satellite service, for all conditions and for all methods of modulation, shall not exceed –148 dBW/m^2/MHz for all angles of arrival.

Reasons: This footnote is required to protect passive sensors operating in this band.

ADD IAP/14/224

RESOLUTION RAS (WRC-2000)

Use of the bands [ ] by the radio astronomy service

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that a large number of spectral lines of astrophysical interest above 71 GHz provide unique information about cosmic processes, such as the chemistry of the interstellar medium and the formation of stars and planets, and that this information cannot be obtained from any other source;

b) that Doppler shifted lines, which are also of great interest for astronomical studies, are found far removed from the rest frequency of some spectral lines and that highly Doppler shifted lines may offer the only means to obtain information about the very early Universe and the formation of galaxies;

c) that mm-wave radio astronomy receivers are designed to cover substantial portions of the atmospheric windows above 70 GHz to take advantage of the information contained in spectral lines, as well as in continuum radiation;

d) that several administrations operate mm-wave radio astronomy observatories and that some are building or are planning to build a limited number of large new facilities to exploit the most advanced technologies; and that these facilities are intended to serve the needs of the worldwide scientific community;

e) that mm-wave observatories must be located on high mountain tops or plateaus to take advantage of the driest possible atmospheric conditions necessary to obtain high-quality observations; and require substantial investments on behalf of the scientific communities concerned, and that therefore their number will remain low,

noting

that sharing between the radio astronomy service and other terrestrial services operating in bands above 71 GHz is facilitated by the natural attenuation provided by atmospheric gases, and that it can be further facilitated by adequate geographic separation,

urges

administrations to establish coordination zones around mm-wave radio astronomy sites operating in bands above 71 GHz. Coordination zone radii should be determined following the procedure outlined in Recommendation ITU-R RA.1031-1, separately for ground-based transmitters, airborne transmitters and transmitters that may be located on high altitude platforms (HAPS),

resolves

1 that in the frequency bands referred to in this Resolution, co-primary status of the radio astronomy service shall be recognized within coordination zones established by administrations. No coordination requirements should be imposed upon terrestrial services outside established coordination zones;

2 that in the bands referred to in this Resolution, co-primary services operating stations within a coordination zone should coordinate their operations with affected radio astronomy stations within five years of the date of notification of the radio astronomy site to the Radiocommunication Bureau.

Annex 1 lists the radio astronomy sites that operate, or plan to operate in the bands referred to in this Resolution as of [8 June 2000]. Observatories that operate only up to 92 GHz are identified with *** under the SITE column.

ADD IAP/14/225

Reasons: RES RAS sets out the details of the limitation on the radio astronomy service. Annex 1 lists the observatories that operate in the radio astronomy service in bands shared with terrestrial services above 71 GHz at the time of WRC-2000.

[8] The Nobeyama site includes a 45 m diameter telescope, an interferometer that consists of six antennas of 10 m diameter, and a 60 cm diameter submillimeter telescope.

ADD IAP/14/226

RESOLUTION XXX (WRC-2000)

Consideration by a future world radiocommunication conference of issues dealing with sharing between passive and active services above 71 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the changes made to the Table of Frequency Allocations by **WRC-2000** in bands above 71 GHz were based on the requirements known at the time of the Conference;

b) that the passive service spectrum requirements above 71 GHz are based on physical phenomenon and therefore are well known. These requirements are reflected in the changes made to the Table of Frequency Allocations by **WRC-2000**;

c) that several bands above 71 GHz are already used by EESS (passive) and SR (passive) because they are unique bands to measure specific atmospheric parameters;

d) that currently there is only limited knowledge of requirements and implementation plans for the active services to operate in bands above 71 GHz;

e) that in the past, technological developments have led to viable communication systems operating at increasingly higher frequencies and this can be expected to continue so as to make communication technology available in the future for the frequency bands above 71 GHz;

f) that in the future, there should be accommodation of alternative spectrum needs of the active and passive services when the new technologies become available;

g) that, following the revisions to the Table of Frequency Allocations by **WRC-2000**, sharing studies may be required for services in some bands above 71 GHz;

h) that interference criteria for passive sensors have been developed and are given in Recommendation ITU-R SA.1029-1;

i) that sharing criteria for active and passive services in bands above 71 GHz have not yet fully developed within ITU-R;

j) that, in order to ensure the protection of passive services above 71 GHz, **WRC-2000** avoided co-allocations of active and passive services to prevent potential sharing problems,

recognizing

that to the extent practicable, the burden of sharing among active and passive services should be equitably distributed amongst the allocated services,

invites ITU-R

1 to continue its studies to determine if sharing is possible between active and passive services in the bands above 71 GHz;

2 to take into account the principles of burden sharing to the extent practicable in their studies;

3 to complete the necessary studies, as soon as the technical characteristics of the active services in these bands are known;

4 to develop Recommendations specifying sharing criteria for those bands where sharing is feasible,

resolves

that a future competent conference should consider the results of ITU-R studies with a view to revise as appropriate the Radio Regulations in order to accommodate the emerging requirements of the active services taking into account the requirements of the passive services, in bands above 71 GHz,

instructs the Secretary-General

to bring this Resolution to the attention of the international and regional organizations concerned.

ADD IAP/14/227

RESOLUTION YYY (WRC-2000)

Consideration by a future competent world radiocommunication conference of issues dealing with sharing between active services above 71 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that **WRC-2000** made changes to the Table of Frequency Allocations above 71 GHz, following consideration of science service issues;

b) that there are several co-primary active services in some bands above 71 GHz in the Table of Frequency Allocations as revised by **WRC-2000**;

c) that there is limited knowledge of characteristics of active services that may be developed to operate in bands above 71 GHz;

d) that sharing criteria for sharing between active services in bands above 71 GHz have not yet been fully developed within ITU-R;

e) that sharing between multiple co-primary active services may hinder the development of each active service in bands above 71 GHz;

f) that the technology for some active services may be commercially available earlier than for some other active services;

g) that adequate spectrum should be available for the active services for which the technology is available at a later time,

noting

that sharing criteria need to be developed, to be used by a future conference, for determining to what extent sharing between multiple co-primary active services is possible in each of the bands,

resolves

1 that appropriate measures should be taken to fulfil the spectrum requirements for active services for which the technology is commercially available at a later time;

2 that sharing criteria be developed for co-primary active services in bands above 71 GHz;

3 that the sharing criteria developed should form a basis for a review of active service allocations above 71 GHz at a future conference, if necessary,

requests ITU-R

to complete the necessary studies with a view to presenting, at the appropriate time, the technical information likely to be required as a basis for the work of a future competent conference,

instructs the Secretary-General

to bring this Resolution to the attention of the international and regional organizations concerned.

Reasons: There is no consensus whether sharing between the passive services and the active services is feasible in many of the bands above 71 GHz. This is because there is a lack of information available on these active services in this frequency range. New Resolution XXX (WRC-2000) has been added which calls for ITU-R studies on sharing between active and passive services in bands above 71 GHz. Similarly, sharing conditions between many of the relocated active services above 71 GHz are not known and need to be developed and Resolution YYY (WRC-2000) calls for studies that can develop sharing criteria and should form a basis for a review of active service allocations above 71 GHz at a future conference, if necessary.

ADD IAP/14/228

S4.XXX Regarding frequency bands above 71 GHz, administrations should consider Resolutions **XXX (WRC-2000)** and **YYY (WRC-2000)** in the development of domestic policies and regulation which would open specific bands for use by an allocated radio service. Administrations should note the possibility of changes to Article **S5** to accommodate emerging requirements of active services, as indicated in Resolutions **XXX (WRC-2000)** and **YYY (WRC-2000)**.

Reasons: Article S4 provides guidance to administrations on the assignments and use of frequencies given in the Table of Frequency Allocations in Article S5. Additional footnote S4.XXX will draw the attention of administrations to Resolutions XXX (WRC-2000) and YYY (WRC-2000) regarding frequency allocations above 71 GHz.

WRC-2000 agenda item 1.19 - to consider the report of the inter-conference representative group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

Ensuring the protection of other radiocommunication services and Region 2 BSS against interference from any revisions to the Regions 1 and 3 Plan, and not requiring these services to provide greater protection to Regions 1 and 3 BSS than at present

Background information

WRC-97 updated the Regions 1 and 3 BSS and feeder-link Plans, including the relevant technical criteria, and provided assignments for all new countries. However, there was general dissatisfaction with the number of channels assigned (five for Region 1 and four for Region 3). The new replanning is intended to provide for each Region 1 and 3 country an amount of spectrum that permits the economical development of BSS systems.

To prepare for this, WRC-97 adopted Resolution 532 which created the IRG (Inter-conference Representative Group) and the associated GTE (Group of Technical Experts). The same Resolution specified in Annex 1 the principles that will govern the studies of the IRG and GTE. The IRG and GTE studied the feasibility of increasing to around ten the number of 27-MHz channels per country provided in the WRC-97 Plan for Regions 1 and 3. Under agenda item 1.19 as originally adopted at WRC-97, WRC-99 (now WRC-2000) would then use the results of the IRG/GTE studies to decide whether or not a subsequent WRC should revise the WRC-97 Plan.

However, the 1998 meeting of ITU Council amended agenda item 1.19 to its present form. The goal of ”around ten channels” was replaced by “an amount of spectrum that permits the development of an economical BSS system.” And the purpose of the IRG/GTE studies was changed from determining the feasibility of the goal, to providing the basis for a subsequent conference to construct a new plan. Nonetheless, the IRG/GTE planning studies are still constrained to observe the eight “principles” set forth in Annex 1 to Resolution 532, including those intended to ensure compatibility with other services and to preserve the integrity of the Region 2 Plan.

These guiding principles (see Annex 1 to Resolution 532) include the following:

“7 Ensure that the integrity of the Region 2 Plan and its associated provisions is preserved, by providing the same protection to the assignments contained in those Plans as is now received under the relevant provisions of the Radio Regulations, and by not requiring more protection from assignments in the Region 2 Plan than that currently provided under the Radio Regulations.

8 Ensure compatibility between the BSS in Regions 1 and 3 and services having allocations in the planned bands in all three Regions.”

At the final IRG meeting a report was prepared on the results of the technical, planning feasibility and regulatory studies. This report will be submitted by the Director, BR, to WRC-2000.

IAP/14/229

CITEL supports the objective of increasing the capacity assigned to each country of Regions 1 and 3 sufficiently to permit the economic development of BSS systems (to around ten channels). Any replanning studies, or actual replanning, must protect FSS, terrestrial services and Region 2 BSS in accordance with Principles 7 and 8 of Resolution 532 (WRC-97), Annex 1. Further, FSS, terrestrial services and Region 2 BSS must not be required to provide greater protection to the Regions 1 and 3 Plan than at present. This leads to the following:

a) Assignments in the Region 2 BSS Plan (including Article 4 modifications) shall be protected to the level received under the current provisions of the Radio Regulations. Also, such assignments shall not be required to provide more protection than is provided under the current provisions.

b) FSS and terrestrial systems, for which appropriate coordination procedures have been initiated, should be protected from revisions to the Regions 1 and 3 Plans to the level received under the current provisions of the Radio Regulations. Also such systems should not be required to provide more protection than is provided under the current provisions.

c) As part of this protection, the preservation of the orbital arc 37WL to 10EL, as delineated in Annex 7 of Appendix S30, and ensuring Region 2 FSS access to it, is essential (see separate IAP on this subject for details).

d) *concerning a)* and *b),* BR must determine which FSS, terrestrial and Region 2 BSS systems are affected by revisions of the Regions 1 and 3 Plans. For any such assignments in the Regions 1 and 3 Plans, a note in the revised Plan should specify that before implementation, the agreement of the affected administration must be secured. Similarly for any Regions 1 and 3 assignment in the revised Plan that might be potentially affected by an FSS, terrestrial or Region 2 BSS system, a note should be added to the Regions 1 and 3 Plan assignment specifying that it cannot seek protection from the potentially “affecting” system.

Reasons: Any revision of the Regions 1 and 3 Plans, or replanning studies, must protect other services and Region 2 BSS in accordance with the current criteria of Appendices S30 and S30A, and must not introduce additional constraints upon those services, in accordance with Principles 7 and 8 of Annex 1 to Resolution 532 (WRC-97). Systems that have initiated the coordination procedure should be protected by any revisions of the Regions 1 and 3 Plans. Similarly, in the other direction, systems that have initiated the coordination procedure should not have to protect new assignments in the Regions 1 and 3 Plans. As envisioned by Principles 7 and 8 of Resolution 532, these other services that are currently undergoing coordination under the Radio Regulations should not be subject to new, retroactive requirements.

WRC-2000 agenda item 1.19*bis* - in accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board's Rules of Procedure relating to the application of RR 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference

Background information

No. S23.13 (RR 2674) states that, "in devising the characteristics of a space station in the broadcasting-satellite service, all technical means available shall be used to reduce, to the maximum, the radiation over the territory of other countries unless an agreement has been previously reached with such countries." No. S23.13 (RR 2674) was adopted at WARC-71. It was intended as a statement of good engineering practice to reduce BSS interference with the terrestrial services outside of the intended service area.

At WRC-95, however, some countries sought to have the interpretation of No. S23.13 (RR 2674) revised to require, as a condition for registration, the approval of other countries within the service area of a BSS system proposed as a plan modification. After thorough debate, WRC-95 instructed the RRB to revise its Rules of Procedures to reflect the results of its debate. The decision reached by WRC-95 reflected a difficult compromise on the parts of all parties involved. The RRB made the revisions, but further concerns were raised at WRC-97. These concerns led WRC-97 to adopt Resolution 536 which resolves that: "in addition to observing No. S23.13/2674, and before providing satellite broadcasting services to other administrations, administrations originating the services should obtain the agreement of those other administrations."

Still dissatisfied after a review of the RRB Rules for RR S23.13 under the "review of finding" procedures of Article S14, the concerned countries persuaded the 1998 meeting of ITU Council to adopt new agenda item 1.19*bis*.

IAP/14/230

Therefore, CITEL is of the view that there is no need to repeat the work and discussion of WRC-95 and WRC-97, and that Resolution 536 (WRC-97) and RR S23.13 are sufficient. CITEL proposes that WRC-2000 not revise the present Rule of Procedure for RR S23.13/2674 to apply it retroactively, i.e. to BSS filings (under Article 4 of Appendix S30 or under Resolution 33 (Rev.WRC-97) or under Article S9) made prior to 18 November 1995. CITEL also supports the existing separation of Article 4 of Appendix S30 and the Rule of Procedure for RR S23.13/2674.

Reasons: Agenda item 1.19*bis* has the effect of reopening an issue that was resolved after much discussion first at WRC-95, and then at WRC-97 by the adoption of Resolution 536.

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

pfd limits in Annex 1 to Appendix S30 (Sections 5 *b)* and 5 *c)*)

Background information

Annex 1 to Appendix S30 of the Radio Regulations specifies limits for determining whether a service is affected by a proposed modification to the BSS Plan (i.e. when it is necessary to seek the agreement of any other administration). Section 5 of Annex 1 specifies limits to the change in the pfd to protect the terrestrial services of administrations in Regions 1 and 3 from modifications to the Region 2 Plan. In particular, Section 5 *c)* specifies the pfd limits for administrations in Region 1 east of longitude 30° E. Further, through Section 8 *a)*, the pfd limits in Section 5 *b)* of Annex 1 apply to protect terrestrial services in Regions 1 and 3 from modifications to the Regions 1 and 3 BSS Plan.

This pfd limit is very stringent at low angles of elevation. For example, in order to meet this pfd limit the BSS spacecraft power must be significantly lower in remote areas of a Region as compared to other areas in the centre of the Region. As a result, the provision of BSS service to these areas requires larger BSS receive dishes, in some cases as large as 2.4 m.

A relaxation in the pfd limit in Section 5 *c)* of Annex 1 of Appendix S30, as proposed below, would allow the use of 60 cm BSS receive dishes in these areas for BSS service. ITU-R studied possible modifications to the limits in Sections 5 *b)* and 5 *c)* of Annex 1. Section 5.2.3.5 of the CPM Report contains a proposed change to these limits. Consistent with the CPM Report, the following changes to Section 5 of Annex 1 of Appendix S30 are proposed. As a result of these modifications to Sections 5 *b)* and 5 *c)*, Table 3 of Article 10 of Appendix S30 should be reviewed and revised appropriately.

MOD IAP/14/231

APPENDIX S30

ANNEX 1

5 Limits to the change in the power flux-density to protect the terrestrial services of administrations in Regions 1 and 3[16]

With respect to § 4.3.3.4 of Article 4, an administration in Region 1 or 3 shall be considered as being affected if the proposed modification to the Region 2 Plan would result in the following power flux-density limits being exceeded:

a) in the frequency band 12.2-12.7 GHz for all the territories of administrations in Regions 1[17] and 3 and for any arrival angle γ:

–125 dB(W/m^2/4 kHz) for broadcasting-satellite space stations using circular polarization;

[16] See § 3.18 of Annex 5.

[17] In the band 12.5-12.7 GHz in Region 1, these limits are applicable only to the territory of administrations mentioned in Nos. **S5.494** and **S5.496**.

–128 dB(W/m^2/4 kHz) for broadcasting-satellite space stations using linear polarization;

b) in the frequency band 12.2-12.~~5~~7 GHz for territories of administrations in Regions 1[17] and 3 ~~and those in the western part of Region 1, west of longitude 30° E~~[18]:

–148~~132~~ dB(W/m^2/~~5 M~~4 kHz) for $0° \le \gamma < $ ~~10~~5°;

–~~132~~148 + 0.5~~4.2~~ (γ – ~~10~~5) dB(W/m^2/~~5 M~~4 kHz) for ~~10~~5° $\le \gamma <$ ~~15~~25°;

–138~~111~~ dB(W/m^2/~~5 M~~4 kHz) for ~~15~~25° $\le \gamma < 90°$;

~~*c)* in the frequency band 12.2-12.7 GHz for territories of administrations in Region 1[17], east of longitude 30° E:~~

~~–134 dB(W/m^2/5 MHz) for $\gamma = 0°$;~~

~~–134 + 4.6975 γ^2 dB(W/m^2/5 MHz) for $0° < \gamma \le 0.8°$;~~

~~–128.5 + 25 log γ dB(W/m^2/5 MHz) for $\gamma > 0.8°$;~~

~~d~~c) in the frequency band 12.5-12.7 GHz for all the territories of administrations of Regions 1[17] and 3:

–148 dB(W/m^2/4 kHz) for $\gamma = 0°$;

–148 + 4.6975 γ^2 dB(W/m^2/4 kHz) for $0° < \gamma \le 0.8°$;

–142.5 + 25 log γ dB(W/m^2/4 kHz) for $\gamma > 0.8°$;

where γ is the angle of arrival of the incident wave above the horizontal plane, in degrees.

Reasons: The proposed modification to the pfd limit in Section 5 *c)* of Annex 1 of Appendix S30 would allow the use of much smaller BSS receive earth station antennas, for instance, on the order 60 cm diameter, in these areas for BSS service. This proposal is consistent with the CPM Report.

---

[17] In the band 12.5-12.7 GHz in Region 1, these limits are applicable only to the territory of administrations mentioned in Nos. **S5.494** and **S5.496**.

[18] See Resolution **34**.

WRC-2000 agenda item 2 - to examine the revised ITU-R Recommendations incorporated by reference in the Radio Regulations in accordance with Resolution 28 (WRC-95); and decide whether or not to update the corresponding references in the Radio Regulations, in accordance with principles contained in the Annex to Resolution 27 (Rev.WRC-97)

Proposals to modify Resolution 27 (Rev.WRC-97) and Resolution 28 (WRC-95)

Background information

Certain provisions of the Radio Regulations make specific reference to ITU-R Recommendations. As the ITU-R Recommendations are updated, it is necessary to determine if such references should be continued, suppressed, or updated citing the revised version of the applicable ITU-R Recommendation.

Although the principle of Incorporation by Reference is widely supported by ITU members, its implementation in practice leads to various difficulties. It is important that administrations are aware of which Recommendations could be candidates for incorporation by reference into the Radio Regulations. Also, administrations need to know of any ITU-R Recommendation currently incorporated by reference, which are being (or have been) revised during the current study period. Administrations would benefit greatly by being advised of such recommendations well in advance of a WRC. Therefore, a mechanism for the early identification should be established.

In order to allow administrations as much time as possible to consult their experts and to consider the implications of updating references in the Radio Regulations, to reflect changes to Recommendations which are currently incorporated by reference, the approach outlined in 1) below is proposed. Similarly, to facilitate the work of administrations in their preparation for the possible introduction of new instances where Recommendations may be incorporated by reference into the Radio Regulations, the approach outlined in 2) below is proposed.

1) Rather than have only the Radiocommunication Assembly (RA) communicate to the WRC a list of the ITU-R Recommendations currently incorporated by reference in the Radio Regulations which have been revised and approved during the elapsed study period, the Director of the Radiocommunication Bureau should provide a report to the Conference Preparatory Meeting. This report would also include a listing of those ITU-R Recommendations currently incorporated by reference which are being revised in preparation for the Radiocommunication Assembly. This report would be for information only and would not confer any special status on the Recommendations listed.

2) If a Recommendation is not currently incorporated by reference into the Radio Regulations, it could only be considered for incorporation by reference if it is in response to a WRC agenda item.

MOD IAP/14/232

RESOLUTION 27 (Rev.WRC-~~97~~2000)

References to ITU-R and ITU-T Recommendations in the Radio Regulations

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that the principles of incorporation by reference were adopted by the WRC-95 and have been revised by this Conference (see Annex 1 to this Resolution);

b) that there are provisions of the Radio Regulations which employ mandatory incorporation by reference but fail to make explicit reference to the ITU-R or ITU-T Recommendations incorporated;

c) that the 199~~7~~9 Conference Preparatory Meeting (CPM-~~97~~99) for this Conference urged administrations to give further consideration to the status of material incorporated by reference:

– using the initial assessment provided by the Radiocommunication Bureau in the CPM-99 Report and the set of principles given in Annex 1 to this Resolution;

– noting that mandatory references shall be explicit and use the appropriate regulatory language;

– taking into account the factors set out in Annex 2 to this Resolution;

d) that the Director of the Radiocommunication Bureau has drawn up a list (see Annex 1 to the CPM-99 Report to this Conference) of the provisions of the Radio Regulations using incorporation by reference, which provides an initial assessment of the status of each reference and forms the basis for the work on appropriate referencing, examples of which are contained in Annex 3 to this Resolution;

e) that the Bureau has drawn up a list, contained in Annex 4 to this Resolution, of the ITU-R Recommendations to which explicit reference is made in the Radio Regulations,

resolves

that ITU-R and ITU-T Recommendations incorporated or proposed for incorporation by reference in the provisions of the Radio Regulations be identified and examined at WRC-~~99~~[03], with a view to establishing the correct method of reference in accordance with the principles set out in Annex 1 to this Resolution and taking into account the factors listed in Annex 2 to this Resolution, in order to complete the simplification of the Radio Regulations in respect of incorporation by reference,

further resolves

that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference,

instructs the Director of the Radiocommunication Bureau

to arrange for a review of the provisions of the Radio Regulations containing references to ITU-R or ITU-T Recommendations and propose suitable recommendations to the CPM-~~99~~[02] for inclusion in its Report to WRC-~~99~~[03], using the list of provisions contained in Annex 3 to this Resolution together with the guidance contained in Annexes 1 and 2 to this Resolution, and taking into account the list of ITU-R Recommendations contained in Annex 4 to this Resolution,

urges administrations

to use the CPM Report to WRC-~~99~~[03] in order to prepare their proposals on incorporation by reference to that Conference.

ANNEX 1 TO RESOLUTION 27 (Rev.WRC-~~97~~2000)

Principles of incorporation by reference

1 Where references are non-mandatory, it is not necessary to establish specific conditions in applying the texts quoted. In such cases, reference could, for example, be made to "the latest version" of a Recommendation.

2 Mandatory references to Resolutions or Recommendations of a world radiocommunication conference (WRC) are acceptable without restriction, since such texts will have been agreed by a WRC.

3 Where mandatory references are suggested, and the relevant texts are brief, the referenced material should be incorporated in the body of the Radio Regulations.

4 If, on a case-by-case basis, it is decided to incorporate material by reference on a mandatory basis, then the following provisions shall apply:

4.1 the referenced text shall have the same treaty status as the Radio Regulations themselves;

4.2 the reference must be explicit, specifying the specific part of the text (if appropriate) and the version or issue number;

4.3 the referenced text must be adopted by the Plenary of a competent WRC, but should not be part of the Final Acts;

4.4 all texts incorporated by reference must be readily available, by being published in a separate volume;

4.5 if, between WRCs, a referenced text (e.g. an ITU-R Recommendation) is updated, the reference in the Radio Regulations shall continue to apply to the original version until such time as a competent WRC agrees to incorporate the new version of the reference. The mechanism for considering such a step is given in Resolution **28 (Rev.WRC-~~95~~2000)**.

ANNEX 2 TO RESOLUTION 27 (Rev.WRC-~~97~~2000)

Factors to be considered for the further application of incorporation by reference

In reviewing the provisions of the Radio Regulations employing references to other texts, administrations and study groups should address the following factors:

1 whether each reference is of mandatory~~, i.e. incorporated by reference,~~ or non-mandatory character;

2 whether in existing non-mandatory references, or mandatory references which are determined to be of non-mandatory character, appropriate linking language is used, e.g. the words “should” or “may”;

3 whether in existing mandatory references, or other types of reference which are determined to be of mandatory character, clear mandatory linking language is used, e.g. the word “shall”;

4 whether the incorporated ITU-R or ITU-T Recommendation(s) are explicitly identified;

5 where referenced ITU-R or ITU-T Recommendations are not explicitly identified, determine which ones should be identified;

6 whether text incorporated from ITU-R or ITU-T Recommendations should be placed directly in the Radio Regulations instead of using incorporation by reference;

7 if the ITU-R or ITU-T Recommendation to be incorporated is, as a whole, unsuitable as treaty status text, whether to limit the reference to those portions of the ITU-R or ITU-T Recommendation which are of a suitable nature or to place the mandatory portion directly in the Radio Regulations.

Reasons: To clarify that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference. Also, minor consequential editorial changes have also been identified.

MOD IAP/14/233

RESOLUTION 28 (Rev.WRC-~~95~~2000)

Revision of references to ITU-R Recommendations incorporated by reference in the Radio Regulations

The World Radiocommunication Conference (~~Geneva, 1995~~Istanbul, 2000),

considering

a) that the Voluntary Group of Experts on simplification of the Radio Regulations (VGE) proposed the transfer of certain texts of the Radio Regulations to other documents, especially to ITU-R Recommendations, using the incorporation by reference procedure;

b) that, in some cases, the provisions of the Radio Regulations imply an obligation on Member States ‡ to conform to the criteria or specifications incorporated by reference;

c) that references to incorporated texts shall be explicit and shall refer to a precisely identified provision;

d) that, taking into account the rapid evolution of technology, ITU-R may revise the Recommendations incorporated by reference at short intervals;

e) that revised and approved Recommendations will not have the same legal force as the initial Recommendations, incorporated by reference until a competent world radiocommunication conference has so decided;

f) that it would be desirable to ensure, in the cases provided for in the Radio Regulations, that the provisions reflect the most recent technical developments,

noting

that Member States would benefit greatly from being advised, as early as possible, of which Recommendations have been revised and approved during the study period,

resolves

1 that each Radiocommunication Assembly shall communicate to the following world radiocommunication conference a list of the ITU-R Recommendations incorporated by reference in the Radio Regulations which have been revised and approved during the elapsed study period;

2 that, on this basis, the WRC shall examine those revised Recommendations, and decide whether or not to update the corresponding references in the Radio Regulations;

3 that, if the WRC decides not to update the corresponding references, ITU-R shall continue publishing the ITU-R Recommendations currently referenced in the Radio Regulations;

4 that WRCs shall place the examination of Recommendations in conformity with *resolves* 1 and *resolves* 2 of this Resolution on the agenda of future WRCs,

further resolves

5 to instruct the Director of the Radiocommunication Bureau to report to the CPM immediately preceding the WRC those ITU-R Recommendations already incorporated by reference in the Radio Regulations which have been revised and approved since the previous WRC, or which may be revised in time for the Radiocommunication Assembly;

6 that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference,

urges administrations

to participate actively in the work of the Radiocommunication Study Groups and the Radiocommunication Assembly in the revision of those Recommendations to which mandatory references are made in the Radio Regulations.

Reasons: To establish a procedure to advise administrations, well in advance of a WRC, of those ITU-R Recommendations already incorporated by reference in the Radio Regulations which have been revised and approved since the previous WRC, or which may be revised in time for the Radiocommunication Assembly. Also to clarify that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference. Minor consequential editorial changes have also been identified.

WRC-2000 agenda item 4 - in accordance with Resolution 95 (WRC-97), to review the Resolutions and Recommendations of previous conferences with a view to their possible revision, replacement or abrogation

Suppression of Resolution 63

Background information

A proposal for the suppression of Resolution 63, this Resolution is being suppressed because the work of Task Group 1/2 related to this Resolution has been completed.

SUP IAP/14/234

RESOLUTION 63

Relating to the protection of radiocommunication services against interference caused by radiation from industrial, scientific and medical (ISM) equipment[1]

Reasons: Task Group 1/2 completed its work related to Resolution 63.

Application of RR No. S5.488 - a procedural matter related to clarification of provision No. S5.488 (formerly No. 839) was brought to the attention of the CPM

Footnote S5.488

Background information

A procedural matter related to clarification of provision No. S5.488 (formerly No. 839) was brought to the attention of the CPM.

Former Radio Regulations provision RR839 included the requirement for agreement under Article 14 for FSS in the frequency band 11.7-12.2 GHz in Region 2. This provision was modified by WRC-95 to become S5.488. WRC-97 did not introduce any change to that provision.

The RRB revised the Rules of Procedure relating to S5.488 at its 13th meeting 6-14 July 1998, Geneva, which became effective as from 1 January 1999. This revision was based on the understanding that the new wording of S5.488, with no explicit reference to S9.21, means that there is no longer a need for the specific procedures of S9.21 to be applied to FSS networks in the band 11.7-12.2 GHz in Region 2. The use of the frequency band 11.7-12.2 GHz, for FSS GSO in Region 2, was subject to the application of Article 14 until 1 January 1999.

Since there are now no hard pfd limits applicable to geostationary FSS in this band, the revised Rule removes the only regulatory mechanism available to terrestrial services for their protection from GSO FSS service. It is worth mentioning that terrestrial services are protected from non-GSO FSS systems through provisional pfd levels contained in Resolution 131 (WRC-97), and in S21.16. All other intra- and inter-service relations in this band are not affected by the modified Rule since, for them, there are other regulatory mechanisms that apply.

In order to bridge the apparent regulatory gap, there is a need to establish an appropriate regulatory mechanism by which the terrestrial service sharing the same frequency band with the space service, on an equal basis, are to be adequately protected.

Considering that there is a need to ensure protection of the fixed service operating in the band 11.7-12.2 GHz, and that the simplest and safest way for this purpose is to adopt Approach 1, as described in section 7.6.3.1 of the CPM Report administrations propose to introduce in Article S21 hard pfd limits for geostationary fixed-satellite networks of Region 2 similar to those currently in Article S21 (S21.16) for non-GSO FSS systems operating in this frequency band. A consequential change of S5.488 is also proposed.

MOD IAP/14/235

S5.488 The use of the bands 11.7-12.2 GHz by geostationary-satellite networks in the fixed-satellite service in Region 2 and 12.2-12.7 GHz by the broadcasting-satellite service in Region 2 is limited to national and subregional systems. ~~The use of the band 11.7-12.2 GHz by the fixed-satellite service in Region 2 is subject to previous agreement between the administrations concerned and those having services, operating or planned to operate in accordance with the Table, which may be affected (see Articles **S9** and **S11**).~~ For the use of the band 12.2-12.7 GHz by the broadcasting-satellite service in Region 2, see Appendix **S30**.

Reasons: The hard limits proposed for inclusion in Article S21 ensure full protection of terrestrial services, hence there is no need for specific additional provisions.

MOD IAP/14/236

TABLE **S21-4** *(continued)*

Frequency band	Service*	Limit in dB(W/m²) for angle of arrival (δ) above the horizontal plane			Reference bandwidth
		0°-5°	5°-25°	25°-90°	
10.7-11.7 GHz	Fixed-satellite (space-to-Earth)	–150 [14]	$-150 + 0.5(\delta - 5)$ [14]	–140 [14]	4 kHz
11.7-12.2 GHz (Region 2)	Fixed-satellite (space-to-Earth) geostationary-satellite orbit	–148	$-148 + 0.5(\delta - 5)$	–138	4 kHz
11.7-12.5 GHz (Region 1) 11.7-12.2 GHz (Region 2) 11.7-12.2 GHz (Region 3) 12.2-12.7 GHz (Region 2)	Fixed-satellite (space-to-Earth), non-geostationary-satellite orbit	–148 [15]	$-148 + 0.5(\delta - 5)$ [15]	–138 [15]	4 kHz

WRC-2000 agenda item 1.11 - to consider constraints on existing allocations and to consider additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions 214 (Rev.WRC-97) and 219 (WRC-97)

Background information

A number of studies have been carried out since MSS allocations for non-GSO satellite systems were first agreed at WARC-92. These have led to ITU-R Recommendations which indicate the sharing techniques which are being used by those systems to share with each other and other co-primary services.

The table below (Non-GSO MSS sharing summary) from Recommendation ITU-R M.[YA] "Methods for achieving coordinated use of multiple non-GSO MSS systems below 1 GHz and sharing with other services in existing MSS allocations" summarizes the techniques and Recommendations applied to existing MSS allocations. Many of these techniques are being employed in practice successfully.

Non-GSO MSS sharing summary

	Narrow band	**Wideband**
Fixed and mobile (148-149.9 MHz) (455-456 MHz and 459-460 MHz in Region 2) (454-455 MHz by footnotes)	Combination: – Dynamic channel avoidance (Rec. ITU-R M.1039) – Low duty cycle – Brief message duration (Rec. ITU-R M.1185)	Combination: – Low output power density – Brief message duration – Low data rate – Filtering at satellite – Geographical separation
Fixed and mobile (137-138 MHz) (400.15-401 MHz)	Ground level pfd per RR **S5.208**	Ground level pfd per RR **S5.208**
Meteorological satellites (137-138 MHz) (400.15-401 MHz)	Assignment separation	Combination: – Low pfd at ground level – Cross polarization discrimination – Adaptive filter at satellite
Space operations Space research (137-138 MHz)	Channel avoidance	Combination: – Low pfd – Cross polarization discrimination
Space research (400.15-401 MHz)	Channel avoidance	Combination: – Low pfd – Cross polarization discrimination
Meteorological aids (400.15-401 MHz)	Channel avoidance	Combination: – Low pfd – Cross polarization discrimination

The constraints on existing allocations are reflected in the footnotes to the allocations, and in the Annex 1 to Appendix S5. These have evolved to their present form since WARC-92, and now reflect a balance with regard to sharing criteria among the primary services concerned.

These constraints have served to provide a basis for implementing non-GSO MSS systems in these bands and at the same time provide protection to other space and terrestrial services. Therefore in respect to the constraints of the MSS in existing allocations below 1 GHz, no further modifications are needed.

NOC IAP/14/237

S9.11A *e)* for a station for which the requirement to coordinate is included in a footnote of the Table of Frequency Allocations referring to this provision:

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

APPENDIX S5

ANNEX 1

1 Coordination thresholds for sharing between MSS (space-to-Earth) and terrestrial services in the same frequency bands and between non-GSO MSS feeder links (space-to-Earth) and terrestrial services in the same frequency bands

1.1 Below 1 GHz*

NOC IAP/14/238

1.1.1 In the bands 137-138 MHz and 400.15-401 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to terrestrial services (except aeronautical mobile (OR) service networks operated by the administrations listed in Nos. **S5.204** and **S5.206** as of 1 November 1996) is required only if the pfd produced by this space station exceeds –125 dB (W/m^2/4 kHz) at the Earth's surface.

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

NOC IAP/14/239

1.1.2 In the band 137-138 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to the aeronautical mobile (OR) service is required only if the pfd produced by this space station at the Earth's surface exceeds:

– –125 dB (W/m^2/4 kHz) for networks for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996;

– –140 dB (W/m^2/4 kHz) for networks for which complete Appendix **S4**/**3** coordination information has been received by the Bureau after 1 November 1996 for the administrations referred to in § 1.1.1 above.

* These provisions apply only to the MSS.

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

NOC IAP/14/240

1.1.3 In the band 137-138 MHz, coordination is also required for a space station on a replacement satellite of a MSS network for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996 and the pfd exceeds -125 dB(W/m^2/4 kHz) at the Earth's surface for the administrations referred to in § 1.1.1 above.

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

3.2 General considerations

NOC IAP/14/241

TABLE 1

Earth stations operating at frequencies below 1 GHz

Frequency sharing situation		**Coordination distance (in sharing situations involving services allocated with equal rights) (km)**
Frequency band and earth station for which coordination area is determined	**Other service or station**	
148-149.9 MHz ground-based (mobile)	Ground-based stations	As determined using Equation (1) and Fig. 1 of Recommendation ITU-R M.1185 In this case, the coordination distance is calculated by the administration of the terrestrial station using the parameters of its terrestrial stations and the most up-to-date relevant parameters published by the Bureau for the earth station.
149.9-150.05 MHz ground-based (mobile) 399.9-400.05 MHz ground-based (mobile)	Radionavigation-satellite service	The coordination distance is calculated by the administration of the MSS earth station using the parameters of its earth stations and the most up-to-date relevant parameters published by the Bureau for the radionavigation-satellite service earth station
400.15-401 MHz ground-based	Meteorological aids (radiosonde)	580

TABLE 1 (*end*)

Frequency sharing situation		**Coordination distance (in sharing situations involving services allocated with equal rights) (km)**
Frequency band and earth station for which coordination area is determined	**Other service or station**	
All bands below 1 GHz ground-based	Mobile (aircraft)	500
All bands below 1 GHz aircraft (mobile)	Ground-based stations	500
400.15-401 MHz aircraft (mobile)	Meteorological aids (radiosonde)	1 080
All bands below 1 GHz aircraft (mobile)	Mobile (aircraft)	1 000
454-456 MHz 459-460 MHz ground-based	Ground-based stations	500

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for use by non-GSO systems below 1 GHz, as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Modifications to Section II of Article S22 in relation to the sharing conditions among non-GSO FSS, FSS and GSO BSS services

Background information

Resolution 130 (WRC-97) and Resolution 538 (WRC-97) each requested ITU-R to conduct a) “appropriate technical, operational and regulatory studies” to review the regulatory conditions relating to the coexistence of non-GSO FSS and GSO FSS and GSO BSS systems, in order to ensure that undue constraints are not placed on the development of non-GSO FSS, GSO FSS and GSO BSS systems, and b) the development of a methodology for calculating the power levels produced by non-GSO FSS systems and the compliance of these levels with the applicable limits established pursuant to Resolutions 130 and 538. Joint Task Group 4-9-11 was established by ITU-R to pursue these mandates and to determine the necessary technical bases.

At (CPM99-2), a compromise was reached on a number of the key technical criteria that would provide adequate protection to GSO FSS and GSO BSS systems without unduly constraining non-GSO FSS systems. Many of the elements of this compromise are reflected in Chapter 3 of the CPM Report, and are reproduced in the following proposals. The CPM Report recognizes, however, that there are other essential elements of the compromise package which have yet to be developed. CITEL is making proposals to address these other essential elements. Taking into account the work of ITU-R and CPM-99 on this matter, the following is proposed:

ARTICLE S22

Space services[1]

Section II – Control of interference to geostationary-satellite systems

NOC IAP/14/242

S22.2

to

S22.5A

SUP IAP/14/243

S22.5B

MOD IAP/14/244

S22.5C § 5 1) The equivalent power flux-density[2], epfd$_{down}$ at any point on the Earth's surface visible from the geostationary-satellite orbit, produced by emissions from all the space stations of a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Tables ~~**S22-1**~~, **S22-1A** to **S22-1D**, including emissions from a reflecting satellite, for all conditions and for all methods of modulation, shall not exceed the limits given in Tables ~~**S22-1**~~**S22-1A** to **S22-1D**, for the given percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Tables ~~**S22-1**~~**S22-1A** to **S22-ID**, for all pointing directions towards the geostationary-satellite orbit.

MOD IAP/14/245

---

2 **S22.5C.1, D.1, F.1** The equivalent power flux-density is defined as the sum of the power flux-densities produced at a GSO receive station~~point~~ on the Earth's surface or in the geostationary orbit, as appropriate, by all the transmit~~space~~ stations within a non-geostationary-satellite system, taking into account the off-axis discrimination of a reference receiving antenna assumed to be pointing ~~towards the geostationary-satellite orbit~~in its nominal direction. The equivalent power flux-density is calculated using the following formula:

$$\cancel{epfd = 10 \cdot \log_{10}\left[\sum_{i=1}^{N_s} 10^{pfd_i/10} \cdot \frac{G_r(\theta_i)}{G_{max}}\right]}$$

$$epfd = 10 \cdot \log_{10}\left[\sum_{i=1}^{N_a} 10^{\frac{P_i}{10}} \cdot \frac{G_t(\theta_i)}{4.\pi d_i^2} \cdot \frac{G_r(\phi_i)}{G_{r,max}}\right]$$

~~where:~~

~~N_s: number of non-geostationary space stations visible from the point considered at the Earth's surface, within an elevation angle greater than or equal to 0°;~~

~~i: index of the non-geostationary space station considered;~~

~~pfd_i: power flux-density produced at the point considered on the Earth's surface in dB(W/m^2) in the reference bandwidth;~~

~~θ_i: angle between the direction considered towards the geostationary-satellite orbit and the direction of the interfering space station in the non-geostationary-satellite system;~~

~~$G_r(\theta_i)$: gain (as a ratio) of the receive reference antenna to be considered as part of a geostationary-satellite network;~~

~~G_{max}: maximum gain (as a ratio) of the above receive reference antenna;~~

~~$epfd$: computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.~~

where:

N_a: is the number of transmit stations in the non-geostationary-satellite systems that are visible from the GSO receive station considered on the Earth's surface or in the geostationary orbit, as appropriate;

i: is the index of the transmit station considered in the non-geostationary-satellite system;

P_i: is the RF power at the input of the antenna of the transmit station, considered in the non-geostationary-satellite system in dBW in the reference bandwidth;

θ_i: is the off-axis angle between the boresight of the transmit station considered in the non-geostationary-satellite system and the direction of the GSO receive station;

$G_t(\theta_i)$: is the transmit antenna gain (as a ratio) of the station considered in the non-geostationary-satellite system in the direction of the GSO receive station;

d_i: is the distance in metres between the transmit station considered in the non-geostationary-satellite system and the GSO receive station;

ϕ_i: is the off-axis angle between the boresight of the antenna of the GSO receive station and the direction of the ith transmit station considered in the non-geostationary-satellite system;

$G_r(\phi_i)$: is the receive antenna gain (as a ratio) of the GSO receive station in the direction of the ith transmit station considered in the non-geostationary-satellite system;

$G_{r,max}$: is the maximum gain (as a ratio) of the antenna of the GSO receive station;

epfd: is the computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.

3 For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

4 Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO FSS systems.

5 In addition to the limits shown in Table **S22-1A**, the following single-entry $epfd_{down}$ limits apply to all antenna sizes greater than 60 cm in the frequency bands listed in Table **S22-1A**.

100% of the time $epfd_{down}$ dB(W/(m^2·40 kHz))	**Latitude (north or south) (°)**
-160	0 < |Latitude| ≤ 57.5
-160 + 3.4(57.5 - |Latitude|)/4	57.5 < |Latitude| ≤ 63.75
-165.3	63.75 ≤ |Latitude|

Reasons: The limits proposed above for the 60 cm and 1.2 m antennas were agreed within ITU-R. The limits proposed for the 3 m and 10 m antennas represent a compromise agreed upon at the CPM-99 meeting. The compromise package agreed upon consists of the following:

i) “validation” $epfd_{down}$ masks for reference GSO FSS earth station antenna diameters of 60 cm, 1.2 m, 3 m, and 10 m;

ii) “operational” $epfd_{down}$ limits for all antenna diameters between 3 m and 18 m;

iii) “additional operational” $epfd_{down}$ limits for antenna diameters of 3 m and 10 m; and

iv) “validation” $epfd_{down}$ limits for antenna diameters exceeding 60 cm located at high latitudes.

CPM-99 agreed that “validation” masks, in conjunction with “operational” and “additional operational” limits, as appropriate, would adequately protect GSO FSS systems using 60 cm, 1.2 m, 3 m and 10 m antennas. Table S22-1A above contains the limits referred to in items i) and iv) of the compromise package.

10 Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO BSS systems.

11 For BSS antenna diameters 180 cm, 240 cm and 300 cm, in addition to the single-entry limits shown in Table **S22-1D**, the following single-entry 100% of the time $epfd_{down}$ limit also applies in the frequency bands listed in Table **S22-1D**:

100% of the time $epfd_{down}$ dB(W/(m^2·40 kHz))	**Latitude (north or south) (°)**
-160.0	0 < │Latitude│ ≤ 57.5
–160.0 + 3.4 * (57.5 - │Latitude│)/4	57.5 < │Latitude│ ≤ 63.75
–165.3	63.75 ≤ │Latitude│

12 For BSS antenna diameter 240 cm, in addition to the single-entry 100% of the time $epfd_{down}$ limit specified in footnote 11 of this table, a –167 dB(W/(m^2·40 kHz)) single-entry 100% of the time operational $epfd_{down}$ limit also applies to receive antennas located in Region 2, west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.]*

Reasons: The limits proposed above represent a compromise agreed upon at the CPM-99 meeting consisting of the following:

i) "validation" $epfd_{down}$ masks for reference GSO BSS earth station antenna diameters of 30 cm, 45 cm, 60 cm, 90 cm, 120 cm, 180 cm, 240 cm, and 300 cm;

ii) latitude dependent validation 100% of the time $epfd_{down}$ limits for 180 cm, 240 cm, and 300 cm BSS earth station antennas; and

iii) "operational" 100% of the time single-entry $epfd_{down}$ limits for 240 cm BSS antenna diameters in a certain northern high latitude area of Region 2.

Table S22-1D above contains the limits referred to in items i), ii) and iii) of the compromise package. The limit in item iii) is required because the power of BSS transmissions that can be radiated toward a certain northern high latitude area of Region 2 is limited by the existing pfd limits contained in section 5 *c*) of Annex 1 to Appendix S30. This leads to the use of larger BSS earth station antennas in this geographical area and more sensitive links. The square brackets around the last sentence in footnote 12 can be removed only if the pfd limits in section 5 *c)* of Annex 1 to Appendix S30 are sufficiently relaxed as described in section 5.2.3.5 of the CPM Report.

The compromise package includes the following elements which have yet to be developed.

* This transitional regime would be applicable only if the pfd limits in section 5 *c)* of Annex 1 to Appendix **S30** are sufficiently relaxed.

With regard to the operational $epfd_{down}$ limits in iii), there is a need for regulatory procedures to implement operational limits which: identifies non-GSO systems exceeding the operational limits; and ensures immediate reduction of the interference level to the operational limits by any non-GSO system exceeding those limits. There is a need for a resolution calling for ITU-R to develop, as a matter of urgency, recommendations to permit administrations to check compliance with the operational limits.

MOD IAP/14/251

S22.5D 2) The ~~aggregate~~equivalent power flux-density~~23~~, $epfd_{up}$, produced at any point in the geostationary-satellite orbit by emissions from all the earth stations in a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Table **S22-2**, for all conditions and for all methods of modulation, shall not exceed the limits given in Table **S22-2** for the specified percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Table **S22-2**, for all pointing directions towards the Earth's surface visible from any given location in the geostationary-satellite orbit.

MOD IAP/14/261

S22.5~~G~~CA The limits given in Tables **S22-1A to S22-1D~~ and S22-3~~** may be exceeded on the territory of any country whose administration has so agreed.

(SUP) IAP/14/262

S22.5G

ADD IAP/14/263

S22.5H The limits specified in Nos. **S22.5C**, **S22.5D** and **S22.5F** apply to non-GSO FSS systems for which complete coordination or notification information, as appropriate, has been received by the Bureau after 22 November 1997. The limits in No. **S22.5G** do not apply to non-GSO FSS systems for which complete notification information has been received by the Bureau before 22 November 1997.

Reasons: Reflect the "*instructs the Radiocommunication Bureau*" in Resolutions 130 (WRC-97) and 538 (WRC-97), and *resolves* 2 of Resolution 130 (WRC-97). Review of the findings by the Bureau under "*instructs the Radiocommunication Bureau*" in Resolution 130 (WRC-97) and Resolution 538 (WRC-97) should be kept in an updated version of these Resolutions to cover transitional aspects. It was noted that no notification was received prior to 22 November 1997 for non-GSO FSS systems (Earth-to-space) in the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.8-18.1 GHz (Region 2).

ADD IAP/14/264

S22.5I An administration operating a non-GSO FSS system which is in compliance with the limits in Nos. **S22.5C**, **S22.5D** and **S22.5F** (see also Resolution **WWW (WRC-2000)**) shall be considered as having fulfilled its obligations under No. **S22.2** with respect to any GSO network, irrespective of the dates of receipt by the Bureau of the complete coordination or notification information, as appropriate, for the non-GSO system and of the complete coordination information for the GSO network, provided that the $epfd_{down}$ radiated by the non-GSO FSS system into any operating GSO FSS earth station does not exceed the operational limits given in footnote 12 of Table **S22-1D** or the operational limits given in Tables **S22-4A** and **S22-4B**, when the diameter of the earth station is equal to the values given in Table **S22-4A** or the gain of the earth station is equal to or greater than the values given in Table **S22-4B** for the corresponding orbital inclination of the GSO FSS satellite. Except as otherwise agreed between concerned administrations, an administration operating a non-GSO FSS system that is subject to the limits in Nos. **S22.5B, S22.5C and S22.5D** and which radiates $epfd_{down}$ into any operating GSO FSS earth station at levels in excess of the operational limits given in footnote 12 of Table **S22-1D** or the operational limits given in Tables **S22-4A** and **S22-4B**, when the diameter of the earth station is equal to the values given in Table **S22-4A** or the gain of the earth station is equal to or greater than the values given in Table **S22-4B** for the corresponding orbital inclination of the GSO FSS satellite, shall be considered in violation of its obligations under No. **S22.2**.

Reasons: Reflects *resolves* 4 and 1.4 of Resolutions 130 (WRC-97) and 538 (WRC-97), and the principles provided in section 3.1.2.1.4.2 *c)*. Other additions to the provision correct the language, and make explicit the intention that any non-GSO FSS system that exceeds the validation, operational or additional operational limits, as applicable, shall, except otherwise agreed between concerned administrations, be deemed to be in violation of its obligations under No. S22.2.

ADD IAP/14/265

TABLE **S22-4A**[16, 18]

Operational limits to the epfd_{down} radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	epfd_{down} dB(W/m^2)	Percentage of time during which epfd_{down} may not be exceeded	Reference bandwidth (kHz)	Receive GSO earth station antenna diameter [17] (m)	Orbital inclination of GSO satellite (degrees)
10.7-11.7 in all Regions; 11.7-12.2 in Region 2; 12.2-12.5 in Region 3; and 12.5-12.75 in Regions 1 and 3 (prior to 31 December 2005)	–163 –166 –167.5 –169.5	100	40	3 6 9 ≥18	≤2.5
	–160 –163 –164.5 –166.5	100	40	3 6 9 ≥18	≤4.5
10.7-11.7 in all Regions; 11.7-12.2 in Region 2; 12.2-12.5 in Region 3; and 12.5-12.75 in Regions 1 and 3 (after 31 December 2005)	–161.25 –164 –165.5 –167.5	100	40	3 6 9 ≥18	≤2.5
	–158.25 –161 –162.5 –164.5	100	40	3 6 9 ≥18	≤4.5

16 For certain receive earth stations, see also ADD **S9.7A** and ADD **S9.7B**.

17 Linear interpolation of epfd levels in decibels should be performed for other intermediate antenna diameters using a logarithmic scale for the antenna diameter.

18 In addition to the operational limits shown in Table **S22-4A**, the additional operational limits in Table **S22-4A1** apply to certain GSO FSS earth station antenna sizes in the frequency bands listed in Table **S22-4A**. A method of assessing interference levels for intermediate antenna sizes should also be developed within ITU-R.

ADD IAP/14/265*bis*

TABLE **S22-4A1**

Additional operational limits to the $epfd_{down}$ radiated by non-GSO FSS systems into 3 m and 10 m GSO FSS earth station antennas

$epfd_{down}$ (dB(W/(m^2/40 kHz)))	Percentage of time during which $epfd_{down}$ may be exceeded	Receive GSO earth station antenna diameter (m)
–182 –179 –176 –171 –168 –165 –163 –161.25 –161.25	0.1 0.06 0.03 0.02 0.016 0.007 0.001 0.00025 0	3
–185 –183 –179 –175 –171 –168 –166 –166	0.03 0.02 0.01 0.004 0.002 0.001 0.0002 0	10

Reasons: The operational limits proposed for antennas equal to or greater than 3 m in diameter represent a compromise agreed upon at the CPM-99 meeting. The compromise package agreed upon consists of the following:

i) “validation” $epfd_{down}$ masks for reference GSO FSS earth station antenna diameters of 60 cm, 1.2 m, 3 m, and 10 m;

ii) “operational” $epfd_{down}$ limits for all antenna diameters between 3 m and 18 m;

iii) “additional operational” $epfd_{down}$ limits for antenna diameters of 3 m and 10 m; and

iv) “validation” $epfd_{down}$ limits for antenna diameters exceeding 60 cm located at high latitudes.

CPM-99 agreed that “validation” masks, in conjunction with “operational” and “additional operational” limits, as appropriate, would adequately protect GSO FSS systems using 60 cm, 1.2 m, 3 m and 10 m antennas. Tables S22-4A and S22-4A1 contain the limits referred to in items ii) and iii) of the compromise package.

ADD IAP/14/266

TABLE **S22-4B**[19]

Operational limits to the epfd$_{down}$ radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	epfd$_{down}$ dB(W/m^2)	Percentage of time during which epfd$_{down}$ may not be exceeded	Reference bandwidth (kHz)	Receive GSO earth station antenna Gain (dBi)	Orbital inclination of GSO satellite (degrees)
19.7-20.2	–157 –157 –155	100 100 100	40 40 40	≥49 ≥43[20] ≥49	≤2.5 ≤2.5 >2.5 and ≤4.5
19.7-20.2	–143 –143 –141	100 100 100	1 000 1 000 1 000	≥49 ≥43[20] ≥49	≤2.5 ≤2.5 >2.5 and ≤4.5
17.8-18.6	–164 –162	100 100	40 40	≥49 ≥49	≤2.5 >2.5 and ≤4.5
17.8-18.6	–150 –148	100 100	1 000 1 000	≥49 ≥49	≤2.5 >2.5 and ≤4.5

19 For certain receive earth stations, see also ADD S9.7A and ADD S9.7B.

20 The operational limit applies to non-GSO systems operating at altitudes of 7 000 km or above in order to protect GSO FSS systems employing adaptive coding.

Reasons: The operational limits proposed for antennas with a gain equal to or greater than 49 dBi represent a compromise agreed upon at the CPM-99 meeting. CPM-99 agreed that the “operational” limits contained in Table S22-4B above in conjunction with epfd$_{down}$ “validation” masks would adequately protect GSO FSS systems with an antenna gain equal to or greater than 49 dBi.

ADD IAP/14/267

S22.5J In case of *force majeure*, telecommand and ranging carriers transmitted to non-geostationary satellites in the fixed-satellite service are not subject to the limits given in Table S22-2.

Reasons: Specific provision needed to cover emergency situations.

ADD IAP/14/268

S22.5K Administrations operating or planning to operate non-GSO FSS systems in the bands listed in Tables **S22-1A** through **S22-1D** of No. **S22.5B** will apply the provisions of Resolution **WWW (WRC-2000)** to ensure that the actual aggregate interference into GSO FSS and GSO BSS networks caused by such systems operating co-frequency in these frequency bands does not exceed the aggregate power levels shown in Annex 1 of Resolution **WWW (WRC-2000)**. In the event that an administration operating a GSO network in conformity with the Radio Regulations identifies epfd levels from non-GSO FSS systems which may be in excess of the aggregate limits contained in Annex 1 of Resolution **WWW (WRC-2000)**, the administrations responsible for the non-GSO FSS systems will apply the provisions contained in *resolves* 2 of Resolution **WWW (WRC-2000)**.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Proposed modifications to APS4

Background information

CPM-99, to facilitate introduction of non-GSO FSS systems while affording protection to GSO FSS and BSS, agreed to three types of $epfd_{down}$ limits. These are: validation limits, to be verified by the Radiocommunication Bureau using an agreed software tool; operational limits, to provide operational GSO earth stations protection from synchronization loss; and additional operational limits to ensure protection to operational 3 m and 10 m GSO FSS earth stations operating in the 10.7-12.75 GHz bands. The operational limits, which are single values for 100 per cent of the time, provide an opportunity for development of regulatory procedures to be implemented by the BR which would afford GSO systems a means of redress in the event such limits are exceeded by non-GSO FSS systems. The additional operational limits are specified values associated with periods of time. Such limits, as with the operational limits, must be met in practice, by each non-GSO FSS system. With regard to the additional operational $epfd_{down}$ limits, an administration proposing a non-GSO FSS system would have to commit that the proposed system will meet these additional operational limits. The Administrations propose that this requirement be met by the inclusion of an additional data entry in Appendix S4.

APPENDIX S4

Consolidated list and tables of characteristics for use in the application of the procedures of Chapter SIII

ANNEX 2A

Characteristics of satellite networks or earth or radio astronomy stations[2]

A General characteristics to be provided for the satellite network or the earth or radio astronomy station

ADD IAP/14/269

A.14 Commitment regarding compliance with additional operational epfd$_{down}$ limits

For non-geostationary satellite systems operating in the fixed-satellite service in the bands 10.7-11.7 GHz (in all Regions), 11.7-12.2 GHz (Region 2), 12.2-12.5 GHz (Region 3), and 12.5-12.75 GHz (Regions 1 and 3), a commitment that the filed for system will meet the additional operational epfd$_{down}$ limits that are specified in Table **S22-4A** under No. **S22.5G**.

Reasons: To satisfy an aspect of the compromise package relating to additional $epfd_{down}$ limits that is included in section 3.1.2.4.8 of the CPM Report.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Revisions to Articles S9, S11 and Appendix S5 for non-GSO systems which are subject to S22.2

a) Proposals for advanced publication under Article S9

Background information

In order to provide for the advanced publication of information for non-GSO systems, a new footnote is required for Article S9, sub-section IB, and a reference point for this footnote added to No. S9.5B.

MOD IAP/14/271

S9.5B If, upon receipt of the Weekly Circular containing information published under No. **S9.2B**, any administration considers its existing or planned satellite systems[7bis] or networks[7bis] or terrestrial stations[7] to be affected, it may send its comments to the publishing administration, so that the latter may take those comments into consideration when initiating the coordination procedure. A copy of these comments shall also be sent to the Bureau. Thereafter, both administrations shall endeavour to cooperate in joint efforts to resolve any difficulties, with the assistance of the Bureau, if so requested by either of the parties, and shall exchange any additional relevant information that may be available.

ADD IAP/14/272

---

72 [7bis] **S9.5B.2** When the advanced publication of information is for a satellite network or satellite system using a non-geostationary-satellite orbit in a frequency band for which the requirement to coordinate is included in a footnote of the Table of Frequency Allocations referring to MOD **S9.10**, the only stations to be taken into account are those for which the requirement to coordinate was also under MOD **S9.10** or under **S9.12** for which advanced publication information was received between 22 November 1997 and 2 June 2000.

Reasons: These two revisions of Article S9, sub-section IB, provide for the advance publication of information for non-GSO satellites which are subject to MOD S9.10 and No. S22.2.

b) Procedure for effecting coordination in Article S9

Background information

The current use of the reference to No. S9.12 in the CPM Report is inappropriate for non-GSO FSS systems where No. S22.2 applies because the other provisions under No. S9.11A (formerly Resolution 46) do not apply. Therefore, a new entry is required to Section II of Article S9. This could be MOD S9.10 which is well placed for this purpose and is currently unused.

MOD IAP/14/273

S9.10 *cbis)* for a station in a satellite network using a non-geostationary-satellite orbit, in respect of any other satellite network using a non-geostationary-satellite orbit, with the exception of coordination between earth stations operating in the opposite direction of transmission, for which the requirement to coordinate is included in a footnote of the Table of Frequency Allocations referring to this provision;~~Not used.~~

Reasons: This is a more appropriate entry to Article S9, Section II, than S9.12.

c) Proposal for Article S11 to limit the application of the Bureau's examination

Background information

The CPM-99 agreed on validation limits, operational limits and additional operational limits to be included in Article S22 of the Radio Regulations. However, only the validation limits are to be verified by the Bureau in its examination of a non-GSO FSS filing. Since No. S11.31 applies generally, it is essential to limit its application to the validation limits.

MOD IAP/14/274

S11.31 *a)* with respect to its conformity with the Table of Frequency Allocations[7] and the other provisions[8],[8*bis*] of these Regulations, except those relating to conformity with the procedures for obtaining coordination or the probability of harmful interference, or those relating to conformity with a plan, as appropriate, which are the subject of the following sub-paragraphs;[9]

ADD IAP/14/275

[8*bis*] **S11.31.2*bis*** When examining the conformity of the notice with respect to Article **S22**, the Bureau shall limit its examination to **S22.5**, **S22.5A**, MOD **S22.5C**, MOD **S22.5D** and MOD **S22.5F** and shall take into account that, under MOD **S22.5G**, the limits contained in Tables **S22-1A** to **S22-1D** may be exceeded on the territories of countries whose administrations have so agreed.

Reasons: There are power-limit tables proposed for Article S22 other than those containing the validation limits. In Article S22, however, only the Tables containing the validation limits will be taken into account by the Bureau when a notice for a non-GSO system is being examined for its conformity to the Radio Regulations.

d) Modifications to Appendix S5 that are consequential to the modifications to Article S9

Background information

Consequential to the modifications to Article S9, the references to Resolutions 130 and 538 in Appendix S5 must be replaced with references to Article S9.

ADD IAP/14/276

APPENDIX S5

TABLE S5-1 (*continued*)

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.10** Non-GSO/ non-GSO	A station in a satellite network using a non-geostationary-satellite orbit in the frequency bands for which a footnote refers to MOD S9.10 in respect of any other satellite using a non-geostationary-satellite orbit, with the exception of coordination between earth stations operating in the opposite direction of transmission	10.7-11.7 GHz 11.7-12.2 GHz (Region 2) 12.2-12.5 GHz (Region 3) 12.5-12.75 GHz 12.75-13.25 GHz 13.75-14.5 GHz 17.3-18.1 GHz (Region 1, Region 3) 17.8-18.6 GHz 19.7-20.2 GHz 27.5-28.6 GHz 29.5-30 GHz	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	

Reasons: These modifications to Appendix S5 are to replace the references to Resolutions 130 and 538 with references to No. S9.10 in Article S9. Note, there are consequential revisions to Table S5-1A in Appendix S5 to delete the frequency bands which are referred to in column 3 above.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Additions and/or modifications to Articles S9, S11, S22 and Appendices S4 and S5 to require coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antenna

Background information

WRC-97 adopted provisional power flux-density limits in certain frequency bands which would apply to non-GSO FSS systems to protect GSO FSS networks, and GSO BSS networks. Resolution 130 (WRC-97), *Use of non-geostationary systems in the fixed-satellite service in certain frequency bands*, and Article S22 of the Radio Regulations contain limits corresponding to an interference level caused by one non-GSO system in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz, and 19.7-20.2 GHz. Studies demonstrate that neither the WRC-97 provisional $epfd_{down}$ limits and associated percentages of time nor the proposed modifications agreed during ITU-R studies adequately protect existing GSO FSS networks with very large earth station antennas. Section 3.1.2 of the CPM Report for WRC-2000 concludes that transmissions to earth stations with very large antennas need to be protected and that an additional regulatory procedure would be necessary. Coordination triggers based on the characteristics of the satellite network using the GSO were agreed by the ITU-R and confirmed by CPM-99. In addition to the GSO network triggers, it was decided to include the condition of the $epfd_{down}$ radiated by the non-GSO FSS system. CPM-99-2 decided that two values would be needed in each band and that exceeding either $epfd_{down}$ value would trigger coordination. WP 4A completed the studies on the $epfd_{down}$ thresholds to trigger coordination. Annex 3 to Chapter 3 of the CPM Report contains example regulatory and procedural text and the coordination triggers agreed by WP 4A. Building on the CPM Report text, this proposal includes additions and/or modifications to Articles S9, S11 and S22 and Appendices S4 and S5 to require coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large earth station antennas.

ARTICLE S9

Sub-Section IIA – Requirement and request for coordination

ADD IAP/14/277

S9.7A *a1)* [11bis, 11ter] for a specific earth station within a geostationary-satellite network in the fixed-satellite service in certain frequency bands in respect of a non-geostationary-satellite system in the fixed-satellite service;

ADD IAP/14/278

S9.7B *a2)* [11bis, 11ter] for a non-geostationary-satellite system in the fixed-satellite service in certain frequency bands in respect of a specific earth station within a geostationary-satellite network in the fixed-satellite service;

ADD IAP/14/279

[11bis] **S9.7A.1** and **S9.7B.1** The coordination of a specific earth station under **S9.7A** or **S9.7B** shall remain within the authority of the administration having this station located on its territory.

ADD IAP/14/280

[11ter] **S9.7A.2** and **S9.7B.2** Coordination information relating to a specific earth station received by the Bureau prior to [date to be established by WRC-2000] is considered as complete **S9.7A** or **S9.7B** information from the date of receipt of complete information of the associated satellite network under **S9.7** provided that the characteristics of the specific earth stations are within the parameters of any typical earth station included in the GSO FSS network coordination request.

MOD IAP/14/281

---

[12] **S9.8.1** and **S9.9.1** Application of this provision with respect to Articles 6 and 7 of Appendices **S30** and **S30A** is suspended pending a decision of WRC-~~99~~2000 on the revision of these two Appendices.

Reasons: GSO FSS earth stations with very large antennas are not adequately protected by the $epfd_{down}$ limits contained in Tables ADD S22-1A to S22-1C and case-by-case coordination of systems operating co-frequency, co-directional links in the space-to-Earth direction would then be required. The proposed ADD S9.7A and ADD S9.7B would require coordination between non-GSO FSS transmit satellites and GSO FSS receive earth stations with very large antennas. Proposals IAP/14/60, 61, 62, 76, and 77 include footnotes referencing ADD S9.7A and ADD S9.7B to Tables S22-1A, S22-1B, S22-1C, S22-4A, S22-4B, respectively. By referring to coordination provisions under S9.7A and S9.7B, the request for coordination would be sent by the requesting administration to the Bureau under S9.30. The Bureau would act under S9.34 to identify administrations with which coordination may need to be effected and publish the information in the Weekly Circular. Since coordination between a non-GSO FSS space station and very large GSO FSS earth stations is a new type of coordination that does not currently exist in Article S9, it is necessary to add two new entry points in Article S9:

- One entry point to enable the non-GSO space station administration to request coordination with administrations having specific very large earth station antennas located on their territory.

- Another entry point to enable the reciprocal coordination to take place, i.e. the possibility for an administration planning to implement a specific very large GSO earth station stations located on their territory to request coordination with administrations having non-GSO FSS transmit space stations.

ARTICLE S11

Notification and recording of frequency assignments[1, 2, 3]

Section II – Examination of notices and recording of frequency assignments in the Master Register

MOD IAP/14/282

S11.32A *c)* with respect to the probability of harmful interference that may be caused to or by assignments recorded with a favourable finding under Nos. **S11.36** and **S11.37** or **S11.38**, or recorded in application of No. **S11.41**, or published under Nos. **S9.38** or **S9.58** but not yet notified, as appropriate, for those cases for which the notifying administration states that the procedure for coordination under Nos. **S9.7, S9.7A** or **S9.7B** could not be successfully completed (see also No. **S9.65**);[10] or

MOD IAP/14/283

---

[10] **S11.32A.1** The examination of such notices with respect to any other frequency assignment for which a request for coordination under Nos. **S9.7, S9.7A** or **S9.7B** has been published under No. **S9.38** but not yet notified shall be effected by the Bureau in the order of their publication under the same number using the most recent information available.

Reasons: The insertion of a coordination trigger related to $epfd_{down}$ level radiated by the non-GSO FSS system into the earth station employing the very large antenna considered when this earth station is pointed to the wanted GSO satellite provides a mechanism to examine the notice with respect to the probability of harmful interference that may be caused to or by above-listed assignments, and therefore S11.38 and S11.41 are applicable.

MODIFICATIONS TO APPENDIX **S4**

ANNEX 2B

Table of characteristics to be submitted for space and radio astronomy services

The required characteristics for coordinating specific very large GSO earth stations with non-GSO FSS transmit space stations could be items for “Notification or coordination of a geostationary-satellite network (including Appendix **S30B**)” or “Notification or coordination of an earth station”.

MOD IAP/14/284

C – Characteristics to be provided for each group of frequency assignments for a satellite antenna beam or an earth station antenna

Items in Appendix	Advance publication of a geostationary-satellite network	Advance publication of a non-geostationary-satellite network subject to coordination under Section II of Article S9	Advance publication of a non-geostationary-satellite network not subject to coordination under Section II of Article S9	Notification or coordination of a geostationary-satellite network (including Appendix S30B)	Notification or coordination of a non-geostationary-satellite network	Notification or coordination of an earth station	Notice for space stations in the broadcasting-satellite service under Appendix S30 *	Notice for feeder-link stations under Appendix S30A *	Notice for stations in the fixed-satellite service under Appendix S30B	Items in Appendix	Radio astronomy

X Mandatory information O Optional information C This information need only be furnished when it has been used as a basis to effect coordination with another administration

1 Only the value of maximum power density is mandatory.

2 For transmission from the space station only.

3 For space-to-space relay only.

4 For transmission from the earth station only.

5 Not required for coordination under Nos. **S9.15**, **S9.17** or **S9.17A**.

6 Required, if applicable, for the type of transmission. If not applicable, a reason why it is not applicable is required.

7 One or the other of C.8.a or C.8.b is mandatory, but not both.

8 Only the value of total peak envelope power is required for coordination under Nos. **S9.15**, **S9.17** or **S9.17A**.

9 Information mandatory for coordination under No. ADD **S9.7A**.

NOTE – Additional characteristics to be provided may include A.4.c, A.1.e.1, A.1.e.2, C.4, B.5 and C.5.b. As a result of decisions that may be made at WRC-2000, these additional characteristics may replace C.10.a, C.10.b, C.10.c.1, C.10.c.2 and C.10.c.5 in the notification or coordination of an earth station column.

* The application of this column is suspended pending the decision of WRC-99.

X Mandatory information O Optional information C This information need only be furnished when it has been used as a basis to effect coordination with another administration

[9] Information mandatory for coordination under No. ADD **S9.7A**.

NOTE – Additional characteristics to be provided may include A.4.c, A.1.e.1, A.1.e.2, C.4, B.5 and C.5.b. As a result of decisions that may be made at WRC-2000, these additional characteristics may replace C.10.a, C.10.b, C.10.c.1, C.10.c.2 and C.10.c.5 in the notification or coordination of an earth station column.

[10] Only the list of country or geographic designators or a narrative description of the service area shall be supplied.

Reasons: This is consequential to ADD S9.7A and ADD S9.7B. Administrations will need to submit specific earth station information for earth stations associated with geostationary-satellite networks in the fixed-satellite service meeting the conditions in the proposed addition to Appendix S5. Since there is currently no requirement to give the specific locations of earth stations, in addition to ADD S9.7A.2 and ADD S9.7B.2, a resolution for the transition period may also be needed to have typical earth stations associated with GSO FSS networks, already in coordination or notified, that meet the criteria to be brought in as specific earth stations. In this resolution, there will have to be some guidance on date priorities. The modifications under the column for *Notification or coordination of a geostationary-satellite network (including Appendix S30B)* would apply to earth stations associated with GSO FSS networks already in coordination or notified. The modifications in the column for *Notification or coordination of an earth station* would apply to earth stations communicated to the Bureau after the date established by WRC-2000 under ADD S9.7A.1 and ADD S9.7B.1. Additional guidance will need to be added to the *Instructions for Filling Out the Form of Notice ApS4/II and ApS4/III Relating to Space Radiocommunications Stations* distributed by Circular Letter CR/65 or in a similar instruction.

MOD IAP/14/285

			a) –174.5 dB(W/(m^2 · 40 kHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude, or –202 dB(W/(m^2· 40 kHz)) for any percentage of the time for non-GSO systems with any satellites operating above 2 500 km altitude in the frequency band 10.7-12.75 GHz; b) –157 dB(W/(m^2 · MHz)) for any percentage of time for non-GSO systems with all satellites only operating at or below 2 500 km altitude or –185 dB(W/(m^2 · MHz)) for any percentage of the time for non-GSO systems with any satellites operating above 2 500 km altitude in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz		

Reasons: This is consequential to ADD S9.7A and S9.7B.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where epfd limits have been adopted

Background information

The ITU-R and CPM-99 agreed that "[t]here is a need to provide a regulatory mechanism that would ensure protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where equivalent power flux-density (epfd) limits have been adopted." CPM-99 Report at section 3.1.1.3.2. With respect specifically to the GSO BSS, section 3.1.3.1.4(b) of the CPM-99 Report to WRC-2000 states that "[t]here is a need to ensure that the aggregate epfd produced by all co-frequency non-GSO FSS systems does not exceed the maximum interference levels, as determined by the agreed to aggregate epfd masks, that are necessary to protect these GSO BSS systems." This agreement can be implemented by including aggregate $epfd_{down}$ limits annexed to a WRC-2000 Resolution. Such a Resolution is proposed below based on the agreement reached within the ITU-R.

In addition to the single-entry $epfd_{down}$ limits (validation, operational, and additional operational), CPM-99 agreed that a mechanism was needed which would provide assurance to GSO FSS and GSO BSS systems that the aggregate interference from all non-GSO FSS systems would not exceed that determined as an acceptable level. Aggregate validation limits had already been developed within the ITU-R based on the single-entry validation limits and are contained in Table WWW-1A to WWW-1D below.

Additional language has been added to Resolution WWW (WRC-2000) to call for the development of procedures in an ITU-R recommendation that can be used by administrations during non-GSO FSS coordinations and to recognize that Resolution 130 (Rev.WRC-2000) calls for the development of an ITU-R recommendation on additional operational limits.

ADD IAP/14/287

RESOLUTION WWW (WRC-2000)

Protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where epfd limits have been adopted

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-97 has adopted, in Article **S22**, provisional epfd limits to be met by non-GSO FSS systems in order to protect GSO FSS and GSO BSS networks in parts of the frequency range 10.7-30 GHz;

b) that WRC-2000 has revised Article **S22** to ensure the limits contained therein provide adequate protection to GSO systems without causing undue constraints to any of the systems and services sharing these frequency bands;

c) that Article **S22** includes single entry validation, operational and for certain antenna sizes additional operational epfd limits which apply to non-GSO FSS systems in these bands;

d) that these single-entry validation limits have been derived from aggregate equivalent power flux-density (epfd) masks, assuming a maximum effective number of non-GSO FSS systems of 3.5;

e) that the aggregate interference caused by all co-frequency non-GSO FSS systems in these bands into GSO FSS systems should not exceed the maximum interference levels that are necessary to protect these GSO systems;

f) that WRC-97 decided, and WRC-2000 confirmed, that non-GSO FSS systems in these bands are to coordinate the use of these frequencies between themselves under the provisions of No. **S9.10** of the Radio Regulations;

g) that the orbital characteristics of such systems are likely to be inhomogeneous;

h) that as a result of this likely inhomogeneity, the aggregate epfd levels from multiple non-GSO FSS systems are not directly related to the number of actual systems sharing a frequency band, and the number of such systems operating co-frequency is likely to be small;

i) that the possible misapplication of single entry limits should be avoided,

recognizing

a) that non-GSO FSS systems are likely to need to implement interference mitigation techniques to share frequencies among themselves;

b) that because the use of such interference mitigation techniques will likely keep the number of non-GSO systems small, the aggregate interference caused by non-GSO FSS systems into GSO systems will also likely be small;

c) that notwithstanding *considering e)* and *recognizing b)*, there may be instances where the aggregate interference from non-GSO systems could exceed the interference levels given in Annex 1;

d) that administrations operating GSO systems may wish to ensure that the aggregate epfd produced by all operating co-frequency non-GSO FSS systems in the frequency bands referred to in *considering a)* above into GSO FSS and/or GSO BSS networks does not exceed the aggregate interference levels given in Annex 1,

further recognizing

e) that Resolution **130** (**Rev.WRC-2000**) requests the ITU-R to develop a recommendation that includes the aggregate additional operational limits contained in Annex 2 of Resolution **130** to be used as guidance by administrations during their non-GSO FSS coordinations,

resolves

1 that administrations operating or planning to operate non-GSO FSS systems in the frequency bands referred to in *considering a)* above, individually or in collaboration, take all possible steps, including by means of appropriate modifications to their systems if necessary, to ensure that the actual aggregate interference into GSO FSS and GSO BSS networks caused by such systems operating co-frequency in these frequency bands does not exceed the aggregate power levels shown in Annex 1, (see No. **S22.5K**);

2 that, in the event that an administration operating a GSO network identifies that the aggregate interference levels in Annex 1 are exceeded, administrations operating non-GSO FSS systems in these frequency bands shall expeditiously take all necessary measures to reduce the aggregate epfd levels to those in Annex 1 or to reduce such interference to higher levels that are acceptable to the affected GSO administration, (see No. **S22.5K**),

requests ITU-R

1 to develop, as a matter of urgency, and complete, in time for consideration by the next WRC, a methodology, based on the worst case non-GSO FSS satellite pfd mask and other conservative assumptions, for calculating the aggregate epfd produced by all non-GSO FSS systems operating or planning to operate co-frequency in the frequency bands referred to in *considering a)* above into GSO FSS and GSO BSS networks and for comparing the calculated levels with the aggregate power levels shown in Annex 1;

2 to continue its studies on the accurate modelling of interference from non-GSO FSS systems into GSO FSS and GSO BSS networks in the frequency bands referred to in *considering a)* above in order to assist the administrations planning or operating non-GSO FSS systems in their efforts to limit the aggregate epfd levels produced by their systems into GSO networks;

3 to develop a recommendation, as a matter of urgency, that contains procedures to be used amongst administrations to ensure that the aggregate epfd limits contained in Annex 1 are not exceeded by operators of non-GSO FSS systems,

requests the Director of the Radiocommunication Bureau

1 to assist in the development of the methodology referred to in *requests ITU-R* 1 above;

2 to report to WRC-02/03 on the results of studies in *requests ITU-R* 1 and 3 above.

ANNEX 1 TO RESOLUTION WWW (WRC-2000)

TABLE **WWW-1A**[1,3]

Limits to the aggregate $epfd_{down}$ radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	$epfd_{down}$ dB(W/m^2)	Percentage of time during which $epfd_{down}$ may not be exceeded	Reference bandwidth (kHz)	Reference antenna diameter, and reference radiation pattern[2]
10.7-11.7 in all Regions 11.7-12.2 in Region 2 12.2-12.5 in Region 3 and 12.5-12.75 in Regions 1 and 3	–170.0 –168.6 –165.3 –160.4 –160.0 –160.0	0 90 99 99.97 99.99 100	40	60 cm Rec. ITU-R S.[4/57]

1 Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO BSS systems.

2 For BSS antenna diameters 180 cm, 240 cm and 300 cm, in addition to the aggregate limit shown in Table **WWW-1D**, the following aggregate 100% of the time $epfd_{down}$ limit also applies:

100% of the time $epfd_{down}$ dB(W/(m^2 · 40 kHz))	**Latitude (North or South) (°)**
–160.0	0 < |Latitude| ≤ 57.5
–160.0 + 3.4 * (57.5 - |Latitude|)/4	57.5 < |Latitude| ≤ 63.75
–165.3	63.75 ≤ |Latitude|

3 For BSS antenna diameter 240 cm, in addition to the aggregate 100% of the time $epfd_{down}$ limit specified in footnote 2 of this table, a –167 dB(W/(m^2 · 40 kHz)) aggregate 100% of the time operational $epfd_{down}$ limit also applies to receive antennas located in Region 2, west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.]*

* This transitional regime would be applicable only if the pfd limits in section 5 *c)* of Annex 1 to Appendix **S30** are sufficiently relaxed.

Reasons: The ITU-R agreed that there is a need to provide a regulatory mechanism that would ensure protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where $epfd_{down}$ limits have been adopted. See section 3.1.1.3.2 of the CPM Report to WRC-2000. The aggregate limits contained in Tables WWW-1A to WWW-1D above are related to the single entry validation limits proposed in Tables S22-1A to S22-1D using the conversion methodology and conversion factor of 3.5, both agreed upon within the ITU-R.

In addition to the single-entry $epfd_{down}$ limits (validation, operational, and additional operational), CPM-99 agreed that a mechanism was needed which would provide assurance to GSO FSS and GSO BSS systems that the aggregate interference from all non-GSO FSS systems would not exceed that determined as an acceptable level. Aggregate validation limits had already been developed within the ITU-R based on the single-entry validation limits and are contained in Table WWW-1A to WWW-1D.

The square brackets around the last sentence in footnote 3 of Table WWW-1D can be removed only if the pfd limits in section 5 *c*) of Annex 1 to Appendix S30 are sufficiently relaxed as described in section 5.2.3.5 of the CPM Report.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Section VII

Background information

The CPM-99 Report indicated the need for regulatory procedures to implement the operational and additional operational $epfd_{down}$ limits which identify non-GSO systems exceeding the operational/additional operational limits and ensure immediate reduction of the interference level to the operational/additional operational limits by any non-GSO system exceeding those limits. The procedures proposed below, which would form a new Section VII to Article S15, were developed in response to this requirement.

Proposed section to include in Section VII - Article S15 for assuring compliance with operational limits and additional operational limits in Article S22

ADD IAP/14/288

S15.47 § 35 When an administration identifies $epfd_{down}$ levels in excess of the applicable operational $epfd_{down}$ limits or additional operational $epfd_{down}$ limits of Tables **S22-4A** and **S22-4B** and footnote 3 to Table **S22-1D** of the Radio Regulations, it shall first attempt to identify the source of the excess $epfd_{down}$ levels.

S15.48 § 36 If the administration operating the affected geostationary satellite network is able to identify the source of the excess $epfd_{down}$ interference, the administration may proceed to No. **S15.56** below.

S15.49 § 37 An administration that is unable to determine the source of the excess $epfd_{down}$ interference it is experiencing shall send a request for cooperation to all administrations operating non-geostationary fixed-satellite service systems in the band(s) where excess $epfd_{down}$ interference was experienced. The request should provide all relevant details, such as the location and operating frequencies of the affected geostationary earth station, and provide the dates, times, and, if available, levels of the excess $epfd_{down}$ interference experienced. A copy of the request shall be sent concurrently to the Bureau and to the non-GSO FSS operators, where possible.

S15.50 § 38 Each administration receiving the request shall acknowledge receipt, within 5 days. The administration receiving the request is urged to provide, with its acknowledgement, any information that may be used to identify the source of the excess $epfd_{down}$ interference. A copy of the acknowledgment and associated information shall be provided concurrently to the Bureau.

S15.51 § 39 If any administration fails to respond to a request made within 5 days, the Bureau shall send, by the close of the next business day, each such non-responding administration the acknowledgment called for in No. **S15.50** to be provided within 3 days thereafter. The Bureau shall provide copies of the request to the requesting administration and all recipients of the initial request.

S15.52 § 40 Once an administration has acknowledged receipt of the request made in No. **S15.49** above, it shall, within an additional 3 days thereafter, provide the requesting administration, the Bureau, and all other recipients of the initial request pursuant to No. **S15.49** above either with an admission that a non-geostationary fixed-satellite service system for which it is responsible is the cause of the excess $epfd_{down}$ interference or with information indicating that no non-geostationary fixed-satellite service system for which it is responsible could have caused the excess $epfd_{down}$ interference experienced by the network of the requesting administration.

S15.53 § 41 If any administration receiving a request pursuant to No. **S15.51** above fails to respond within the specified 3 day period, the Bureau shall immediately include the following statement in the "Remarks" column of the Master Register for the relevant frequency assignments for the subject non-geostationary fixed-satellite service system: "The use of these frequency bands by [name of system/name of administration] is the subject of an unresolved complaint of excess interference."

S15.54 § 42 The statement shall remain in the Master Register until such time as the responsible administration either provides information pursuant to No. **S15.52** above indicating that its non-geostationary fixed-satellite system is not the cause of the excess interference or, if it is the source of the excess $epfd_{down}$ interference, that it has complied with the obligations set forth in **S15.57**. The Bureau shall include notice of this entry in the Master Register in the Weekly Circular.

S15.55 § 43 If any administration fails to provide a timely and complete response pursuant to No. **S15.51** above, the remedial measures of Nos. **S15.52** and **S15.53** shall apply.

S15.56 § 44 Once the source of the excess $epfd_{down}$ interference has been identified, the administration operating the affected GSO satellite network shall inform the administration operating the non-geostationary fixed-satellite service system causing the excess interference of the excess, and request immediate corrective action. The notification/request for corrective action should provide all relevant details such as the amount and source of the excess $epfd_{down}$ interference received, and shall be copied to the Radiocommunication Bureau.

S15.57 § 45 Upon receipt of a request for corrective action made pursuant to No. **S15.56** above, the administration operating the non-geostationary fixed-satellite service system causing the excess interference shall immediately reduce emissions of the subject system to the levels required in Table **S22-4A** or Table **S22-4B** or footnote 3 to Table **S22-1D**, as appropriate, and, within 5 days of receipt of the request, so advise the administration whose network is affected. A copy of the acknowledgement and confirmation of the action taken shall be sent to the Bureau.

S15.58 § 46 Within 5 days after receipt of a request for corrective action made pursuant to No. **S15.56** above, in cases where the procedures in Nos. **S15.49** through **S15.55** above had not previously been applied, the administration receiving the request may, as an alternative to reducing emissions in the manner set forth in No. **S15.57**, provide the requesting administration and the Bureau with information indicating that no non-geostationary fixed-satellite service system for which it is responsible could have caused the excess $epfd_{down}$ interference experienced by the network of the requesting administration. In such a case, the procedures in Nos. **S15.49** through **S15.55** shall be applied before the procedures in Nos. **S15.59** and **S15.60** may be applied.

S15.59 § 47 If any administration fails to comply with No. **S15.57** above, the Bureau shall immediately include the following statement in the "Remarks" column of the Master Register for the relevant frequency assignments for the subject non-geostationary fixed-satellite service system: "The use of these frequency bands by [name of system/name of administration] is in violation of Nos. **S22.5G** and **S22.2** of the Radio Regulations."

The Bureau shall include notice of this entry in the Master Register in the Weekly Circular. The statement in the "Remarks" column shall remain in the Master Register until such time as the responsible administration complies with No. **S15.57** above.

S15.60 § 48 If after 30 days from the entry of the statement in the Master Register pursuant to No. **S15.59**, the administration operating the non-geostationary fixed-satellite service system causing the excess interference has not reduced emissions of the subject system to the levels required in Table **S22-4A** or Table **S22-4B** or footnote 3 to Table **S22-1D**, as appropriate, the Bureau shall:

The content of S15.60 § 48 will depend on the option selected. For consideration by WRC-2000, CITEL has identified the following possible options for the completion of this provision:

- *Suspension of right to international recognition,*
- *Cancellation of entry in MIFR,*
- *No further action,*
- *Other possible options.*

Reasons: CPM-99 agreed that "validation" masks, in conjunction with "operational" and "additional operational" limits, as appropriate, would adequately protect GSO FSS and GSO BSS systems. CPM-99 also agreed on the need for regulatory procedures to implement the operational limits which identify any non-GSO FSS systems exceeded in the operational limits and ensure immediate reduction of the interference level to the operational limits by any non-GSO FSS system exceeding those limits. See sections 3.1.2.4.7, 3.1.2.4.8, and 3.1.6.2 of the CPM Report. The procedures proposed above respond to this need.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Proposed suppression of Annex 1 to Resolution 130 (WRC-97)

Background information

Some modifications to Resolution 130 are currently being reviewed by CITEL Administrations. The proposals below are submitted since the limits in the Annex to this Resolution have been revised and are to be included in Article S22.

SUP IAP/14/289

ANNEX 1 TO RESOLUTION 130 (WRC-97)

Provisional limits

Reasons: Suppression of Annex 1 is as recommended in Annex 5 to Chapter 3 of the Report of CPM-99-2.

WRC-2000 agenda item 1.13.1 - to review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

Suppresion of Annex 1 to Resolution 538 (WRC-97)

Background information

Some modifications to Resolution 538 are currently being reviewed by CITEL Administrations. The proposals below are submitted since the limits in the Annex to this Resolution have been revised and are to be included in Article S22.

SUP IAP/14/290

ANNEX TO RESOLUTION 538 (WRC-97)

Provisional limits

Reasons: Limits as revised by WRC-2000 will be included in Article S22 of the Radio Regulations.

WRC-2000 agenda item 1.18 - to consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix 18/S18, taking into account Resolution 342 (WRC-97)

Resolution 87 (Minneapolis, 1998) Role of the notifying administration in the case of an administration on behalf of a named group of administrations

Background information

The administrations have considered any possible modifications to the Radio Regulations under Resolution 87. The administrations have not experienced any difficulties either with other administrations acting as the notifying administration for a group of named administrations or acting as the notifying administration for INTELSAT. The CITEL Administrations believe that the Radio Regulations are now adequate in this area and require no changes regarding the responsibilities of the notifying administration. The notifying administration and the intergovernmental organizations should retain the flexibility of making their own arrangements for interfaces with the ITU. Members of an intergovernmental organization responsible for satellite networks can best determine how it needs to comply with the Radio Regulations.

NOC IAP/14/291

S9.1 Before initiating any action under this Article or under Article **S11** in respect of frequency assignments for a satellite network or a satellite system, an administration, or one[6] acting on behalf of a group of named administrations, shall, prior to the coordination procedure described in Section II of Article **S9** below, where applicable, send to the Bureau a general description of the network or system for advance publication in the Weekly Circular not earlier than five years and preferably not later than two years before the planned date of bringing into use of the network or system (see also Nos. **S11.44** and **S11.44B** to **S11.44I**). The characteristics to be provided for this purpose are listed in Appendix **S4**. The coordination or notification information may also be communicated to the Bureau at the same time; it shall be considered as having been received by the Bureau not earlier than six months after the date of receipt of the information for advance publication where coordination is required by Section II of Article **S9**. Where coordination is not required by Section II, notification shall be considered as having been received by the Bureau not earlier than six months after the date of publication of the advance publication information.

Reasons: The current Radio Regulations are adequate. With respect to No. S9.1 the proposal applies only to the issue of the notifying administration.

NOC IAP/14/292

---

[6] **S9.1.1** Whenever, under this provision, an administration acts on behalf of a group of named administrations, all members of that group retain the right to respond in respect of their own networks or systems.

Reasons: The current Radio Regulations are adequate.

NOC IAP/14/293

---

[10] **S9.6.1** In the case of coordination of an assignment in a satellite network, an administration may act on behalf of a group of named administrations. Whenever, under this provision, an administration acts on behalf of a group of named administrations, all members of the group retain the right to respond in respect of their own services which could affect or be affected by the proposed assignment.

Reasons: The current Radio Regulations are adequate.

NOC IAP/14/294

---

[4] **S11.15.1** A frequency assignment to a space station or typical earth station as part of the satellite network may be notified by one administration acting on behalf of a group of named administrations. Any further notice (modification or deletion) relating to such an assignment shall, in the absence of information to the contrary, be regarded as having been submitted on behalf of the entire group.

Reasons: The current Radio Regulations are adequate.

WRC-2000 agenda item 1.19 - to consider the report of the inter-conference representative group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

Annex 7 to Appendix S30. Ensuring continued future access for Region 2 FSS networks to the GSO arc segment 37° W to 10° E in the band 11.7-12.2 GHz as currently provided by Annex 7 of Appendix S30

Background information

In addition to inviting the ITU-R to study the technical possibilities for increasing the minimum capacity assigned to all Region 1 and 3 countries in the BSS Plan for those Regions, Resolution **532** (**WRC-97**) requested the IRG "to examine Annex 7 [of Appendix S30/30] in the light of its studies for possible revision of the BSS Plans and with respect to the decisions taken by **WRC-97**, such as the reduction of downlink e.i.r.p." In response, the IRG and its associated Group of Technical Experts (GTE) examined Annex 7 in considerable detail.

The examination focused principally on Section A3) of the Annex, quoted here in its entirety.

"Any new orbital position in the Regions 1 and 3 Plan in the range of the orbital arc between 37° W and 10° E associated with a new assignment, or resulting from a modification of an assignment in the Plan, shall be coincident with, or within 1° to the east of, a nominal orbital position in the Region 1 and 3 Plan at the date of entry into force of the Final Acts of the 1977 Conference (in force on 1 January 1979).

In the event of a modification to an assignment in the Regions 1 and 3 Plan, the use of a new nominal orbital position not coincident with any nominal orbital position in the Plan at the date of entry into force of the Final Acts of the 1977 Conference (in force on 1 January 1979) shall involve an 8 dB reduction in the e.i.r.p. compared to that appearing in the Regions 1 and 3 Plan for the assignment before modification."

The need for such restrictions was agreed at WARC SAT-77 to take four facts into account: a) the band 11.7-12.2 GHz is allocated on a primary basis to the FSS in Region 2, the BSS in Region 1 and 3, and the terrestrial services (FS, MS, and BS) in all three Regions; b) the GSO arc segment 37° W to 10° E is of common interest to the Region 2 FSS and the Region 1 BSS; c) the BSS Plan adopted at WARC SAT-77 utilized "nominal orbital positions" at regular 6° intervals beginning with, and moving eastward from, 37° W; and, d) in 1977, the e.i.r.p. of a typical FSS satellite was over 20 dB lower than that assumed for the BSS satellites in the Plan.

One obvious consequence was that, in order to serve Region 2 from the orbital arc in question, future FSS systems would necessarily have to operate from positions between adjacent BSS orbital positions in the Plan. Technical studies at WARC SAT-77 showed that, for an FSS network serving eastern South America and a BSS Plan assignment serving western Africa, such operation required a minimum orbital separation of about 2.5° between the FSS and the BSS satellites. Accordingly, the first paragraph of section A3 ensures that future additions to the BSS Plan will not reduce the separation between adjacent BSS positions below 5°.

Another consequence was that, to facilitate sharing with both terrestrial services and the Region 2 FSS, it would be desirable to use lower satellite e.i.r.p.s for additions to the BSS Plan at positions different from those in the original Plan. For this reason, the second paragraph of Section A3) of Annex 7 specifies an 8 dB e.i.r.p. reduction when the Plan modification involves a new orbital position. It should be noted that this constraint is not confined to the arc 37° W to 10° E.

The technical examination by the ITU-R of the orbital position and e.i.r.p. constraints of Annex 7 led to the following main conclusions.

1) Despite the fact that the technical characteristics of both FSS and BSS networks have changed considerably since 1977 (higher e.i.r.p.s and smaller antennas for the FSS; lower e.i.r.p.s and even smaller antennas for the BSS; the use of digital modulation, lower system noise temperatures, and antennas with improved sidelobe levels in both), all of the technical studies conclude that the worst-case minimum required separation between a Region 2 FSS and a Region 1 BSS satellite remains at about 2 to 2.5°.

2) With the general reduction of 5 dB in the satellite e.i.r.p. assumed in revising the original BSS Plan at **WRC-97**, the 8 dB reduction for in the second paragraph of Section A3) of Annex 7 is no longer required to protect the terrestrial services.

3) The sharing criteria of Annex 1 of Appendix S30 (for protecting Region 2 FSS networks that have been notified or are in coordination from modifications to the Regions 1 and 3 Plans) and the corresponding criteria of Annex 4 of Appendix S30 (to protect the Plan from new Region 2 FSS systems) are not, in themselves, sufficient to ensure either access by Region 2 FSS networks or appropriate interference protection to both FSS and BSS in the orbital arc 37° W to 10° E.

4) The results of the IRG planning feasibility studies demonstrated that compliance with the Annex 7 orbit position limitations was not a barrier to the successful elaboration of a Plan for Regions 1 and 3 providing the desired 10 channels for each country (12 channels for Region 3 countries).

In addition to the foregoing technical conclusions, it was observed that, although the countries of North America have made heavy use of the GSO at positions west of about 60° W for FSS networks providing national coverage, the countries of South America have not yet made significant use of more easterly orbital positions. Indeed, although several planned “international” FSS networks include the 11.7-12.2 GHz band at positions in the orbital arc identified in Annex 7, only one such network is in operation, and none of them seek to use the full band or to offer a representative range of services. It can therefore be argued that, just as the **WRC-97** Plan provides long-term guarantees of orbit-spectrum access for national-coverage BSS systems for the developing countries of Region 1 and 3, the developing countries of Latin America continue to need provisions that will allow them to implement future national or multinational FSS systems. The need for such provisions is probably greater today than it was in 1977 precisely because of the heavy FSS use of more westerly orbital positions.

APPENDIX S30

ANNEX 7

Orbital position limitations

NOC IAP/14/295

A In applying the procedure of Article 4 for modifications to the appropriate Regional Plan, administrations should observe the following criteria:

NOC IAP/14/296

1) No broadcasting satellite serving an area in Region 1 and using a frequency in the band 11.7-12.2 GHz shall occupy a nominal orbital position further west than 37° W or further east than 146° E.

2) No broadcasting satellite serving an area in Region 2 that involves an orbital position different from that contained in the Region 2 Plan shall occupy a nominal orbital position:

a) further east than 54° W in the band 12.5-12.7 GHz; *or*

b) further east than 44° W in the band 12.2-12.5 GHz; *or*

c) further west than 175.2° W in the band 12.2-12.7 GHz.

However, modifications necessary to resolve possible incompatibilities during the incorporation of the Regions 1 and 3 feeder-link Plan into the Radio Regulations shall be permitted.

MOD IAP/14/297

3) Any new orbital position in the Regions 1 and 3 Plan in the range of the orbital arc between 37° W and 10° E associated with a new assignment, or resulting from a modification of an assignment in the Plan, shall be coincident with, or within 1° to the east of, a nominal orbital position in the Region 1 and 3 Plan at the date of entry into force of the Final Acts of the 19~~77~~97 Conference (in force on 1 January 19~~79~~99).

Within this range of orbital arc, ~~In the event of a modification to an assignment in the Regions 1 and 3 Plan,~~ the use of a new nominal orbital position not coincident with any nominal orbital position in the Plan at the date of entry into force of the Final Acts of the 19~~77~~97 Conference (in force on 1 January 19~~79~~99) shall involve ~~an 8~~ a 3 dB reduction in the e.i.r.p. compared to that appearing in the Regions 1 and 3 Plan for the assignment before modification.

NOC IAP/14/298

B The Region 2 Plan is based on the grouping of the space stations in nominal orbital positions of +0.2° and –0.2° from the centre of the cluster of satellites. Administrations may locate those satellites within a cluster at any orbital position within that cluster, provided they obtain the agreement of administrations having assignments to space stations in the same cluster. (See § 4.13.1 of Annex 3 to Appendix **S30A**.)

Reasons: The provisions of Annex 7 of Appendix S30, suitably updated as proposed here, are no less essential to the future development of Region 2 FSS networks for Latin American countries than they were when originally adopted at WARC SAT-77 and continued at WRC-97. They constitute a demonstrably effective means for ensuring equitable access by Region 2 FSS systems to the orbital arc 37° W to 10° E and the band 11.7-12.2 GHz while allowing the number of Region 1 BSS Plan assignments in this part of the orbit-spectrum resource to double through the addition of new orbital positions to the Plan. When WRC-97 revised the Regions 1 and 3 Plan, they reduced the e.i.r.p. of all assignments by 5 dB (except for the two or three already in operation); therefore, the e.i.r.p. reduction in the second paragraph of Section A3) can be reduced from 8 to 3 dB.

WRC-2000 agenda item 1.20 - to consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

pfd limits in Annex 1 to Appendix S30 (Section 8 *b*)

Background information

Chapter 5 of the CPM Report addresses issues associated with Appendix S30 and S30A of the Radio Regulations. Specifically section 5.2.3.5 covers issues related to protection of the terrestrial service from modifications to the Appendix S30 BSS Plans. Sections 4, 5 and 8 of Annex 1 of Appendix S30 specifies power flux-density (pfd) limits to determine if terrestrial services may be affected by modifications to the Plans.

The CPM Report addresses in detail sections 5 *b*) and 5 *c*) of Annex 1 (pfd limits to protect terrestrial services in Regions 1 and 3) and proposes modifying those pfd limits to be consistent with the pfd limits contained in Table S21-4 of Article S21 for the protection of the fixed service from the fixed-satellite service. Additionally, section 5.2.3.5 of the CPM Report encourages review of the pfd limits to protect terrestrial services in sections 4, 5 and 8 of Annex 1 of Appendix S30 for possible modification or consolidation.

This proposal addresses section 8 *b*) of Annex 1, which provides the pfd limit to determine if terrestrial services in Region 2 may be affected by a modification to the Region 2 BSS Plan. The current limit is a single pfd value that does not vary as a function of arrival angle as is typical of pfd limits to protect terrestrial services in the Radio Regulations. After review of the existing limit it is proposed that the power flux-density limit in 8 *b*) be modified to bring it into alignment with the pfd limits to protect the fixed service in other parts of the Radio Regulations. This proposal is consistent with the proposal contained in the CPM Report regarding pfd limits to protect terrestrial services in Regions 1 and 3.

APPENDIX S30

ANNEX 1

NOC

8 Limits to the change in the power flux-density to protect the terrestrial services of other administrations

a) In Region 1 or 3:

With respect to § 4.3.1.4 of Article 4, an administration in Region 1 or 3 shall be considered as being affected if the consequence of the proposed modification of an existing assignment in the Regions 1 and 3 Plan is to increase the power flux-density arriving on any part of the territory of that administration by more than 0.25 dB over that resulting from that frequency assignment in the Regions 1 and 3 Plan at the time of entry into force of the Final Acts (1977 Conference, in force on 1 January 1979). The same administration shall be considered as not being affected if the value of the power flux-density anywhere in its territory does not exceed the limits expressed in § 5 *a)* and 5 *b)* of this Annex applied to the frequency range 11.7-12.5 GHz.

With respect to § 4.3.1.4 of Article 4, in the case of an addition of a new assignment to the Regions 1 and 3 Plan, an administration in Region 1 or 3 is considered as being affected if the power flux-density on any part of its territory exceeds the limit expressed in § 5 *a)* and 5 *b)* of this Annex applied to the frequency range 11.7-12.5 GHz.

MOD IAP/14/299

b) In Region 2:

With respect to § 4.3.3.4 of Article 4, an administration in Region 2 shall be considered as being affected if the consequence of the proposed modification to an existing assignment in the Region 2 Plan is to increase the power flux-density arriving on any part of the territory of that administration by more than 0.25 dB over that resulting from that frequency assignment in the Region 2 Plan at the time of entry into force of the Final Acts (1985 Conference). The same administration shall be considered as not being affected if the value of the power flux-density anywhere in its territory does not exceed the following limits: ~~–115 dB(W/m²).~~

-148 dB(W/m^2/4 kHz) for $0° \leq \gamma < 5°$

$-148 + 0.5 (\gamma - 5)$ dB(W/m^2/4 kHz) for $5° \leq \gamma < 25°$

-138 dB(W/m^2/4 kHz) for $25° \leq \gamma < 90°$

where γ is the angle of arrival of the incident wave above the horizontal plane, in degrees.

With respect to § 4.3.3.4 of Article 4, in the case of an addition of a new assignment to the Region 2 Plan, an administration in Region 2 is considered as being affected if the power flux-density on any part of its territory exceeds ~~–115 dB(W/m²).~~ the following limits:

-148 dB(W/m^2/4 kHz) for $0° \leq \gamma < 5°$

$-148 + 0.5 (\gamma - 5)$ dB(W/m^2/4 kHz) for $5° \leq \gamma < 25°$

-138 dB(W/m^2/4 kHz) for $25° \leq \gamma < 90°$

where γ is the angle of arrival of the incident wave above the horizontal plane, in degrees.

Reasons: A modification in the pfd limit in Section 8 *b*) of Annex 1 of Appendix S30, as proposed above, would be consistent with pfd limits to protect terrestrial services in other parts of the Radio Regulations. This proposal conforms to the proposal in the CPM Report regarding pfd limits to protect terrestrial services in Regions 1 and 3.

PROPOSAL FOR THE WORK OF THE CONFERENCE

Please replace proposal IAP/14/20 with the following:

NOC IAP/14/20

S52.219 3) Coast stations employing class J3E or J2D emissions in accordance with No. **S52.217** in the bands between 4 000 kHz and 27 500 kHz shall use the minimum power necessary to cover their service area and shall at no time use a peak envelope power in excess of 10 kW per channel.

Reasons: This is consistent with CITEL's proposals IAP/14/30 MOD S52.222 where CITEL proposes only an editorial modification and IAP/14/32 MOD S52.222.2 which modifies the power in order to provide adequate communications coverage due to geographical differences.

57-73	Proposal to modify Appendix S18 and Resolution 342	1.18								x		x	x		x								x											x	x	

Agenda item 1.8 - To consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Proposal for communications by earth stations on board vessels using frequencies allocated to the fixed-satellite service and used by existing space segment in the fixed-satellite service

Background information

This item concerns provision of communications by earth stations on board vessels (ESVs) using frequencies allocated to the fixed-satellite service and used by existing space segment in the fixed-satellite service. These stations operate in three distinct modes: at sea; while stationary in or near port; and in motion approaching or departing from port.

Operations at sea (beyond a certain distance for near-shore coordination) by ESVs in the fixed-satellite service do not present a potential for interference to stations in the fixed service operating in accordance with the 6 GHz FS allocation, and therefore need not be coordinated. Operations while these earth stations are stationary at pre-determined points can be coordinated bilaterally with fixed service systems. Technical and regulatory issues concern the potential for interference between in-motion operations by these ESVs operating close to shore and stations in the fixed service both on and offshore.

The studies that have been conducted in ITU-R have illustrated that the values for the minimum distance are principally affected by the interference criteria required to protect the fixed service and the number of passages per unit time by vessels equipped with earth stations. Based on different values for these assumptions, the results of these preliminary studies yielded a range of values for the minimum distance from 100 km to 540 km. It should be noted that studies submitted to the CPM by some administrations suggested values for the minimum distance of 150 km to 370 km. Upon further review CITEL Administrations are of the opinion that 200 km is sufficiently conservative to protect the fixed service systems operating in the same band from interference.

ADD IAP/14/44

S5.ESV In the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz, transponders on space stations in the fixed-satellite service may be used, additionally, by earth stations on vessels. Such use is subject to the provisions specified in the procedures of Resolution **ZZZ (WRC-2000)**.

Reasons: To establish regulatory and technical provisions for operations of earth stations on board vessels in the fixed-satellite service and protection for terrestrial stations operating in the FS in the same band.

ADD IAP/14/45

RESOLUTION ZZZ (WRC-2000)

Provisions to enable earth stations located on board vessels to operate in fixed-satellite service networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that there is a demand for global wideband satellite communication services on vessels;

b) that the technology exists that would permit the use of fixed-satellite services (FSS) networks by earth stations on board vessels (ESVs) operating in the 3 700-4 200 MHz and 5 925-6 425 MHz bands;

c) that ESVs have the potential to cause unacceptable interference to the fixed service (FS) systems in the band 5 925-6 425 MHz;

d) that FS systems have the potential to cause interference to ESVs in the 3 700-4 200 MHz band;

e) that ESVs operating in these bands require considerably less than the full bandwidth in this FSS allocation and only a portion of the visible geostationary arc;

f) that there are a limited number of geostationary FSS systems that have global coverage;

g) that in order to ensure the protection and future growth of the FS, the ESV must operate with certain technical and operational constraints;

h) that administrations may authorize radiocommunication stations on off-shore structures and platforms for which they are responsible;

i) that based on appropriate assumptions a minimum distance can be calculated beyond which the ESV will not have the potential to cause unacceptable interference to the fixed service in this band,

noting

a) that operation within the territorial sea is at the discretion of the administration with territorial authority, in which case the relevant procedures of that administration will apply;

b) that operation of earth stations on vessels from specified fixed points at locations outside the territorial sea but for which an administration has territorial jurisdiction is fully within the FSS,

resolves

1 that the administration that issues the radio licence for the use of ESVs in these bands (licensing administration) shall ensure that such stations do not cause unacceptable interference to stations in the fixed service;

2 that licensing administrations shall ensure that ESVs are capable of operating in compliance with the requirements of this Resolution;

3 that operators of ESVs shall comply with the conditions listed in the Annex to this Resolution and as may be established by the licensing administration(s);

4 that ESVs shall not claim protection from fixed service station transmissions;

5 that on a provisional basis any transmissions from ESVs within a distance of 200 km of any given coast shall be based upon the prior agreement of that coastal administration;

6 that ESV operators shall provide any assistance necessary to the coastal administration in order to facilitate the agreement;

7 that the ESV system shall include means of identification and automatic mechanisms to terminate transmissions whenever the station operates outside its pre-authorized geographic (see *resolves* 5) or operational limits;

8 that ESVs shall be equipped so as to enable the licensing administration under the provisions of Article **S18** to verify earth station performance and to accomplish the switch off of the ESV transmission immediately upon request by an administration whose services may be affected;

9 that when ESVs operating beyond the territorial sea but within 200 km of the coast of an administration fail to comply with the terms required by that administration pursuant to *resolves* 3 and 5, then that administration may:

– request the ESV to comply with such terms or cease operation immediately; or

– request the licensing administration to require such compliance or immediate cessation of the operation;

10 that any licensing authority that licenses ESVs shall agree to maintain at all times a point of contact, which shall be published in a circular of the ITU, that may be contacted by an affected administration seeking assistance pursuant to *resolves* 3 and 5 above,

invites ITU-R as a matter of urgency

1 to continue its studies to determine the optimum technical and operational constraints to be applied to ESV operations and, in particular, to determine the minimum operational distance from the coast of an administration beyond which ESVs are assumed not to have the potential to cause unacceptable interference to fixed service stations of that administration;

2 to develop recommendations on methods for coordination between terrestrial stations and ESVs while in motion at less than the minimum distance specified in *resolves* 5;

3 to report on the results of these studies to the Conference Preparatory Meeting for WRC-[03],

urges administrations

to participate actively in the aforementioned studies by submitting contributions to ITU-R,

requests

WRC-[03] to take appropriate action based on those studies.

ANNEX TO RESOLUTION ZZZ (WRC-2000)

Provisional technical constraints applicable to ESVs operating in the bands 3 700-4 200 MHz and 5 925-6 425 MHz

Minimum diameter of ESV antenna:	2.4 m
Maximum half-power beamwidth of ESV antenna:	1.5 degrees
Minimum elevation angle of ESV antenna:	10°
Maximum necessary bandwidth per vessel:	2.346 MHz
Maximum necessary bandwidth in a single operating area:	36 MHz
Maximum ESV transmitter power spectral density at the input to the antenna:	17 dB(W/MHz)
Tracking accuracy of ESV antenna:	0.2 degrees

Reasons: To establish regulatory and operational provisions for ESV operations in the fixed-satellite service and to avoid the uncontrolled deployment of, and communications by ESVs and ensure the protection of the fixed service.

CONTENTS

WRC-2000 agenda item 1.2 - To finalize remaining issues in the review of Appendix S3 to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation 66 (Rev.WRC-97) and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services

Background information

Recommendation 66 (Rev.WRC-97) directs ITU-R to submit a report to WRC-2000 with a view to finalizing the space services spurious emissions limits in Appendix S3 of the Radio Regulations. The CITEL Administrations propose text that would remove the “design objectives” designation from the space services spurious emissions limits and make related appropriate modifications applicable to deep-space systems, satellites with spurious emissions falling within the necessary bandwidth of another transmitter on the same satellite, and amateur earth stations below 30 MHz. Also, the CITEL Administrations propose to adequately recognize the case of very narrowband and unmodulated signals, particularly for the space services. Furthermore, the CITEL Administrations propose to correct an oversight in Appendix S3 regarding limits for the radiodetermination service, and specify that spurious emission levels for radar systems be determined from radiated emissions.

APPENDIX S3

Table of maximum permitted spurious emission power levels

(See Article **S3**)

1 The following sections indicate the maximum permitted levels of spurious emissions, in terms of power as indicated in the tables, of any spurious component supplied by a transmitter to the antenna transmission line. Section I is applicable until 1 January 2012 to transmitters installed on or before 1 January 2003; Section II is applicable to transmitters installed after 1 January 2003 and to all transmitters after 1 January 2012. This Appendix does not cover out-of-band emissions. Out-of-band emissions are dealt with in No. **S4.5**.

2 Spurious emission from any part of the installation, other than the antenna and its transmission line, shall not have an effect greater than would occur if this antenna system were supplied with the maximum permitted power at that spurious emission frequency.

3 These levels shall not, however, apply to emergency position-indicating radiobeacon (EPIRB) stations, emergency locator transmitters, ships’ emergency transmitters, lifeboat transmitters, survival craft stations or maritime transmitters when used in emergency situations.

4 For technical or operational reasons, more stringent levels than those specified may be applied to protect specific services in certain frequency bands. The levels applied to protect these services, such as safety and passive services, shall be those agreed upon by the appropriate world radiocommunication conference. More stringent levels may also be fixed by specific agreement between the administrations concerned. Additionally, special consideration of transmitter spurious emissions may be required for the protection of safety services, radio astronomy and space services using passive sensors. Information on the levels of interference detrimental to radio astronomy, Earth exploration satellites and meteorological passive sensing is given in the most recent version of Recommendation ITU-R SM.329.

5 Spurious emission limits for combined radiocommunication and information technology equipment are those for the radiocommunication transmitters.

Section I – Spurious emission limits for transmitters installed on or before 1 January 2003 (valid until 1 January 2012)

MOD IAP/14/1

6 ~~The measurement methods for radar systems should be guided by Recommendation ITU-R M.1177. For those radar systems for which acceptable methods of measurement do not exist, t~~Radar systems are exempt from spurious emission limits under this section. The lowest practicable power of spurious emission should be achieved.

TABLE I

Attenuation values and absolute mean power levels used to calculate maximum permitted spurious emission power levels for use with radio equipment

Frequency band containing the assignment (lower limit exclusive, upper limit inclusive)	**For any spurious component, the attenuation (mean power within the necessary bandwidth relative to the mean power of the spurious component concerned) shall be at least that specified below and the absolute mean power levels given shall not be exceeded**[1]
9 kHz to 30 MHz	40 dB 50 mW [2, 3, 4]
30 MHz to 235 MHz	
– mean power above 25 W	60 dB 1 mW [5]
– mean power 25 W or less	40 dB 25 µW
235 MHz to 960 MHz	
– mean power above 25 W	60 dB 20 mW [6, 7]
– mean power 25 W or less	40 dB 25 µW [6, 7]
960 MHz to 17.7 GHz	
– mean power above 10 W	50 dB 100 mW [6, 7, 8, 9]
– mean power 10 W or less	100 µW [6, 7, 8, 9]
Above 17.7 GHz	The lowest possible values achievable shall be employed (see Recommendation **66 (Rev.WRC-97)**).

TABLE I (*end*)

1 When checking compliance with the provisions of the Table, it shall be verified that the bandwidth of the measuring equipment is sufficiently wide to accept all significant components of the spurious emission concerned.

2 For mobile transmitters which operate below 30 MHz, any spurious component shall have an attenuation of at least 40 dB without exceeding the value of 200 mW, but every effort should be made to comply with the level of 50 mW wherever practicable.

3 For transmitters of a mean power exceeding 50 kW which can operate on two or more frequencies covering a frequency range approaching an octave or more, while a reduction below 50 mW is not mandatory, a minimum attenuation of 60 dB shall be provided.

4 For hand-portable equipment of mean power less than 5 W, the attenuation shall be 30 dB, but every practicable effort should be made to attain 40 dB attenuation.

5 Administrations may adopt a level of 10 mW provided that harmful interference is not caused.

6 Where several transmitters feed a common antenna or closely spaced antennas on neighbouring frequencies, every practicable effort should be made to comply with the levels specified.

7 Since these levels may not provide adequate protection for receiving stations in the radio astronomy and space services, more stringent levels might be considered in each individual case in the light of the geographical position of the stations concerned.

8 These levels are not applicable to systems using digital modulation techniques, but may be used as a guide. Values for these systems may be provided by the relevant ITU-R Recommendations, when available (see Recommendation **66 (Rev.WRC-97)**).

9 These levels are not applicable to stations in the space services, but the levels of their spurious emissions should be reduced to the lowest possible values compatible with the technical and economic constraints to which the equipment is subject. Values for these systems may be provided by the relevant ITU-R Recommendations, when available (see Recommendation **66 (Rev.WRC-97)**).

Section II – Spurious emission limits for transmitters installed after 1 January 2003 and for all transmitters after 1 January 2012

Application of these limits

7 The frequency range of the measurement of spurious emissions is from 9 kHz to 110 GHz or the second harmonic if higher.

MOD IAP/14/2

8 Guidance regarding the methods of measuring spurious emissions is given in the most recent version of Recommendation ITU-R SM.329. The e.i.r.p. method specified in that Recommendation should be used when it is not possible to measure the power supplied to the antenna transmission line, or for specific applications, such as radars, where the antenna is designed to provide significant attenuation at the spurious frequencies. Additionally, the e.i.r.p. method may need some modification for special cases, e.g. beam-forming radars.

9 Guidance regarding the methods of measuring spurious emissions from radar systems is given in the most recent version of Recommendation ITU-R M.1177. The reference bandwidths required for proper measurement of radar spurious emissions should be calculated for each particular radar system. Thus, for the three general types of radar pulse modulation utilized for radionavigation, radiolocation, acquisition, tracking and other radiodetermination functions, the reference bandwidth values should be:

– for fixed-frequency, non-pulse-coded radar, one divided by the radar pulse length, in seconds (e.g. if the radar pulse length is 1 μs, then the reference bandwidth is 1/1 μs = 1 MHz);

– for fixed-frequency, phase coded pulsed radar, one divided by the phase chip length, in seconds (e.g. if the phase coded chip is 2 μs long, then the reference bandwidth is 1/2 μs = 500 kHz);

– for frequency modulated (FM) or chirped radar, the square root of the quantity obtained by dividing the radar bandwidth in MHz by the pulse length, in seconds (e.g. if the FM is from 1 250 MHz to 1 280 MHz or 30 MHz during the pulse of 10 μs, then the reference bandwidth is $(30 \text{ MHz}/10\ \mu\text{s})^{1/2}$ = 1.73 MHz).

For those radar systems for which acceptable methods of measurement do not exist, the lowest practicable power of spurious emission should be achieved.

10 The spurious emission levels are specified in the following reference bandwidths:

– 1 kHz between 9 kHz and 150 kHz

– 10 kHz between 150 kHz and 30 MHz

– 100 kHz between 30 MHz and 1 GHz

– 1 MHz above 1 GHz.

As a special case, the reference bandwidth of all space service spurious emissions should be 4 kHz.

11 For the purpose of setting limits, all emissions, including harmonic emissions, intermodulation products, frequency conversion products and parasitic emissions, which fall at frequencies separated from the centre frequency of the emission by ±250%, or more, of the necessary bandwidth of the emission will generally be considered as spurious emissions. However, this frequency separation may be dependent on the type of modulation used, the maximum bit rate in the case of digital modulation, the type of transmitter and frequency coordination factors. For example, in the case of digital (including digital broadcasting) modulation systems, broadband systems, pulsed modulation systems and narrow-band high power transmitters, the frequency separation may need to differ from the ±250% factor. For multichannel or multicarrier transmitters/transponders, where several carriers may be transmitted simultaneously from a final output amplifier or an active antenna, the centre frequency of the emission is taken to be the centre of the –3 dB bandwidth of the transmitter or transponder and the necessary bandwidth is taken to be the transmitter or transponder bandwidth.

ADD IAP/14/3

11*bis* As an emitted signal becomes more and more narrow (to the limiting case of an unmodulated carrier with theoretical necessary bandwidth of zero), the application of the term “necessary bandwidth” as used in determining the region where spurious emission limits apply to space services, becomes more and more difficult. In the limit, ±250% of necessary bandwidth (generally recognized as establishing the region beyond which spurious emissions are defined), approaches zero. Beacon and other unmodulated signals, such as those used in uplink and downlink circuits in control and tracking of satellites, are examples of a case where it is difficult to practically apply the term “necessary bandwidth” in determining where out-of-band emissions end, and spurious emissions begin. Pending further studies and definitive action by a future world radiocommunication conference, in calculating the region where spurious emission limits apply for transmitters using amplifiers to pass essentially an unmodulated signal (or a signal with very small bandwidth), the amplifier bandwidth is taken to be the necessary bandwidth (in calculating the regions where spurious emissions apply.

ADD IAP/14/4

11*ter* For satellites employing more than one transponder, and when considering the limits for spurious emission as indicated by Headnote 11 to Appendix **S3**, spurious emissions from one transponder may fall on a frequency at which a companion, second transponder is transmitting or in the guardband between two transponders. In this situation, the level of spurious emission from the first transponder is well exceeded by fundamental emissions of the second transponder or within the guard bands between the different transponders. Therefore, limits in this Appendix do not apply to those spurious emissions on a satellite which fall within the bands where there are transmissions from the same satellite into the same service area.

12 Examples of applying 43 + 10 log (*P*) to calculate attenuation requirements

Where specified in relation to mean power, spurious emissions are to be at least *x* dB below the total mean power *P*, i.e. –*x* dBc. The power *P* (W) is to be measured in a bandwidth wide enough to include the total mean power. The spurious emissions are to be measured in the reference bandwidths given in the Recommendation. The measurement of the spurious emission power is independent of the value of necessary bandwidth. Because the absolute emission power limit, derived from 43 + 10 log (*P*), can become too stringent for high-power transmitters, alternative relative powers are also provided in Table II.

Example 1

A land mobile transmitter, with any value of necessary bandwidth, must meet a spurious emission attenuation of 43 + 10 log (*P*), or 70 dBc, whichever is less stringent. To measure spurious emissions in the frequency range between 30 MHz and 1 GHz, Recommendation ITU-R SM.329-7 *recommends* 4.1 indicates the use of a reference bandwidth of 100 kHz. For other frequency ranges, the measurement must use the appropriate reference bandwidths given in *recommends* 4.1.

With a measured total mean power of 10 W:

– Attenuation relative to total mean power = 43 + 10 log (10) = 53 dBc.

– The 53 dBc value is less stringent than the 70 dBc, so the 53 dBc value is used.

– Therefore: Spurious emissions must not exceed 53 dBc in a 100 kHz bandwidth, or converting to an absolute level, spurious emissions must not exceed 10 dBW – 53 dBc = –43 dBW in a 100 kHz reference bandwidth.

With a measured total mean power of 1 000 W:

– Attenuation relative to total mean power = 43 + 10 log (1 000) = 73 dBc.

– The 73 dBc value is more stringent than the 70 dBc limit, so the 70 dBc value is used.

– Therefore: Spurious emissions must not exceed 70 dBc in a 100 kHz bandwidth, or converting to an absolute level, spurious emissions must not exceed 30 dBW – 70 dBc = –40 dBW in a 100 kHz reference bandwidth.

Example 2

A space service transmitter with any value of necessary bandwidth must meet a spurious emission attenuation of 43 + 10 log (*P*), or 60 dBc, whichever is less stringent. To measure spurious emissions at any frequency, Note 10 to Table II indicates using a reference bandwidth of 4 kHz.

With a measured total mean power of 20 W:

– Attenuation relative to total mean power = 43 + 10 log (20) = 56 dBc.

– The 56 dBc value is less stringent than the 60 dBc limit, so the 56 dBc value is used.

– Therefore: Spurious emissions must not exceed 56 dBc in a 4 kHz reference bandwidth, or converting to an absolute level, spurious emissions must not exceed 13 dBW – 56 dBc = −43 dBW in a 4 kHz reference bandwidth.

MOD IAP/14/5

TABLE II

Attenuation values used to calculate maximum permitted spurious emission power levels for use with radio equipment

Service category in accordance with Article S1, or equipment type [15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
All services except those services quoted below:	43 + 10 log (*P*), or 70 dBc, whichever is less stringent
Space services (earth stations) [10, ~~14~~16]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Space services (space stations) [10, ~~14~~17]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Radiodetermination[14]	43 + 10 log (*PEP*), or 60 dB, whichever is less stringent
Broadcast television [11]	46 + 10 log (*P*), or 60 dBc, whichever is less stringent, without exceeding the absolute mean power level of 1 mW for VHF stations or 12 mW for UHF stations. However, greater attenuation may be necessary on a case by case basis.
Broadcast FM	46 + 10 log (*P*), or 70 dBc, whichever is less stringent; the absolute mean power level of 1 mW should not be exceeded
Broadcasting at MF/HF	50 dBc; the absolute mean power level of 50 mW should not be exceeded
SSB from mobile stations [12]	43 dB below *PEP*
Amateur services operating below 30 MHz (including with SSB) [12, 16]	43 + 10 log (*PEP*), or 50 dB, whichever is less stringent
Services operating below 30 MHz, except space, radiodetermination, broadcast, those using SSB from mobile stations, and amateur [12]	43 + 10 log (*X*), or 60 dBc, whichever is less stringent, where *X* = *PEP* for SSB modulation, and *X* = *P* for other modulation

TABLE II (*end*)

Service category in accordance with Article S1, or equipment type [15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
Low-power device radio equipment [13]	56 + 10 log (*P*), or 40 dBc, whichever is less stringent
Emergency position-indicating radio beacon Emergency locator transmitter Personal location beacon Search and rescue transponder Ship emergency, lifeboat and survival craft transmitters Land, aeronautical or maritime transmitters when used in emergency	No limit

P: mean power in watts supplied to the antenna transmission line, in accordance with No. **S1.158**. When burst transmission is used, the mean power *P* and the mean power of any spurious emissions are measured using power averaging over the burst duration.

PEP: peak envelope power in watts supplied to the antenna transmission line, in accordance with No. **S1.157**.

dBc: decibels relative to the unmodulated carrier power of the emission. In the cases which do not have a carrier, for example in some digital modulation schemes where the carrier is not accessible for measurement, the reference level equivalent to dBc is decibels relative to the mean power *P*.

[10] Spurious emission limits for all space services are stated in a 4 kHz reference bandwidth.

[11] For analogue television transmissions, the mean power level is defined with a specified video signal modulation. This video signal has to be chosen in such a way that the maximum mean power level (e.g. at the video signal blanking level for negatively modulated television systems) is supplied to the antenna transmission line.

[12] All classes of emission using SSB are included in the category “SSB”.

[13] Low-power radio devices having a maximum output power of less than 100 mW and intended for short-range communication or control purposes; such equipment is in general exempt from individual licensing.

MOD IAP/14/6

[14] ~~These values are “design objectives”. This note will not be applicable after WRC-99~~Radiodetermination (Radar) system spurious emission dB attenuation shall be determined for radiated emission levels, not at the antenna transmission line. The measurement methods for determining the radiated spurious emission levels from the radar systems should be guided by Recommendation ITU-R M.1177.

[15] In some cases of digital modulation (including digital broadcasting), broadband systems, pulsed modulation and narrow-band high-power transmitters for all categories of services, there may be difficulties in meeting limits close to ± 250% of the necessary bandwidth.

ADD IAP/14/7

[16] Amateur earth stations operating below 30 MHz are in the service category “Amateur services operating below 30 MHz (including with SSB)”.

ADD IAP/14/8

[17] Space stations, intended to operate in deep space (defined in **S1.177**) are exempt from spurious emission limits.

Reasons: Recommendation 66 (Rev.WRC-97) directs the ITU-R to submit a report to the next WRC with a view to finalizing the space services spurious emissions limits in Appendix S3 of the Radio Regulations. The CITEL administrations propose to confirm the values in Table II and “clean up” the table by removing the “design objectives” designation from the space services spurious emissions limits. Furthermore, by clarifying the exemption of radar systems from the Section I limits, the CITEL administrations propose to correct an oversight in Appendix S3 regarding limits for the radiodetermination service that may lead incorrectly to the application of the Section I limits to radars. Also, the CITEL administrations propose to clarify the application of the e.i.r.p. measurement method to radars particularly, but also to other systems where antenna line measurements may not be appropriate.

WRC-2000 agenda item 1.4 - To consider issues concerning allocations and regulatory aspects related to Resolutions 126 (WRC-97), 128 (WRC-97), 129 (WRC-97), 133 (WRC-97), 134 (WRC-97) and 726 (WRC-97)

Proposal for the confirmation of the fixed service allocation in the 31.8-33.4 GHz frequency range (Resolutions 126 and 726)

Background information

Resolutions 126 and 726 invite ITU-R to address, among other issues, sharing between high density fixed systems (HDFS) and other radiocommunication services sharing spectrum in the bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz bands.

At WRC-97, a number of frequency bands above 30 GHz were identified through Resolution 726 as available for the deployment of high-density fixed systems. Included in Resolution 726 is the frequency range 31.8-33.4 GHz. WRC-97 amended the Table of Frequency Allocations to include the fixed service on a primary basis in the 31.8-33.4 GHz range subject to conditions found in Resolution 126. The first condition stipulated that this allocation to the fixed service would not go into force until 1 January 2001. Secondly, this allocation would be reviewed at WRC-2000 taking into account the results of sharing studies and the future requirements of the other allocated services. The frequency range 31.8-33.4 GHz has also has primary allocations to the radionavigation, space research (space-to-Earth) (deep space) and the inter-satellite services.

ITU-R, through various working parties, have studied the sharing potential between the fixed service (high density applications) and the other primary services. With regard to sharing between the fixed and radionavigation service, studies indicated that sharing may be possible through the use of appropriate mitigation and operational measures, recognizing that fixed systems may receive emissions from airborne radionavigation systems. However, actual interference events are expected to be rare. The CPM Report recommended that sharing between the fixed and radionavigation service could be addressed through the development of appropriate ITU-R Recommendations. Sharing between the fixed service and the deep space facilities is considered practical as there are only a few deep space sites in the world and coordination with the fixed stations is feasible. It would be appropriate to adopt a suitable free-space spectral pfd limit at the surface of the Earth in order to provide adequate protection to HDFS systems from BSS satellites in a temporary near-Earth orbit phase, Studies have also concluded that interference levels from high-density fixed stations into inter-satellite receivers are well within acceptable limits.

Use of the frequency band 31.8-33.4 GHz for high-density systems in the fixed service

MOD IAP/14/13

S5.547A ~~Use of the band 31.8-33.4 GHz by the fixed service shall be in accordance with Resolution **126 (WRC-97)**.~~Due to the operational nature of the radionavigation service, systems in the fixed service operating in the 31.8-33.4 GHz band may be subject to emissions from airborne radionavigation systems. Interference into fixed systems is expected to be rare, however, administrations are encouraged to take practical measures to minimize potential interference, taking into account **S4.10**.

MOD IAP/14/14

TABLE **S21-4** *(end)*

Frequency band	**Service***	**Limit in dB(W/m²) for angle of arrival (δ) above the horizontal plane**			**Reference bandwidth**
		0°-5°	**5°-25°**	**25°-90°**	
31.8-32.3 GHz	Space research	–120	–120 + 0.75(δ – 5)	–105	1 MHz
32-33 GHz	Inter-satellite	–135	–135 + (δ – 5)	–115	1 MHz

Reasons: Sharing studies have concluded that reasonable measures can be taken by the various services using this band to ensure practical co-existence. As a result, it is possible to confirm the fixed allocations in the band 31.8-33.4 GHz, and to identify this band as being available for HDFS applications. Consequently, Resolution 126 can be suppressed. In addition, the draft CPM Report to WRC-2000 provides suitable pfd limits to protect the fixed service. With regard to the band 31.8-33.4 GHz, Resolution 726 can be suppressed since the necessary ITU-R studies required to confirm the fixed service allocation have been completed.

WRC-2000 agenda item 1.6.2 - Identification of a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000

Background information

At the time that the WRC-2000 agenda was established, studies were under way within TG 8/1 examining whether global roaming could be accomplished by identifying one or more global radio control channels that could allow radios to be tuned to the appropriate frequency band identifying a "physical" channel was wanted, in favour of using other approaches that may include the development of a "logical" channel structure for this purpose.

Based on discussions to date within TG 8/1, it has been determined that facilitation of multimode terminal operation and worldwide roaming of IMT-2000 is possible without a specific physical global radio control channel.

IAP/14/15

There is no need to identify a global radio control channel for IMT-2000 in the Radio Regulations, therefore no action is required by WRC-2000.

WRC-2000 agenda item 1.7 - Review of the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting operational, distress and safety communications, taking into account Resolution 346 (WRC-97)

Proposal to protect the operational, distress and safety communications in the HF bands used by the aeronautical mobile (R) and maritime mobile services

Background information

WP 8B and CPM have identified two issues comprising this agenda item:

1) HF bands allocated for the distress and safety communications of the maritime and aeronautical mobile (R) services have been subjected to an increase in harmful interference caused by unauthorized use. It is essential for the safety-of-life and property that these distress and safety channels are kept free from unauthorized use and harmful interference.

2) Several maritime HF distress and safety frequencies are also used for international routine calling. The routine calling can cause interference to distress and safety communications due to the caller not being aware of ongoing traffic on the ship calling frequency since the ship is tuned to a different receive frequency for coast station calls and replies.

In addition, both the CPM Report and the report of the SCRPM to CPM address the issue of interference in the HF bands by providing possible methods with satisfying this agenda item. One method proposes the modification of Resolution 207, where administrations would be drawn towards the fact that the interference is often due to unauthorized sources and to study solutions in assisting the mitigation of this interference. Another method calls upon ITU-R to study the future technical and operational needs of the maritime mobile and aeronautical mobile (R) services, in particular solutions providing effective and efficient distress and safety communications. Therefore, CITEL administrations propose the modification of Resolution 207 and the addition of new Resolution [HF].

Maritime issues

The protection of maritime HF distress and safety frequencies, in particular the frequencies 12 290 kHz and 16 420 kHz, is addressed in Resolution 346 (WRC-97). A significant source of interference to distress traffic on these frequencies is due to their use as calling frequencies. Resolution 346 calls for administrations to minimize the use of these frequencies for non-safety calling purposes by coast and ship stations.

GMDSS distress and safety frequencies are also used for calling in some of the other maritime HF bands. In each maritime HF band one channel is designated as an international calling channel pair for radiotelephony. In the 4, 6, 12 and 16 MHz bands, the distress and safety frequency is the same as the ships transmitting frequency on the calling channel.

The radiotelephony calling channels are used on duplex basis, whilst the distress and safety frequencies are used on simplex. When a ship is calling a coast station, it transmits on the distress frequency. The problem is that at times that the ship has difficulty monitoring whether or not there is ongoing distress traffic, because its receiver is on the corresponding coast station frequency. This problem occurs in the 4, 6, 12 and 16 MHz bands and not in the 8, 18, 22 and 25 MHz bands. The problem is being caused by the transmitting station not adhering to existing regulatory standards which require a station to listen on its transmitting frequency prior to transmitting. Equipment modification may be necessary in order to listen on the ship frequency of a duplex pair prior to transmitting on that frequency.

Once initial contact has been established and working frequencies coordinated, traffic handling is accomplished directly on the coordinated working frequencies.

CPM identified that compliance with existing Radio Regulations, S52.224 which requires that a station listens before transmitting, is a method to help alleviate the interference problem. Further regulations are not required, rather enforcement of the existing regulation. CPM considered the modification of Article S52 and Appendices S13 and S17 to exclude routine calling from the HF distress and safety frequencies as a method to satisfy the agenda item. This method may require modification of existing equipment.

CITEL administrations propose no change to divide the existing distress and calling channels in two separate frequencies, one exclusive distress and safety frequency and one international radiotelephony calling frequency. The distress frequencies should remain the same as they are at present where calling is allowed and no modifications to the distress procedures are required. Strict compliance and enforcement of existing Radio Regulations, S52.224, which requires that a station listen before it transmits, would alleviate this problem.

This proposal contains the minimum modifications required in the Radio Regulations and its Appendices in order to improve the situation on the HF radiotelephony distress and safety frequencies.

CPM further encouraged the use of digital selective calling (DSC) instead of calling by radiotelephony, while recognizing that all vessels may not be fitted with DSC.

This proposal is also encouraging ships and coast stations to use digital selective calling. If voice calling is required, it should in the first instance be done on the coast station working channel and secondarily on the appropriate calling frequency.

Aeronautical issues

The interference to HF frequencies allocated to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz appears to be the result of unauthorized non-aviation use of aeronautical mobile (R) frequencies. In some parts of the world the aeronautical mobile (R) HF frequencies are being used for land mobile, broadcast, fixed point-to-point communications and in maritime applications such as in support of fishing fleets. These unauthorized uses have resulted in frequent cases of harmful interference and have diminished the spectrum available for the aeronautical mobile (R) safety-of-life applications.

Administrations should ensure that stations of services other than the aeronautical mobile (R) service refrain from using frequencies in the bands allocated exclusively to the aeronautical mobile (R) service. Administrations should make every effort to identify and locate the source of any unauthorized emission causing harmful interference. Recognizing that such emissions are capable of endangering human life and property and the safe and regular conduct of aircraft operations, should take necessary measures to prevent stations from operating in contravention of ITU Radio Regulations.

WP 8B and CPM recommend modifications of Article S15 to ensure that suitable provisions are made for the aeronautical mobile (R) service.

CITEL administrations propose modifications to Article S15 to include reference to Appendix S27. This modification will ensure special consideration is given to avoiding interference on the frequencies used for safety and regularity of flight. Currently, Article S15 only refers to Article S31 Appendix S13, which is primarily for maritime services.

CITEL administrations propose no changes to Appendix S27. Presently, the HF bands allocated to the aeronautical mobile (R) service are nearly saturated by the use of analogue voice communications. This spectrum must be maintained for the new digital high-frequency data link (HFDL) communications. HFDL communications will provide a capability for the transfer of air traffic control and aeronautical operational control data to and from pilots operating over oceanic airspace, on polar routes, and in airspace over sparsely populated or undeveloped countries where other communications systems are not practical. The International Civil Aviation Organization (ICAO) will have completed Standards and Recommended Practices for HFDL before the end of 1999. Appendix S27 contains the Allotment Plan for the aeronautical use of HF aeronautical mobile (Route) service. Review of Appendix S27, if necessary, should be performed by ICAO and by ITU-R Working Party 8B and consequently considered by a subsequent WRC.

ARTICLE S15

Interferences

Section I – Interference from Radio Stations

MOD IAP/14/16

S15.8 § 4 Special consideration shall be given to avoiding interference on distress and safety frequencies and those related to distress and safety identified in Appendix **S13** and safety and regularity of flight identified in Appendix **S27**.

Reasons: Frequencies for safety and regulatory of flight in the aeronautical mobile (R) service are not listed in Appendix S13, since this Appendix is primarily for maritime services. Inclusion of Appendix S27 in this provision will ensure special consideration is given to avoiding interference on these frequencies used for safety and regularity of flight.

Section VI – Procedure in a case of harmful interference

MOD IAP/14/17

S15.28 § 20 Recognizing that transmissions on the distress and safety frequencies and frequencies used for the safety and regularity of flight (see Article **S31** ~~and~~, Appendix **S13** and Appendix **S27**) require absolute international protection and that the elimination of harmful interference to such transmissions is imperative, administrations undertake to act immediately when their attention is drawn to any such harmful interference.

Reasons: Frequencies for safety and regulatory of flight in the aeronautical mobile (R) service are not listed in Article S31 or Appendix S13, since this Appendix is primarily for maritime services. Inclusion of Appendix S27 would lead to the protection of frequencies used for safety and regularity of flight against interference.

MOD IAP/14/18

S15.35 § 27 On being informed that a station over which it has jurisdiction is believed to have been the cause of harmful interference, an administration shall, as soon as possible, acknowledge receipt of that information by ~~telegram~~the quickest means available. Such acknowledgement shall not constitute an acceptance of responsibility.

Reasons: Improvements in technology provide quicker means of communicating information, such email and facsimiles. The quicker a case of interference is reported, the quicker the action can be taken against that interference, and the shorter the duration of the interference.

ARTICLE S52

Special rules relating to the use of frequencies

NOC IAP/14/19

S52.216 *C – Bands between 4 000 kHz and 27 500 kHz*

C1 – Mode of operation of stations

MOD IAP/14/20

S52.219 3) Coast stations employing class J3E or J2D emissions in accordance with No. **S52.217** in the bands between 4 000 kHz and 27 500 kHz shall use the minimum power necessary to cover their service area and shall at no time use a peak envelope power in excess of 10 kW per channel. On the radiotelephony calling frequencies 4 417 kHz and 6 516 kHz coast stations shall limit their peak envelope power to the lowest value to maintain reliable communications, not to exceed 5 kW.

Reasons: Due to geographical differences, the higher power of 5 kW is required to provide adequate communications coverage.

NOC IAP/14/21

S52.220 4) Ship stations employing class J3E or J2D emissions in accordance with No. **S52.217** in the bands between 4 000 kHz and 27 500 kHz shall at no time use a peak envelope power in excess of 1.5 kW per channel.

Reasons: Higher shipboard power increases the potential for interference and out-of-band emissions.

ADD IAP/14/22

S52.220A Administrations should encourage the coast stations and ships under their jurisdiction to utilize the digital selective-calling techniques for call and reply.

Reasons: Decreases the potential for interference on the distress channels.

ADD IAP/14/23

S52.220B When calling by radiotelephony is necessary, it should be done (in order of preference):

Reasons: Decreases the potential for interference on the distress channels.

ADD IAP/14/24

S52.220C 1) On the working frequencies assigned to the coast station in question or

Reasons: Decreases the potential for interference on the distress channels.

ADD IAP/14/25

S52.220D 2) when this is not possible, on the international calling frequencies listed under **S52.221**.

Reasons: Decreases the potential for interference on the distress channels.

C2 – Call and reply

NOC IAP/14/26

S52.221 § 97 1) Ship stations may use the following carrier frequencies for calling in radiotelephony:

4 125 kHz[3, 4, 5]
6 215 kHz[4, 5]
8 255 kHz
12 290 kHz[5]
16 420 kHz[5]
18 795 kHz
22 060 kHz
25 097 kHz

Reasons: It is not necessary to convert calling frequencies from duplex to simplex.

NOC IAP/14/27

---

[3] **S52.221.1** In the United States, the carrier frequency 4 125 kHz is also authorized for common use by coast and ship stations for single-sideband radiotelephony on a simplex basis, provided the peak envelope power of such stations does not exceed 1 kW (see also No. **S52.222.2**).

Reasons: This note supports existing United States use of this channel in remote areas of our Search and Rescue areas of responsibility and supports communications in remote areas.

NOC IAP/14/28

[4] **S52.221.2** The carrier frequencies 4 125 kHz and 6 215 kHz are also authorized for common use by coast and ship stations for single-sideband radiotelephony on a simplex basis for call and reply purposes, provided that the peak envelope power of such stations does not exceed 1 kW. The use of these frequencies for working purposes is not permitted (see also Appendix **S13** and No. **S52.221.1**).

Reasons: This note supports existing use of this channel in remote areas of Search and Rescue responsibility and supports communications in remote areas.

NOC IAP/14/29

[5] **S52.221.3** The carrier frequencies 4 125 kHz, 6 215 kHz, 8 291 kHz, 12 290 kHz and 16 420 kHz are also authorized for common use by coast and ship stations for single-sideband radiotelephony on a simplex basis for distress and safety traffic.

Reasons: This note supports existing uses and enhances maritime safety in remote geographical areas.

MOD IAP/14/30

S52.222 2) Coast stations may use the following carrier frequencies for calling in radiotelephony[6]:

4 417 kHz[7]
6 516 kHz[7]
8 779 kHz
13 137 kHz

17 302 kHz
19 770 kHz
22 756 kHz
26 172 kHz

Reasons: Conversion to simplex operation is not necessary.

SUP IAP/14/31

[6] **S52.222.1**

Reasons: This system is out of date and no longer in use.

MOD IAP/14/32

[7] **S52.222.2** The carrier frequencies 4 417 kHz and 6 516 kHz are also authorized for common use by coast and ship stations for single-sideband radiotelephony on a simplex basis, provided that the peak envelope power of such stations ~~does not exceed 1 kW~~shall be limited to the lowest value to maintain reliable communications, not to exceed 5 kW. The use of 6 516 kHz for this purpose should be limited to daytime operation (see also No. **S52.221.1**).

Reasons: Consequential to MOD S52.219.

NOC IAP/14/33

S52.224 § 99 1) Before transmitting on the carrier frequencies 4 125 kHz, 6 215 kHz, 8 291 kHz, 12 290 kHz or 16 420 kHz a station shall listen on the frequency for a reasonable period to make sure that no distress traffic is being sent (see Recommendation ITU-R M.1171).

Reasons: It may not be a simple task to monitor the ship transmit frequency when set to a duplex calling channel.

MOD IAP/14/34

S52.227 2) The frequencies to be used for the conduct of simplex radiotelephony are shown in Appendix **S17**, Sub-Section B. In these cases, the peak envelope power of the coast station transmitter shall not exceed 1 kW.

Reasons: Editorial.

APPENDIX S17

Frequencies and channelling arrangements in the high-frequency bands for the maritime mobile service

(See Article **S52**)

NOC IAP/14/35

PART A – Table of subdivided bands

PART B – Channelling arrangements

Section I – Radiotelephony

NOC IAP/14/36

5 The following frequencies in Sub-Section A are allocated for calling purposes:

– Channel No. 421 in the 4 MHz band;

– Channel No. 606 in the 6 MHz band;

– Channel No. 821 in the 8 MHz band;

– Channel No. 1221 in the 12 MHz band;

– Channel No. 1621 in the 16 MHz band;

– Channel No. 1806 in the 18 MHz band;

– Channel No. 2221 in the 22 MHz band;

– Channel No. 2510 in the 25 MHz band.

The remaining frequencies in Sub-Sections A, B, C-1 and C-2 are working frequencies.

Reasons: Conversion to simplex operation is not necessary.

NOC IAP/14/37

5A For the use of the carrier frequencies:

4 125 kHz (Channel No. 421)

6 215 kHz (Channel No. 606)

8 291 kHz (Channel No. 833)

12 290 kHz (Channel No. 1221)

16 420 kHz (Channel No. 1621)

in Sub-Section A, by coast and ship stations for distress and safety purposes, see Article **S31** and Appendix **S13**.

Reasons: Conversion to simplex operation is not necessary.

NOC IAP/14/38

Sub-Section A

Table of single-sideband transmitting frequencies (kHz) for duplex (two-frequency) operation

Reasons: Conversion to simplex operation is not necessary.

NOC IAP/14/39

APPENDIX S27*

Frequency allotment Plan for the aeronautical mobile (R) service and related information

Reasons: ICAO in consultation with the ITU-R should perform any review of Appendix S27, if necessary. The HF bands allocated to the aeronautical mobile (R) service are nearly saturated by the use of analog voice communications. This spectrum must be maintained for the new digital high-frequency data link (HFDL) communications. The worldwide implementation of HFDL communications will reduce the burden on voice communications between pilots and controllers by using the data link for routine communications and freeing voice communications for more critical communications.

MOD IAP/14/40

RESOLUTION 207 (~~Mob-87~~Rev.WRC-2000)

Unauthorized use of frequencies in the bands allocated to the maritime mobile service and to the aeronautical mobile (R) service[1]

The World ~~Administrative~~ Radiocommunication Conference ~~for the Mobile Services, Geneva, 1987~~(Istanbul, 2000),

considering

a) that provisions of the Radio Regulations prohibit the unauthorized use of certain frequencies for other than safety related communications;

b) that enforcing compliance with these regulatory provisions is becoming increasingly difficult with the availability of low-cost HF SSB transceivers;

~~a~~c) that monitoring observations of the use of frequencies in the band 2 170-2 194 kHz and in the bands allocated exclusively to the maritime mobile service between 4 063 kHz and 27 500 kHz and to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz show that a number of frequencies in these bands are still being used by stations of other services, some of which are operating in contravention of No. **S23.2**;

~~b~~d) that these stations are causing harmful interference to the maritime mobile and aeronautical mobile (R) services;

~~c~~e) that HF radio is the sole means of communication in certain situations for the maritime mobile service and that certain frequencies in the bands mentioned in *considering ~~a~~c)* are reserved for distress and safety purposes;

~~d~~f) that HF radio is the sole means of communication in certain situations for the aeronautical mobile (R) service and that this is a safety service~~,~~;

g) that this Conference has reviewed the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting the operational, distress and safety communications [and has adopted Resolution [HF] (WRC-2000) to study the future technical and operational needs for the existing distress and safety frequencies and possible solutions to provide for efficient and effective distress, safety and other communications beyond the year 2000],

considering in particular

~~e~~h) that it is of paramount importance that the distress and safety channels of the maritime mobile service be kept free from harmful interference, since they are essential for the protection of the safety of life and property;

~~f~~i) that it is also of paramount importance that channels directly concerned with the safe and regular conduct of aircraft operations be kept free from harmful interference, since they are essential for the safety of life and property,

---

[1] WRC-97 made editorial amendments to this Resolution.

resolves

to urge administrations

1 to ensure that stations of services other than the maritime mobile service abstain from using frequencies in distress and safety channels and their guard bands and in the bands allocated exclusively to that service, except under the conditions expressly specified in Nos. **S4.4**, **S5.128**, **S5.129**, **S5.137** and **S4.13** to **S4.15**; and to ensure that stations of services other than the aeronautical mobile (R) service refrain from using frequencies allocated to that service except under the conditions expressly specified in Nos. **S4.4** and **S4.13**;

2 to make every effort to identify and locate the source of any unauthorized emission capable of endangering human life or property and the safe and regular conduct of aircraft operations, and to communicate their findings to the Radiocommunication Bureau;

3 to participate in the monitoring programmes that the Bureau may organize pursuant to this Resolution;

4 to make every effort to ensure that such emissions are made in appropriate bands allocated to services other than the maritime mobile service or the aeronautical mobile (R) service;

5 to request their competent authorities to take, within their respective jurisdiction, such legislative or regulatory measures which they consider necessary or appropriate in order to prevent stations from unauthorized use of distress and safety channels or operating in contravention of No. **S23.2**,

to invite the Radiocommunication Bureau

1 to study possible solutions, technical and regulatory, to assist in mitigating HF interference;

~~1~~2 to continue to organize monitoring programmes, at regular intervals, in the maritime distress and safety channels and their guard bands and in the bands allocated exclusively to the maritime mobile service between 4 063 kHz and 27 500 kHz and to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz, with a view to ensuring the timely distribution of monitoring data and identifying the stations of other services operating on these channels or in these bands;

~~2~~3 to seek the cooperation of administrations in identifying the sources of those emissions by all available means and in securing the cessation of those emissions;

~~3~~4 when the station of another service transmitting in a band allocated to the maritime mobile service or to the aeronautical mobile (R) service has been identified, to inform the administration concerned,

to invite ITU-R and ITU-D

1 to increase regional awareness of appropriate practices to help mitigate interference in the HF bands, especially on distress and emergency channels;

2 to include the problem of interference to distress and emergency channels on agenda of regional radiocommunication and development seminars,

requests administrations

to take all necessary steps in such cases to ensure the cessation of any transmissions contravening the provisions of the Radio Regulations on the frequencies or in the bands referred to in this Resolution.

ADD IAP/14/41

DRAFT RESOLUTION [HF] (WRC-2000)

Technical and operational needs for distress and safety frequencies allocated to the maritime mobile service and the aeronautical mobile (R) service

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the HF frequencies currently used by the aeronautical and maritime mobile services for distress, safety and other communications, including allotted operational frequencies, suffer from harmful interference and are often subject to difficult propagation conditions;

b) that WRC-97 considered some aspects of the use of the HF bands for distress and safety communications in the context of the Global Maritime Distress and Safety System (GMDSS), especially with regard to regulatory measures;

c) that existing regulatory measures prohibit the unauthorized use of certain frequencies for other than safety related traffic;

d) that enforcing compliance with these regulatory measures is becoming increasingly difficult with the availability of low-cost HF SSB transceivers;

e) that unauthorized operations using maritime and aeronautical HF frequencies are continuing to increase and are already a serious risk to HF distress, safety and other communications;

f) that this Conference revised Resolution **207** regarding the unauthorized use of frequencies in the bands allocated to the maritime mobile service and to the aeronautical mobile (R) service;

g) that there is a need for a review of the frequency assignments and provisions for HF distress, safety and aeronautical mobile (R) service communications;

h) that some administrations have resorted to the use of transmitting warning messages on operational HF channels as a means of deterring unauthorized users,

resolves to invite ITU-R

1 to study the future technical and operational needs for the existing HF operational, distress and safety frequencies and possible solutions to provide for efficient and effective operational, distress and safety communications in the maritime mobile and aeronautical mobile (R) services beyond the year 2000;

2 to report the results of the studies referred to in *resolves* 1 to WRC-03,

further resolves

1 to urge all administrations and concerned organizations, including IMO and ICAO, to actively participate and contribute to the ITU-R studies;

2 to urge administrations to take all practicable steps to comply with Resolution **207 (Rev.WRC-2000)**,

instructs the Secretary-General

to communicate this Resolution to the attention of the International Maritime Organization and the International Civil Aviation Organization.

WRC-2000 agenda item 1.8 - To consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Proposal for communications by earth stations on board vessels using frequencies allocated to the fixed-satellite service and used by existing space segment in the fixed-satellite service

Background information

This item concerns provision of communications by earth stations on board vessels (ESVs) using frequencies allocated to the fixed-satellite service and used by existing space segment in the fixed-satellite service. These stations operate in three distinct modes: at sea; while stationary in or near port; and in motion approaching or departing from port.

Operations at sea (beyond a certain distance for near-shore coordination) by ESVs in the fixed-satellite service do not present a potential for interference to stations in the fixed service operating in accordance with the 6 GHz FS allocation, and therefore need not be coordinated. Operations while these earth stations are stationary at predetermined points can be coordinated bilaterally with fixed service systems. Technical and regulatory issues concern the potential for interference between in-motion operations by these ESVs operating close to shore and stations in the fixed service both on and offshore.

The studies that have been conducted in ITU-R have illustrated that the values for the minimum distance are principally affected by the interference criteria required to protect the fixed service and the number of passages per unit time by vessels equipped with earth stations. Based on different values for these assumptions, the results of these preliminary studies yielded a range of values for the minimum distance from 100 km to 540 km. It should be noted that studies submitted to CPM by some administrations suggested values for the minimum distance of 150 km to 370 km. However, there should be a single minimum distance value.

MOD IAP/14/42

ADD IAP/14/45

RESOLUTION ZZZ (WRC-2000)

Provisions to enable earth stations located on board vessels to operate in fixed-satellite service networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that there is a demand for global wideband satellite communication services on vessels;

b) that the technology exists that would permit the use of fixed-satellite services (FSS) networks by earth stations on board vessels (ESVs) operating in the 3 700-4 200 MHz and 5 925-6 425 MHz bands;

c) that ESVs have the potential to cause unacceptable interference to the fixed service (FS) systems in the band 5 925-6 425 MHz;

d) that FS systems have the potential to cause interference to ESVs in the 3 700-4 200 MHz band;

e) that ESVs operating in these bands require considerably less than the full bandwidth in this FSS allocation and only a portion of the visible geostationary arc;

f) that there are a limited number of geostationary FSS systems that have global coverage;

g) that in order to ensure the protection and future growth of the FS, the ESV must operate with certain technical and operational constraints;

h) that administrations may authorize radiocommunication stations on off-shore structures and platforms for which they are responsible;

i) that based on appropriate assumptions a minimum distance can be calculated beyond which the ESV will not have the potential to cause unacceptable interference to the fixed service in this band,

noting

a) that operation within the territorial sea is at the discretion of the administration with territorial authority, in which case the relevant procedures of that administration will apply;

b) that operation of earth stations on vessels from specified fixed points at locations outside the territorial sea but for which an administration has territorial jurisdiction is fully within the FSS,

resolves

1 that the administration that issues the radio licence for the use of ESVs in these bands (licensing administration) shall ensure that such stations do not cause unacceptable interference to stations in the fixed service;

2 that licensing administrations shall ensure that ESVs are capable of operating in compliance with the requirements of this Resolution;

3 that operators of ESVs shall comply with the conditions established by the licensing administration(s);

4 that ESVs shall not claim protection from fixed service station transmissions;

5 that any transmissions from ESVs within a distance X km off any given coast shall be based upon the prior agreement of that coastal administration;

6 that the ESV system shall include means of identification and automatic mechanisms to terminate transmissions whenever the station operates outside its pre-authorized geographic (see *resolves* 5) or operational limits;

7 that ESVs shall be equipped so as to enable the licensing administration under the provisions of Article **S18** to verify earth station performance and to accomplish the switch off of the ESV transmission immediately upon request by an administration whose services may be affected;

8 that when ESVs operating beyond the territorial sea but within X km of the coast of an administration fail to comply with the terms required by that administration pursuant to *resolves* 3 and 5, then that administration may:

– request the ESV to comply with such terms or cease operation immediately; or

– request the licensing administration to require such compliance or immediate cessation of the operation;

9 that any licensing authority that licenses ESVs shall agree to maintain at all times a point of contact, which shall be published in a circular of the ITU, that may be contacted by an affected administration seeking assistance pursuant to *resolves* 3 and 5 above.

WRC-2000 agenda item 1.9 - To take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions 213 (Rev.WRC-95) and 220 (WRC-97)

Background information

Proposals were made to WRC-97 to reallocate portions of the 1 559 -1 610 MHz band which, with the exception of a fixed service allocation in some countries, currently is exclusively allocated to the radionavigation-satellite service and aeronautical radionavigation service worldwide. Other proposals were made not to change the existing allocations in these bands. In Resolution 220 (WRC-97), ITU-R was requested to study, as a matter of urgency, the technical criteria and operational and safety requirements to determine if sharing between the aeronautical radionavigation and radionavigation-satellite services, operating or planned to be operate, in the band 1 559-1 610 MHz, and the mobile-satellite service in a portion of the 1 559-1 567 MHz frequency range, is feasible, taking into account the essential need to protect systems operating in the aeronautical radionavigation and radionavigation-satellite services in the band 1 559-1 610 MHz.

There are millions of RNSS receivers in use today for a wide range of applications, including safety-of-life-critical navigation on land, at sea, and in the air. Today, most of these receivers operate with the global positioning system (GPS), an important element of the global navigation satellite system (GNSS) that operates in the 1 559-1 610 MHz band.

GPS provides position and time information to users by means of one-way transmissions using RNSS (space-to-Earth) allocations. GPS is information technology that uses systems of hardware and software, as well as information (time and ephemeris) transmitted from satellites to provide derived information to the user.

GLONASS and GPS are established elements of the International Civil Aviation Organization (ICAO) GNSS, operating in the band 1 559-1 610 MHz. These systems are accepted by the ICAO Council for use in international civil aviation. ICAO is currently developing standards and recommended practices for international application in civil aviation. The GNSS will be used during all phases of flight, including precision approaches and landing, and under all weather conditions. The latter places extensive requirements on the performance characteristics of the system. The aeronautical use of RNSS is recognized in the Radio Regulations as a safety-of-life application. GPS is the sole basis for the formation of International Atomic Time and Coordinated Universal Time (UTC) by the International Bureau of Weights and Measures. GPS is also the primary means by which clocks are synchronized within telecommunications networks for Time Division Multiple Access transmissions. Time and frequency functions are or will be available on other RNSS systems.

As Resolution 220 (WRC-97) recognizes RNSS and ARNS systems are evolutionary and other types of GNSS are under development for operation in the band 1 559-1 610 MHz. There are both aeronautical and non-aeronautical safety-of-life services in the 1 559-1 610 MHz band, and it is well established that there is an essential need to protect systems operating in the ARNS and RNSS.

The core signal structures of the MSS and the RNSS and ARNS are fundamentally different: MSS uses a two-way signal while ARNS and RNSS transmits a weak, receive-only signal. Having systems from a radiocommunication service operate on a co-primary, co-frequency basis in the 1 559-1 610 MHz band would limit ARNS and RNSS operators' flexibility to adjust their spectrum usage, and would hamper efforts to develop a GNSS that is capable of meeting evolving international needs and of providing adequate protection for international civil use worldwide.

Studies undertaken in the ITU addressed current aeronautical radionavigation and radionavigation-satellite service systems, as well as future radionavigation services planned for this band.

These studies reached the following conclusions:

- MSS (space-to-Earth) and ARNS/RNSS are fundamentally incompatible in any portion of the 1 559-1 567 MHz band. Not only do MSS signals disrupt ARNS/RNSS, but GNSS pseudolites disrupt MSS signals.
- The –112 dB(W/m^2/MHz) power flux-density level at the Earth's surface that is mentioned in Resolution 220 clearly would not protect existing RNSS systems (such as GPS) from harmful interference.
- The RNSS is extensively used, and is continuing to undergo a tremendous expansion which drives further evolution. These factors, along with the many critical timing, positioning, and navigation uses of RNSS sharing of the 1 559-1 610 MHz band, weigh conclusively against sharing any portion of the band segment at 1 559-1 567 MHz with any co-frequency communication service.
- The use of pseudolites in the ARNS/RNSS bands at 1 559-1 567 MHz is in its early stages, but is expected to increase in terms of numbers, geographic scope, and complete utilization of the frequency band in the near future. This use is incompatible with co-frequency MSS (space-to-Earth).

NOC IAP/14/46

CITEL Administrations propose that no allocation be made to the mobile-satellite service (space-to-Earth) in any portion of the 1 559-1 567 MHz band under agenda item 1.9.

Reasons: The current allocation, 1 559-1 610 MHz, is required for radionavigation services, including critical aeronautical safety applications, on a worldwide basis. Based on studies conducted in ITU-R pursuant to Resolution 220, sharing in this band with communications services such as the mobile-satellite service (space-to-Earth) is not possible.

SUP IAP/14/47

RESOLUTION 220 (WRC-97)

Studies to consider the feasibility of use of a portion of the band 1 559-1 610 MHz by the mobile-satellite service (space-to-Earth)

Reasons: Studies performed by ITU-R show that co-frequency sharing between the mobile-satellite service and the radionavigation-satellite and aeronautical radionavigation services within the band 1 559-1 567 MHz is not feasible. ITU-R studies satisfy the requirement of Resolution 220 (WRC-97). As a result, Resolution 220 should be suppressed.

WRC-2000 agenda item 1.12 - To consider the progress of studies on sharing between feeder links of non-GSO MSS networks and GSO FSS networks in the bands 19.3-19.7 GHz and 29.1-29.5 GHz, taking into account Resolution 121 (Rev.WRC-97)

Proposal for the modification of S5.541A and the suppression of Resolution 121

Background information

Resolution 121 requests that ITU-R conduct a study of sharing possibilities between GSO FSS and non-GSO MSS feeder links in the bands. In response, ITU-R WP 4A of Study Group 4 has agreed a draft new Recommendation, “Mitigation techniques to facilitate coordination in the 20/30 GHz non-GSO MSS feeder links”.

The Recommendation includes the topics of adaptive power control, high gain antennas, geographic isolation, site diversity and link balancing.

This Recommendation is considered to have covered the requirements of Resolution 121 (Rev.WRC-97) and thus satisfies the agenda.

MOD IAP/14/48

S5.541A Feeder links of non-geostationary networks in the mobile-satellite service and geostationary networks in the fixed-satellite service operating in the band 29.1-29.5 GHz (Earth-to-space) shall employ uplink adaptive power control or other methods of fade compensation, such that the earth station transmissions shall be conducted at the power level required to meet the desired link performance while reducing the level of mutual interference between both networks. These methods shall apply to networks for which Appendix **S4** coordination information is considered as having been received by the Bureau after 17 May 1996 and until they are changed by a future competent world radiocommunication conference. Administrations submitting Appendix **S4** information for coordination before this date are encouraged to utilize these techniques to the extent practicable.~~ These methods are also subject to review by ITU-R (see Resolution **121 (Rev.WRC-97)**).~~

Reasons: The objective of Resolution 121 has been addressed through the development of a draft new Recommendation in Study Group 4 of ITU-R.

SUP IAP/14/49

RESOLUTION 121 (Rev.WRC-97)

Continued development of interference criteria and methodologies for fixed-satellite service coordination between feeder links of non-geostationary satellite networks in the mobile-satellite service and geostationary-satellite networks in the fixed-satellite service in the bands 19.3-19.7 GHz and 29.1-29.5 GHz

Reasons: The objectives of Resolution 121 have been met.

WRC-2000 agenda item 1.14 - To review the results of the studies on the feasibility of implementing non-GSO MSS feeder links in the 15.43-15.63 GHz in accordance with Resolution 123 (WRC-97)

Remove the 15.43-15.63 GHz space-to-Earth allocation from the tables of Article RR S5

Background information

Studies conducted subject to Resolution 123 (WRC-97) dealt with two aspects:

1) need for the allocation to non-GSO MSS feeder links in the band 15.43-15.63 GHz (space-to-Earth);

2) feasibility of implementing non-GSO MSS feeder links in the band 15.43-15.63 GHz (space-to-Earth) regarding protection of RAS, EESS (passive) and SRS (passive) operating in the band 15.35-15.4 GHz.

The ITU-R studies concluded that the space-to-Earth operation of non-GSO MSS feeder links in parts of the 15.43-15.63 GHz band is significantly difficult and sometimes impossible, due to technical limitations that would have to be imposed on the feeder links.

The ITU-R studies complied with the Resolution 123 (WRC-97) provisions completely and hence covered all issues related to agenda item 1.14. Taking into account that Resolution 123 (WRC-97) has attained its objectives and aims, it would be appropriate to suppress it.

The results of the studies, as reported in the CPM Report, showed that it should be feasible to implement the existing non-GSO MSS feeder downlinks in the band 15.43-15.63 GHz taking into account the protection requirements for RAS and other passive services in this band. Providing that the existing non-GSO MSS feeder downlinks systems planning to use this band can provide the required protection to the passive services, the ITU-R studies did not identify any additional technical or operational disadvantages with respect to the existing systems.

The CPM Report also concludes that, for future non-GSO MSS systems using the space-to-Earth allocation at 15.43-15.63 GHz, substantial mitigation techniques would be required to adequately protect the RAS from harmful interference.

The technical studies also concluded that, because of high levels of suppression of out-of-band emissions required, use of the band 15.43-15.63 GHz for space-to-Earth feeder links should not extend beyond non-GSO MSS satellite networks for which advanced publication information has been received by the Bureau prior to WRC-2000.

Common CITEL proposals were developed to reflect this point of view.

MOD IAP/14/50

SUP IAP/14/51

RESOLUTION 123 (WRC-97)

Feasibility of implementing feeder links of non-geostationary satellite networks in the mobile-satellite service in the band 15.43-15.63 GHz (space-to-Earth) while taking into account the protection of the radio astronomy service, the Earth exploration-satellite (passive) service and the space research (passive) service in the band 15.35-15.4 GHz

MOD IAP/14/52

S5.511A Use of the band 15.43-15.63 GHz by the fixed-satellite service (~~space-to-Earth (see Resolution **123 (WRC-97)**) and~~ Earth-to-space) is limited to feeder links of non-geostationary systems in the mobile-satellite service, subject to coordination under No. **S9.11A**. In the space-to-Earth direction, the use of this band is limited to feeder links of non-GSO MSS systems for which advanced publication information has been received prior to WRC-2000 and the minimum earth station elevation angle above and gain towards the local horizontal plane and the minimum coordination distances to protect an earth station from harmful interference shall be in accordance with Recommendation ITU-R S.1341. Also in the space-to-Earth direction, harmful interference shall not be caused to stations of the radio astronomy service using the band 15.35-15.4 GHz. The threshold levels of interference and associated power flux-density limits which are detrimental to the radio astronomy service are given in Recommendation ITU-R RA.769-1 for 98% of the time. Special measures will need to be employed to protect the radio astronomy service in the band 15.35-15.4 GHz.

WRC-2000 agenda item 1.17 - To consider possible worldwide allocation for the earth exploration-satellite (passive) and space research (passive) services in the band 18.6-18.8 GHz, taking into account the results of the ITU-R studies

Proposal for worldwide allocation to the Earth exploration-satellite (passive) services in the band 18.6-18.8 GHz on a primary basis

Background information

At present, the allocations for the Earth exploration-satellite (passive) and the space research (passive) services in the band 18.6-18.8 GHz are on a primary basis in Region 2, but on a secondary basis in Regions 1 and 3.

The allocation to the Earth exploration-satellite (passive) service must be upgraded to primary status if the long-term ability to obtain environmental data with passive spaceborne sensors is to be preserved. Compatibility between the passive sensors and the fixed and fixed-satellite services requires adoption of constraints on the parameters of the fixed and fixed-satellite systems that use the band.

A pfd limit of –95 dBW/m^2 in a reference bandwidth of 200 MHz on geostationary systems in the fixed-satellite service will enable passive sensors to perform their mission if measurements are restricted to portions of the sensor orbit where the sensor is moving away from the equator while taking sensor data over land masses. Additionally, allowing for an exceedance of this value by 3 dB for up to 5% of the time will allow the fixed-satellite service to implement power control in overcoming rain fades when needed.

Similarly, limiting the power delivered to any antenna of a station in the fixed service measured across the band 18.6-18.8 GHz to not exceed 0 dBW in 200 MHz along with an antenna pattern complying with Recommendation ITU-R F.699-4 will enable sharing with the fixed service.

MOD IAP/14/53

<u>MOD</u> S5.522	<u>MOD</u> S5.522	<u>MOD</u> S5.522

Reasons: To establish a common worldwide primary allocation to the Earth exploration-satellite (passive) services to be used for environmental measurements.

MOD IAP/14/54

S5.522 ~~In making assignments to stations in the fixed and mobile services, administrations are invited to take account of passive sensors in the Earth-exploration satellite and space research services operating in the band 18.6-18.8 GHz. In this band, administrations should endeavour to limit as far as possible both the power delivered by the transmitter to the antenna and the e.i.r.p. in order to reduce the risk of interference to passive sensors to the minimum.~~In the band 18.6-18.8 GHz, fixed and mobile service stations shall be limited to a total power delivered to each antenna of 0 dBW.

Reasons: To enable passive sensors and the fixed service to operate in the band without excessive interference to the sensors.

MOD IAP/14/55

S5.523 ~~In assigning frequencies to stations in the fixed-satellite service in the direction space-to-Earth, administrations are requested to limit as far as practicable the power flux-density at the Earth's surface in the band 18.6-18.8 GHz, in order to reduce the risk of interference to passive sensors in the earth exploration-satellite and space research services.~~ The fixed-satellite service shall be limited to a power flux-density at the Earth's surface of –95 (dBW/m^2) across the 18.6-18.8 GHz band for all angles of arrival. This power flux-density limit may be exceeded by 3 dB for up to 5% of the time everywhere in the FSS service area. The use of this band by non-geostationary-satellite orbit fixed satellite service systems with apogees lower than 20 000 km shall be in accordance with the provisions of Resolution **ZZZ (WRC-2000)**.

Reasons: To enable passive sensors and the fixed-satellite service to operate in the band without excessive interference to the sensors. Further studies have not been completed to determine an allowable power flux-density limit on non-geostationary fixed-satellite service systems needed to protect Earth exploration-satellite service (passive).

ADD IAP/14/56

DRAFT RESOLUTION ZZZ (WRC-2000)

Power flux-density limits applicable to non-GSO systems for protection of Earth exploration-satellite service (passive) in the band 18.6-18.8 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-2000 made changes to the Table of Frequency Allocations in the band 18.6-18.8 GHz;

b) that the power flux-density (pfd) limit in footnote MOD S5.523 of the Radio Regulations was derived solely upon consideration of geostationary-satellite orbit fixed-satellite service systems and non-geostationary-satellite orbit fixed-satellite service systems with apogees higher than 20 000 km;

c) that initial sharing studies have indicated that low-Earth orbiting fixed-satellite service systems cause significantly greater interference into Earth exploration-satellite (passive) service sensors than do geostationary-satellite orbit fixed-satellite service systems;

d) that further sharing studies are required of the power flux-density limit applicable to non-geostationary-satellite orbit fixed satellite service systems operating below 20 000 km for the protection of Earth exploration-satellite (passive) service systems,

resolves

that non-geostationary-satellite orbit fixed-satellite service systems operating with apogees below 20 000 km shall do so only on a non-interference basis until an appropriate power flux-density limit is determined for protection of EESS (passive) systems,

invites ITU-R

to study, as a matter of urgency, the appropriate power flux-density values to be applied to non-geostationary-satellite systems in the 18.6-18.8 GHz band to ensure protection of the Earth exploration-satellite (passive) service without unduly constraining the development of either type of system, and submit the results to a future competent conference,

instructs the Secretary-General

to bring this Resolution to the attention of the international and regional organizations concerned.

WRC-2000 agenda item 1.18 - To consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix 18/S18, taking into account Resolution 342 (WRC-97)

Proposal to modify Appendix S18 and Resolution 342

Background information

Appendix S18 of the ITU Radio Regulations defines the channels of the maritime mobile service. These channels support a variety of functions including “Distress, Safety and Calling: public correspondence, inter-ship, ship/shore/ship, port operations and ship movement”. The maritime mobile frequency band, 156-174 MHz, (effectively 156-162 MHz in the Americas due to previous domestic regulatory actions) supports maritime communications worldwide.

WP 8B and CPM studied this agenda item and determined that the status of the ITU-R studies indicate that revisions of Appendix S18 to introduce new digital technologies is not possible at this conference. However, it is possible to take action to address the issue of congestion.

With the rapidly increasing use of the VHF maritime mobile band, particularly for data communications, increased congestion and mutual interference is being experienced which, among others, has resulted in unacceptable degradation of the distress and safety related function for which this band is utilized. Unless action is taken this situation will only worsen as usage continue to grow.

At WRC-97, CITEL proposed simplex use of duplex channels for Appendix S18. This was approved for a few specific public correspondence channels only, channels 18 and 82-86. Note *m)* to Appendix S18 must be modified to add more channels for simplex use. This will allow for more efficient use of Appendix S18 channels and provide flexibility for administrations to meet their immediate requirements, while maintaining compatibility with the vast number of ships and pleasure craft now using the band in accordance with Appendix S18.

WP 8B and CPM recommend modifications to Appendix S18 to provide administrations with further flexibility to use the channels of Appendix S18 in simplex mode if required. This would allow the use of duplex channels in Appendix S18 in simplex mode and would increase the number of available channels. The cost of the change would be minimal and administrations could be able to quickly address certain local problems of congestion. Furthermore, the conference could consider permitting, subject to non-interference and no protection, the use of some of these channels or sub-bands created by the conversion of duplex channel to simplex channels for the initial testing and possible future introduction of new technologies, subject to non-operational use. This would necessarily be subject to special arrangement between interested or affected administrations.

CITEL administrations propose to modify Note *m)* to allow simplex use of duplex channels for the remainder of the channels not already identified as simplex. CITEL administrations also propose the addition of a new Note [*z)*] to allow the use of the simplex channels per Note *m)* for the testing and development of new technologies on a non-operational basis, subject to special arrangements between affected or interested administrations.

In addition, CITEL administrations propose to modify Resolution 342 to continue the study of one or more new interoperable technologies for the maritime mobile service.

MOD IAP/14/57

invites ITU-R

MOD IAP/14/68

to continue studies on the following with a view to providing a report to ~~WRC-99~~a future WRC and identify the future requirements of the maritime mobile service. If the requirements warrant the replacement of existing technology with new technology then:

SUP IAP/14/69

a)

(MOD) IAP/14/70

~~b~~a) to identify suitable technical characteristics of the system or interoperable systems to replace existing technology;

MOD IAP/14/71

~~c~~b) to identify necessary modifications if required, to the frequency plan contained within Appendix **S18**;

MOD IAP/14/72

~~d~~c) to recommend a timetable for the introduction of new technology if required, and ~~the necessary changes~~a transition plan;

(MOD) IAP/14/73

~~e~~d) to study and recommend how new technology can be introduced without harming the distress and safety requirements,

instructs the Secretary-General

to communicate this Resolution to the International Maritime Organization.

Reasons: These modifications do not restrict the new technology to digital or to one technology; all available technologies should be studied, as new technologies are constantly emerging. It is spectrally inefficient to set aside spectrum, which is already extremely congested, for a new technology that has not yet been determined.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 15-E
2 February 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

GENERAL REVIEW OF RESOLUTIONS AND RECOMMENDATIONS OF WARC/WRC

Attached is the report of the Director of the Radiocommunication Bureau which was prepared in response to Resolution 95 (WRC-97).

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

Director, Radiocommunication Bureau

GENERAL REVIEW OF RESOLUTIONS AND RECOMMENDATIONS OF WARC/WRC

WRC-97, by its Resolution 95, instructed the Director of the Radiocommunication Bureau,

"to conduct a general review of the Resolutions and Recommendations of previous conferences and, if necessary after consultation with the Radiocommunication Advisory Group and the chairmen of the relevant radiocommunication study groups, to submit a report to future competent world radiocommunication conferences which indicates their current status, and what follow-up action may be advised.".

The Bureau performed an initial study in this respect and submitted the results to CPM-99, for information. CPM took note of it and made some specific suggestions (see Chapter 7, section 7.4, of the CPM Report to WRC-2000).

Further reports on this subject were submitted to the tenth Chairmen and Vice-Chairmen meeting (Geneva, 26 November 1999) and to the eighth meeting of the Radiocommunication Advisory Group (Geneva, 17-20 January 2000). Based on the advice received from these meetings, the Bureau prepared an updated report which is contained in the Attachment to this document.

The Bureau wishes to emphasize that the indications in the column "Possible follow-up" should not be considered as proposals for the work of the Conference, but, in accordance with the *instructs* of Resolution 95 (see above), are merely suggestions as to the possible course of action to be taken in respect of the concerned Resolution/Recommendation.

The Bureau refrained from indicating any possible course of action in respect to those Resolutions/Recommendations that are explicitly on the agenda of WRC-2000.

Attachment: 1

ATTACHMENT

Review of WARC/WRC Resolutions and Recommendations in response to Resolution 95 (WRC-97)

Res. No.	Subject	Remark	Possible follow-up
1	Notification of frequency assignments	Still relevant.	NOC
2	Equitable use of GSO and frequency bands for space services	Still relevant.	NOC
4	Period of validity of GSO space systems	Still relevant; for consideration by a future WRC.	NOC
5	Technical cooperation - propagation in tropical areas	**Obsolete** (in view of the BDT activities).	SUP
7	National radio-frequency management	Some actions completed; new elements became relevant in the context of the structural changes within Member States.	MOD
8	Transfer procedures/changes in HF-FX	**Obsolete**, all actions completed on 31 December 1998.	SUP
10	Frequencies for Red Cross	Basic provisions still relevant, but text should be updated taking into account current technologies in use.	MOD
13	Formation of call signs	Still relevant, without real problems. More details in Document 16. NOTE - This Resolution is referred to in No. S19.32.	NOC
14	Transfer of technology	**Obsolete** in view of the current BDT activities.	SUP
15	Cooperation in space radiocommunications	Many aspects are obsolete in view of the current BDT activities.	MOD/SUP
18	Identification/non-parties in an armed conflict	Still relevant.	NOC
20	Technical cooperation - aeronautical service	**Obsolete** in view of the ICAO activities.	SUP
21	Transfer of HF-FX in 2007	Still relevant (some elements are obsolete). NOTE - This Resolution is referred to in Nos. S5.136, S5.143, S5.146, S5.151.	MOD
23	Suspension of provisions for TEX in HF	**Obsolete** as from 1 January 1999 (date of entry into force of the simplified Radio Regulations).	SUP
24	Review of Constitution/provisional application	**Obsolete** in view of the action taken by PP-98.	SUP
25	Operation of Global Satellite Systems	Still relevant (some elements are obsolete).	MOD
26	Review of footnotes	Still relevant (permanent agenda item at each WRC).	NOC

27	Incorporation by reference/principles	Still relevant (permanent agenda item at each WRC). Ongoing studies. See Chapter 7 of CPM Report (section 7.3 and Annexes 2-5 to Chapter 7). NOTE - This Resolution is referred to in No. S3.7, as well as in many other provisions.	MOD
28	Revision of references to ITU-R Recommendations	Still relevant. **Report by RA-2000 to WRC-2000.**	NOC
29	Occupancy by FX/MO of the HF bands allocated to the BC in 1992	Actions initiated; for consideration by a future WRC (preliminary agenda item 2.13 for WRC-02/03, as per Resolution 722). **See also Document 5.**	NOC
30	WIC on CD-ROM	Actions completed. **See BR Report to WRC-2000.**	MOD/SUP
33	Procedure for BSS (pre-planned)	Still relevant. To be reviewed by a future WRC. NOTE - This Resolution is quoted in various provisions (e.g. Nos. S5.311, S5.396) and in various other Resolutions (e.g. 34, 42, 49, 507, 525 and 528). As other provisions are applicable to the relevant submissions after 1 January 1999, appropriate amendments need to be introduced in these references.	NOC
34	Planning the band 12.5-12.75 GHz in R3	Still relevant. See also the Note in the comments related to Resolution 33.	NOC
42	Interim systems in R2 (BSS and FSS) in AP30/30A bands	Still relevant. See also the Note in the comments related to Resolution 33.	NOC
44	Compatibility of equipment in MSS	**Obsolete** in view of current situation.	SUP
46	Coordination/notification procedures in non-GSO bands	**Obsolete** as from 1 January 1999 (matter covered by the simplified Radio Regulations). NOTE - As many texts of the RR contain references to this Resolution, consequential changes/amendments to these texts may be required, in the frame of agenda item 3, should this Resolution be abrogated (e.g. in Appendix S5, in Resolutions 27, 49, 54, 70, 121, 127, 130, 132, 215, 219, 538, 716 and 728, and in Recommendation 104).	SUP
49	Due diligence	Still relevant. Additional aspects introduced by PP-98. **Report to WRC-2000 and future WRC.** See also the Note in the comments related to Resolutions 33 and 46.	MOD
50	Interval between WRCs	**Obsolete** in view of the action taken by PP-98.	SUP
51	Transitional arrangements concerning coordination and notification	Still relevant (at least until the year 2005).	NOC
52	Provisional application of some provisions of Article S11	**Obsolete** as from 1 January 1999.	SUP

53	Updating of the remarks of Appendices S30 and S30A	Still relevant. For consideration by WRC-2000 (agenda item 1.21).	-
54	Provisional application of RS46 procedures in some bands	**Obsolete** as from 1 January 1999. See also the Note in the comments related to Resolution 46.	SUP
60	Revision of APS7/28	**Obsolete**, action completed. For consideration by WRC-2000 (agenda item 1.3); see Chapter 7 of CPM Report (§ 7.2.4 suggests a possible revision of Resolution 60).	-
63	Protection from ISM equipment	**Obsolete**, action completed.	SUP
70	Standards for LEO	**Obsolete** in view of current situation. See also the Note in the comments related to Resolution 46.	SUP
72	Regional preparations	Actions completed (report submitted to PP-98; relevant instructions are now contained in Resolution 25 (Rev.Minneapolis, 1998).	SUP
73	Compatibility BSS-R1/FSS-R3 in 12 GHz	Still relevant. For consideration by WRC-2000 (?)	NOC
80	Principles of the Constitution, to be taken into consideration	**Report by RRB to WRC-2000.**	-
95	Review of Resolution/Recommendation	Still relevant (permanent agenda item at each WRC). **Report to RAG-2000 and WRC-2000.**	NOC
105	Improvements in APS30B	Still relevant.	NOC
111	FSS in 18/20/30 GHz	Still relevant (ongoing studies).	NOC
114	FSS (feeder links for MSS) in 5 GHz	Still relevant. NOTE **-** This Resolution is referred to in Nos. S5.441 and S5.444A.	NOC
121	Coordination criteria feeder links in 19/29 GHz	Ongoing studies, **progress report to WRC-2000** (agenda item 1.12); see Chapter 6 of CPM Report (§ 6.4.2 suggests that Resolution 121 could be suppressed). See also the Note in the comments related to Resolution 46. NOTE **-** This Resolution is referred to in No. S5.541A.	-
122	HAP in 47/48 GHz	Ongoing studies, WRC-2000 to review (agenda item 1.5); see Chapter 6 of CPM Report (§ 6.2.1.2 suggests the need for more studies, with example draft modification to Resolution 122 in Annex 1 to Chapter 6). NOTE **-** This Resolution is referred to in No. S5.552A.	-

123	Feeder links to non-GSO MSS in 15 GHz	Ongoing studies, WRC-2000 to review (agenda item 1.14); see Chapter 6 of CPM Report (§ 6.5.2 suggests that Resolution 123 could be suppressed). NOTE - This Resolution is referred to in No. S5.511A.	-
124	Sharing FX/EESS in 8 GHz	ITU-R studies completed. DNR ITU-R F.[Document 9/1019] submitted to RA-2000. WRC-2000 may wish to review this Resolution. NOTE - This Resolution is referred to in No. S5.462A.	MOD
125	Sharing MSS/RA in 1.6 GHz	Ongoing studies, future WRC to review.	NOC
126	HD systems (FX) in 31-33 GHz	Ongoing studies, WRC-2000 to review (agenda item 1.4); see Chapter 6 of CPM Report (§ 6.1.1.4 suggests suppression of Resolution 126). NOTE - This Resolution is referred to in No. S5.547A.	-
127	New allocations for feeder links to GSO MSS in 1.4 GHz	Ongoing studies, for consideration by a future WRC (preliminary agenda item 3.5 for WRC-02/03, as per Resolution 722). See also the Note in the comments related to Resolution 46.	NOC
128	Allocation to FSS in 42 GHz	Ongoing studies, WRC-2000 to review (agenda item 1.4); see Chapter 6 of CPM Report (§ 6.1.4 suggests retaining of a suitably modified Resolution 128 in order to complete the remaining studies). NOTE - This Resolution is referred to in No. S5.551.	-
129	Sharing FSS/other in 41 GHz	Ongoing studies, WRC-2000 to review (agenda item 1.4); see Chapter 6 of CPM Report (§ 6.1.5 indicates that no further studies are required).	-
130	Use of non-GSO FSS in certain bands	Ongoing studies; some elements of a transitional nature; for consideration by WRC-2000 (agenda item 1.13); see Chapter 3 of CPM Report (Annex 5 to Chapter 3 contains an example modification to Resolution 130, by suppressing Annexes 1 and 2). See also the Note in the comments related to Resolution 46. NOTE - This Resolution is referred to in Nos. S5.441, S5.484A, AS9.5, AS11.3, S22.5C1, S22.5D1.	-

131	pfd limits for non-GSO FSS in 11/18 GHz	Ongoing studies; some elements of a transitional nature; for consideration by WRC-2000 (agenda item 1.13); see Chapter 3 of CPM Report (§ 3.1.4.5 and Annex 4 to Chapter 3; Resolution 131 might be suppressed). NOTE - This Resolution is referred to in Nos. S21.16.6, S21.16.8, S21.16.9.	-
132	FSS in 18/28 GHz	Some elements are still relevant (e.g. *resolves* 2, which contains instructions to the Bureau as to the treatments of some submissions). See also the Note in the comments related to Resolution 46.	MOD
133	Sharing FX/other in 40 GHz	Ongoing studies; for consideration by WRC-2000 (agenda item 1.4); see Chapter 6 of CPM Report (§ 6.1.2).	-
134	FSS in 40.5-42.5 GHz	Ongoing studies; for consideration by WRC-2000 (agenda item 1.4). NOTE - This Resolution is referred to in Nos. S5.551D, S5.551E.	-
205	Protection of MSS in 406-406.1 MHz	Still relevant.	NOC
207	Monitor MMS/AM(R)S	Still relevant (implicitly on the agenda of WRC-2000, agenda item 1.7); see Chapter 1 of CPM Report (§ 1.2.3.1, possible MOD to Resolution 207).	-
209	Enlarging the scope of GMDSS	For consideration by a future WRC; **may not be relevant any longer**.	SUP
212	Implementation of IMT-2000	Still relevant, for consideration by WRC-2000 (agenda item 1.6); see Chapter 1 (§ 1.1) of CPM Report proposing three options: NOC, MOD or SUP, with a linked proposal for a new Resolution or Recommendation on this subject. NOTE - This Resolution is referred to in No. S5.388.	-
213	Use of 1.7 GHz by MSS	Ongoing studies, for consideration by WRC-2000 (agenda item 1.9); see Chapter 2 of CPM Report (§ 2.2). NOTE - This Resolution is referred to in No. S5.277.	-
214	Use of bands below 1 GHz by MSS	Ongoing studies, for consideration by WRC-2000 (agenda item 1.11); see Chapter 2 of CPM Report (§§ 2.3.1 and 2.3.2).	-
215	Coordination among non-GSO MSS	Still relevant, ongoing studies. See also the Note in the comments related to Resolution 46.	NOC

216	Broadening the allocation to the MSS in 14-14.5 GHz	Ongoing studies, for consideration by a future WRC (preliminary agenda item 8.5 for WRC-99, as per Resolution 721).	(MOD)
217	Wind profiler radars	Still relevant. NOTE - This Resolution is referred to in Nos. S5.162 and S5.291A.	NOC
218	MSS in 1.5/1.6 GHz	Ongoing studies, for consideration by WRC-2000 (agenda item 1.10); see Chapter 2 of CPM Report (§ 2.1). NOTE - This Resolution is referred to in Nos. S5.353A and S5.357A.	-
219	Allocation to MSS in 405-406 MHz	Ongoing studies, for consideration by WRC-2000 (agenda item 1.11); see Chapter 2 of CPM Report (§ 2.3.3). See also the Note in the comments related to Resolution 46.	-
220	Allocation to MSS in portion of the band 1 559-1 567 MHz	Ongoing studies, for consideration by WRC-2000 (agenda item 1.9); see Chapter 2 of CPM Report (§ 2.2).	-
300	Paired frequencies for NBDPT in HF/MMS	For consideration by a future WRC; some elements are **obsolete** in view of the decisions by WRC-95/97 concerning the examinations in HF bands. More details in the BR Report to WRC-2000 (Document 16). NOTE - This Resolution is referred to in No. S52.106.	MOD
310	Ship movement telemetry	Ongoing studies, for consideration by a future WRC.	NOC
312	Group channels for Morse telegraphy	Some elements are still relevant, although the use of Morse telegraphy has dramatically decreased. NOTE - This Resolution is referred to in No. S52.80.	MOD
331	Transition arrangements for the GMDSS	Ongoing studies, for consideration by a future WRC (preliminary agenda item 2.10 for WRC-02/03, as per Resolution 722). NOTE - This Resolution is referred to in Nos. S5.82, S30.4, S31.17.	NOC/(MOD)
339	Coordination of NAVTEX	Still relevant. NOTE - This Resolution is referred to in No. S5.79A.	NOC
340	Additional SAR information	Still relevant, ongoing activities (see also Document 16). NOTE - This Resolution is referred to in No. S32.5A.	NOC
341	On-board communications in UHF	Still relevant, ongoing activities. NOTE - This Resolution is referred to in No. S5.287.	NOC

342	Revision of APS18	Ongoing studies, for consideration by WRC-2000 (agenda item 1.18); see Chapter 1 of CPM Report (§ 1.3).	-
343	Certificates (vessels using GMDSS equipment on a non-compulsory basis)	Still relevant. NOTE - This Resolution is referred to in No. S48.7.	NOC
344	Exhaustion of MMSI	For consideration by a future WRC (preliminary agenda item 2.11.1 for WRC-02/03, as per Resolution 722). **BR Report to each WRC (see also Document16).**	NOC
345	Operation of GMDSS equipment on non-compulsory fitted vessels	Still relevant, ongoing activities.	NOC
346	Protection of distress and safety frequencies in 12/16 MHz	Ongoing studies, for consideration by WRC-2000 (agenda item 1.7); see Chapter 1 of CPM Report (§ 1.2).	-
347	Digital modulation in the MMS at MF/HF	Ongoing studies, for consideration by a future WRC (preliminary agenda item 2.4 for WRC-02/03, as per Resolution 722).	NOC/(MOD)
348	Priority of distress and safety communications	Ongoing studies, for consideration by a future WRC.	NOC
349	False alerts in GMDSS	Still relevant, ongoing activities. NOTE - This Resolution is referred to in No. S32.10A.	NOC
405	Frequencies for AM(R)	Still relevant, ongoing activities in ICAO.	NOC
406	Use of bands other than HF for AM(R) and AMS(R)	**Obsolete**, bearing in mind the technological improvements as well as current uses.	SUP
411	Implementation of new provisions for AM(OR)	**Obsolete** as from 15 December 1997.	SUP
412	Transfer arrangements for AM(OR)	**Obsolete**; all activities completed on 1 April 1999.	SUP
500	New carrier for LFBC in R1	Partly obsolete; additional details in the BR Report to WRC-2000 (Document 16).	MOD/SUP
506	GSO only, in BSS bands (12 GHz)	Still relevant.	NOC
507	Agreements/Plans for BSS	**Obsolete** (in view of the undertaken activities). See also the Note in the comments related to Resolution 33. NOTE - This Resolution is referred to in No. S11.37.2.	SUP
517	Transition from DSB to SSB in HFBC	Still relevant, ongoing activities. **BR Report to a competent conference (WRC-02/03?)** NOTE - This Resolution is referred to in No. S5.311.	NOC
518	Area/country symbols in APS30/S30A	**Obsolete** (in view of the current practices).	SUP
519	Provisions for interim systems	Still relevant (?), for consideration by a future WRC.	NOC

524	Revision of AP30/30A	**Obsolete** (in view of the activities taken by WRC-97 and the IRG/GTE activities).	SUP
525	Introduction of HDTV in 22 GHz	Still relevant. See also the Note in the comments related to Resolution 33. NOTE - This Resolution is referred to in No. S5.530.	NOC
526	Additional provisions for HDTV	Still relevant, for consideration by a future WRC.	NOC
527	Terrestrial VHF DAB	Still relevant, for consideration by a future WRC (preliminary agenda item 3.1 for WRC-02/03, as per Resolution 722).	NOC
528	BSS (sound) in 1.5 GHz	Still relevant, for consideration by a future WRC. See also the Note in the comments related to Resolution 33. NOTE - This Resolution is referred to in Nos. S5.345, S5.393 and S5.418.	NOC
531	Review of APS30/S30A	**Obsolete** (in view of the activities taken by WRC-97 and the IRG/GTE activities).	SUP
532	Review of APS30/S30A	Ongoing studies, for consideration by WRC-2000 (agenda item 1.19); see Chapter 5 of CPM Report.	-
533	Implementation of certain provisions relating to APS30/S30A	Still relevant; for possible review by WRC-2000.	-
534	Implementation of certain provisions relating to APS30/S30A	**Obsolete** (as from 1 January 1999).	SUP
535	Application of S12	The major part implemented. Some elements still relevant (funding of participants from LDC to seminars).	MOD
536	BSS satellites serving other countries	Still relevant.	NOC
537	Statistics on HFBC equipment	For consideration by a future WRC (see also doc. 16 containing results of a preliminary survey).	NOC
538	Non-GSO FSS in the bands of Appendices S30 and S30A	Ongoing studies; some elements of a transitional nature; for consideration by WRC-2000 (agenda item 1.13); see Chapters 3 and 5 of CPM Report (§§ 3.1 and 3.2; Annex 5 to Chapter 3 contains example modification to Resolution 538). See also the Note in the comments related to Resolution 46. NOTE - This Resolution is referred to in Nos. S5.484A, S5.487A, S5.516, A59.5, AS11.3, S22.5C1, S22.5D1.	-
602	Differential data correction on maritime radiobeacons	Still relevant, partly obsolete.	MOD
641	Use of the band 7 000-7 100 kHz	Still relevant.	NOC

642	Earth stations in the amateur sat. service	Still relevant.	NOC
644	Disaster communications	Partly implemented; some elements still relevant.	MOD
703	Interference criteria for the shared bands	Partly overtaken by events, bearing in mind the application of the concept of incorporation by reference of the relevant ITU-R Recommendations (see also Document 16).	MOD/SUP
705	Protection of services in 70-130 kHz	Some elements still relevant; for consideration by a future WRC.	MOD
706	Operation of FX/MOB in 90-110 kHz	Partly implemented; some elements still relevant; for consideration by a future WRC.	MOD
712	Allocation to space services	Partly implemented; some elements still relevant (*resolves* 1, *resolves* 2; which were put on the provisional agenda for WRC-99, as it appeared in Resolution 721); see also comments against Resolutions 723 and 727.	MOD
715	Sharing in 150 MHz and 400 MHz	Still relevant (ongoing studies).	NOC
716	Use of bands around 2 GHz	Still relevant, some elements are obsolete, **progress report to WRC-2000 (Document 16)**. See also the Note in the comments related to Resolution 46. NOTE - This Resolution is referred to in Nos. S5.389A, S5.389C and S5.390.	MOD
721	Agenda for the WRC-2000	**Obsolete** in view of the actions taken by the Council (Resolution 1130).	SUP
722	Preliminary agenda for WRC-01	For consideration by WRC-2000.	-
723	Allocations to space services	Still relevant; one item (*resolves* 2) for consideration by WRC-2000 (agenda item 1.16), other item (*resolves* 1) for consideration by a future WRC (preliminary agenda 8.6 for WRC-99, as foreseen by Resolution 721); see Chapters 4 and 8 of CPM Report (§ 4.1.1; § 8.1.3.3).	-
724	Use of the band 5 250-5 350 MHz by spaceborne active sensors	Still relevant, ongoing studies.	NOC
725	Use of the band 5 350-5 460 MHz by spaceborne active sensors	Still relevant, ongoing studies.	NOC
726	Allocations for high-density FX above 30 GHz	Still relevant; for consideration by WRC-2000 (agenda item 1.4); see Chapter 6 of CPM Report (§ 6.1.3.4 proposes modification or deletion of Resolution 726). NOTE - This Resolution is referred to in No. S5.547.	-
727	Use of 420-470 MHz by EESS (active)	Still relevant; for consideration by a future WRC (preliminary agenda 8.7 for WRC-99, as foreseen by Resolution 721).	NOC/(MOD)

728	Non-GSO MSS in 470-862 MHz	Still relevant; for consideration by a future WRC (preliminary agenda item 3.4 for WRC-02/03, as per Resolution 722). See also the Note in the comments related to Resolution 46.	NOC
729	Adaptive systems at MF/HF	Still relevant; ongoing studies with a view to present results to a future WRC (preliminary agenda item 3.6 for WRC-02/03, as per Resolution 722).	NOC

Rec. No.	**Subject**	**Remark**	**Possible follow-up**
7	Standard forms for licences	Still relevant.	NOC
8	Automatic identification	Still relevant, ongoing studies.	NOC
9	Operation of BC stations on board ships/aircraft	Still relevant.	NOC
14	Identification of special vessels	Many aspects are obsolete, ongoing studies with a view to present results to a future WRC. NOTE - This Recommendation is referred to in No. S33.28.	MOD
32	Space monitoring	Still relevant, although some elements are obsolete; may be consolidated with Recommendation 36.	MOD
34	Principles for allocation of frequency bands	Still relevant, ongoing studies.	NOC
35	Procedure for modification of a Plan	For consideration by WRC-2000 (agenda item 1.20).	-
36	International monitoring of emissions from space stations	Still relevant; may be consolidated with Recommendation 32.	MOD
61	Interference assessment above 28 MHz, standards	Only one ITU-R Recommendation established since 1979 (S.1150). To be deleted?	SUP/MOD
63	Calculation of necessary bandwidth	Still relevant (in the new context).	MOD
64	Protection ratios and E_{min}	Still relevant (in the new context).	MOD
66	Max. level of unwanted emissions	For consideration by WRC-2000 (agenda item 1.2); see Chapter 7 of CPM Report (§ 7.1).	-
71	Type approval	Still relevant.	NOC
100	Bands for troposcatter	Partly obsolete, ongoing studies with a view to present results to a future WRC.	MOD
104	pfd and e.i.r.p. limits	Still relevant, ongoing studies. See also the Note in the comments related to Resolution 46.	(MOD)

105	Coordination area	For consideration by WRC-2000 (agenda item 1.3).	-
316	Use of SES within harbours	**Obsolete** (Inmarsat MoU).	SUP/MOD
318	Improved APS18	Implicitly on the agenda of WRC-2000 (agenda item 1.18); see Chapter 1 of CPM Report (§ 1.3).	-
319	Adjacent channel interference in HF-MMS	Still relevant; ongoing studies with a view to present results to a future WRC.	NOC
401	Use of worldwide frequencies in AP27	Although this Recommendation contains useful suggestions to administrations, it is not observed by many administrations.	NOC/MOD
402	Coordinated use of WW frequencies in AP27	Although this Recommendation contains useful suggestions to administrations, it is not observed by many administrations. More details in the BR Report to WRC-2000 (Document 16).	MOD/SUP
405	Utilization of AMSS(R)	Obsolete, in view of current practices.	SUP
503	HFBC	Obsolete (implemented, observed by adm.).	SUP
506	Harmonics in BSS	Still relevant.	NOC
507	Spurious emissions in BSS	For consideration by WRC-2000 (agenda item 1.2).	-
515	Other modulation in HFBC	Ongoing studies.	NOC
517	SSB PR in HFBC	Some elements are obsolete, ongoing studies.	MOD
518	HFBC receivers	**Obsolete** in view of current practices.	SUP
519	Introduction of SSB, cessation of DSB	For consideration by a future WRC.	NOC
520	Elimination of out-of-band HFBC emissions	Still relevant.	NOC

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 16-E
4 February 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

REPORT OF THE THE RADIOCOMMUNICATION BUREAU ON EXPERIENCES IN THE APPLICATION OF THE RADIO REGULATORY PROCEDURES AND OTHER RELATED MATTERS

This document summarizes the experiences of the Radiocommunication Bureau in the application of the radio regulatory procedures, as contained in the articles of the Simplified Radio Regulations, as well as in the associated resolutions and recommendations. It contains also progress reports on various post-conference activities.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

Director, Radiocommunication Bureau

REPORT OF THE RADIOCOMMUNICATION BUREAU ON EXPERIENCES IN THE APPLICATION OF THE RADIO REGULATORY PROCEDURES AND OTHER RELATED MATTERS REFERRED TO IN SPECIFIC RESOLUTIONS AND RECOMMENDATIONS

1 Introduction

In accordance with the provisions of Article 7 of the Convention (CV180), the Director of the Radiocommunication Bureau is required to submit a report to the Conference on the activities of the Radiocommunication Sector covering the period between the two WRCs. Resolutions from previous WARC/WRCs, as well as from Plenipotentiary Conferences, also instruct the Director to submit appropriate reports on specific issues.

The Conference Preparatory Meeting prepared its Report to WRC-2000 on technical, operational and regulatory/procedural matters to be considered by WRC-2000 in response to Resolution 1130. Some elements in the CPM Report were drafted, *inter alia*, on the basis of contributions from the Bureau submitted to CPM-99. Such elements are not repeated in this document; appropriate cross-references to the relevant sections of the CPM Report to WRC-2000 are indicated in **Attachment 2** to this document.

This document summarizes the experiences of the Radiocommunication Bureau in the application of the radio regulatory procedures, as contained in the articles of the Simplified Radio Regulations, as well as in the associated resolutions and recommendations. It also contains progress reports on various post-conference activities, as well as on issues addressed in various Resolutions which call for such reports.

Further input from the Radiocommunication Bureau, as requested by other resolutions or recommendations, is contained in other conference documents.

2 Experiences in the application of the radio regulatory procedures

This section summarizes the experiences of the Bureau in the application of the procedures referred to in Articles S9 and S11 of the Radio Regulations, as well as in the associated articles, resolutions and recommendations, where appropriate. These experiences are rather limited, bearing in mind the relatively short time of application of the new procedures (since 1 January 1999).

2.1 Comments relating to Article S5

The practical application of the provisions of Nos. S5.488 and S5.491 has raised two particular issues that the Conference may wish to consider.

2.1.1 Application of Nos. S5.488 and S5.491 to geostationary-satellite systems

The use of the bands 11.7-12.2 GHz in Region 2 and 12.2-12.5 GHz in Region 3 by geostationary satellites in the fixed-satellite service is limited to national and subregional systems (Nos. S5.488 and S5.491). In order for the Bureau to examine properly any coordination request (CR) with frequency assignments under Nos. S5.488 or S5.491, as appropriate, such CR should have a service area limited to the national territory(ies) of the notifying administration, or in the case of an extended subregional service area, the CR should contain the agreement from any other administrations the territory(ies) of which is/are included in the planned service area (refer also to RRB's decisions on this issue, 13th meeting (6-14 July 1998)).

In the majority of cases, if not all, the above-required agreement in the case of a subregional system is missing. In such situations, the Bureau would normally reach an "Unfavourable Finding" with respect to the provisions of RR1503/No. S11.31. However, in the general interest of administrations, the Bureau has opted for a more flexible approach and decided to provide a period of three months to administrations to finalize the situation by defining the service area(s) in terms of administrations (country/territory symbol) which have agreed 1) to the inclusion of their territory in the proposed service area of the satellite system under consideration and 2) to authorize and name the administration proposing the system to act as notifying administration on their behalf. In the event that no reply is received from the administration initiating the coordination within the three-month period, the finding is amended to Unfavourable. This review of the finding has a retroactive impact on the result of No. S9.36 examinations of other networks performed by the Bureau during the above-mentioned intervening period (review of list of required coordinations).

The implementation of the above approach has proved to be burdensome for the Bureau, as well as for administrations, as it generates a lot of administrative exchanges between the BR and involved administrations.

In view of the above, the Conference may wish to reconsider the inclusion of such procedures (or otherwise) in Nos. S5.488 and S5.491.

2.1.2 Application of Nos. S5.488 and S5.491 to non-geostationary-satellites systems

The RRB, at its 12th meeting (20-24 April 1998), reviewed the Rule of Procedure concerning the application of Nos. S5.488 and S5.491 to non-geostationary-satellite systems. After having analysed all WRC-97 decisions related to the use of non-GSO FSS systems in certain frequency bands, particularly Resolutions 130 (WRC-97) and 538 (WRC-97), the RRB agreed to remove the restriction of national and subregional usage referred to in the above footnotes for non-GSO FSS systems. The Bureau has since applied the relevant Rule of Procedure and processed non-GSO systems accordingly.

The Conference may wish to consider whether the practice adopted in the Rule of Procedure might be reflected in the text of Nos. S5.488 and S5.491.

2.1.3 Application of No. S5.488 (Article 14/No. S9.21 for FSS in the band 11.7-12.2 GHz in Region 2)

At its 13th meeting (6-14 July 1998), the RRB revised the Rule of Procedure relating to the application of Article 14/No. S9.21 in No. S5.488 (former RR839). This revision was based on the understanding that the new text of No. S5.488, with no explicit reference to S9.21, means that there is no longer a need for the specific procedure of No. S9.21 to be applied in the band 11.7-12.2 GHz in Region 2, as of 1 January 1999.

The Radiocommunication Bureau subsequently raised with the RRB (16th meeting 24-28 May 1999) that this modification removes the only regulatory mechanism available to terrestrial services for their protection from GSO FSS services in this band in Region 2. With the concurrence of the RRB, this matter was brought to the attention of the CPM, which supported the need to clarify this regulatory procedural situation (refer CPM Report, Chapter 7, paragraph 7.6).

Three approaches were identified by the CPM:

Approach 1: introduction of hard pfd limits for GSO FSS networks operating in the band 11.7-12.2 GHz in Region 2.

Approach 2: introduction of pfd values, which are thresholds. For any Region 2 FSS networks exceeding the specified pfd values, there would be a requirement to reach agreement with any affected administrations.

Approach 3: to refer explicitly to No. S9.21 in No. S5.488 (to restore previous requirement to apply Article 14 as in RR839).

The Conference may wish to consider clarification of the application of S5.488 using one of the approaches outlined by the CPM (as noted above).

2.2 Comments relating to Article S9

Article S9 does not contain an explicit statement concerning the publication of Special Sections containing the status of the coordination procedures under Nos. S9.11 to S9.14 and S9.21. To this effect, the RRB adopted an appropriate Rule of Procedure (see Rule of Procedure against S9.52C).

The matter may be remedied by the introducing of an additional provision in Article S9, and a possible text is given below:

ADD

S9.53A Upon expiry of the deadline for comments to a coordination request under Nos. **S9.11** to **S9.14** and **S9.21**, the Bureau shall, according to its record, publish a Special Section, indicating the list of administrations having submitted their disagreement or other comments within the regulatory deadline.

2.3 Comments relating to Article S11

2.3.1 Treatment of inter-satellite links under S11.32

At its 17th meeting held from 13 to 17 September 1999, the RRB, having regard to advice from Study Group 7, approved a new Rule of Procedure in the application of No. S5.392 which indicates that, for inter-satellite links in frequency bands 2 025-2 110 MHz and 2 200-2 290 MHz, the link between the geostationary (GSO) space station and the non-geostationary (non-GSO) space station should not be taken into account by the Radiocommunication Bureau in its regulatory examination under RR 1504/S11.32. The adopted rule is specific to particular frequency bands and services. Indeed, the only space services allocated in these two frequency bands are the space research, Earth exploration-satellite and space operation services, and the space-to-space transmissions referred to are limited to data relay satellite systems operating within the allocated services.

At its 18th meeting (8-12 November 1999), and 19th meeting (21-25 February 2000) the Board noted emerging difficulties in treating cases involving inter-satellite links between GSO and non-GSO systems. The Bureau indicated that it currently has on hand notices from administrations involving some 50 cases that include inter-satellite links between GSO and non-GSO systems in various frequency bands allocated to the inter-satellite service. The RRB agreed that advice from appropriate ITU-R study groups should be sought as regards technical criteria, calculation method and associated tools to enable the Bureau to undertake an examination of conformity pursuant to No. S11.32. Accordingly appropriate advice has been sought from Study Group 4.

The scope of approaches that might be followed to resolve this issue could vary from the application of the principles already adopted in the Rule of Procedure on No. S5.392 (e.g. no coordination requirement) to a coordination requirement triggered only by bandwidths overlap. One important issue is to consider the respective regulatory treatment of one and the same link viewed from its two ends, in the particular case of an inter-satellite link between a GSO space station and a non-GSO space station: either coordination is not required from the GSO and non-GSO perspective, or coordination could be required from the GSO perspective, but not the non-GSO one, or coordination is required for both systems.

In light of the above and pending consideration by ITU-R Study Group 4, it is suggested that the Conference consider and determine the most appropriate regulatory approach to be taken.

2.3.2 Application of S11.39

The current wording of No. S11.39 (its last sentence which was added at WRC-97) may give rise to confusion, as it is not clear what the relationship of Nos. S11.39A to S11.39E is with respect to the first and second sentence of No. S11.39. In order to clarify this relationship, the RRB adopted an appropriate Rule of Procedure (see Rule of Procedure against S11.39).

In order to make the situation absolutely clear, provision No. S11.39 may be formulated in the following way:

MOD

S11.39 When the examination with respect to No. **S11.34** leads to a favourable finding, the assignment shall be recorded in the Master Register. When the finding is unfavourable, the notice shall be returned to the notifying administration, with an indication of the appropriate action. However, notices under Appendices **S25**, **S26** and **S27** which are in accordance with the technical principles of the relevant appendix but not with the associated allotment plan shall be treated as follows:

Furthermore, a new provision may be necessary, like the following one:

ADD

S11.39F A notice which is not in conformity with the technical principles of Appendices **S25**, **S26** or **S27**, as applicable, shall be returned to the notifying administration, unless the administration undertakes that it will be operated in accordance with No. **S4.4**; in such a case the assignment shall be recorded in the Master Register for information purposes and subject to application of No. **S8.5**.

2.4 Comments relating to Article S21

Provision No. S21.6 refers to Table S21-2, specifying the frequency bands which are shared with equal rights between space services, on one hand, and the fixed and mobile service, on the other hand, where the terrestrial station is subjected to power limits. This provision (and the related Table S21-2) enter into the category of the provisions referred to in Nos. S11.31.2; i.e. the category of provisions of a mandatory character. The characteristics of the relevant frequency assignment are examined from the viewpoint of conformity with these provisions, where the non-conformity results in unfavourable regulatory finding and in return of the notice to the notifying administration.

The Bureau scrutinized the Table of Frequency Allocations and compared it with Table S21-2. This comparison indicated that Table S21-2 is incomplete as it does not reflect all sharing situations from Article S5, nor does it contain power limits for some frequency bands which are shared with equal rights between space services, on one hand, and the fixed and mobile service, on the other hand. The missing bands are indicated with revision marks.

Table S21-2 contains power limits only in the bands between 1 610 MHz and 29.5 GHz. Provision No. S5.542 extends the applicability of power limits specified in Nos. S21.3 and S21.5 up to 31 GHz. Consequently, there is no provision which specifies the applicability of the power limit below 1 610 MHz and above 31 GHz, although the Table of Frequency Allocations contains other shared bands with allocations to space services (Earth-to-space) in the bands below 1 610 MHz (e.g. 1 427-1 429 MHz) as well as in the bands above 31 GHz (e.g. 31-31.3 GHz, 34.2-34.7 GHz, 40-40.5 GHz, 42.5-47 GHz, 47.2-50.2 GHz, 50.4-51.4 GHz, etc.). Therefore, no Article S21 examination is required by the RR in these bands. The Conference may wish to review this situation and to take appropriate decisions in this regard.

TABLE **S21-2**

Frequency band	Service	Limit as specified in Nos.
1 610-1 645.5 MHz (No. **S5.359**) 1 646.5-1 660 MHz (No. **S5.359**) 1 675-1 690 MHz (Region 2) 1 690-1 700 MHz (Region 2 countries listed in No. **S5.381**) 1 700-1 710 MHz (Region 2) 1 980-2 010 MHz 2 010-2 025 MHz (Region 2) 2 025-2 110 MHz 2 200-2 290 MHz 2 655-2 670 MHz[5] (Regions 2 and 3) 2 670-2 690 MHz 5 670-5 725 MHz (Nos. **S5.453** and **S5.455**) 5 725-5 755 MHz[5] (Region 1 countries listed in Nos. **S5.451**, **S5.453** and **S5.455**) 5 755-5 850 MHz[5] (Region 1 countries listed in Nos. **S5.451**, **S5.453**, **S5.455** and **S5.456**) 5 850-7 075 MHz 7 900-8 400 MHz 8 400-8 500 MHz	Fixed-satellite Meteorological-satellite Space research Space operation Earth exploration-satellite Mobile-satellite	**S21.2, S21.3, S21.4** and **S21.5**
10.7-11.7 GHz[5] (Region 1) 12.5-12.75 GHz[5] (Nos. **S5.494** and **S5.496**) 12.7-12.75 GHz[5] (Region 2) 12.75-13.25 GHz 13.75-14 GHz (Nos. **S5.499** and **S5.500**) 14.0-14.25 GHz (No. **S5.505**) 14.25-14.3 GHz (Nos. **S5.505**, **S5.508** and **S5.509**) 14.3-14.4 GHz[5] (Regions 1 and 3) 14.4-14.5 GHz 14.5-14.8 GHz	Fixed-satellite	**S21.2, S21.3** and **S21.5**
17.3-17.7 GHz (No. **S5.514**) 17.7-18.4 GHz 19.3-19.7~~6~~ GHz 22.55-23.55 GHz 24.45-24.75 GHz (Regions 1 and 3) 24.75-25.25 GHz (Region 3) 25.25-29.5 GHz 29.5-31 GHz (No. **S5.542**)	Fixed-satellite Inter-satellite Space research Mobile-satellite	**S21.2, S21.3** and **S21.5**

[5] **S21.6.1** The equality of right to operate when a band of frequencies is allocated in different Regions to different services of the same category is established in No. **S4.8**. Therefore any limits concerning inter-Regional interference which may appear in ITU-R Recommendations should, as far as practicable, be observed by administrations.

2.5 Comments relating to Resolution 300 (Rev.Mob-87)

This Resolution was initially adopted by the World Maritime Administrative Radio Conference (Geneva, 1974; WMARC-74), as Resolution Mar2-7, intended to serve as an interim measure concerning the use and notification of paired frequencies for NBDP telegraphy and data transmission systems in the HF bands allocated to the maritime mobile service, without prejudging the decisions of future competent conferences as to the establishment of an appropriate plan for the bands and systems in question. According to Resolution Mar2-7, administrations were requested to select the pairs of frequencies *with the assistance of the then IFRB* (see *resolves* 1.2 of that Resolution); the notices which were not in conformity with the above provisions (i.e. notices related to frequency pairs which were selected by the administration concerned without the IFRB's involvement) were returned to the notifying administrations (see *resolves* 1.4).

WARC-79 reviewed Resolution Mar2-7 and decided to maintain it, as Resolution 300, with minor changes of editorial character. However, when establishing the calendar of future planning conferences, WARC-79 did not envisage any conference whose mandate would be the establishment of a plan for the NBDP telegraphy in the HF bands.

Resolution 300 was further reviewed by the World Administrative Radio Conference for the mobile services (Geneva, 1987; Mob-87). WARC-Mob-87 made available an increased number of paired frequencies reserved for NBDP telegraphy and modified Resolution 300 in two aspects: 1) it deleted the reference to the would-be plan for NBDP telegraphy in the HF bands, and 2) it removed the mandatory provisions (set forth in the former paragraph 1.2) concerning the administrations' obligations to select frequencies for their coast stations with the assistance of the then IFRB. Nevertheless, it maintained the principle of a two-way examination of the probability of harmful interference to be caused by or to other existing or proposed uses, with the requirement for the then IFRB to inform the administrations concerned on the results of the examination.

WRC-95 and WRC-97 reviewed the overall concept of notification, examination and recording of frequency assignment notices and decided to abolish the examination of the probability of harmful interference in the non-planned bands below 28 MHz, as from 18 November 1995. However, these conferences did not change the concepts of Resolution 300 (Rev.Mob-87), which remain the only instrument which requires the examination of the probability of harmful interference in the non-planned band below 28 MHz.

In order to apply the procedures of Resolution 300, the then IFRB developed appropriate software, whose features are explained in IFRB Circular-letters No. 488 (dated 22 July 1981) and No. 874 (dated 20 August 1991). The relevant software modules have been running on the ITU mainframe computer Siemens until the end of 1999, when the ITU mainframe computer was phased out due to the non-compliance of the related database management system (CA-IDMS 10.21) with the Year-2000 requirements. Therefore, since 1 January 2000, the Bureau has no operational tool for performing these examinations[1] and the relevant notices are being kept in abeyance until such a time as the appropriate software module is put into production.

The summary statistics on the cases treated under the procedures set forth in Resolution 300 (Rev.Mob-87) since 1991 (date of the availability of the additional channels) until the end of 1999 are given in Table 1.

---

[1] The development of new software module for these examinations, under TerRaSys, is foreseen only after 1 January 2001, bearing in mind the established priorities in this regard, which are based on the volume of notices which are to be treated by the relevant tool.

TABLE 1

Statistics related to the procedure governed by Resolution 300

Year	1991	1992	1993	1994	1995	1996	1997	1998	1999
No. of cases	2 929	3 429	429	88	82	47	50	83	21

In this connection, the Bureau wishes to indicate that despite the numerous incompatibilities identified during the examinations, which were communicated to the notifying administrations, the administrations rarely opted for an alternative frequency. Furthermore, there were very few cases of harmful interference in these bands that were reported to the Bureau (for information or for assistance).

In view of the above, it may be appropriate to review the need for maintaining the procedures of Resolution 300 (Rev.Mob-87), bearing in mind that these are the only procedures which call for an examination of the probability of harmful interference in the non-planned bands below 28 MHz, and taking also into account the usefulness of such examinations in the light of the administrations' actions in response to the identified incompatibilities. The administrations may wish to consider aligning the procedures of Resolution 300 (Rev.Mob-87) with those of Article S11, which would also eliminate the need for developing a new software module (under TerRaSys) for examination of the probability of harmful interference of the notices governed by current Resolution 300 (Rev.Mob-87), an activity which would be required if the current procedures of Resolution 300 (Rev.Mob-87) were to be maintained with no change. An example modification to Resolution 300 is given in **Attachment 1**.

2.6 Comments relating to Resolution 500

Resolution 500 has been adopted by WARC-79 and has been applied only 14 times since its adoption, the last one in August 1995. In view of the very low rate of modifications in the LF broadcasting band, the usefulness of this Resolution is questionable. Furthermore, the current version of the resolution, in *resolves* 5, contains a sentence which makes reference to RR1241 (i.e. examination with respect to the probability of harmful interference) which is not applicable any longer, bearing in mind the changes in the radio regulatory procedures adopted by WRC-95 and WRC-97.

2.7 Comments relating to Recommendation 402

2.7.1 This Recommendation was initially adopted by the World Administrative Radio Conference on the aeronautical mobile (R) service, Geneva, 1978, as an initial tool for assisting administrations to coordinate their requirements for worldwide frequencies in the respective allotments of the allotment plan of Appendix 27Aer2 (now Appendix S27). The category of worldwide frequencies was introduced at WARC-Aer2 with a view to support the requirements for long-distance aeronautical operational control communications (AOCC). In view of the limited number of worldwide frequencies, and in order to preserve the integrity of communications over worldwide frequencies, WARC-Aer2 adopted Recommendations Aer2-2 (subsequently numbered to 401 by WARC-79) and Aer2-3 (subsequently numbered to 402 by WARC-79). By Recommendation 401 (former number Aer2-2), WARC-Aer2 recommended to administrations to keep the number of HF stations for AOCC to a minimum, so as to ensure efficient use of worldwide frequencies, and where practicable, to establish such arrangements which would result in establishing a single station which would provide a service to several aircraft operating agencies from different countries. By Recommendation 402 (former number Aer2-3), WARC-Aer2 established a mechanism for a voluntary coordination between administrations, through both ITU and the ICAO, intended to ensure an efficient use of worldwide frequencies, while preserving the rights of administrations to use any frequency assignment in conformity with the relevant procedures of the Radio Regulations.

2.7.2 In order to facilitate the implementation of the decisions of WARC-Aer2, the then IFRB collected appropriate information from administrations on the planned use of the frequencies for long-distance AOCC and, in close collaboration with the ICAO, has developed the initial List of coordinated use of frequencies for long-distance AOCC. That List was communicated with the IFRB Circular-letter No. 533 of 1 February 1983 (i.e. on the date of the entry into force of the new allotment arrangement) so as to ensure timely implementation of the identified requirements for long distance AOCC. The same Circular-letter also contained an outline of the procedure for accommodating new requirements.

2.7.3 Administrations had cooperated for quite some time in following the joint ITU/ICAO procedure for choice of frequencies for long-distance AOCC. However, in some cases the administrations also preferred to exercise their rights in putting into operation frequency assignments, on the worldwide frequencies, which were not in accordance with the List of coordinated frequencies. By the end of 1990, the MIFR already contained some 70 frequency assignments of the worldwide frequencies for long-distance AOCC which were not in accordance with the ITU/ICAO List of coordinated frequencies. In view of the possible consequences of such an approach by large number of administrations, the then IFRB, in communicating the updated List of coordinated frequencies (IFRB Circular-letter No. 847 of 10 December 1990), has expressed its concern as to the possible degradation of the worldwide system for long-distance AOCC, due to the lack of application of the procedures of Recommendation 402. Similar concerns were expressed by the ICAO through an appropriate ICAO State letter.

2.7.4 Despite the concerns expressed by ITU and the ICAO, administrations continued to notify assignments of the worldwide frequencies for long-distance AOCC which were not in accordance with the ITU/ICAO List of coordinated frequencies and without applying the procedures of Recommendation 402. As the procedure of Recommendation 402 is not mandatory, the Bureau was obliged to accept such notifications when the notifying administration insisted on its notifications under Article 12/S11 of the Radio Regulations. In such cases, appropriate correspondence is being initiated, drawing the attention of the notifying administration on the desirability of applying the procedures of Recommendation 402. Similar correspondence is being addressed to the ICAO. The summary statistics on the cases treated since 1991 are given in Table 2.

TABLE 2

Statistics related to the procedure governed by Recommendation 402

Year	**1991**	**1992**	**1993**	**1994**	**1995**	**1996**	**1997**	**1998**	**1999**
No. of notifications nominally governed by RC402	9	12	11	7	10	11	8	35	18
No. of cases included in the ITU/ICAO List	8	4	0	0	0	0	0	0	0

2.7.5 The statistical data clearly indicate the current irrelevance of the procedures of Recommendation 402. In view of the above, administrations may wish to consider various options as to the future of Recommendation 402, e.g.:

- a possible suppression of Recommendation 402, bearing in mind the ever-increasing non-observance of the related procedures which are strictly voluntary;
- an alternative regulatory mechanism (e.g. through an appropriate resolution) which would make these procedures mandatory, so as to preserve the integrity of the worldwide system for long-distance AOCC.

3 Post-conference activities and other issues addressed in various resolutions which call for progress reports

3.1 Implementation of Resolution 13 (Rev.WRC-97)

With this Resolution, WRC-97 instructed the Director to explore the possibility of extending the present allocation scheme concerning the allocation of international call sign series if it appears that all the possibilities of the present system of forming call signs is exhausted.

The Bureau wishes to report that the capacity of the call sign system based on the provisions of the present Radio Regulations (Article S19) is still sufficient[2]. Therefore, the Bureau considers that there is not yet a need for exploring the possibility of forming new international series on the basis of the method indicated in *resolves* 3.1 of Resolution 13 (Rev.WRC-97).

The report on the changes in the allocation of call sign series, referred to in No. S19.33, is contained in another conference document.

3.2 Incorporation by reference (issues referred to in Resolutions 27 (Rev.WRC-97) and 28 (WRC-95))

3.2.1 WRC-97, by its Resolution 27 (Rev.WRC-97), instructed the Director, BR, to arrange for a review of the provisions of the Radio Regulations containing references to ITU-R or ITU-T Recommendations with a view to proposing suitable recommendations to CPM-99 for inclusion in its Report to WRC-2000. Such a review was initiated through the Special Committee on Regulatory/Procedural Matters (SC), where a specific Rapporteur Group (SC-4) addressed this issue. In this connection, the Bureau submitted the results of its studies of those provisions in the *Articles* of the Radio Regulations, which make reference to ITU-R Recommendations, to the SC meeting (12-16 July 1999). The results of the study were incorporated in the SC Report to CPM-99. Additional reports, on those provisions in the *Appendices* of the Radio Regulations, which make reference to ITU-R Recommendations as they appear in the 1998 edition of the RR, were presented to CPM-99. The CPM conclusions in this respect can be found in section 7.3 of the CPM Report to WRC-2000, as well as in Annexes 2-5 to Chapter 7 of the same report.

3.2.2 The above study indicated that in many cases the reference to an ITU-R Recommendation could be replaced by a reference to another provision of the Radio Regulations, or by a short descriptive text, especially in those cases where such references to ITU-R Recommendations were introduced due to the rearrangement of the RR, pursuant to the VGE recommendations, and which formerly referred to a specific RR provision now transferred to an

[2] On 1 December 1999, twenty-nine international series (out of 978 possible series) were still free for future utilization.

ITU Recommendation. In other cases, where the numerous references to a single ITU-R Recommendation resulted in the inconsistency of the linking language (e.g. mandatory in some cases and non-mandatory, or undefined, in other cases), the study indicated that references to ITU-R Recommendations could be streamlined by proposing a clear mandatory linking language in one key provision, and by amending the other provisions accordingly. Finally, in several cases, the study detected a redundancy as the Radio Regulations already contained the material which was incorporated by a reference to an ITU-R Recommendation.

3.2.3 In applying the approach described in paragraph 3.2.2 above, it was concluded that it may be possible to considerably decrease the number of RR provisions making reference to ITU-R Recommendations, thus facilitating the task of continuing review of the provisions of the RR which make reference to ITU-R Recommendations with a view to possibly updating the relevant references, as requested by Resolution 28 (WRC-95), a task which is often performed under time pressure during conferences. Example modifications to the provisions of the Radio Regulations in this respect are contained in Annex 5 to Chapter 7 of the CPM Report to WRC-2000.

3.2.4 Both the SC and the CPM noted that Part A to Annex 3 to Resolution 27 (Rev.WRC-97) was incomplete as it does not list several provisions of Articles to Radio Regulations which make reference to ITU-R Recommendations (e.g. S5.391, S5.511C, S5.536A, S19.96A, S22.5A, S22.5C) which were adopted at WRC-97 after the adoption of Resolution 27 (Rev.WRC-97). Similar conclusions were drawn with respect to Part B to Annex 3 of Resolution 27 (Rev.WRC-97). The CPM noted the inconveniences due to incomplete lists in Resolution 27 (Rev.WRC-97) which resulted in an incomplete Volume 4 of the Radio Regulations. In order to ensure that the Radio Regulations do contain the complete collection of the ITU-R Recommendations that are incorporated by reference, CPM considered that a more formal mechanism should be adopted via a Resolution at WRC-2000 which would list explicitly all ITU-R Recommendations that are incorporated by reference and which will be published in the Radio Regulations.

3.2.5 With respect to Resolution 28 (WRC-95), an appropriate Report will be prepared immediately after the completion of the work of the RA-2000.

3.3 Resolution 73 (WRC-97)

Resolution 73 (WRC-97) relates to the measures to resolve the eventual incompatibility between the broadcasting-satellite service in Region 1 and the fixed-satellite service in the frequency band 12.2-12.5 GHz in Region 3, and vice versa. The Bureau has now processed all FSS networks received prior to 27 October 1997, and is therefore in a position to provide assistance, upon request and on a case-by-case basis, to Administrations of Region 3, which would enable then to proceed with the required coordination of their FSS satellite networks with BSS networks for which the Appendix S30, Annex 2 information has been received by the Bureau before 27 October 1997, also taking account of BSS networks included in the Ap30 Plan. See also NOTE 2 of Resolution 73 (WRC-97).

3.4 Liaison with IMO on coordination of NAVTEX services (Resolution 339 (WRC-97))

3.4.1 Pursuant to this Resolution, the Bureau established appropriate contacts with the IMO with a view to obtaining, on a regular basis, the relevant information on operational coordination for NAVTEX services on the frequencies 490 kHz, 518 kHz and 4 209.5 kHz. The format of the List of Coast Stations (List IV) was modified accordingly. The Bureau receives the relevant information regularly from IMO and also requests this information whenever a new edition of List IV or its recapitulative supplements is undertaken. The information is being published regularly since August 1998.

3.4.2 In this connection, the Bureau wishes to report on the apparent inconsistency in the instructions dealing with the publication of this information. Resolution 339 (WRC-97), in *instructs 2*, specifies that the information related to NAVTEX services is to be published in the List of Coast Stations (List IV). On the other side, Appendix S13 specifies in its Part A6, Section IV, paragraph 11, that List VI (Radiodetermination and Special Service Stations) shall also contain operational details on coast stations which are transmitting NAVTEX information, with a further provision, in paragraph 13 of the same section, that the frequency 518 kHz shall be used for transmission of NAVTEX information. Bearing in mind the different periodicity of the publication of Lists IV and VI, as well as the fact that Appendix S13 deals with non-GMDSS distress and safety communications, the Bureau considers that the IMO information on the coast stations that are providing NAVTEX services on the GMDSS frequencies 490 kHz, 518 kHz and 4 209.5 kHz is to be published only in List IV, as specified in Resolution 339 (WRC-97). List VI will continue to contain particulars of only those stations that are transmitting NAVTEX-type information on frequencies other than the GMDSS frequencies 490 kHz, 518 kHz and 4 209.5 kHz.

3.5 Additional search and rescue information in databases (Resolution 340 (WRC-97))

With this Resolution, administrations were invited to consider the incorporation of additional information (as listed in annex to Resolution 340 (WRC-97)) in their national maritime databases and to provide Rescue Coordination Centers (RCC) immediate access to these databases on an uninterrupted basis, with a view to support and facilitate the search and rescue activities. The Resolution further instructed the Director, BR, to consult the administrations with a view to incorporating these additional search and rescue information into the ITU maritime services database.

The Bureau initiated these consultations in February 1998, through the Circular-letter CM/6 of 27 February 1998. On that occasion, the Bureau explained the structure of its Maritime mobile Access and Retrieval System (MARS), and its plans concerning the introduction of additional data elements in MARS, with a view to allow RCC immediate and uninterrupted online access to all these information. Administrations were requested to inform the Bureau of their plans as to the providing the additional information to the Bureau, as well as their views as to the availability of these additional data to users other than RCC.

Based on the positive responses from many administrations, as well as on other suggestions from administrations, the Bureau has modified the structure of its Maritime mobile Access and Retrieval System (MARS) so as to incorporate the additional data elements. The additional information, submitted in accordance with the new formats, is being made accessible, through the Internet, to the following categories of users:

a) ***General users:*** all information as published in the List of Ship Stations, plus the additional information except names and addresses of the contact person ashore and the alternative 24-hour emergency telephone number.

b) ***Administrations and notified Rescue Coordination Centres/SAR authorities*****:** all information as published in the List of Ship Stations and **all** the new additional information referred to in Resolution 340 (WRC-97).

This modification is being carried out in two phases. Through phase one, which was completed at the end of 1999, all the new additional data elements for users of category a) was introduced into MARS. Through phase two, which is to be completed in the first quarter of 2000, the complete additional information for users of category b) will be introduced into MARS, using protected fields

In a parallel activity, the Bureau developed appropriate formats for submission, by administrations, of the additional data and communicated them to administrations with the Circular-letter CM/9 of 16 April 1999.

3.6 Exhaustion of the maritime mobile service identity numbering resources (issues referred to in Resolution 344 (WRC-97)) and other related issues

3.6.1 General

Resolution 344 (WRC-97) instructed the Director, BR to monitor the status of the MMSI resource, and to report to each WRC on the anticipated reserve capacity and expected exhaustion of the resource.

In its Report to WRC-97, the Bureau already reported on the near exhaustion of the international blocks of ship station numbers in the selective calling system (5-digit numbers). Similar concerns were reported with regard to MMSI, where the systematic assignment, by the administrations, of identities containing three-trailing zeroes, resulted in a drastic reduction of the capacity of the MID numbering plan and in ever increasing number of requests for additional MIDs.

This section summarizes the activities since WRC-97 and presents the current situation in this respect.

3.6.2 Blocks of selective call numbers for ship stations

In application of the provisions of Article S19 of the Radio Regulations, the Radiocommunication Bureau is responsible for the allocation of series of selective call numbers at the request of the administrations concerned.

Despite the very rigorous management of this resource, its capacity (1 000 blocks of 100 selective call numbers for ship stations) has been exhausted, as all series have been allocated to administrations. Consequently, as from 16 March 1999, the Bureau has not been in a position to supply any further series of five-digit selective call numbers to ship stations.

In BR Circular-letter CR/55 of 6 August 1996, the Bureau informed administrations on the near depletion of selective call number series and urged administrations to assign such identities to stations only when no other means of identification are applicable. The Bureau also invited administrations to re-examine their needs on blocks of ship station selective call numbers with a view to returning, to ITU, unused blocks of ship station selective call numbers, so as to provide for the possibility to make them available, when required, to other administrations. However, the response from the administrations to such an appeal from the Bureau was minimal.

On 16 March 1999, the Bureau allocated the last available block of selective call numbers. This information was communicated to administrations in the ITU Operational Bulletin No. 693 of 1 June 1999. In communicating that information, the Bureau also drew the attention of the administrations to the modified provisions of Article S19 of the Radio Regulations, notably S19.96A as adopted by WRC-97, which offer the possibility of reusing the same five-digit ship station selective call numbers within one administration, and which may be a solution for some problems. The Bureau also drew the attention of the administrations that, for operating the NBDP equipment in accordance with Recommendation ITU-R M.625, administrations may use the numerical identification system based on Maritime Identification Digits (MIDs), thus avoiding the use of 5-digit ship station selective call numbers.

With the same communication, the Bureau reiterated its appeal to administrations to re-examine their needs on blocks of ship station selective call numbers with a view to returning, to ITU, any unused blocks of ship station selective call numbers. However, not a single block of selective call numbers was returned to ITU.

It is to be noted that the Sequential Single Frequency Selective Calling System for use in the Maritime Mobile Service (SSFC) represents the first automatic international calling system, based on Recommendation ITU-R M.257, which was introduced at the World Administrative Radio Conference on the Maritime Mobile Service (Geneva, 1967). Originally this identification system was designed for maritime radiotelephony, however, at a later stage, the SSFC selective calling numbers were recommended for use in Narrow-Band Direct-Printing (NBDP) equipment in accordance with Recommendation ITU-R M.476. It was recommended that if both radiotelephony station and the NBDP equipment are installed on board a ship, the same selective calling number should be used for calling. With the introduction of other systems (e.g. digital selective calling, numerical identification system based on Maritime Identification Digits), the SSFC system is being progressively phased out and the exhaustion of five-digit selective call numbers for ship stations does not represent a considerable problem, as other means of identification are widely available to administrations.

3.6.3 Use of Maritime Identification Digits (MID)

The MID numbering system (based on 9-digit identities to stations in the Maritime Mobile and the Maritime Mobile-Satellite Services), which was introduced by WRC-97, is designed to meet the long-term requirements for establishment of an **unique ship identity** for both safety and telecommunication purposes, in a large variety of automated radiocommunication systems (e.g. with Digital Selective Calling (DSC) equipment at MF, HF and VHF; with NBDP equipment in accordance with Recommendation ITU-R M.625, with Inmarsat equipment), and within the GMDSS. However, the restrictions in the public switched networks is some countries (whose national networks were not able to transmit more than six digits of the MMSI) and the design specifications of some radiocommunication systems (whose number-translation algorithms were not able to handle nine significant digits), imposed some restrictions to administrations in assigning MMSI numbers to ships carrying alerting devices of the GMDSS and participating in different maritime radio services. This led to a situation where some administrations used to assign, on a systematic basis, only MMSI numbers with three trailing zeros, thus reducing the capacity of the relevant MID by a factor of 1 000.

In the period preceding the full implementation of the GMDSS (1 February 1999) and immediately after that date, the requests for additional MIDs have increased considerably, having in mind the requirements for mandatory carriage of alerting devices of the GMDSS and ever increasing number of installed ship earth stations. However, many of these requests were not justified as the conditions stipulated in the Radio Regulations, concerning the eligibility for additional MIDs, were not satisfied. In addition to the specific guidance suggested by the Bureau to each administration, the Bureau also prepared general guidelines to administrations in this respect (Circular-letter No. CM/4, dated 9 February 1998), drawing the attention of the administrations to the improvements in PSTN and in various Inmarsat systems, which made obsolete many previous restrictions as to the assigning identities to individual stations. Administrations were advised to review their assignment schemes so as to make optimum use of the possibilities of forming identities from the available MIDs, thus preserving the capacity of the numbering plan.

The Bureau wishes to report that there is no shortage yet in MIDs in any part of the world. However, the situation may change very rapidly if the current restrictions of the Inmarsat number-translation algorithm, related to standard systems B and M, are not resolved soon, having in mind the ever increasing trend of installing SES of these standards.

3.7 Implementation of Resolution 535 (WRC-97) (application of Article S12 of the Radio Regulations and related issues)

Provisions Nos. S12.9 and S12.33 indicated the need for Rules of Procedures for the definition of the technical analysis to be made by the Bureau. Criteria for this analysis were proposed by WRC-97 in Resolution 535 (WRC-97). After examination, the Bureau proposed to the RRB that it confirm the criteria of Resolution 535 (WRC-97). The corresponding Rule of Procedure was adopted by the RRB at its 14th meeting and was published in the consolidated edition of the Rules of Procedures, in 1998.

The appropriate software referred to in Resolution 535 (WRC-97) has been developed in time for the first season under the new procedure, with assistance from many administrations, broadcasters and regional coordination groups. Following the formal testing (initiated in July 1998 through the Circular-letter CR/100), the first release of that software, containing modules for data capture, propagation prediction and compatibility analysis, was communicated to administrations, on CD-ROM format, with Circular-letter CR/112 of 8 December 1998. The software was also made available from the ITU Website. The HFBC web page, on the ITU Website, is being kept updated permanently with updated reference tables and on-line help files, as well as with improved versions of the software.

Administrations from the least developed countries were provided with computer systems equipped to run the HFBC software, as well as BR TerRaSys software. Appropriate training and software demonstration was provided accordingly.

The Bureau also participated in several regional coordination groups. In the meetings of these groups, as well as in various radiocommunication seminars, the Bureau staff demonstrated the use of the HFBC software. Participants from developing countries were granted appropriate fellowships for some of these meetings.

The Bureau also provided various kinds of assistance to administrations requesting it, ranging from selection of appropriate frequency to application of different steps of the procedure.

3.8 Survey of HF broadcasting transmitter and receiver statistics (Resolution 537 (WRC-97))

With this Resolution, WRC-97 resolved that the first survey of transmitter and receiver statistics called for in Resolution 517 (Rev.WRC-97) should be conducted as a matter of urgency. In response to this Resolution, Working Party 10A of ITU-R Study Group 10 prepared a preliminary report on receiver and transmitter survey. The following conclusions were reported in this regard:[3]

- No SSB receiver equipped with a synchronous demodulator has been identified in the price range up to USD 200. Even in the price range from 200 to USD 600, only 15% of the HF receiver models identified are equipped with a synchronous detector.
- It is not known what percentage of the estimated 500 to 700 million HF receivers in the world are capable of SSB reception and have a synchronous detector.
- It is estimated that between 11 and 22% of the HF transmitters in the world are already capable of carrying SSB signals.

[3] The report itself, Document 10/47, is available from the Bureau for consultation; TIES registered users may obtain it from the address: www.itu.int/itudoc/itu-r/sg10/docs/sg10/1998-99/contrib/047e.html

- It is further estimated that between 9 and 14% of the HF transmitters in the world are already capable of being converted to carrying SSB signals.
- It is probable that most HF transmitter which can carry SSB signals, could also carry digital signals. However this assumption will need to be confirmed when the details of an ITU-R recommended digital AM system are available.

3.9 Application of Resolution 703 (Rev.WARC-92) relating to the calculation methodologies and interference criteria

This Resolution was established, in its initial form, by the World Administrative Radio Conference for Space Telecommunications, Geneva, 1971, as Resolution Spa2-6, as a means by which administrations could convey to the then IFRB their agreement or otherwise to the application of the revised or new CCIR Recommendations affecting the calculation methods or criteria relating to sharing of frequency bands between space and terrestrial radiocommunication services, or between space radiocommunication services, instead of those referred to in the relevant provisions of the Radio Regulations. Such a consultation was considered essential with a view to making possible, for the administrations that so wish, an early application of the improved calculation methods and interference criteria relating to coordination procedures, bearing in mind the fact that adoption of the relevant ITU-R (ex-CCIR) Recommendations followed shorter time periods than the periodicity of WARCs. Furthermore, such a procedure enabled many administrations to receive timely information on the relevant CCIR Recommendations dealing with calculation methodologies and interference criteria after the relevant meetings of the CCIR study groups and prior to the CCIR Assemblies, thus enabling timely preparation of the radio regulatory authorities whose experts could not take part in the activities preceding the adoption of the relevant CCIR Recommendations. However, the non-reply in the application of this consultation procedure had no impact on the rights of administrations that failed to reply, as the non-reply was considered as agreement by the concerned administration to the continuing application of the calculation methods and criteria defined in the Radio Regulations.

In pursuance of this Resolution, the consultation procedure has been conducted regularly for quite some time, involving the ITU Secretary-General, the ex-CCIR, the ex-IFRB and the Radiocommunication Bureau. However, the structural changes to ITU in 1992, which established new working arrangements based on biennial cycles of Radiocommunication Assemblies and WRCs, together with the new methods for approval of ITU-R Recommendations by correspondence which resulted in frequent modifications of the relevant ITU-R Recommendations, made this consultation procedure rather inefficient as many responses very often became obsolete even before the publication of the results of the consultation procedure having in mind the pace of change in the ITU-R Recommendations.

Furthermore, the low rate of response from administrations (rarely more than 15%) demonstrated that many administrations preferred the stable calculation methods as they appear in the Radio Regulations to the modified ones. For instance, in the last consultation procedure, which was performed by the Bureau in 1996-1997, only 16 replies were received (see Circular-letter CR/71 of 21 April 1997).

A further factor has been the application of "Incorporation by Reference" which has established a formal procedure for reviewing the provisions of the Radio Regulations which make reference to ITU-R Recommendations with a view to introducing normally the reference to the most recent version of the referred ITU-R Recommendation in the appropriate provision of the RR. Consequently, the consultation mechanism foreseen in Resolution 703 does not apply in these cases.

In view of the above, and bearing in mind the facts 1) that coordination is a bilateral matter for administrations which are free to adopt such criteria as they deem appropriate in the mutual coordination activities, and 2) that the ITU-R Recommendations are now available on-line in both their draft and final forms, administrations may wish to review the need for maintaining this Resolution and its time-consuming consultation procedure.

3.10 Use of bands around 2 GHz, by the fixed- and mobile-satellite services, and associated transition arrangements (Resolution 716 (WRC-95))

This Resolution covers several related issues concerning the use of the frequency bands 1 980-2 010 MHz and 2 170-2 200 MHz, in all three Regions, as well as the use of the bands 2 010-2 025 MHz and 2 160-2 170 MHz in Region 2, by the fixed- and mobile-satellite services.

3.10.1 Overview of the allocations

3.10.1.1 The bands 1 980-2 010 MHz and 2 170-2 200 MHz were allocated, by WARC-92, to the mobile-satellite service, in all three Regions. These bands were identified as host bands for the satellite component of IMT-2000, for those administrations that wish to implement IMT-2000. Initially, these bands should have been available for the MSS on 1 January 2005 (with the proviso that these bands may be available for MSS, in the United States, on 1 January 1996). Subsequently, WRC-95 has modified the relevant dates and, according to the WRC-95 decisions, these bands became available for the MSS on 1 January 2000 (except the band 1 980-1 990 MHz which will become available for the MSS, in Region 2, on 1 January 2005). However, the operation of the MSS, in the bands 1 980-2 010 MHz and 2 170-2 200 MHz, is subject to various restrictions which are summarized in Table 3 below.

TABLE 3

Summary of restrictions to the MSS (worldwide allocations)

Frequency band	Restriction	Provision No.
1 980-2 010 MHz	MSS shall operate on a non-interference basis with respect to, shall not claim protection from, and shall not hamper the development prior to 1 January 2005 of, the fixed and mobile services in Algeria, Benin, Cape Verde, Egypt, Mali, Syria and Tunisia	**S5.389F**
1 980-1 990 MHz	MSS shall operate on a non-interference basis with respect to, and shall not constrain the development of, the fixed and mobile services in Argentina, Brazil, Canada, Chile Ecuador, United States, Honduras, Jamaica, Mexico, Peru, Suriname, Trinidad and Tobago, Uruguay and Venezuela	**S5.389B**
2 170-2 200 MHz	MSS shall operate on a non-interference basis with respect to, shall not claim protection from, and shall not hamper the development prior to 1 January 2005 of, the fixed and mobile services in Algeria, Benin, Cape Verde, Egypt, Mali, Syria and Tunisia	**S5.389F**

3.10.1.2 With respect to other bands which are subject to Resolution 716, notably 2 010-2 025 MHz and 2 160-2 170 MHz, which are allocated to the MSS in Region 2, the situation is somewhat similar. According to the decisions of WRC-95, these bands should become available for MSS on 1 January 2005 (with the proviso that the allocation would become effective on 1 January 2000 in Canada and in United States). However, WRC-97 modified these dates and, according to the decisions of WRC-97, these bands would become available for MSS on 1 January 2002 (with the proviso that the allocation would become effective on 1 January 2000 in Canada and in United States). Here, as well, the operation of the MSS, in the bands 2 010-2 025 MHz and 2 160-2 170 MHz, is subject to various restrictions which are summarized in Table 4 below.

TABLE 4

Summary of restrictions to the MSS (Region 2 allocations)

Frequency band	Restriction	Provision No.
2 010-2 025 MHz	MSS in Region 2 shall operate on a non-interference basis with respect to, and shall not constrain the development of, the fixed and mobile services in Regions 1 and 3	**S5.389E**
2 010-2 025 MHz	MSS shall operate on a non-interference basis with respect to the fixed and mobile services in Argentina, Brazil, Chile, Colombia, Cuba, Ecuador and Suriname, until 1 January 2005	**S5.390**
2 160-2 170 MHz	MSS in Region 2 shall operate on a non-interference basis with respect to, and shall not constrain the development of, the fixed and mobile services in Regions 1 and 3	**S5.389E**
2 160-2 170 MHz	MSS shall operate on a non-interference basis with respect to the fixed and mobile services in Argentina, Brazil, Chile, Colombia, Cuba, Ecuador and Suriname, until 1 January 2005	**S5.390**

3.10.2 Sharing considerations and transition arrangements

3.10.2.1 Resolution 716 (WRC-95), in its *considering d)*, recognizes that the long-term sharing between the fixed service and the mobile-satellite service would be complex and difficult and that, consequently, it would be advisable to transfer the fixed service stations operating in these bands to other segments of the spectrum. Furthermore, and in order to ensure appropriate recognition of the frequency assignments to the fixed and mobile services in the concerned frequency coordination activities, administrations were requested to notify to the BR the basic characteristics of frequency assignments to existing or planned stations in the bands subjected to Resolution 716 (WRC-95), with the proviso that administrations may notify typical stations in the fixed and mobile services up until 1 January 2000. On the other hand, and bearing in mind, *inter alia*, the operational and economical aspects of the eventual transfer of the fixed and mobile services to other bands, WRC-95 resolved to invite various studies so as to facilitate the introduction and future use of the 2 GHz band by the MSS.

3.10.2.2 Based on the above considerations, ITU-R adopted Questions 201/8 and 118/9 and undertook a study with a view to establishing appropriate coordination methodologies (e.g. for evaluating potential for interference from MSS (Earth-to-space) transmissions into fixed services receivers, for assessing the impact of the MSS (space-to-Earth) systems to the performances in the fixed service receivers, for assessment of the potential of interference from fixed service transmitter to MSS space station receivers), as well as planning tools for transition of the FS systems from these bands to other segments of the spectrum. Several draft new recommendations were prepared in this regard, many of them jointly by Study Groups 8 and 9. A comprehensive list of the ITU-R Recommendations which should be considered in the coordination activities is included in Recommendation ITU-R F.1405, entitled "Guidance to facilitate coordination and use of frequency bands shared between the fixed service and the mobile-satellite service in the frequency range 1-3 GHz", as well as in draft new Recommendation ITU-R M.[Document 8/43], entitled "Guidance to facilitate coordination and use of frequency bands shared between the MSS and the fixed service in the frequency range 1-3 GHz". This latter ITU-R Recommendation, which was adopted at the meeting of Study Group 8, in November 1999, is undergoing the necessary procedure for approval by correspondence before WRC-2000, together with some other draft new recommendations on the same subject.

3.10.2.3 The application of the methodologies referred to in various ITU-R Recommendations requires, however, development of algorithms and calculation procedures that may be used in detailed bilateral coordination between concerned parties, and which are based, *inter alia*, on accurate terrain databases. Therefore, the practical value of these methodologies depends essentially on the availability of complex simulation tools which should be able to simulate a large variety of likely configurations which could occur in various countries. Such tools might have been developed in various administrations, but no software was submitted to the Bureau in this respect, despite the fact that the need for submitting such computer tools to the Bureau, by administrations, was identified by the ITU membership at various occasions. Given the lack of such tools[4], the Bureau is not in a position to provide the assistance referred to in *resolves* 6 of Resolution 716 (WRC-95). Fortunately, the Bureau has not yet been requested by any administration to provide such assistance.

3.10.2.4 Resolution 716 (WRC-95) also requested administrations to notify to the Bureau the basic characteristics of frequency assignments to existing or planned stations in the fixed and mobile stations so as to ensure their recognition in the subsequent coordination activities. The response of the administrations in this respect, as well as the overall situation concerning the recorded frequency assignments in the relevant bands is summarized in Table 5:

TABLE 5

Summary of notifications

Frequency band (MHz)	Notified frequency assignments (17.11.95 - 1.10.99)	Total number of recorded assignments (on 1.1.2000)
1 980-2 010 (all Regions)	• to individual stations: 226 • to typical stations: 8	1 399
2 170–2 200 (all Regions)	• to individual stations: 308 • to typical stations: 7	597
2 010-2 025	• From R2: 12 • From R1 and R3: 130	867 (from all Regions)
2 160-2 170	• From R2: 15 • From R1 and R3: 102	1 237 (from all Regions)

[4] Due to other priorities, the Bureau is not in a position to devote resources for development of complex computer modules in this respect.

3.10.2.5 Resolution 716 (WRC-95) also calls for phasing out, by 1 January 2000, the troposcatter systems operating in the bands 1 980-2 010 MHz (in all three Regions) and 2 010-2 025 MHz (in Region 2), bearing in mind that sharing between fixed service systems using tropospheric scatter and Earth-to-space links in MSS in the same frequency band segments is not possible. The relevant review of the Master Register, as of 1 January 2000, indicates that there were still ten such assignments in the band 1 980-2 010 MHz and two assignments in the band 2 010-2 025 MHz (R2 only).

ATTACHMENT 1

Example modification to Resolution 300

RESOLUTION 300 (Rev.~~Mob-87~~WRC-2000)

Use and notification of the paired frequencies reserved for narrow-band direct-printing telegraphy and data transmission systems in the HF bands allocated on an exclusive basis to the maritime mobile service

(See Appendix **S17** (Part B, Section II)~~/Appendix **32**~~)

The World~~ Administrative~~ Radiocommunication Conference~~ for the Mobile Services~~,~~ Geneva, 1987~~ Istanbul, 2000,

considering

a) that certain sections of the HF bands allocated to the maritime mobile service have been reserved for narrow-band direct-printing telegraphy and data transmission systems for use on a paired frequency basis only;

b) that Appendix **S17** (Part B, Section II)~~/Appendix **32**~~ contains a channelling arrangement in the maritime mobile HF bands for narrow-band direct-printing telegraphy and data systems (paired frequencies);

~~*c)* that this Conference has made available an increased number of paired frequencies reserved for narrow-band direct-printing telegraphy and data transmission systems for use on a paired basis only, and has modified Appendix **S17** (Part B, Section II)/Appendix **32** accordingly;~~

~~*d)* that WMARC-74 established interim measures for the orderly bringing into use of the paired frequencies;~~

~~*e)*~~ that ~~the~~ WMARC-74 and WARC-Mob-87 established a provisional procedure for the use and notification of paired frequencies for narrow-band direct-printing telegraphy and that the application of this procedure by administrations and by the Radiocommunication Bureau was satisfactory~~,~~;

d) that WRC-95 and WRC-97 have modified the relevant procedures for examination of the frequency assignments in the non-planned bands,

resolves

~~1~~ that paired frequencies in the HF bands reserved for narrow-band direct-printing telegraphy between coast stations and ship stations shall be used by these stations, notified to the Bureau and recorded in the Master International Frequency Register in ~~the following manner:~~accordance with the standard procedures of Article **S11**; as from [3 June 2000],

instructs the Bureau

to review the frequency assignments referred to in this Resolution, which are currently recorded in the Master Register, and to modify their findings so as to reflect the standard examination and recording procedures as stipulated in Article **S11**.

~~1.1 assignments of pairs of frequencies for transmission and reception shall be made solely to coast stations. Ship stations of any nationality shall use by right for their transmissions the receiving frequencies of the coast stations with which they exchange traffic;~~

~~1.2 each administration shall choose the pairs of frequencies for its requirements, if necessary with the assistance of the Bureau;~~

~~1.3 the assignments thus selected shall be notified to the Bureau in notices as shown in Appendix **S4/1** and administrations shall supply the basic characteristics listed in Annexes 1A and 1B/Section A or B of that Appendix, as appropriate;~~

~~1.4 whenever practicable, each notice should reach the Bureau before the date on which the assignment is brought into use. It must reach the Bureau not earlier than one year before the date on which it is to be brought into use but in any case not later than 30 days after it is actually brought into use;~~

~~1.5 assignments which are in conformity with the Radio Regulations, and in particular Appendix **S17** (Part B, Section II)/Appendix **32**, shall be examined by the Bureau from the viewpoint of the probability of harmful interference to be caused by or to other existing or proposed uses. The Bureau shall inform the administration concerned of the results of its examination and shall record the notified assignment with reference to this Resolution and without any date in Column 2. The date of receipt of the notice by the Bureau and the date of putting into use of the assignment shall be entered in the Remarks Column. In cases where the Bureau identifies incompatibilities, it shall make suggestions with a view to resolving them;~~

~~1.6 any notice not in conformity with the Radio Regulations shall be returned to the notifying administration by the Bureau, together with any suggestion which the Bureau may be able to submit in this respect;~~

~~1.7 should difficulties arise between administrations using the same channel, or adjacent channels, the matter shall be settled by agreement between the administrations concerned taking into account the information published by the Bureau;~~

~~2 that a future competent conference be invited to review this Resolution and examine any difficulties which may have arisen in its application;~~

~~3 that the entries made in the Master Register under this Resolution shall in no way prejudge any decisions which may be taken by the aforementioned conference,~~

~~*invites the Council*~~

~~*to place this Resolution on the agenda of the next competent conference in order to examine any difficulties which may have arisen in its application.*~~

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 17-E
11 February 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

REPORT ON THE IMPLEMENTATION OF RESOLUTION 533 (WRC-97)

Pursuant to the provisions of Resolution 533 (WRC-97), attached is a report from the Director, Radiocommunication Bureau.

The Conference is also invited to consider the issue raised in the appendix to the report.

Yoshio UTSUMI
Secretary-General

Annex: 1

ANNEX

CONTRIBUTION FOR THE BR REPORT TO WRC-2000

Report on the implementation of Resolution 533 (WRC-97)

1 The Bureau informed all ITU administrations in its Circular Letter CR/91 of 6 March 1998 that pursuant to the adoption of the revised Plan for the broadcasting-satellite service and the associated feeder links for Regions 1 and 3 by WRC-97, as contained in Appendices S30 and S30A and in accordance with Resolution 533 (WRC-97), the Radiocommunication Bureau was instructed to review the requirements for coordination of the satellite networks submitted under Article 4 of the above-mentioned appendices including those which were already published in the Special Sections annexed to the Bureau Weekly Circulars since the establishment of the initial Plans at WARC Sat-77 and WARC Orb-88.

2 According to this Resolution, the Bureau shall apply in its examinations of Article 4 submissions of Regions 1 and 3 the new technical planning criteria and reference situation of the revised Plan for Regions 1 and 3, derived, in particular, from the application of the protection ratios used for Equivalent Protection Margin (EPM) analyses at WRC-97 as defined in Annexes 5 and 3 to Appendices S30 and S30A respectively (protection ratios contained in Recommendation ITU-R BO.1297) instead of the protection ratios applied at WARC Sat-77 and WARC Orb-88.

3 It is worth mentioning that, for assignments which are in conformity with Appendices S30 and S30A notified to the Bureau under Article 5 of these appendices, brought into use before 27 October 1997 and for which the date of bringing into use has been confirmed to the Bureau in accordance with paragraph 5.2.8 of these appendices, parameters used for the establishment of the initial Plans at WARC Sat-77 and WARC Orb-88, or those published in the corresponding Special Sections, as the case may be, were utilized.

4 WRC-97 decided that the Bureau shall use the EPM criteria instead of the Overall Equivalent Protection Margin (OEPM) criteria to establish a new reference situation for the revised Regions 1 and 3 broadcasting-satellite service and the associated feeder-link Plans. In creating the new reference situation, the Bureau shall convert the merged OEPM Plan file into separate feeder-link and downlink EPM Plan files. WRC-97 also adopted the following new technical parameters:

4.1 reference receiving earth station antenna pattern (Recommendation ITU-R BO.1213) as defined in Figure 7*bis*, paragraph 3.7.2 of Annex 5 to Appendix S30;

4.2 reference transmitting earth station antenna pattern (Recommendation ITU-R BO.1295) as defined in curves A' and B' of Figure A, paragraph 3.5.3 of Annex 3 to Appendix S30A;

4.3 reference receiving space station antenna pattern (Recommendation ITU-R BO.1296) as defined in curves A' and B' of Figure B, paragraph 3.7.3 of Annex 3 to Appendix S30A;

4.4 downlink transmitting space station fast roll-off antenna patterns as defined in Figure 11b, paragraph 3.13.3 of Annex 5 to Appendix S30;

4.5 receiving space station pointing accuracy: 0.1° instead of 0.2° (as defined in paragraph 3.7.4 of Annex 3 to Appendix S30A);

4.6 angular rotation of the transmitting space station beam about its axis not exceeding ±1° instead of ±2° (as defined in section 3.14 of Annex 5 to Appendix S30);

4.7 reduced feeder-link receiver system noise temperature (as defined in section 3.8 of Annex 3 to Appendix S30A).

5 For the revised Regions 1 and 3 Plan, the Conference also applied the transmitting and receiving space station East-West station keeping error of ±0.1° (as defined in section 3.11 of Annex 5 to Appendix S30 and section 3.15 of Annex 3 to Appendix S30A), as well as the new rain climatic zones (Recommendation ITU-R P.837-1) as defined in Figures 1 and 2, section 2.1 of Annex 5 to Appendix S30 and Figures 1 and 3, section 2.2 of Annex 3 to Appendix S30A.

6 In view of the above, the Radiocommunication Bureau in its technical examination of pending Article 4 modifications, as well as for the review of all Special Sections previously published, took the following actions:

6.1 A message was sent to each individual administration which has submitted modification(s) under Article 4 of Appendices S30 and/or S30A informing them of the situation of their respective submitted network in order to take necessary action, as appropriate, with respect to the applicability of the new technical parameters adopted by WRC-97.

6.2 For the identification of affected administrations under provisions 4.3.1.1 and 4.2.1.1 of Article 4 of Appendices S30 and S30A respectively, the new protection ratios were used for EPM analyses as defined in Annexes 5 and 3 to Appendices S30 and S30A respectively, instead of those applied for the establishment of the initial Plans at WARC Sat-77 and WARC Orb-88, except for assignments referred to in paragraph 3 above.

In this examination, the Bureau, in accordance with *resolves* 3 of Resolution 533 (WRC-97), used the feeder-link and downlink files which have been derived from the merged plan file adopted by WRC-97 and complemented then by including the feeder links of Radiosat-6 and Radiosat-7 networks[1]. Reference situations calculated from these feeder-link and downlink files were published in a separate Circular Letter (CR/105 of 18 November 1998).

6.3 As a result of the individual consultation referred to in point 6.2 above, the Bureau determined the revised list of administrations likely to be affected by the subject network, should the modified parameters of a network have an impact on:

6.3.1 the pfd levels already calculated by the Bureau in application of provisions 4.3.1.2 to 4.3.1.5 of Article 4 of Appendix S30;

6.3.2 the coordination areas already calculated by the Bureau in application of provisions 4.2.1.2 and 4.2.1.3 of Article 4 of Appendix S30A (WRC-97);

6.3.3 the $\Delta T/T$ level already calculated by the Bureau in application of provision 4.2.1.4 of Article 4 of Appendix S30A;

6.3.4 the $\Delta T/T$ level already calculated by the Bureau in application of provision 4.2.3.4 of Article 4 of Appendix S30A.

7 Administrations were also informed that in the examination of all pending Article 4 networks, including those submitted by administrations of Region 2 as well as for the Special Sections previously published, in using the new technical parameters and criteria adopted by

---

[1] Radiosat-6 and Radiosat-7 were provisionally added to the feeder-link Plan at WRC-97 subject to the examination by the Bureau of the impact on the revised Regions 1 and 3 Plan. After WRC-97, the Bureau reviewed the situation and found that the procedure of Article 4 for these networks were successfully completed. They were therefore definitively included in the revised Plan.

WRC-97, only those parameters mentioned in paragraph 4 above would be subject to a possible modification. Any other cases of modification that are requested by an administration in reply to the Bureau's message referred to in point 6.2 above, would be treated in accordance with the related Rules of Procedure.

8 In order to implement the decisions of WRC-97, a considerable amount of time and resources were devoted to the preparation of the draft new and/or draft modifications to the current Rules of Procedures. These drafts were submitted to the RRB in its 13th and 14th meetings in 1998 and were considered by the Board and approved as amended.

9 In the meantime several new software packages were developed and some packages already being used were revised or enhanced to cope with the decisions of WRC-97. They were then carefully tested before being put into production. These latter courses of action took a considerable amount of time and resources in particular, during a period that the Bureau was experiencing a shortage of expert staff and had many other post-WRC-97 tasks. In some cases the changes and/or enhancements were substantial due to the fact that complex new subsidiary software needed to be developed when the main software was partially or totally not available. Initially, the following new or enhanced software was developed:

9.1 Software for BSS - BSS analysis (MSPACEg and related utilities)

The MSPACEg software, used for the identification of affected administrations under provisions 4.3.1.1 and 4.2.1.1 of Article 4 of Appendices S30 and S30A respectively, was revised to be aligned with the new protection ratios used for EPM analyses as defined in Annexes 5 and 3 to Appendices S30 and S30A respectively (protection ratios contained in Recommendation ITU-R BO.1297) instead of the protection ratios applied at WARC Sat-77 and WARC Orb-88. However, the protection ratios used at these two Conferences continue to be applied to the case of assignments of the Regions 1 and 3 feeder-link or downlink Plans with status code PE or AE[2].

This software was also modified to cope with the decision to use EPM criteria and establish new separated reference situations for the revised downlink and associated feeder-link Plans instead of the merged OEPM Plan file, as well as to comply with the new technical parameters referred to in paragraph 4 above.

Special utilities have been developed and used for splitting the merged Plan into separate feeder-link and downlink Plans. These utilities were also used for eliminating redundant beams which were introduced to provide different strapping between feeder-link and downlink channels.

In addition, MSPACEg was enhanced with the development of a more precise calculation for the station-keeping error (see Attachment 1) and the introduction of protection masks to derive the so called "worst-case approach" (see Attachment 2).

9.2 GIMS/pfd

The GIMS/pfd package, used for the identification of affected administrations under provisions 4.3.1.2/4.3.3.2 to 4.3.1.5/4.3.3.5/4.3.3.6 of Article 4 of Appendix S30, was enhanced with the development of more precise subroutines for calculation and interpolation of antenna gain contours thus generating more accurate pfd levels.

[2] See Articles 11 and 9A of Appendices S30 and S30A respectively.

10 Based on the available tools referred to above, the Bureau performed the technical examinations and published the results in the corresponding new AP30 (Resolution 533) and AP30A (Resolution 533) Special Sections relating to all previously published Article 4 networks. Concerning the examinations for which the corresponding software was not fully available, the results based on the parts available were published on a provisional basis with an indication that the definitive results would be included in a corrigenda once the tools became available. A total of 90 Special Sections for downlink and 95 Special Sections for feeder links were published during the six months from September 1998 to February 1999.

11 The following new or enhanced software was further developed:

11.1 CONVTODB

The CONVTODB software was developed for the preparation of the new merged SNS database containing the APS30/S30A Plans and Article 4 networks as well as all the FSS networks. It converts the technical parameters of the APS30/S30A Plans and Article 4 networks contained in the MSPACE files into a database format in order to, with the aid of some additional adjustments, insert them in the SNS database.

11.2 GIBC/PFD/PXT

The GIBC/PFD/PXT package, used for the identification of affected administrations under provisions 4.3.1.2/4.3.3.2 to 4.3.1.5/4.3.3.5/4.3.3.6 of Article 4 of Appendix S30, was developed to work with the new database referred to in paragraph 11.1 above and to provide the more precise and detailed definitive results referred to in paragraph 10 above. In particular, the information provided under paragraphs 4.3.1.5, 4.3.3.5 or 4.3.3.6 will now offer the possibility to identify directly all the administrations responsible for FSS networks and/or BSS networks in non-planned bands which are likely to be affected.

12 After the release of the final version of these latest developed software packages, the Bureau published the corresponding corrigenda to the above-mentioned AP30 (Resolution 533) Special Sections including the definitive results of the technical re-examinations. A total of 85 Special Sections corrigenda were published during three months from August 1999 to October 1999.

13 The implementation of Resolution 533 (WRC-97) in so far as the revision of the Special Sections related to broadcasting-satellite service (downlink and feeder-link Plans) was concerned, was completed at the end of October 1999.

14 As of November 1999, the Bureau resumed its activities relating to the technical examination of the requests for modification submitted under Article 4 with the earliest date of receipt 18 March 1996.

ATTACHMENT 1

Implementation of the station keeping error

1 The Bureau has reviewed the impact of inclusion of space station keeping errors in interference analyses. From the analyses performed, it appears that the current assumption used in MSPACE is that the worst-case space station keeping will be calculated taking into account the combined effect of both easterly and westerly sources of interference. This may result in overestimation of interference due to the fact that when easterly interferers are examined, the wanted satellite will be considered to be offset towards the east and at the same time, when westerly interferers are examined, the wanted satellite is considered to be offset towards the west. Currently MSPACE combines the results of these two situations.

2 It is therefore necessary that calculations of space station keeping errors for both uplink and downlink be performed, for each channel and at each test point, by separately calculating the "westerly worst case" and "easterly worst case" and then taking whichever of the two results gives the worst reference situation.

3 Furthermore, for cases in which the interfering beams are co-located with the wanted beam as a result of the space station keeping errors, the wanted beam is assumed to be co-located with each of the interfering beams.

4 From the analyses performed by the Bureau it appears that the reference values produced by the new method are closer to the realistic values than those of the existing method. The new method requires more computing time, however, this seemed to be resolved by using high performance computers.

5 Therefore, the new methodology reviewed by the Bureau, and confirmed by the RRB and ITU-R relevant study groups, concerning the space station keeping error has been included in interference analyses of the MSPACEg software (see MSPACEg v1.42 manual).

6 As for the application of the new methodology mentioned in paragraphs 2 and 3 above for the Region 2 Plan, more study is required due to the fact that some parameters used in the Plan are different from Regions 1 and 3 Plans.

ATTACHMENT 2

Implementation of the worst-case interference calculation method with respect to sections 3.5.1 and 3.8 of Annex 5 to Appendix S30 and section 1.7 of Annex 3 to Appendix S30A

1 WRC-97 adopted new versions of Annexes 5 and 3 to Appendices S30 and S30A respectively and instructed the Bureau to apply, as of 22 November 1997, the technical data contained in these revised annexes to submissions made under Articles 4 and 5 of these appendices (Resolution 534).

2 Annex 5 to Appendix S30 and Annex 3 to Appendix S30A permit the use of bandwidths and/or channel spacings different from those specified in these annexes (sections 3.5.1, 3.8 of Annex 5 and section 1.7 of Annex 3) and instructs the Bureau to treat submissions using bandwidths and/or channel spacings differing from those of sections 3.5.1, 3.8 of Annex 5 and section 1.7 of Annex 3 in accordance with applicable ITU-R recommendations for protection masks, when available. In the absence of such recommendations, the Bureau shall use the worst-case approach as adopted by the Radio Regulations Board.

3 For cases where the interferer is a digital emission, ITU-R recommendations (e.g. Recommendation ITU-R BO.1293) provide guidance for treatment of assignments which use a channel spacing and/or bandwidth different from values given in sections 3.5.1 and 3.8 of Annex 5 to Appendix S30.

4 For cases where the interferer is an analogue emission, interference calculation methods used so far by the Bureau, in accordance with advice provided by JWP 10-11S (note to the Director, Radiocommunication Bureau, November 1994), are as follows:

- when analogue is interfering with analogue: the Bureau should treat analogue transmissions with different channel centre frequencies (within ±10 MHz) and/or different bandwidth and/or different frequency deviations as if they were standard emissions[1] for the purpose of determining their effect into standard transmissions and for establishing their reference margins;
- when analogue is interfering with digital: the Bureau should assume that digital carriers are equivalent to standard analogue signals for the purpose of determining the way they are affected by analogue carriers and for establishing their reference margins.

5 Application of these methods is not the worst-case approach as required by WRC-97 and may lead to the following undesirable results:

- completely ignoring interference in Regions 1 and 3 Plans when the assigned (centre) frequency of the interfering emission falls in the second adjacent channel as shown in Figure 2 (cases 1.1, 1.2, 1.3) of Annex 2 to this document;
- calculation of the interference in cases where there is no overlap as shown in Figure 3 (cases 2.1, 2.2, 2.3) of Annex 2 to this document;

---

[1] Standard emissions are those emissions which use the following parameters:

- **for Regions 1 and 3:** 27 MHz bandwidth, 19.18 MHz channel spacing and the assigned frequencies as specified in Articles 11 and 9A of Appendices S30 and S30A.
- **for Region 2:** 24 MHz bandwidth, 14.58 MHz channel spacing and the assigned frequencies as specified in Articles 10 and 9 of Appendices S30 and S30A.

- overestimating the interference level as shown in Figure 4 (cases 3.2, 3.3) of Annex 2 to this document;
- underestimating the interference level as shown in Figure 4 (case 3.1) of Annex 2 to this document.

6 The Bureau has received many Article 4 submissions which use channel spacings and/or bandwidths different from the values given in sections 3.5.1 and 3.8 of Annex 5 to Appendix S30.

7 To allow the Bureau to treat Article 4 submissions with parameters different from those described in Annexes 5 and 3 to Appendices S30 and S30A, new Rules of Procedure relating to sections 3.5.1 and 3.8 of Annex 5 to Appendix S30 and 1.7 of Annex 3 to Appendix S30A have been adopted by the Radio Regulations Board at its 12th meeting (20-24 April 1998).

8 The new rules adopted by the RRB contain references to the worst-case approach presented in Annex 1 to this attachment, which has been applied provisionally in interference analyses of the MSPACEg software (see MSPACEg v1.42 manual) for all regional BSS Plans to deal with analogue interferers until the relevant ITU-R recommendations become available as required by WRC-97.

ANNEX 1

(to Attachment 2)

Description of the provisional worst-case "analogue" approach to deal with interference from assignments using analogue modulations involving non-standard interfering or wanted assignments

1 Introduction

The purpose of this document is to describe a worst-case approach for calculating interference from assignments using analogue modulations where either the wanted (analogue or digital) or the interfering (analogue) assignments use channel spacing and/or bandwidth different from the values given in sections 3.5 and 3.8 of Annex 5 to Appendix S30[1].

2 Principles and assumptions

In the case of assignments of the Regions 1 and 3 feeder-link or downlink Plans with status code P or A[2], the worst-case approach is based on the consideration of:

a) the provisional status of the proposed worst-case approach, which will be applied by the Bureau until relevant ITU-R recommendations become available;

b) the variation of the relative protection ratio in dB as a linear function of the overlapping bandwidth. This relative protection ratio is the difference between the co-channel protection ratio and a protection ratio at a given frequency offset. It has a purpose similar to the adjustment factor described in Recommendation ITU-R BO.1293, but with an opposite sign;

c) the relative protection ratio of –8 dB for the first standard adjacent channel, which is the difference between the co-channel and the adjacent channel protection ratios, for a frequency offset of 19.18 MHz and a frequency bandwidth of 27 MHz for both the interfering and the wanted channels (i.e. an overlapping bandwidth of 7.82 MHz);

d) the shape of the WARC Sat-77 protection mask provided in Figure 1 of Annex 6 of Appendix S30, i.e.:

   1) a flat part, corresponding to a frequency offset where the plateau part[3] of the interfering signal still overlaps with the plateau part[3] of the wanted signal; and

   2) a variation of the relative protection ratio as a linear function of the overlapping bandwidth which is also a linear function of the frequency offset.

In the case of the Region 2 Plan, the worst-case approach is based on the consideration of:

a) the provisional status of the proposed worst-case approach, which will be applied by the Bureau until relevant ITU-R recommendations will become available;

[1] This would also apply for Appendix S30A.

[2] See Articles 11 and 9A of Appendices S30 and S30A respectively.

[3] Corresponds to the part of the signal where the spectral power density has an almost constant maximum value.

b) the variation of the relative protection ratio in dB as a linear function of the overlapping bandwidth. This relative protection ratio is the difference between the co-channel protection ratio and a protection ratio at a given frequency offset. It has a purpose similar to the adjustment factor described in Recommendation ITU-R BO.1293, but with an opposite sign;

c) the relative protection ratio of –14.4 dB for the first standard adjacent channel, which is the difference between the co-channel and the adjacent channel protection ratios, for a frequency offset of 14.58 MHz and a frequency bandwidth of 24 MHz for both the interfering and the wanted channels (i.e. an overlapping bandwidth of 9.42 MHz);

d) the relative protection ratio of –37.9 dB for the second standard adjacent channel, which is the difference between the co-channel and the adjacent channel protection ratios, for a frequency offset of 29.16 MHz and a frequency bandwidth of 24 MHz for both the interfering and the wanted channels (i.e. an "equivalent overlapping bandwidth" of –5.16 MHz);

e) the shape of the RARC-Sat-83 protection mask provided in Figure 6 of Annex 5 of Appendix S30:

1) a flat part, corresponding to a frequency offset where the plateau part[3] of the interfering signal still overlaps with the plateau part[3] of the wanted signal; and

2) a variation of the relative protection ratio as three linear functions of the overlapping bandwidth which are also linear functions of the frequency offset.

In the case of assignments of the Regions 1 and 3 feeder-link or downlink Plans with status code PE or AE[2], the worst-case approach is based on the consideration of:

a) the provisional status of the proposed worst-case approach, which will be applied by the Bureau until relevant ITU-R recommendations become available;

b) the variation of the relative protection ratio in dB as a linear function of the overlapping bandwidth. This relative protection ratio is the difference between the co-channel protection ratio and a protection ratio at a given frequency offset. It has a purpose similar to the adjustment factor described in Recommendation ITU-R BO.1293, but with an opposite sign;

c) the relative protection ratios of –19 dB and –16 dB for the feeder-link and the downlink Plans respectively, both for the first standard adjacent channel, which is the difference between the co-channel and the adjacent channel protection ratios, for a frequency offset of 19.18 MHz and a frequency bandwidth of 27 MHz for both the interfering and the wanted channels (i.e. an overlapping bandwidth of 7.82 MHz);

d) the shape of the WARC SAT-77 protection mask provided in Figure 1 of Annex 6 of Appendix S30, i.e.:

1) a flat part, corresponding to a frequency offset where the plateau part[3] of the interfering signal still overlaps with the plateau part[3] of the wanted signal; and

2) a variation of the relative protection ratio as a linear function of the overlapping bandwidth which is also a linear function of the frequency offset.

3 Examples of various protection masks using absolute protection ratios

Figure 1 below describes a comparison of various protection masks, based on absolute protection ratios.

In the case of the Regions 1 and 3 protection masks, the Regions 1 and 3 Plans standard bandwidth of 27 MHz is assumed for both the wanted and interfering assignments, and in the case of the Region 2 protection mask the Region 2 Plan standard bandwidth of 24 MHz is assumed both the wanted and interfering assignments.

APPENDIX

Report on the implementation of Resolution 533 (WRC-97)

Possible inconsistency between the text of the *resolves* 2 (3rd indent) of Resolution 533 (WRC-97) and that of the Plans remarks column with respect to Hispasat-2 analogue and digital emissions at 30° W

1 The request for modification to Appendices S30/S30A Plans (addition of Hispasat-2) was received by the Radiocommunication Bureau on 7 March 1991.

2 The Bureau published the relevant Special Sections in application of the various provisions of Article 4 of the above-mentioned appendices.

3 The analogue emission (27 MHz) of that network was included in the Plans at WRC-97. The digital emission (27 MHz) of that network was still at the stage of coordination at that time.

4 According to the definition of the symbols contained in columns 16 and 18 of sections 11.1 and 9A.1 of Articles 11 and 9A of Appendices S30 and S30A respectively (pages 433 and 598 of Volume 2 of the Radio Regulations refer), the date of bringing into use of both analogue (27 MHz) and digital (27 MHz) emissions of Hispasat-2 was subject to the eight years regulatory time limit referred to in paragraphs 4.3.5 and 4.2.5 of Article 4 of Appendices S30 and S30A.

5 Based on the information available to the Bureau, the assignments in question (analogue (27 MHz) and digital (27 MHz)) were not brought into use within that time limit. The Bureau therefore, in application of paragraphs 4.3.5 and 4.2.5 of Article 4 of Appendices S30 and S30A and its associated Rules of Procedure, suppressed them from its files.

6 The Spanish Administration disagreed with the course of action taken by the Bureau and in its letter of 22 October 1999 requested the Director, Radiocommunication Bureau to submit the case to the 18th meeting of the Radio Regulations Board (8-12 November 1999, Geneva) for its consideration. In that letter, the Administration of Spain, **based on its interpretation of Resolution 533 (WRC-97) and in particular the wording of the 3rd indent of *resolves* 2 of that Resolution**, "requests the Board to review the finding of the Bureau in order to keep the assignments of Hispasat-2 in the Plans contained in Appendices S30 and S30A with the view to take them into account when processing modifications to these appendices. Should the matter be left for consideration by the future conference, the Spanish Administration sees no objection to associate the Hispasat-2 assignments with a note indicating that they are maintained in the Plans subject to their review by the next WRC. In such a case, the Spanish Administration would submit a document on the inconsistency among the different decisions of WRC-97 for its consideration by the WRC".

7 At the 18th meeting of the Radio Regulations Board (8-12 November 1999, Geneva), the RRB considered the matter and the following decisions were taken:

Quote

1) The RRB confirmed the decision of the Bureau on the cancellation of the Hispasat-2 analogue and digital satellite network at 30° W.

2) In reviewing the Spanish Administration's request, the RRB recognized a potential ambiguity between the text of *resolves* 2 of Resolution 533 (WRC-97) and that contained in sections 11.1 and 9A.1 of Articles 11 and 9A of Appendices S30 and S30A

respectively. Consequently the Board decided to refer the matter to WRC-2000 for its consideration and appropriate action. In this connection, the Board is aware of a potential retroactive impact of a conference decision on the above-mentioned matter.

3) In order to avoid suspension of the processing of submissions from administrations or consequential additional workload for the Bureau, the Board decided to instruct the Bureau to continue to take into account Hispasat-2 in its calculations on a provisional basis pending the decision of WRC-2000 on the matter. In so doing the Bureau shall indicate appropriately, in its Weekly Circular Special Sections, the provisional nature of Hispasat-2 assignments when that network is identified in the results of the compatibility analysis.

4) Depending on the conference decision on the matter, the Bureau shall, either definitively remove Hispasat-2 assignments from the Plans, its files and the Special Sections already published, or remove the provisional nature of the results of its calculations. The results of the above, shall be reflected by the Bureau in its Weekly Circular Special Sections.

Unquote

8 Pursuant to the decisions taken at the 18th meeting of the RRB, the cancellation of the analogue (27 MHz) and digital (27 MHz) assignments of Hispasat-2 were withdrawn and the corresponding Special Sections were published and annexed to Weekly Circular 2409 of 21 December 1999.

9 In view of the above, the Conference is invited to consider this matter and instruct the Bureau accordingly.

PLENARY MEETING

Sweden

PROPOSAL FOR THE WORK OF THE CONFERENCE

The Administration of Sweden has examined the footnotes to the Table of Frequency Allocations under agenda item 1.1 and concluded that the following footnote should be modified by deleting the name of Sweden.

MOD S/18/1

S5.514 *Additional allocation:* in Algeria, Germany, Angola, Saudi Arabia, Austria, Bahrain, Bangladesh, Bosnia and Herzegovina, Cameroon, Costa Rica, El Salvador, the United Arab Emirates, Finland, Guatemala, Honduras, India, the Islamic Republic of Iran, Iraq, Israel, Japan, Jordan, Kuwait, Libya, Nepal, Nicaragua, Oman, Pakistan, Qatar, Slovenia, Sudan~~, Sweden~~ and Yugoslavia, the band 17.3-17.7 GHz is also allocated to the fixed and mobile services on a secondary basis. The power limits given in Nos. **S21.3** and **S21.5** shall apply.

PROPOSAL FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.1

Introduction

Item 1.1 of the agenda for WRC-2000 refers to the deletion of country names from the footnotes of the RR Table of Frequency Allocations, whenever such reference is no longer necessary.

Therefore, the Republic of Lithuania submits the following proposal for deletion of its country name from footnote S5.177.

The following proposal is being submitted for consideration by WRC-2000:

MOD LTU/19/1

S5.177 *Additional allocation:* in Armenia, Azerbaijan, Belarus, Bulgaria, Estonia, Georgia, Kazakstan, Latvia, ~~Lithuania,~~ Moldova, Mongolia, Uzbekistan, Poland, Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the band 73-74 MHz is also allocated to the broadcasting service on a primary basis, subject to agreement obtained under No. **S9.21**.

PLENARY MEETING

Asia-Pacific Telecommunity (APT)
Conference Preparatory Group (APG)

COMMON PROPOSALS FOR THE WORK OF THE CONFERENCE

Introduction

This document provides the common proposals of the Asia-Pacific Telecommunity (APT) Members that were developed through the fourth meeting of the APT Conference Preparatory Group for WRC-2000 (APG2000-4) held in Tokyo, Japan from 31 January - 4 February 2000.

CONTENTS

Agenda item 1.1

1.1 requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, if in accordance with Resolution **26 (Rev.WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), China (People’s Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People’s Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

In Circular Letter CR/131, the Radiocommunication Bureau requests administrations to review those footnotes to the Table of Frequency Allocations (Article S5 of the Radio Regulations) where their country names appear in order to identify any footnotes that may be reduced in scope or deleted. The need for a regular review of footnotes was established by Resolution 26 (Rev.WRC-97).

APT Members generally support deletion of country names and country footnotes in accordance with the principles embodied in Resolution 26 (Rev.WRC-97). APT Members have considered all footnotes which include their name and have developed an agreed common proposal. In some cases the deletion of footnotes is delayed until a specified future date.

APT supports the removal of footnotes S5.181, S5.197, S5.259, S5.355 and S5.359 by administrations when no longer needed.

MOD ASP/20/1

S5.77 *Different category of service:* in Australia, China, the French Overseas Territories of Region 3, India, Indonesia (until 1 January 2005), the Islamic Republic of Iran, Japan, Pakistan, Papua New Guinea and Sri Lanka, the allocation of the band 415-495 kHz to the aeronautical radionavigation service is on a primary basis. Administrations in these countries shall take all practical steps necessary to ensure that aeronautical radionavigation stations in the band 435-495 kHz do not cause interference to reception by coast stations of ship stations transmitting on frequencies designated for ship stations on a worldwide basis (see No. **S52.39**).

Reasons: In order to safeguard existing services, it is imperative that the relative status of assignments in the band 415-495 kHz do not change until 1 January 2005.

MOD ASP/20/2

S5.262 *Additional allocation:* in Saudi Arabia, Armenia, Azerbaijan, Bahrain, Belarus, Bosnia and Herzegovina, Bulgaria, Colombia, Costa Rica, Cuba, Egypt, the United Arab Emirates, Ecuador, Estonia, Georgia, Hungary, ~~Indonesia,~~ the Islamic Republic of Iran, Iraq, Israel, Jordan, Kazakstan, Kuwait, Liberia, Malaysia, Moldova, Nigeria, Uzbekistan, Pakistan, the Philippines, Qatar, Syria, Kyrgyzstan, Slovakia, Romania, Russian Federation, Singapore, Somalia, ~~Sri Lanka,~~ Tajikistan, Turkmenistan, Ukraine and Yugoslavia, the band 400.05-401 MHz is also allocated to the fixed and mobile services on a primary basis.

Reasons: No further requirement for such use in Indonesia and Sri Lanka.

MOD ASP/20/3

S5.355 *Additional allocation:* in Bahrain, Bangladesh, the Congo, Egypt, the United Arab Emirates, Eritrea, Ethiopia, the Islamic Republic of Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Malta, Morocco, Oman, Qatar, Syria, Somalia, Sudan, ~~Sri Lanka,~~ Chad, Togo, Yemen and Zambia, the bands 1 540-1 645.5 MHz and 1 646.5-1 660 MHz are also allocated to the fixed service on a secondary basis.

Reasons: No further requirement for such use in Sri Lanka.

MOD ASP/20/4

S5.432 *Different category of service:* in the Republic of Korea, ~~Indonesia,~~ Japan and Pakistan, the allocation of the band 3 400-3 500 MHz to the mobile, except aeronautical mobile, service is on a primary basis (see No. **S5.33**).

Reasons: No further requirement for such use in Indonesia.

MOD ASP/20/5

S5.505 *Additional allocation:* in Algeria, Angola, Saudi Arabia, ~~Australia,~~ Bahrain, Bangladesh, Botswana, Brunei Darussalam, Cameroon, China, the Congo, the Republic of Korea, Egypt, the United Arab Emirates, Gabon, Guatemala, Guinea, India, Indonesia, the Islamic Republic of Iran, Iraq, Israel, Japan, Jordan, Kuwait, Lesotho, Lebanon, Malaysia, Mali, Morocco, Mauritania, Oman, Pakistan, the Philippines, Qatar, Syria, the Democratic People's Republic of Korea, Senegal, Singapore, Somalia, Sudan, Swaziland, Tanzania, Chad and Yemen, the band 14-14.3 GHz is also allocated to the fixed service on a primary basis.

Reasons: No further requirement.

Agenda item 1.2

1.2 to finalize remaining issues in the review of Appendix **S3** to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation **66 (Rev.WRC-97)** and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

Recommendation 66 (Rev.WRC-97) directs ITU-R to submit a report to WRC-2000 with a view to finalizing the space services spurious emissions limits in Appendix S3 of the Radio Regulations. APT proposes text that would remove the "design objectives" designation from the space services spurious emissions limits and make into regulatory limits (as suggested in the CPM-99 Report) applicable to deep-space systems, satellites with spurious emissions falling within the necessary bandwidth of another transmitter on the same satellite, and amateur earth stations below 30 MHz. Also, APT proposes to adequately recognize the case of very narrow-band and unmodulated signals, particularly for the space services. Furthermore, APT proposes to correct an oversight in Appendix S3 regarding limits for the radiodetermination service, and specify that spurious emission levels for radar systems be determined from radiated emissions.

APPENDIX S3

MOD ASP/20/6

6 ~~The measurement methods for radar systems should be guided by Recommendation ITU-R M.1177. For those radar systems for which acceptable methods of measurement do not exist, the lowest practicable power of spurious emission should be achieved.~~Radar systems are exempt from spurious emission limits under this section. The lowest practicable power of spurious emission should be achieved.

ADD ASP/20/7

11*bis* As an emitted signal becomes more and more narrow (to the limiting case of an unmodulated carrier with theoretical necessary bandwidth of zero), the application of the term "necessary bandwidth" as used in determining the region where spurious emission limits apply to space services, becomes more and more difficult. In the limit ±250% of necessary bandwidth (generally recognized as establishing the region beyond which spurious emissions are defined), approaches zero. Beacons and other unmodulated signals, such as those used in uplink and downlink circuits in control and tracking of satellites, are examples of a case where it is difficult to practically apply the term “necessary bandwidth” in determining where out-of-band emissions end, and spurious emissions begin. Pending further studies and definitive action by a future world radiocommunication conference, in calculating the region where spurious emission limits apply for transmitters using amplifiers to pass essentially an unmodulated signal (or a signal with very small bandwidth), the amplifier bandwidth is taken to be the necessary bandwidth (in calculating the regions where spurious emissions apply).

ADD ASP/20/8

11*ter* For satellites employing more than one transponder, and when considering the limits for spurious emission as indicated by Headnote 11 to Appendix **S3**, spurious emission from one transponder may fall on a frequency at which a companion, second transponder is transmitting, or in the guardband between two transponders. In this situation, the level of spurious emission from the first transponder is well exceeded by fundamental emissions of the second transponder or by out-of-band emissions into the guardband. Therefore, limits in this section do not apply to those spurious emissions on a satellite which fall either within the bands where there are transmissions from different transponders on the same satellite, into the same service area or within the guardbands between the different transponders.

MOD ASP/20/9

TABLE II

Attenuation values used to calculate maximum permitted spurious emission power levels for use with radio equipment

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
All services except those services quoted below:	43 + 10 log (*P*), or 70 dBc, whichever is less stringent
Space services (earth stations) [10, 1~~4~~6]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Space services (space stations) [10, 1~~4~~7]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Radiodetermination[18]	43 + 10 log (*PEP*), or 60 dB, whichever is less stringent
Broadcast television[11]	46 + 10 log (*P*), or 60 dBc, whichever is less stringent, without exceeding the absolute mean power level of 1 mW for VHF stations or 12 mW for UHF stations. However, greater attenuation may be necessary on a case by case basis.
Broadcast FM	46 + 10 log (*P*), or 70 dBc, whichever is less stringent; the absolute mean power level of 1 mW should not be exceeded
Broadcasting at MF/HF	50 dBc; the absolute mean power level of 50 mW should not be exceeded
SSB from mobile stations[12]	43 dB below *PEP*
Amateur services operating below 30 MHz (including with SSB)[1~~2~~6]	43 + 10 log (*PEP*), or 50 dB, whichever is less stringent
Services operating below 30 MHz, except space, radiodetermination, broadcast, those using SSB from mobile stations, and amateur[12]	43 + 10 log (*X*), or 60 dBc, whichever is less stringent, where *X* = *PEP* for SSB modulation, and *X* = *P* for other modulation

TABLE II (*end*)

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
Low-power device radio equipment[13]	56 + 10 log (*P*), or 40 dBc, whichever is less stringent
Emergency position-indicating radio beacon Emergency locator transmitter Personal location beacon Search and rescue transponder Ship emergency, lifeboat and survival craft transmitters Land, aeronautical or maritime transmitters when used in emergency	No limit

P: mean power in watts supplied to the antenna transmission line, in accordance with No. **S1.158**. When burst transmission is used, the mean power *P* and the mean power of any spurious emissions are measured using power averaging over the burst duration.

PEP: peak envelope power in watts supplied to the antenna transmission line, in accordance with No. **S1.157**.

dBc: decibels relative to the unmodulated carrier power of the emission. In the cases which do not have a carrier, for example in some digital modulation schemes where the carrier is not accessible for measurement, the reference level equivalent to dBc is decibels relative to the mean power *P*.

[10] Spurious emission limits for all space services are stated in a 4 kHz reference bandwidth.

[11] For analogue television transmissions, the mean power level is defined with a specified video signal modulation. This video signal has to be chosen in such a way that the maximum mean power level (e.g. at the video signal blanking level for negatively modulated television systems) is supplied to the antenna transmission line.

[12] All classes of emission using SSB are included in the category “SSB”.

[13] Low-power radio devices having a maximum output power of less than 100 mW and intended for short-range communication or control purposes; such equipment is in general exempt from individual licensing.

~~[14] These values are “design objectives”. This note will not be applicable after WRC-99.~~

[15] In some cases of digital modulation (including digital broadcasting), broadband systems, pulsed modulation and narrow-band high-power transmitters for all categories of services, there may be difficulties in meeting limits close to ±250% of the necessary bandwidth.

[16] Amateur earth stations operating below 30 MHz are in the service category "Amateur services operating below 30 MHz (including with SSB)."

[17] Space stations in the space research service intended for operation in deep space, as defined by Article **S1**, are exempt from spurious emission limits.

[18] Radiodetermination (radar) system spurious emission dB attenuation shall be determined for radiated emission levels, not at the antenna transmission line. The measurement methods for determining the radiated spurious emission levels from the radar systems should be guided by Recommendation ITU-R M.1177.

Reasons: To correct the deficiencies identified in the CPM-99 Report.

Agenda item 1.3

1.3 to consider the results of ITU-R studies in respect of Appendix **S7/28** on the method for the determination of the coordination area around an earth station in frequency bands shared among space services and terrestrial radiocommunication services, and take the appropriate decisions to revise this Appendix

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

The above countries support amending Appendix S7 in accordance with the following proposals. There will be consequential amendments required in Appendix S5 and the need for new resolutions to keep the technical parameter up to date.

Agenda item 1.3 - Review of Appendix S7

The following proposal is to revise Appendix S7 according to Method 3 as set out in Chapter 7.2 of the CPM Report. The main revision is derived from new Recommendation ITU-R SM.1003. This replaces the use of Recommendations ITU-R IS.847, IS.848 and IS.849 and references to these Recommendations are suppressed. The tables of predetermined coordination distances found in Appendix S5 are proposed to be moved to Appendix S7 for convenience of location. Other changes are consequential to these revisions.

MOD ASP/20/10

APPENDIX S7

Replacement of the text in Appendix S7

Replace the entire text by the text derived from draft Recommendation ITU-R SM.1003, together with the modified material from Appendix S5 relating to predetermined coordination distances proposed by Task Group 1/6 and currently located in Annex 5 of Document 1-6/93.

Reasons: ITU-R Task Group 1/6 has completed its studies and has developed a new Recommendation ITU-R SM.(Document 1-6/93 Annex 6) on Methods for the determination and the coordination area around earth stations in the frequency range 100 MHz to 105 GHz. This Recommendation is identified in the CPM Report § 7.2.1 as the appropriate text to be used as the basis of a revision of Appendix S7.

MOD ASP/20/11

S1.171 *coordination area:* When determining the need for coordination, t~~T~~he area ~~associated with~~surrounding an *earth station* ~~outside of which a *terrestrial station* sharing the same frequency band neither causes nor is subject to interfering *emissions* greater than a permissible level~~sharing the same frequency band with *terrestrial stations*, or surrounding a transmitting *earth station* sharing the same bidirectionally allocated frequency band with *receiving earth stations*, beyond which the permissible level of interference will not be exceeded and coordination is therefore not required.

NOC ASP/20/12

S1.172 *coordination contour:* The line enclosing the *coordination area*.

MOD ASP/20/13

S1.173 *coordination distance:* When determining the need for coordination, the d~~D~~istance on a given azimuth from an *earth station* sharing the same frequency with terrestrial stations, or from a transmitting earth station sharing the same bidirectionally allocated frequency band with receiving earth stations, beyond which ~~a *terrestrial station* sharing the same frequency band neither causes nor is subject to interfering *emissions* greater than a~~the permissible level of interference will not be exceeded and coordination is therefore not required.

Reasons: Consequential change identified by Task Group 1/6. See § 7.2.3.2 of the CPM Report.

ADD ASP/20/14

S1.173A *coordination:* is the process, undertaken between administrations, for ensuring that proposed frequency assignments may be brought into use in a manner which is compatible with existing assignments, or with other proposed assignments; the process may involve the adjustment of technical characteristics and a detailed evaluation of the propagation conditions using methods agreed by the administrations concerned.

Reasons: The new definitions given refer to the process of coordination. Coordination is not currently defined in Article S1.

Modifications to Annex 2A of Appendix S4

A.7 Earth station site characteristics

For a specific earth station:

a) The horizon elevation angle in degrees and, in the case of a station submitted in accordance with Appendix **S30A**, the antenna gain in the direction of the horizon for each azimuth around the earth station.

ADD ASP/20/15

b) The distance in kilometres from the earth station to the horizon for each azimuth around the earth station.

(SUP) ASP/20/16

b)

(SUP) ASP/20/17

c)

ADD ASP/20/18

c) That is operating to an associated geostationary space station and having due regard to possible inclined-orbit operation of the associated space station:

i) the planned minimum angle of elevation of the antenna in the direction of maximum radiation in degrees from the horizontal plane;

ii) the planned range of operating azimuthal angles for the direction of maximum radiation in degrees, clockwise from true north.

ADD ASP/20/19

cbis) That is operating to associated non-geostationary space stations, the minimum angle of elevation of the antenna in the direction of maximum radiation in degrees from the horizontal plane for each azimuth around the earth station.

(MOD) ASP/20/20

d) The altitude (metres) of the antenna above mean sea level.

Reasons: Additional provisions are needed in Appendix S4 to cover all data elements required to determine the coordination area of a particular earth station using the revised Appendix S7.

TABLE S5-1 *(continued)*

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks

MOD ASP/20/21

No. **S9.15** Non-GSO/ terrestrial	A specific earth station or a typical earth station in respect of terrestrial stations in frequency bands for which a footnote refers to No. **S9.11A** allocated with equal rights to space and terrestrial services, where the coordination area of the earth station includes the territory of another country	~~See Table S5-2~~Frequency bands for which a footnote refers to No. **S9.11A**	The coordination area of the earth station covers the territory of another administration	~~See § 2 of Annex 1 of this~~ Appendix **S7**	

MOD ASP/20/22

No. **S9.16** Terrestrial/ non-GSO	A transmitting station in a terrestrial service within the coordination area of an earth station in a non-GSO network in frequency bands for which a footnote refers to No. **S9.11A**	~~See Table S5-2~~Frequency bands for which a footnote refers to No. **S9.11A**	Transmitting terrestrial station is situated within the coordination area of a receiving earth station	~~See § 2 of Annex 1 of this~~ Appendix **S7**	The coordination area of the affected earth station has already been determined using the calculation method of ~~No. **S9.15**~~Appendix **S7**

MOD ASP/20/23

No. **S9.17** GSO, non-GSO/ terrestrial	A specific earth station or a typical mobile earth station in frequency bands above ~~1 GHz~~100 MHz allocated with equal rights to space and terrestrial services in respect of terrestrial stations, where the coordination area of the earth station includes the territory of another country, with the exception of the coordination under No. **S9.15**	Any frequency band allocated to a space service, except those mentioned in the Plans in Appendix **S30A**	The coordination area of the earth station covers the territory of another administration	Appendix **S7** ~~(for earth stations in the radiodetermination-satellite service (RDSS) in the bands: 1 610-1 626.5 MHz, 2 483.5-2 500 MHz and 2 500-2 516.5 MHz, see Remarks column)~~ ~~1) The coordination area of aircraft earth stations is determined by increasing the service area by 1 000 km with respect to the aeronautical mobile service (terrestrial) or 500 km with respect to terrestrial services other than the aeronautical mobile service~~	~~NOTE – For RDSS earth stations, a uniform coordination distance of 400 km corresponding to an airborne earth station shall be used. In cases where the earth stations are all ground-based, a coordination distance of 100 km shall be used~~	

MOD ASP/20/24

No. **S9.17** GSO, non-GSO/ terrestrial (*cont.*)				~~2) For receiving earth stations in the meteorological-satellite service in frequency bands shared with the meteorological aids service, the coordination distance is considered to be the visibility distance as a function of the earth station horizon elevation angle for a radiosonde at an altitude of 20 km above mean sea level, assuming 4/3 Earth radius~~	Application of this provision with respect to Articles 6 and 7 of Appendices **S30** and **S30A** is suspended pending the decision of WRC-99 on the revision of these two Appendices	

MOD ASP/20/25

No. **S9.17A** GSO, non-GSO/ GSO, non-GSO	A specific earth station in respect of other earth stations operating in the opposite direction of transmission in frequency bands allocated with equal rights to space radiocommunication services in both directions of transmission, where the coordination area of the earth station includes the territory of another country or the earth station is located within the coordination area of a coordinated earth station, with the exception of the frequency bands subject to the Plans in Appendix **S30A**	Any frequency band allocated to a space service	The coordination area of the earth station covers the territory of another administration or the earth station is located within the coordination area of an earth station	~~i) For bands in Table S5-2, see § 2 of Annex 1 of this Appendix~~ ~~ii) See Recommendations ITU-R IS.847, ITU-R IS.848 and ITU-R IS.849~~ <u>Appendix **S7**</u>	

<u>NOC</u> ASP/20/26

No. **S9.18** Terrestrial/ GSO, non-GSO	Any transmitting station of a terrestrial service in the bands referred to in No. **S9.17** within the coordination area of an earth station, in respect of this earth station, with the exception of the coordination under Nos. **S9.16** and **S9.19**	Any frequency band allocated to a space service.	Transmitting terrestrial station is situated within the coordination area of a receiving earth station	See Remarks column	The coordination area of the affected earth station has already been determined using the calculation method of No. **S9.17**

Suppression of section 3 of Annex 1 to Appendix S5

SUP ASP/20/27

3 Coordination areas for mobile earth stations operating below 3 GHz and earth stations providing feeder links for non-GSO satellites operating in the MSS and for non-GSO FSS earth stations

Reasons: The relevant material with appropriate modifications will now be available in Appendix S7. Relocating the material in a central location in Appendix S7 avoids the present duplication of text in Appendix S5.

ANNEX 4 TO RESOLUTION 27 (Rev.WRC-97)

List of ITU-R Recommendations referred to in the Radio Regulations[1]

Recommendation	Title	Status[2]	Document	RR provision[3]

SUP ASP/20/28

ITU-R SF.356-4	Maximum allowable values of interference from line-of-sight radio-relay systems in a telephone channel of a system in the fixed-satellite service employing frequency modulation, when the same frequency bands are shared by both systems	NOC	1997 SF Series	AP S7, § 2.3.1, Note 2

SUP ASP/20/29

ITU-R SF.357-4	Maximum allowable values of interference in a telephone channel of an analogue angle-modulated radio-relay system sharing the same frequency bands as systems in the fixed-satellite service	MOD	1997 SF Series	AP S7, § 2.3.1, Note 2

SUP ASP/20/30

ITU-R IS.847-1	Determination of the coordination area of an earth station operating with a geostationary space station and using the same frequency band as a system in a terrestrial service	NOC	1997 IS Series	**AP S5**, **Table S5-1** **AP S5**, **Annex 2**, **Tables 2** and **3**

SUP ASP/20/31

ITU-R IS.848-1	Determination of the coordination area of a transmitting earth station using the same frequency band as receiving earth stations in bidirectionally allocated frequency bands	NOC	1997 IS Series	**AP S5**, **Table S5-1**

SUP ASP/20/32

ITU-R IS.849-1	Determination of the coordination area for earth stations operating with non-geostationary spacecraft in bands shared with terrestrial services	NOC	1997 IS Series	**AP S5**, **Table S5-1** **AP S5**, **Annex 2**, **Tables 2** and **3**

SUP ASP/20/33

ITU-R M.1185-1	Method for determining coordination distance between ground based mobile earth stations and terrestrial stations operating in the 148.0-149.9 MHz band	MOD	1997 M Series, Part 5	**AP S5**, **Annex 1**, **§ 3.2, Table 1** Resolution 46 (Rev.WRC-97), Annex 2, Table 1

Reasons: Consequential change identified by Task Group 1/6. Section 7.2 of Chapter 7 of the CPM Report indicates that Recommendation ITU-R SM.(Document 1-6/93 Annex 6) has drawn extensively upon the material of these Recommendations. Where material from these Recommendations has not been used, more recent technical material provided by Task Group 1/6 or the Working Parties of the service study groups has replaced it. Therefore, these three Recommendations no longer need to be incorporated by reference within the Radio Regulations.

NOTE - It is assumed that this action and the modifications to Appendix S5 will cause the deletion of these Recommendations from Volume 4 of the Radio Regulations.

SUP ASP/20/34

RESOLUTION 60

Relating to information on the propagation of radio waves used in the determination of the coordination area

Reasons:

1 Resolution 60 provided a mechanism for the updating of the propagation material in Appendix S7 independently from full updates of the Appendix S7 text. Recommendation ITU-R SM.(Doc. 1-6/93 Annex 6) contains new calculation methodologies that have a greater degree of interaction with the propagation models, and it is now less straight forward to adopt new propagation material without checking for consequential changes that might be necessary elsewhere in the text.

2 New arrangements will need to be made for the ongoing maintenance of Recommendation ITU-R SM.(Document 1-6/93 Annex 6). The relevant lead group might prefer to request changes to the propagation material and/or be notified of improvements made by Study Group 3 via the now effective liaison statement process.

3 The CPM Report notes that although Resolution 60 has been in place since 1979 it has not been used.

SUP ASP/20/35

RECOMMENDATION 105 (WRC-95)

Further work by ITU-R on determination of the coordination area around earth stations operating with geostationary-satellite networks in the fixed-satellite service and earth stations providing feeder links to non-geostationary-satellite networks in the mobile-satellite service operating in opposite directions of transmission

Reasons: With the updating of Appendix S7 using the material in Recommendation ITU-R SM.(Doc. 1-6/93 Annex 6) the action called for within Recommendation 105 will have been fulfilled.

SUP ASP/20/36

RECOMMENDATION 711

Relating to the coordination of earth stations

Reasons: If Method 2 for fulfilling the agenda item is adopted there would be a permanent agenda item at future conferences for the updating or addition of the parameters in Tables 1, 2 and 3 of Appendix S7. If Method 3 is selected, a new Resolution ZZZ would make provisions for the addition or modification of the table parameters.

MOD ASP/20/37

RESOLUTION 712 (Rev.WRC-~~95~~2000)

Consideration by a future competent World Radiocommunication Conference of issues dealing with allocations to space services

The World Radiocommunication Conference (~~Geneva, 1995~~Istanbul, 2000),

considering

a) that the agenda of WARC-92 called for the development of new Recommendations and Resolutions relating to allocations to space services which were not placed on the agenda of that Conference;

b) that Recommendation ITU-R SA.363-5 recommends that frequencies below 1 GHz are technically suitable for telecommand of satellites operating below an altitude of 2 000 km;

c) that the United Nations Conference on Environment and Development (UNCED) (Rio de Janeiro, 1992) identified an urgent need for systematic observations of forest cover, and that such observations can best be performed using frequencies in the range 420-470 MHz;

d) that Resolution 35 of the Plenipotentiary Conference (Kyoto, 1994) considered that application of the latest telecommunication and information technologies, especially those associated with space systems, can be extremely useful in implementing and conducting environment protection activities such as monitoring air, river, harbour and sea pollution, remote sensing, wildlife studies, forestry development, and others;

e) that the status of existing allocations available for use by active space-based sensors between 1 and 25 GHz, in frequency bands shared with radiolocation or radionavigation systems, needs to be reviewed in order to facilitate worldwide usage by active space-based sensors;

f) that the allocations to the Earth exploration-satellite service in the frequency bands 8.025-8.4 GHz and 18.6-18.8 GHz are complex and not uniform worldwide, and that the band 18.6-18.8 GHz is vital for passive sensing of ecologically important data;

g) that the allocation of the frequency band 13.75-14 GHz to the fixed-satellite service by WARC-92 reduced the total bandwidth available for active space-based sensors in the frequency range 13-14 GHz, which is important for wideband sensor instruments, e.g. radar altimeters, scatterometers;

h) that future active Earth sensing requirements for monitoring environmental data in the 35 GHz and 95 GHz ranges have been identified;

i) that ITU-R has agreed to certain important technical parameters required for coordination of the space services under Appendix **S7**,

resolves

that, based on proposals from administrations and taking into account the results of studies in the Radiocommunication Study Groups and the 1997 Conference Preparatory Meeting (CPM-97), WRC-97 should consider the following matters:

1 provision of up to 3 MHz of frequency spectrum for the implementation of telecommand links in the space research and space operation services in the frequency range between 100 MHz and 1 GHz;

2 provision of up to 3.5 MHz of frequency spectrum to the Earth exploration-satellite service (active sensors) in the frequency range 420-470 MHz;

3 use of existing allocations by space-based active sensors operating in the Earth exploration-satellite and space research services in frequency bands shared with the radiolocation or radionavigation services, between 1 GHz and 25 GHz, with a view to the possibility of establishing common worldwide primary allocations;

4 use of existing allocations in the frequency range from 7 GHz to 20 GHz to the Earth exploration-satellite, meteorological-satellite, space research and space operation services, with a view to the possibility of establishing common worldwide primary allocations to these services in appropriate bands, taking into account Recommendation **706**;

5 provision of up to 500 MHz of frequency spectrum around 35 GHz and up to 1 GHz of frequency spectrum around 95 GHz for use by space-based active Earth sensors;

6 inclusion of ITU-R approved technical coordination parameters in Appendix **S7**, taking into account Resolution ~~**60** and Recommendation **711**~~**ZZZ**,

invites the Radiocommunication Study Groups

to carry out the necessary studies, taking into account the present uses of allocated bands, with a view to presenting, at the appropriate time, the technical information likely to be required as a basis for the work of the Conference,

instructs the Secretary-General

to bring this Resolution to the attention of the international and regional organizations concerned.

Reasons: CPM Report Method 3 calls for the suppression of Resolution 60 and Recommendation 711.

ADD ASP/20/38

RESOLUTION ZZZ (WRC-2000)

Consideration by a future competent world radiocommunication conference of updates to system parameter tables for use in Appendix S7

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that Appendix **S7** to the Radio Regulations provides a method for the determination of the coordination area which requires assumed technical coordination parameters for the unknown terrestrial station or earth station;

b) that these technical coordination parameters are contained in [Tables 1, 2 and 3 of Annex 2 of Appendix **S7**] [(WRC-2000)];

c) that the technical coordination parameter tables contained in Appendix **S7** are based directly on texts of ITU-R;

d) that ITU-R studies on radiocommunication systems are continuing, and therefore the conclusions of these studies are subject to change and may in future show the need to revise those sections of Appendix **S7** which incorporate the technical coordination parameter tables;

e) that the technical coordination parameter tables may require to be updated when new frequency allocations are made at WRCs;

f) that the technical coordination parameter tables do not show numerical values for all the necessary parameters of certain space radiocommunication services and terrestrial radiocommunication services sharing frequency bands with equal rights,

recognizing

a) that Recommendation ITU-R SM.[Doc. 1/1004] was developed by ITU-R as a basis for revision to Appendix **S7**;

b) that there is a need for future conferences to consider the revision of the tables of technical coordination parameters on an irregular basis,

resolves

1 that ITU-R should come to a conclusion as to whether, according to the latest available information on technical coordination parameter values contained in Annex 2 to Recommendation ITU-R SM.[Doc. 1/1004] that a revision of the technical coordination parameter tables contained in [Annex 2] of Appendix **S7** is warranted;

2 that when ITU-R has come to the conclusion that a revision of [Annex 2] of Appendix **S7** is warranted, the Director of the Radiocommunication Bureau shall so inform the Secretary-General of ITU and send him the proposed amendments to Appendix **S7**, given in the most recent version of Recommendation ITU-R SM.[Doc. 1/1004],

requests

1 ITU-R to continue to study technical parameters concerned with the determination of the coordination area, and to maintain the relevant ITU-R texts in a format which would permit direct insertion into Appendix **S7** in place of the existing [Annex II];

2 that the Council then place, as an extraordinary item, on the agenda of the next world radiocommunication conference, the consideration of the conclusion of ITU-R;

3 that, if the said world radiocommunication conference decides that the technical coordination parameter tables contained in Appendix **S7** are to be revised, the Secretary-General, in consultation with the Bureau, incorporate the amendments agreed at the said conference in a document which contains the new text of [Annex II] of Appendix **S7** in a form suitable for direct substitution in Appendix **S7**,

decides

that from a date established by the said conference, the revised text shall form the basis of all subsequent determinations of the coordination area using Appendix **S7**.

Reasons: Resolution ZZZ provides the framework for updating the system parameter tables in support of Method 3 for fulfilling the agenda item as set out in § 7.2.3.1 of Chapter 7 of the CPM Report.

Modifications to Article S9 to make additional clarity with respect to earth stations in the broadcasting services

Under WRC-2000 agenda item 1.3 ITU-R Task Group 1/6 has prepared a draft new Recommendation called “Determination of the coordination area around an earth station in frequency bands between 0.1 and 105 GHz”. This contribution addresses clarifications needed to certain provisions in Article S9 to clearly incorporate the outcome of the work of Task Group 1/6 with respect to the determination of coordination areas around the earth stations in the broadcasting-satellite service. As stated in section 7.2.2 of the CPM Report the Task Group 1/6 Recommendation enables administrations and the BR to determine coordination areas for mobile earth stations and earth stations in the broadcasting-satellite service (in the non-planned bands) operating within a defined service area. Currently the provision in Article S9 are clear with regard to the mobile earth stations but additional clarity with respect to the earth stations in the broadcasting-satellite service requires minor modifications to a limited number of S9 provisions.

MOD ASP/20/39

S9.17 *f)*[13] for any specific earth station ~~or~~, typical mobile earth station or typical earth station in the broadcasting-satellite service in frequency bands above 1 GHz allocated with equal rights to space and terrestrial services, in respect of terrestrial stations, where the coordination area of the earth station includes the territory of another country, with the exception of the coordination under No. **S9.15** and Article 4 of Appendix **S30A** and the coordination of earth stations in the broadcasting-satellite service which are subject to the Appendix **S30** Plans;

MOD ASP/20/40

S9.19 *i)* for any transmitting station of a terrestrial service in a frequency band shared on an equal primary basis with the broadcasting-satellite service, with respect to an earth station or earth stations defined within a service area of the broadcasting-satellite service, except where this service is subject to the Appendix **S30** Plans;

MOD ASP/20/41

S9.31 The information sent under No. **S9.29** shall also, in the cases covered by Nos. **S9.15**, **S9.17** or **S9.17A**, include a copy of diagrams drawn to appropriate scale indicating, for both transmission and reception, the location of the earth station and its associated coordination area, or the coordination area related to the service area in which it is intended to operate the mobile earth station or earth station in the broadcasting-satellite service except where this service is subject to the Appendix **S30** plan, and the data on which the diagrams are based. In respect of terrestrial stations, in the cases covered by Nos. **S9.16**, **S9.18** and **S9.19** the information shall include the locations of terrestrial stations within the coordination area of the relevant earth station.

Reasons: Taking into account the result of the work of Task Group 1/6 it is appropriate to modify S9.17, S9.19 and S9.31 to clearly state that the earth stations of BSS, in the unplanned bands, are to be coordinated on a service area basis.

Agenda item 1.4

1.4 to consider issues concerning allocations and regulatory aspects related to Resolutions **126 (WRC-97), 128 (WRC-97), 129 (WRC-97), 133 (WRC-97), 134 (WRC-97)** and **726 (WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

WRC-97 made some provisions for the use of high-density applications in the fixed service (HDFS) above 30 GHz. The frequency bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz are listed for HDFS in footnote S5.547 and in Resolution 726. APT considers these bands should be made available for high-density applications to the greatest extent possible. Furthermore, APT considers the bands 37-40 GHz and 40.5-42.5 GHz are also suitable for HDFS. Therefore, appropriate sharing criteria to protect the fixed service from other services to which are allocated in these bands should be established in each band. In the band 41.5-42.5 GHz, the fixed-satellite service may cause interference to the radio astronomy service in the band 42.5-43.5 GHz, and the study under Resolution 128 has not been completed. Therefore, the study on sharing criteria to protect the radio astronomy service should be continued.

The studies under Resolution 726 have basically been completed. However, some studies under this Resolution should be continued, in particular for studies on sharing feasibility between the fixed service and the Earth exploration-satellite service in the band 55.78-59 GHz.

1 Proposal for the high-density applications in the fixed service in the band 31.8-33.4 GHz (Resolution 126 (WRC-97))

MOD ASP/20/42

TABLE **S21-4** *(end)*

Frequency band	Service*	Limit in dB(W/m^2) for angle of arrival (δ) above the horizontal plane			Reference bandwidth
		0°-5°	5°-25°	25°-90°	
31.8-33.0 GHz	Space research Inter-satellite	–120 –135	–120 + 0.75(δ – 5) –135 + (δ – 5)	–105 –115	1 MHz

Reasons: To make the bands 31.8-33.4 GHz available for high-density applications in the fixed service, appropriate pfd masks are needed to protect the fixed service from other services.

MOD ASP/20/43

29.9-34~~,~~.2 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
31.8-32	FIXED MOD S5.547A RADIONAVIGATION SPACE RESEARCH (deep space) (space-to-Earth) MOD S5.547 S5.547B S5.548	
32-32.3	FIXED MOD S5.547A INTER-SATELLITE RADIONAVIGATION SPACE RESEARCH (deep space) (space-to-Earth) MOD S5.547 S5.547C S5.548	
32.3-33	FIXED MOD S5.547A INTER-SATELLITE RADIONAVIGATION MOD S5.547 S5.547D S5.548	
33-33.4	FIXED MOD S5.547A RADIONAVIGATION MOD S5.547 S5.547E	

MOD ASP/20/44

S5.547 The bands 31.8-33.4 GHz, 37-40 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz are available for high-density applications in the fixed service (HDFS) ~~(see Resolution **726(WRC-97)**).~~ Administrations should take this into account, when considering regulatory provisions in relation to these bands.

The band 40.5-42.5 GHz can also be used for HDFS taking into account potential constraints because of usage of high-density FSS sharing the same frequency band.

Reasons: APT considers that the bands 37-40 GHz and 40.5-42.5 GHz are also suitable for HDFS. The study under Resolution 726 which requires ITU-R to study sharing criteria between fixed service and other services in the bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz is completed and the *resolves* of Resolution 726 should be transferred to footnote MOD S5.547. Since this footnote relates to the listed bands, several parts of the Radio Regulations are to be modified.

MOD ASP/20/45

S5.547A ~~Use of the band 31.8-33.4 GHz by the fixed service shall be in accordance with Resolution **126 (WRC-97)**.~~Stations in the fixed service in the band 31.8-33.4 GHz may occasionally receive interference from airborne stations of the radionavigation service. Administrations should take practical measures to minimize such interference, taking into account No. **S4.10**.

Reasons: APT supports the introduction of HDFS in these bands.

SUP ASP/20/46

RESOLUTION 126 (WRC-97)

Use of the frequency band 31.8-33.4 GHz for high-density systems in the fixed service

Reasons: Since the study under Resolution 126 has been completed, S5.547A and the Resolution are no longer needed.

2 Proposal for the high-density application in the fixed service in the band 37-40 GHz (Resolution 133 (WRC-97))

The pfd values provided in Table S21-4 below may be further adjusted to provide adequate protection of high-density applications in the fixed service, which may require review of Resolution 133 (WRC-97) including its suppression.

MOD ASP/20/47

TABLE **S21-4** *(end)*

ADD ASP/20/52

S5.ZZZ In the band 55.78-56.26 GHz, the output power density of stations in the fixed service shall be limited to –21.5 dB(W/MHz), and the far side-lobe antenna gain above 40° from the main beam shall comply with the following mask:

– for $40° < \theta < 65°$ $G = -(3/25) \times \theta - 11/5$ (dBi);

– for $\theta > 65°$ $G = -10$ dBi;

where θ is the off-axis angle.

Reasons: Pre-WRC-97 studies showed that, based on technical parameters for the FS given in Recommendation ITU-R SA.1259, the sharing between the FS and EESS is feasible in the 55.78-59 GHz band. In order to minimize the possibilities of unacceptable interference to passive sensors in the band 55.78-56.26 GHz, FS parameters should be limited in this sub-band to those which are consistent with Recommendation ITU-R SA.1259.

4 Proposal for the use of the 40.5-42.5 GHz band in the fixed-satellite service and protection of the radio astronomy service in the 42.5-43.5 GHz band (Resolutions 128 (WRC-97), 129 (WRC-97) and 134 (WRC-97))

MOD ASP/20/53

RESOLUTION 128 (Rev.WRC-~~97~~2000)

Allocation to the fixed-satellite service (space-to-Earth) in the 41.5-42.5 GHz band and protection of the radio astronomy service in the 42.5-43.5 GHz band

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ~~this Conference~~WRC-97 has added a primary allocation to the fixed-satellite service (space-to-Earth) in the band 41.5-42.5 GHz in Regions 2 and 3 and in certain countries in Region 1 and that this band is adjacent to the band 42.5-43.5 GHz which is allocated, *inter alia*, to the radio astronomy service for both continuum and spectral line observations;

b) that unwanted emissions from space stations in the fixed-satellite service (space-to-Earth) in the band 41.5-42.5 GHz may result in harmful interference to the radio astronomy service in the band 42.5-43.5 GHz;

c) that various technical means may be used to reduce these unwanted emissions from space stations in the fixed-satellite service;

d) that a limited number of radio astronomy stations worldwide require protection, and that there may be means to limit the susceptibility of radio astronomy receivers to interference,

taking into account

the relevant provisions of the Radio Regulations,

resolves

that administrations shall not implement fixed-satellite systems in the band 41.5-42.5 GHz until technical and operational measures have been identified and agreed within ITU-R to protect the radio astronomy service from harmful interference in the band 42.5-43.5 GHz,

invites ITU-R

1 to study, as a matter of urgency, the harmful interference that space stations in the fixed-satellite service (space-to-Earth) operating in the band 41.5-42.5 GHz may cause to stations in the radio astronomy service operating in the band 42.5-43.5 GHz;

2 to identify technical and operational measures that may be taken to protect stations in the radio astronomy service operating in the band 42.5-43.5 GHz, including geographical separation and out-of-band emission limits to be applied to space stations operating in the fixed-satellite service in the band 41.5-42.5 GHz, as well as measures that may be implemented to reduce the susceptibility of stations in the radio astronomy service to harmful interference;

3 to report on the results of these studies to the Conference Preparatory Meeting for WRC-~~99~~02/03,

urges administrations

to participate actively in the aforementioned studies by submitting contributions to ITU-R,

requests

WRC-~~99~~02/03 to take appropriate action based on those studies.

Reasons: Since the technical work for Resolution 128 (WRC-97) has not been completed, it should be continued.

The pfd values provided in Table S21-4 below may be further adjusted to provide adequate protection of high-density applications in the fixed service, taking into account the usage by high-density applications in the fixed-satellite service.

MOD ASP/20/54

Use of the frequency band 40.5-42.5 GHz by the fixed-satellite service

Reasons: Studies on criteria and methodologies for sharing between the fixed-satellite service and other services with allocations in the band 40.5-42.5 GHz have been completed, and the result of the studies can be reflected on Table S21-4.

Agenda item 1.5

1.5 to consider regulatory provisions and possible additional frequency allocations for services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution **122 (WRC-97)**

Extension of Resolution 122

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

ITU-R has concluded that there is merit in revising Resolution 122 to better accommodate the needs of many Region 3 countries for alternative spectrum allocations for HAPS in the 18-32 GHz range as a matter of urgency, because the 47-48 GHz band is more susceptible to rain attenuation in certain areas, especially in Region 3. In addition, the revision places emphasis on the need to progress study of all sharing issues as a matter of urgency.

CPM-99 developed an "example draft modification to Resolution 122 (Rev.WRC-2000)" which had the support of many countries at that meeting. It has been agreed within the APT that the best way to progress this matter is to support, as a minimum first step, the adoption of the CPM text as the basis of a common proposal to WRC-2000.

APT proposals

It is proposed that the time-frame of Resolution 122 should be extended to the next WRC and that recognition be given to the need for further urgent studies related to the use of HAPS in the range 18-32 GHz. The APT has agreed that the modifications to the text of Resolution 122 proposed by CPM-99 should be accepted. However, for Region 3, the APT is also proposing some modifications to Article S5 to enable HAPS to be developed within specific sub-bands within the range 18-32 GHz, and this will require some further consequential amendment of Resolution 122; however here it is proposed that Resolution 122 (WRC-97) be modified based on the following changes which are in line with the text contained in the CPM Report prepared for WRC-2000.

MOD ASP/20/60

RESOLUTION 122 (Rev.WRC-~~97~~2000)

Use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz by high altitude platform stations in the fixed service and by other services and the potential use of bands below 47 GHz by HAPS in the fixed service

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that the band 47.2-50.2 GHz is allocated to the fixed, mobile and fixed-satellite services on a co-primary basis;

b) that ~~this Conference~~WRC-97 has made provision for operation of high altitude platform stations, also known as stratospheric repeaters, within the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz;

c) that ITU has among its purposes “to promote the extension of the benefit of the new telecommunication technologies to all the world’s inhabitants” (No. 6 of the Constitution of the ITU (Geneva, 1992));

d) that systems based on new technologies using high altitude platforms will be able to provide high-capacity, competitive services to urban and rural areas;

e) that the development of any service requires major investment and that manufacturers and operators should be given the confidence to make the necessary investment;

~~e~~f) that high altitude platform systems are in an advanced stage of development and some countries have notified such systems to ITU;

~~f~~g) that the Radio Regulations Board issued a provisional rule of procedure concerning notification periods in No. **S11.24/1228** in February 1997;

~~g~~h) that in spite of the urgency attached to the development of such systems, technical, sharing and regulatory issues should be further studied in order to achieve the most efficient use of the spectrum available for these systems;

~~h~~i) that technical studies ~~are required in order to ascertain the extent to which sharing of the~~have been undertaken on the characteristics of a HAPS system in the frequency bands 47.2-47.5 GHz and 47.9-48.2 GHz ~~is feasible between systems using high altitude platforms in the fixed service and systems in the fixed, fixed-satellite and mobile services, and to ascertain the requirements to protect radio astronomy services in adjacent bands from spurious emissions~~and on the coordination and sharing requirements between HAPS systems and systems in the conventional fixed service and in other services, but that further studies are still in progress on the potential for interference between such systems;

~~i~~j) that the radio astronomy service has primary allocations in the bands 42.5-43.5 GHz and 48.94-49.04 GHz;

~~*j)* that ITU-R studies are already under way on the preferred characteristics of systems using high altitude platforms and the feasibility of sharing between these systems and systems of other services and between these systems and other systems in the fixed service (Questions ITU-R 212/9, ITU-R 218/9 and ITU-R 251/4);~~

k) that ITU-R study results have been presented which indicate that in WRC-97 designated bands at 47.2-47.5/47.9-48.2 GHz, sharing between fixed service systems using HAPS and other conventional fixed service systems in the same area will require appropriate interference mitigation techniques to be developed and implemented;

~~k~~l) that No. **S5.552** urges administrations to reserve fixed-satellite service use of the band 47.2-49.2 GHz for feeder links for the broadcasting-satellite service, and that ~~preliminary~~ ITU-R studies indicate that high altitude platform stations in the fixed service may share with broadcasting-satellite feeder links;

~~*l)* that the development of services using high altitude platform stations in these bands requires major investment and that manufacturers and operators should be given the confidence to make the necessary investment in these applications,~~

m) that ITU-R studies in the bands 47.2-47.5 GHz and 47.9-48.2 GHz indicate that sharing between fixed service systems using HAPS and FSS could be feasible under certain limitations, such as geographical separation between HAPS-based systems and FSS earth stations;

n) that since 47 GHz bands are more susceptible to the rain attenuation in certain areas of Region 3, the range 18-32 GHz has been considered for possible identification of additional spectrum in ITU-R and preliminary studies are in progress for these bands;

o) that the 18-32 GHz range is already heavily used by a number of different services,

resolves

1 to urge administrations to facilitate coordination between high altitude platform stations in the fixed service operating in the bands 47.2-47.5 GHz and 47.9-48.2 GHz and other co-primary services in their territory and adjacent territories;

2 that, on a provisional basis, the procedures of Article **S9** shall be used for coordination between satellite systems and high altitude platform systems;

3 to request ITU-R to continue to carry out urgently studies on the appropriate technical sharing criteria for the situations referred to in *considering ~~h~~i)*~~, with priority given to the sharing with other systems in the fixed and fixed-satellite services, in particular the determination of the appropriate geographical separation from feeder links in the broadcasting-satellite service~~;

4 to request ITU-R, taking into account the requirements of other fixed service systems and other services, to urgently conduct studies on the feasibility of identifying additional frequencies for the use of HAPS in the fixed service in the range 18-32 GHz;

~~4~~5 that WRC-~~99~~02 should review the results of these studies and consider refinement of the regulatory provisions that might facilitate a broader application of these high altitude platform technologies,

instructs the Director of the Radiocommunication Bureau

1 that notices concerning high altitude platform stations that were received by the Bureau prior to 22 November 1997, and provisionally recorded in the Master International Frequency Register in accordance with the provisional rule of procedure issued by the Board, shall be maintained;

2 that from 22 November 1997, and pending review of the sharing studies in *considering* ~~*h*~~*i)* and review of the notification process by WRC-~~99~~02, the Bureau shall accept notices in the bands 47.2-47.5 GHz and 47.9-48.2 GHz only for high altitude platform stations in the fixed service and for feeder links for the broadcasting-satellite service, shall continue to process notices for fixed-satellite service networks (except for feeder links for the broadcasting-satellite service) for which complete information for advance publication has been received prior to 27 October 1997, and shall inform the notifying administrations accordingly.

Reasons: Some of the studies decided by Resolution 122 (WRC-97) have not been completed. Also because of rain attenuation considerations and the technical difficulties in using the current allocation, some countries have sought alternate fixed service allocations in the range 18-32 GHz and for which study of the feasibility of identifying such spectrum has been initiated.

Agenda item 1.5

1.5 to consider regulatory provisions and possible additional frequency allocations for services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution **122 (WRC-97)**

Introduction of HAPS in the bands 27.5-28.5 and 31.0-31.3 GHz

Submitted by the following administrations:

Bhutan (Kingdom of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Democratic People's Republic of Korea, Sri Lanka (Democratic Socialist Republic of), Viet Nam (Socialist Republic of)

Introduction

CPM-99 developed an "example draft modification to Resolution 122 (Rev.WRC-2000)" which had the support of many countries at that meeting. It has been agreed within the APT that the best way to progress this matter is to support, as a minimum first step, the adoption of the CPM text as the basis of a common proposal for WRC-2000.

However, in at least one country in Region 3, there is a plan to introduce HAPS in a band in the range 18 to 32 GHz as a domestic fixed service. This plan has the support of APT countries and it is recognized that suitable footnotes must be added to the Table of Frequency Allocations and that it would be desirable to reflect this also in the proposed new Resolution LLL.

APT proposals

The APT has concluded that the revisions proposed by CPM-99 to Resolution 122 (WRC-97) should be extended and modified and a proposal to achieve this has been submitted to achieve this. It has also concluded that a modification should be made to Article S5 to enable at least one country in this region to accelerate plans related to the introduction of HAPS to meet their particular needs within this region. The existing allocation for HAPS identified in S4.15A states that transmissions to or from high altitude platform stations shall be limited to bands specifically identified in Article S5. To meet these needs a consequential amendment is required to Article S5 and also consequential development of the new resolution will be required.

S5.5SSS For Region 3 in [Bhutan, Indonesia, Iran (Islamic Republic of), Japan, Maldives, Mongolia, Myanmar, Pakistan, Dem. People's Rep. of Korea, Sri Lanka and Viet Nam], the allocation to the fixed service in the band 27.5-28.5 GHz may also be used by high altitude platform stations. The use of the band 27.5-28.5 GHz by high altitude platform stations is limited to the operation in the opposite direction of transmission for the fixed-satellite service and shall not cause harmful interference to or claim protection from co-primary services, and is subject to the provisions of Resolution **LLL (WRC-2000)**.

ADD ASP/20/64

S5.5RRR For Region 3 in [Bhutan, Indonesia, Iran (Islamic Republic of), Japan, Maldives, Mongolia, Myanmar, Pakistan, Dem. People's Rep. of Korea, Sri Lanka and Viet Nam], the allocation to the fixed service in the bands 31.0-31.3 GHz may also be used by high altitude platform stations in the direction of ground to high altitude platform stations. The use of the band 31.0-31.3 GHz shall not cause harmful interference to or claim protection from co-primary services and is subject to the provisions of Resolution **LLL (WRC-2000)**.

MOD ASP/20/65

S11.26 Notices relating to assignments for high altitude platform stations in the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz and the bands 27.5-28.5 GHz and 31.0-31.3 GHz shall reach the Bureau not earlier than five years before the assignments are brought into use.

Reasons: ITU-R has concluded that in many Region 3 countries, alternative spectrum identified for HAPS applications in the fixed service bands within the range 18-32 GHz are necessary as a matter of urgency. Preliminary study results have indicated the potentials for sharing the bands in the 18-32 GHz range with FSS systems by reverse band working mode and other FS systems in case the band allocated for FS is applied to HAPS using adequate mitigation techniques. In fact the concrete bands 29.5-29.9 GHz and 31.0-31.3 GHz are being studied successfully in ITU-R and there would not be much difference between the bands 29.5-29.9 GHz and 27.5-28.5 GHz technically. Moreover, no use of the band 31.0-31.3 GHz as HAPS downlink further enhances the potentials in the viewpoint of the protection of RAS in the band 31.3-31.8 GHz. Continuous studies will be undertaken intensively under the proposed Resolution LLL (WRC-2000), and for which further consequential amendments are necessary.

ADD ASP/20/66

RESOLUTION LLL (WRC-2000)

Use of the bands 47.2-47.5 GHz, 47.9-48.2 GHz, 27.5-28.5 GHz and 31.0-31.3 GHz by high altitude platform stations in the fixed service and by other services and the potential use of bands below 47 GHz by HAPS in the fixed service

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the band 47.2-50.2 GHz is allocated to the fixed, mobile and fixed-satellite services on a co-primary basis;

b) that WRC-97 made provision for operation of high altitude platform stations, also known as stratospheric repeaters, within the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz;

c) that ITU has among its purposes "to promote the extension of the benefit of the new telecommunication technologies to all the world's inhabitants" (No. 6 of the Constitution of ITU (Geneva, 1992));

d) that systems based on new technologies using high altitude platforms will be able to provide high-capacity, competitive services to urban and rural areas;

e) that the development of any service requires major investment and that manufacturers and operators should be given the confidence to make the necessary investment;

f) that high altitude platform systems are in an advanced stage of development and some countries have notified such systems to ITU;

g) that the Radio Regulations Board issued a provisional rule of procedure concerning notification periods in No. **S11.24/1228** in February 1997;

h) that in spite of the urgency attached to the development of such systems, technical, sharing and regulatory issues should be further studied in order to achieve the most efficient use of the spectrum available for these systems;

i) that technical studies have been undertaken on the characteristics of a HAPS system in the frequency bands 47.2-47.5 GHz and 47.9-48.2 GHz and on the coordination and sharing requirements between HAPS systems and systems in the conventional fixed service and in other services, but that further studies are still in progress on the potential for interference between such systems;

j) that the radio astronomy service has primary allocations in the bands 42.5-43.5 GHz and 48.94-49.04 GHz;

k) that ITU-R study results have been presented which indicate that, in WRC-97 designated bands at 47.2-47.5/47.9-48.2 GHz, sharing between fixed service systems using HAPS and other conventional fixed service systems in the same area will require appropriate interference mitigation techniques to be developed and implemented;

l) that No. **S5.552** urges administrations to reserve fixed-satellite service use of the band 47.2-49.2 GHz for feeder links for the broadcasting-satellite service, and that ITU-R studies indicate that high altitude platform stations in the fixed service may share with broadcasting-satellite feeder links;

m) that ITU-R studies in the bands 47.2-47.5 GHz and 47.9-48.2 GHz indicate that sharing between fixed service systems using HAPS and FSS could be feasible under certain limitation, such as geographical separation between HAPS-based systems and FSS earth stations;

n) that, since 47 GHz bands are more susceptible to the rain attenuation in certain areas of Region 3, the range 18-32 GHz has been considered for possible identification of additional spectrum in ITU-R;

o) that the 18-32 GHz range is already heavily used by a number of different services;

p) that preliminary study results have indicated the potential for sharing the bands in the 18-32 GHz range between systems in the fixed-satellite service and systems using high altitude platforms operating in the opposite direction of transmission and between systems using high altitude platforms and other systems in the fixed service in case the band allocated for the fixed service is applied to high altitude platform stations in the direction of ground to high altitude platform stations, using adequate mitigation techniques;

q) that WRC-2000 made some provision for the bands 27.5-28.5 GHz and 31.0-31.3 GHz within the range 18-32 GHz but that studies are still in progress for these bands for use of high altitude platform stations in the fixed service,

resolves

1 to urge administrations to facilitate coordination between high altitude platform stations in the fixed service operating in the bands 47.2-47.5 GHz and 47.9-48.2 GHz and 27.5-28.5 GHz and 31.0-31.3 GHz within the range 18-32 GHz, and other co-primary services in their territory and adjacent territories;

2 that, on a provisional basis, the procedures of Article **S9** shall be used for coordination between satellite systems and high altitude platform systems;

3 to request ITU-R to continue to carry out urgently studies on the appropriate technical sharing criteria for the situations referred to in *considering i)*;

4 to request ITU-R, taking into account the requirements of other fixed service systems and other services, to urgently conduct studies on the feasibility of identifying additional frequencies for the use of HAPS in the fixed service in the range 18-32 GHz;

5 that WRC-02 should review the results of these studies and consider refinement of the regulatory provisions that might facilitate a broader application of these high altitude platform technologies,

instructs the Director of the Radiocommunication Bureau

1 that notices concerning high altitude platform stations that were received by the Bureau prior to 22 November 1997, and provisionally recorded in the Master International Frequency Register in accordance with the provisional rule of procedure issued by the Board, shall be maintained;

2 that from 22 November 1997, and pending review of the sharing studies in *considering i)* and review of the notification process by WRC-02, the Bureau shall accept notices in the bands 47.2-47.5 GHz and 47.9-48.2 GHz only for high altitude platform stations in the fixed service and for feeder links for the broadcasting-satellite service, shall continue to process notices for fixed-satellite service networks (except for feeder links for the broadcasting-satellite service) for which complete information for advance publication has been received prior to 27 October 1997, and shall inform the notifying administrations accordingly.

Reasons: ITU-R has concluded that, in many Region 3 countries, alternative spectrum allocations for HAPS in the 18-32 GHz range should be identified for HAPS applications in the fixed service band as a matter of urgency, because the 47-48 GHz band is more susceptible to rain attenuation in certain areas, especially in Region 3. Therefore *considering p)* and *q)* are proposed in Resolution LLL in order to reflect the progress of studies of ITU-R accurately. The Resolution should be developed to reflect the additional spectrum identified in the revision of Tables S5.

Agenda item 1.5

1.5 to consider regulatory provisions and possible additional frequency allocations for services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution **122 (WRC-97)**

New resolution for studies related to HAPS in bands above 3 GHz for terrestrial radiocommunications

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Iran (Islamic Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People’s Republic of Korea, Sri Lanka (Democratic Socialist Republic of), Viet Nam (Socialist Republic of)

Introduction

At least one administration has the intention to deploy HAPS for national use. Urgent studies are needed to develop sharing criteria and operational conditions to be met in the implementation of such services and frequency bands above 3 GHz allocated exclusively for terrestrial radiocommunications.

It has been agreed within the APT that the best way to progress this matter is to support the development of a new resolution to address this issue.

ADD ASP/20/67

RESOLUTION XXX (WRC-2000)

High altitude platform stations in the frequency bands above 3 GHz allocated exclusively for terrestrial radiocommunications

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that ITU has among its purposes “to promote the extension of the benefit of the new telecommunication technologies to all the world’s inhabitants” (No. 6 of the Constitution of ITU, Geneva, 1992);

b) that systems based on new technologies using high altitude platform stations (HAPS) has potential applicability to various services such as high-capacity, competitive services to urban and rural areas;

c) that WRC-97 made minimum provision to be required for operation of HAPS for the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz;

d) that WRC-97 adopted a resolution that WRC-2000 should consider refinement of the regulatory provisions;

e) that the visible area from HAPS would be within a country or neighbouring countries, which is much narrower than that of the satellite system, taking into account HAPS’s altitude;

f) that some administrations intend to operate the HAPS system in the bands allocated only for terrestrial radiocommunications such as the fixed service and mobile service,

recognizing

a) the progress in ITU-R studies relating to geometrical coordination distance for the visible distance from HAPS; that could allow use of HAPS systems within one country, and subject to coordination with neighbouring countries within the visible area from HAPS, as described in Recommendation ITU-R F.[Doc. 9/1018];

b) that HAPS systems could be operated with a minimum requirement for coordination to provide terrestrial radiocommunications if neighbouring countries are not included in the visible areas from HAPS,

resolves

to request ITU-R to carry out urgently studies for regulatory provisions and frequency sharing to allow HAPS systems in additional bands above 3 GHz exclusively allocated for terrestrial radiocommunications, *instructs ITU-R*

to urgently study techniques to enable for the frequency sharing with services for terrestrial radiocommunications, protection of space systems from unwanted emissions, operational conditions and co-existence of space systems and HAPS systems, and provision for sharing with future space systems,

encourages administrations

planning to use HAPS systems to contribute actively to the sharing studies in accordance with this Resolution.

Reasons: Systems using HAPS (HAPS-based system) for terrestrial applications in bands above 3 GHz have a potential applicability to various services such as high-capacity communications and Earth observation (note that the option for the provision of IMT-2000 services using HAPS is dealt with under agenda item 1.6).

Since the HAPS airship is located at lower altitude compared with the satellite, the transmission delay and path loss in the HAPS-based system is smaller than in the satellite systems. Therefore, it would easily bring about size reduction of communication terminals and realization of high-capacity communications.

A HAPS-based system has flexible design possibilities such as number of airships, service area and offered services and applications, so as to fit the area size of land and the status of the infrastructures construction in each country.

Therefore, each country can define and operate service items such as offered applications, communication fee and service area, based on the designed system. Further studies within ITU-R are needed to allow HAPS systems in additional bands above 3 GHz exclusively allocated for terrestrial radiocommunications.

It is also important that the studies include the operational and regulatory considerations as well as those related to sharing of the spectrum between services.

Agenda item 1.6.1

1.6.1 review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, Korea (Republic of), Japan, Malaysia, Maldives (Republic of), Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand

ISSUE A: IMT-2000 terrestrial component

The need to identify global additional frequency bands for the terrestrial component of IMT-2000, beyond those identified in S5.388, to satisfy future spectrum requirements which have been based on projected market demand.

Introduction

1 WARC-92 identified, in footnote S5.388, the frequency bands 1 885-2 025 MHz and 2 110-2 200 MHz for IMT-2000, including 1 980-2 010 MHz (uplink) and 2 170-2 200 MHz (downlink) for the satellite component. This is reflected in Resolution 212, which was drafted at WARC-92 and amended at WRC-95 and WRC-97. Further developments at WRC-95 led to the allocation in Region 2 of the frequency bands 2 010-2 025 MHz (uplink) and 2 160-2 170 MHz (downlink), from within the IMT-2000 range, for MSS.

2 With respect to satisfying future spectrum requirements for IMT-2000, WRC-2000 agenda item 1.6.1 addresses the need to consider "spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component…".

In line with the wording of the agenda item, APT has decided to place priority on the spectrum requirements of the terrestrial component of IMT-2000 over those of the satellite component.

3 The CPM text concludes on total spectrum requirements for the terrestrial element of IMT-2000 for the three Regions[1], which are based on the sum of the spectrum currently identified for IMT-2000 in S5.388, the spectrum currently identified in the Regions for existing first and second generation systems (e.g. AMPS, GSM, PDC, CDMA, PCS) and an additional spectrum requirement to meet the forecasted traffic volume in geographic areas where the traffic is the highest. This additional spectrum is estimated to be 160 MHz in all three Regions by 2010.

---

[1] 555 MHz in Region 1, 390 MHz in Region 2 and 480 MHz in Region 3.

4 For the terrestrial component, the purpose of WRC-2000 should find global bands for all three Regions to meet the requirement of 160 MHz of additional spectrum. Globally harmonized spectrum will facilitate worldwide roaming and reduce cost, size and complexity of IMT-2000 on a large scale in the 2000 terminals. WRC-2000 should also identify for IMT-2000 spectrum which is currently used in various Regions for existing first and second generation cellular/PCS systems within which IMT-2000 may be implemented in the longer term, depending on national regulation. Because the location of existing first and second generation spectrums are not common to the three Regions, the location of additional spectrum for IMT-2000 may similarly vary. As a result, some flexibility in the identification of additional spectrum for IMT-2000 may be needed.

5 First and second generation mobile systems will continue to operate in the short and medium term and their availability for IMT-2000 will depend on national situations and national regulatory regimes concerning migration and evolution of existing systems towards IMT-2000. As the first and second generation spectrums were already taken into account and it cannot be part of the 160 MHz additional spectrum requirement, that means that global additional spectrum satisfying the additional 160 MHz spectrum requirement is to be identified outside the first and second generation mobile systems bands.

6 For the terrestrial component, the identification of the additional bands should be done through a new footnote(s) in Article S5, referring to a supporting resolution. It is believed that this approach, whereby the identification of spectrum is made by a footnote in association with a RR Resolution, rather than the use of a RR Resolution alone which is generally considered to apply to transitional matters, gives the most stable identification of spectrum for IMT-2000. This is important to facilitate global roaming and global economies of scale in the manufacture of equipment, and is particularly important for developing countries to gain the greatest benefit from IMT-2000. This approach also gives a status to the spectrum identified for IMT-2000 over other mobile systems, which is believed to be particularly important in view of the importance of the IMT-2000 project within ITU, and the significant efforts both within ITU and external standardization bodies in the development of harmonized radio standards for IMT-2000.

7 In addition to the band 806-960 MHz which is currently widely used for first and second generation cellular systems, APT is proposing for identification for IMT-2000 terrestrial component, the frequency bands 1 710-1 885 MHz and 2 520-2 670 MHz. This identification does not preclude other systems and other services to continue to operate in this band, according to national choice. Region 3 administrations will decide on a national basis, based on their own market requirement, to open either band or both or a portion of these bands.

8 The CPM text states that "provisions should be made for some common additional spectrum from the total designation for IMT-2000 extension bands, from which frequencies can be made available in a harmonized way globally, in order to facilitate global operation of IMT-2000". For this purpose, Region 3 countries are considering that, providing that harmonized channelling plans are developed by ITU-R, global operation will be offered with multi-band terminals able to operate within the initial band, the frequency band 2 520-2 670 MHz and the frequency band 1 710-1 885 MHz. If an administration does not wish to make part of these bands available, it may still be possible to make a portion of the band available for international roaming.

9 In relation to frequency bands currently used for first and second generation mobile systems, future frequency arrangements should aim to achieve compatibility with the existing frequency arrangements in operation, including the current duplex spacing and direction employed.

10 This proposal is divided into three parts:

– the first part proposes that no change is needed for the current footnote S5.388;

– the second part addresses spectrum which is proposed to satisfy the additional global requirement;

– the third part introduces a new resolution to be introduced at WRC-2000;
Resolution ZZZ concerning the extension bands for the implementation of IMT-2000.

PART 1

Proposal on initial IMT-2000 spectrum identified in S5.388

1 885-2 200 MHz

No change to the Article S5 Table of Allocations and the associated footnote for this frequency range.

NOC ASP/20/68

S5.388 The bands 1 885-2 025 MHz and 2 110-2 200 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these bands by other services to which they are allocated. The bands should be made available for IMT-2000 in accordance with Resolution **212 (Rev.WRC-97)**.

Reasons: Implementation of IMT-2000 in the bands identified in the Radio Regulations at WARC-92 is already planned in many countries, including the transitional arrangement of existing services. It is therefore essential to maintain the existing provisions within the Radio Regulations relating to these frequency bands.

ADD ASP/20/72

S5.AAA Portions of 806-960 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of this band for other services to which the band is allocated. This band should be made available for IMT-2000 in accordance with Resolution **ZZZ (WRC-2000)**.

Reasons: The band 862-960 MHz in Region 1, 806-902 MHz in Region 2 and 806-960 MHz in Region 3 is allocated on a primary basis to the mobile service, and is currently already used for first and second generation mobile systems in many countries according to national frequency plans. The band 806-960 MHz is therefore an obvious candidate for terrestrial IMT-2000, based on market demand, for use in the longer term where and when the use by existing systems is decreasing.

MOD ASP/20/73

1 710-2 170 MHz

<table>
<tr><th colspan="3">Allocation to services</th></tr>

</table>

ADD ASP/20/74

S5.BBB The whole band or portions of 1 710-1 885 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of this band for other services to which the band is allocated. This band should be made available for IMT-2000 in accordance with Resolution **ZZZ (WRC-2000)**.

Reasons: As indicated in the CPM Report, the band 1 710-1 885 MHz is allocated worldwide to the fixed and mobile services on a primary basis. Many countries can accommodate a significant part of requirement in this band, and in other countries large parts of this band are used for second generation mobile systems. This band is therefore an obvious candidate for identification for terrestrial IMT-2000 extension, based on market demand, for use when and where the use by existing systems is decreasing.

ADD ASP/20/76

S5.CCC The whole band or portions of 2 520-2 670 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of this band for other services to which the band is allocated. This band should be made available for IMT-2000 in accordance with Resolution **ZZZ (WRC-2000)**.

Reasons:

1 The CPM Report concludes that there is a requirement for 160 MHz of additional spectrum for the terrestrial component of IMT-2000, beyond the spectrum already identified in RR No. S5.388 and beyond the spectrum used in the three Regions for first and second generation mobile systems.

2 This band offers the potential to contribute a significant portion of the additional spectrum requirement for IMT-2000. Geographical sharing (urban/rural) might facilitate the transition or possibly enable, in the longer term, remaining operation of other services.

PART 3

Proposal for a resolution regarding the implementation of IMT-2000

The CPM text states that at least a large portion of the additional spectrum could be used in a harmonized way to facilitate global roaming. It is therefore proposed that a new RR Resolution should be developed to implement the additional IMT-2000 spectrum identified at WRC-2000, and that this Resolution should ensure that harmonized frequency arrangements are developed to facilitate coordinated global deployment of IMT-2000. Where necessary, consideration should be given to compatibility with current usage and transition of existing services.

In relation to frequency bands currently used for first and second generation mobile systems, future frequency arrangements should aim to achieve compatibility with the existing frequency arrangements in operation, including the current duplex spacing and direction employed.

For the 806-960 MHz frequency band, where a variety of existing first and second generation arrangements are currently in operation, the studies undertaken should consider the possibility to limit the number of future frequency plans used in the longer term for IMT-2000 deployment in these bands.

ADD ASP/20/77

RESOLUTION ZZZ (WRC-2000)

Extension bands for implementation of International Mobile Telecommunications-2000 (IMT-2000)

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that ITU-R has recommended the 1-3 GHz range as the most suitable for IMT-2000;

b) that WARC-92 identified the bands 1 885-2 025 MHz and 2 110-2 200 MHz, intended for use on a worldwide basis for IMT-2000, including the bands 1 980-2 010 MHz and 2 170-2 200 MHz for the satellite component of IMT-2000 in RR **S5.388** and under the provisions of Resolution **212 (Rev.WRC-97)**;

c) that ITU-R studies forecasted that additional spectrum requirement of 160 MHz for the terrestrial component, in addition to the initial IMT-2000 bands in **S5.388** and in addition to bands used for first and second generation cellular systems in the various regions, is required for identification to provide IMT-2000 in those areas where the traffic is the highest;

d) that ITU-R studies concluded that the bands used by first and second generation systems in the various regions are required for identification for IMT-2000, to be implemented when the use of these bands by first and second generation terrestrial systems has decreased;

e) that, in **S5.CCC** of the Radio Regulations, this Conference has identified additional global spectrum for IMT-2000, in order to meet the additional spectrum requirement;

f) that, in **S5.AAA** and **S5.BBB** of the Radio Regulations, this Conference has identified further spectrum for the terrestrial component of IMT-2000, of which various portions are currently used for first and second generation mobile systems to meet the total spectrum requirement;

g) that the band 2 520-2 670 MHz is allocated to the BSS service on a primary basis according to **S5.416** and to the MSS service on a primary basis according to Nos. **S5.403** and **S5.420** and the broadcasting-satellite service (sound) and complementary terrestrial broadcasting service on a primary basis according to No. **S5.418** of the Radio Regulations;

h) that WRC-02/03 will have on its agenda the review of radiolocation allocations in the band 2 700-3 400 MHz under agenda item 2.6,

noting

a) that globally harmonized operation of IMT-2000 can only be envisaged in frequency bands which are allocated to the mobile service in all three ITU Regions;

b) that, in the frequency bands identified in **S5.AAA** and **S5.BBB**, harmonization to the greatest extent practicable should be aimed for, noting however that frequency arrangements should be compatible with existing first and second generation plans;

c) that harmonized use of the additional global bands identified in **S5.CCC** will facilitate, by offering possibilities of global roaming, the worldwide success of IMT-2000 to the benefit of consumers, manufacturers and operators;

d) that not all administrations may need, or be able to implement, all of the IMT-2000 extension bands identified at this Conference due to the existing services;

e) that Recommendation ITU-R [IMT.RSPC] describes the detailed interface for IMT-2000 and that ITU-R is studying unwanted emission levels for IMT-2000, and administrations can use the level to define unwanted emission limits, but such a level does not necessarily fulfil needs of every administration,

recognizing

a) that administrations might decide to make available, according to their own market demand and using their own time-frame, only portions of the frequency bands identified for IMT-2000 and might also impose operational and technical constrain on IMT-2000 in order to facilitate co-frequency sharing with other existing services;

b) that administrations might take into account the results of the ITU-R work as mentioned in *requests ITU-R* 1 to 3 before introducing IMT-2000 systems in the additional bands,

resolves to invite administrations

to make available, based on market demand, extension bands, up to the projected requirements of 160 MHz, for the terrestrial component of IMT-2000 to meet the forecasted growth of these systems, giving due consideration to the benefits of harmonized utilization of the spectrum for the terrestrial component of IMT-2000 as indicated in *noting b)* and *c)* above, taking into account the use of these bands by the other services to which these bands are allocated,

requests ITU-R

1 to develop harmonized frequency arrangements for operation of the terrestrial component of IMT-2000 in the expansion spectrum identified in **S5.CCC** of this Conference, and study the feasibility of sharing between services allocated in this band;

2 to study the feasibility of sharing in the band 2 700-2 900 MHz between RNS and the mobile services such as IMT-2000, and to report to WRC-02/03 on the results of this study, and on the need for identifying available additional usable spectrum for IMT-2000 in this band;

3 to develop frequency arrangements for operation of IMT-2000 in the spectrum identified in **S5.AAA** and **S5.BBB** of this Conference, aiming to achieve compatibility with existing frequency arrangements in use by first and second generation systems,

further resolves

1 that these studies should be commenced forthwith;

2 that these frequency arrangements should be published by ITU-R in one or more recommendations.

Agenda item 1.6.1

1.6.1 review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, Korea (Republic of), Japan, Malaysia, Maldives (Republic of), Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Thailand, Viet Nam (Socialist Republic of)

ISSUE B: IMT-2000 satellite component

The need to identify global additional frequency bands for the satellite component of IMT-2000, beyond those identified in S5.388 and Resolution 212 (Rev.WRC-97), to satisfy future spectrum requirements which have been based on projected market demand.

Introduction

1 WARC-92 identified, in footnote S5.388, the frequency bands 1 885-2 025 MHz and 2 110-2 200 MHz for IMT-2000, including 1 980-2 010 MHz (uplink) and 2 170-2 200 MHz (downlink) for the satellite component. This is reflected in Resolution 212, which was drafted at WARC-92 and amended at WRC-95 and WRC-97. Further developments at WRC-95 led to the allocation in Region 2 of the frequency bands 2 010-2 025 MHz (uplink) and 2 160-2 170 MHz (downlink), from within the IMT-2000 range, for MSS.

2 WRC-2000, under agenda item 1.6.1, needs to ensure that enough spectrum is identified for the satellite component of IMT-2000 to satisfy the projected spectrum requirements. The CPM Report concludes that there is a need for 2×31.5 MHz by 2005 and 2×67 MHz by 2010 for the satellite component of IMT-2000. This exceeds the spectrum currently identified for the satellite component of IMT-2000 through S5.388 and Resolution 212.

ADD ASP/20/83

S5.SSS The bands 1 525-1 544 MHz, 1 545-1 559 MHz, 1 610-1 626.5 MHz, 1 626.5-1 645.5 MHz, 1 646.5-1 660.5 MHz, 2 483.5-2 500 MHz, 2 500-2 520 MHz and 2 670-2 690 MHz are intended for use, on a worldwide basis, by administrations wishing to implement the satellite component of International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these bands by other services to which they are allocated. (See also **S5.353A** and **S.357A**.)

Reasons:

1 The CPM Report concludes that there is a need for 2×31.5 MHz by 2005 and 2×67 MHz by 2010 for the satellite component of IMT-2000. This exceeds the spectrum currently identified for the satellite component of IMT-2000.

2 The bands 1 525-1 544 MHz, 1 545-1 559 MHz, 1 610-1 626.5 MHz, 1 626.5-1 645.5 MHz, 1 646.5-1 660.5 MHz, 2 483.5-2 500 MHz, 2 500-2 520 MHz and 2 670-2 690 MHz are already allocated globally on a primary basis to the mobile-satellite service.

3 These bands are used and will continue to be used also by non-IMT-2000 MSS systems. By identifying these bands for the satellite component of IMT-2000, administrations are given maximum flexibility for accommodating the deployment of satellite IMT-2000 systems.

Agenda item 1.6.1

1.6.1 review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, Korea (Republic of), Japan, Malaysia, Maldives (Republic of), Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

ISSUE C: IMT-2000 HAPS

Introduction

The purpose of this proposal is to address the use of high altitude platform stations (HAPS) systems as an optional possibility for the delivery of terrestrial IMT-2000 services, within the bands identified for terrestrial IMT-2000 systems in S5.388 subject to licensing, coordination and sharing requirements of administrations. The proposal deals with the regulatory considerations related to HAPS in the context of IMT-2000 only. It does not involve the matter of additional spectrum for the terrestrial component of IMT-2000 and the related considerations of candidate bands.

A high altitude platform station (HAPS) is defined in S1.66A as "a station located on an object at an altitude of 20 to 50 km and at a specified, nominal, fixed point relative to the Earth". Each HAPS deploys a multibeam antenna capable of projecting numerous spot beams within its coverage area. The role of HAPS is equivalent to the terrestrial base station. Accordingly, IMT-2000 terminals are identical to those terminals used with HAPS.

Each HAPS will be positioned above commercial airspace at an altitude that is high enough to provide service to a large footprint but that is low enough to provide dense coverage. HAPS will offer a new means of providing IMT-2000 with minimal ground network build out.

The Radio Regulations, under S4.15A, states that "transmissions to or from high altitude platform stations shall be limited to bands specifically identified in Article S5". The only identification currently in Article S5 is the footnote S5.552A that states that "the allocation to the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz is designated for use by high altitude platform stations. The use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz is subject to the provisions of Resolution 122 (WRC-97)".

The use of HAPS as a means of providing IMT-2000 type services has been the subject of extensive studies in the Study Group 8 process. In particular Task Group 8/1 recognized that the high altitude platform stations could provide base stations enabling optional means of transmission of IMT-2000 services. In relation to identification within Article S5, it is proposed that an additional footnote would be necessary to enable HAPS operation within a terrestrial IMT-2000 system, with the wording of the footnote along the lines of that proposed in S5.HHH in § 1.1.1.5.2 of the CPM Report.

Draft new Recommendation ITU-R M.[Doc. 8/115] as agreed by ITU-R Study Group 8 for adoption by correspondence the minimum performance characteristics, the sharing and coordination requirements associated with the use of HAPS as part of a terrestrial IMT-2000 system. It is appropriate that those characteristics and related requirements be suitably reflected in regulatory provisions and in including in particular the antenna patterns and operational spectral power flux-density (spfd) limits for coordination purposes and to ensure protection of adjacent band operations and services in neighbouring administrations.

Further, the use of HAPS in the currently identified IMT-2000 bands shall be optional for administrations. Each administration shall retain its individual authority over technical and regulatory matters pertaining to the sharing, coordination and implementation of HAPS in these bands.

RR S11.26 states that notification for HAPS in the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz may reach the Bureau as early as five years before the assignments are brought into use. Such a regulatory priority is not appropriate for the IMT-2000 situation, and no provision for any priority of notification is being proposed.

For the possible implementation of HAPS in an IMT-2000 system, the following regulatory changes are proposed:

ADD ASP/20/88

High altitude platform stations

ADD ASP/20/89

S27A.1 High altitude platform stations implemented within a terrestrial IMT-2000 system shall conform to the minimum performance characteristics and operational conditions given in Resolution **XXX (WRC-2000)**.

ADD ASP/20/90

S27A.2 The spectral power flux-density limit at the border of a neighbouring administration shall be as provided in Resolution **XXX (WRC-2000)** unless otherwise agreed by the affected administration.

ADD ASP/20/91

RESOLUTION XXX (WRC-2000)

Minimum performance characteristics and operating conditions for high altitude platform stations providing IMT-2000 services in the bands 1 885-1 980 MHz, 2 010-2 025 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 MHz in Region 2

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that high altitude platform stations (HAPS) have the possibility of delivering IMT-2000 mobile and fixed wireless access using the proposed IMT-2000 terrestrial component radio transmission technologies and protocols;

b) that each HAPS uses a phased array antenna to project hundreds of spot beams to provide telecommunications services to coverage areas that range in size from metropolitan to wider areas;

c) that for non-HAPS terrestrial base stations, such as tower-based systems, the illumination of areas outside the intended operational area is dependent on the characteristics of the tower-mounted antenna and the propagation attenuation. For HAPS, the dependence is more on the characteristics of the HAPS mounted antenna especially the side-lobe performance and the pointing accuracy and as the coverage area increases the antenna performance becomes more demanding;

d) that the characteristics of co-channel sharing and coordination between HAPS systems and other IMT-2000 are determined by the performance of the HAPS antennas, the IMT-2000 radio interface used by HAPS, and the HAPS coverage area;

e) that the level of out-of-band interference from HAPS antennas, the IMT-2000 radio interface used by HAPS and the HAPS coverage area;

f) that HAPS is proposed to be used as a base station of terrestrial IMT-2000 and should not have any priority over other terrestrial IMT-2000 use,

resolves

1 that for the purpose of protecting stations operated by neighbouring administrations from co-channel interference, administrations using HAPS as base stations to provide IMT-2000 shall use antennas that comply with the following antenna pattern:

$$G(\psi) = G_m - 3(\psi/\psi_b)^2 \quad \text{dBi} \quad \text{for} \quad 0 \le \psi \le \psi_1$$

$$G(\psi) = G_m + L_N \quad \text{dBi} \quad \text{for} \quad \psi_1 < \psi \le \psi_2$$

$$G(\psi) = X - 60\log(\psi) \quad \text{dBi} \quad \text{for} \quad \psi_2 < \psi \le \psi_3$$

$$G(\psi) = L_F \quad \text{dBi} \quad \text{for} \quad \psi_3 < \psi \le 90^\circ$$

where:

$G(\psi)$: gain at the angle ψ from the main beam direction (dBi)

G_m: maximum gain in the main lobe (dBi)

ψ_b: one-half of the 3 dB beamwidth in the plane of interest (3 dB below G_m) (degrees)

L_N: near-in-side-lobe level in dB relative to the peak gain required by the system design, and as a maximum value of −25 dB

L_F = G_m – 73 dBi far side-lobe level (dBi)

$$\psi_1 = \psi_b \sqrt{-L_N/3} \quad \text{degrees}$$

$$\psi_2 = 3.745\psi_b \quad \text{degrees}$$

$$X = G_m + L_N + 60\log(\psi_2) \quad \text{dB}$$

$$\psi_3 = 10^{(X - L_F)/60} \quad \text{degrees}$$

The 3 dB beamwidth ($2\psi_b$)is again estimated by:

$$(\psi_b)^2 = 7\,442/(10^{0.1G_m}) \quad \text{(in degrees}^2\text{)}$$

where G_m is the peak aperture gain (dBi);

2 that a HAPS operating as a base station to provide IMT-2000 shall not exceed a co-channel spectral power flux-density (spfd) level of −121.5 dB(W/($m^2 \cdot$ MHz)) on the Earth's surface outside an administration's boundaries unless agreed otherwise with the affected neighbouring administration;

3 that a HAPS operating as a base station to provide IMT-2000, in order to protect mobile earth stations from interference, shall not exceed an out-of-band spfd level of −165 dB(W/($m^2 \cdot$ 4 kHz)) on the Earth's surface in the bands 2 160-2 200 MHz in Region 2 and 2 170-2 200 MHz in Regions 1 and 3;

4 that a HAPS operating as a base station to provide IMT-2000, in order to protect fixed stations from interference, shall not exceed an out-of-band spfd level on the Earth's surface in the bands 2 025-2 110 MHz of:

a) −165 dB(W/($m^2 \cdot$ MHz)) for angles of arrival (θ) less than 5° above the horizontal plane;

b) −165 + 1.75 (θ – 5) dB (W/($m^2 \cdot$ MHz)) for angles of arrival between 5° and 25° above the horizontal plane; and

c) −130 dB(W/($m^2 \cdot$ MHz)) for angles of arrival between 25° and 90° above the horizontal plane.

Reasons: Studies for HAPS within IMT-2000 systems have been completed in Task Group 8/1 and Study Group 8 has agreed to the new Recommendation ITU-R M.[Doc. 8/115] on "Minimum performance characteristics and operational conditions for high altitude platform stations providing IMT-2000 in the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 MHz in Region 2" for adoption by correspondence. This Recommendation provides methods both for the administration putting HAPS into service and for other administrations to evaluate the potential impact of interference, by specifying spfd levels, both co-channel and in adjacent bands, and by specifying the antenna radiation pattern.

RR S4.15A limits transmission to and from HAPS to bands specifically identified in the Table of Frequency Allocations. So far, the only bands which are identified as such by RR S5.552A are 47.2-47.5 GHz and 47.9-48.2 GHz.

The use of HAPS to provide IMT-2000 is therefore conditioned to the identification of the bands identified for IMT-2000 in RR S5.388 as available for use by HAPS.

However, such identification should be limited at present to be within those bands currently identified in RR S5.388, as has been done in the DNR, since new bands to be identified for IMT-2000 under agenda item 1.6.1 may have to share with co-primary and secondary allocations with various services, and sharing has been investigated only in the existing bands so far.

Agenda item 1.6.2

1.6.2 identification of a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

ASP/20/92

APT proposes that a global radio control channel is not necessary.

Reasons: APT countries support the current CPM text.

Agenda item 1.7

1.7 review the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting the operational, distress and safety communications, taking into account Resolution **346 (WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

Section 1.2.3.1 of Chapter 1 of the CPM Report recognized that modification of Resolution 207 (Mob-87) would draw attention to the problem of interference to HF communications from unauthorized sources and the need to study possible solutions to mitigate this type of interference. It was also noted by the CPM that expedient action needs to be taken by responsible administrations in response to interference reports.

MOD ASP/20/93

RESOLUTION 207 (~~Mob-87~~Rev.WRC-2000)

Unauthorized use of frequencies in the bands allocated to the maritime mobile service and to the aeronautical mobile (R) service[1]

The World ~~Administrative~~ Radiocommunication Conference ~~for the Mobile Services, Geneva, 1987~~(Istanbul, 2000),

considering

a) that existing provisions of the Radio Regulations prohibit the unauthorized use of certain frequencies for other than safety-related communications;

~~a~~b) that monitoring observations of the use of frequencies in the band 2 170-2 194 kHz and in the bands allocated exclusively to the maritime mobile service between 4 063 kHz and 27 500 kHz and to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz show that a number of frequencies in these bands are still being used by stations of other services, some of which are operating in contravention of No. **S23.2**;

~~b~~c) that these stations are causing harmful interference to the maritime mobile and aeronautical mobile (R) services;

~~c~~d) that HF radio is the sole means of communication in certain situations for the maritime mobile service and that certain frequencies in the bands mentioned in *considering ~~a~~b)* are reserved for distress and safety purposes;

~~d~~e) that HF radio is the sole means of communication in certain situations for the aeronautical mobile (R) service and that this is a safety service~~,~~;

f) that enforcing compliance with these regulatory provisions is becoming increasingly difficult with the availability of low-cost HF SSB transcievers;

g) that this Conference has reviewed the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting the operational, distress and safety communications,

considering in particular

~~e~~h) that it is of paramount importance that the distress and safety channels of the maritime mobile service be kept free from harmful interference, since they are essential for the protection of the safety of life and property;

~~f~~i) that it is also of paramount importance that channels directly concerned with the safe and regular conduct of aircraft operations be kept free from harmful interference, since they are essential for the safety of life and property,

[1] WRC-97 made editorial amendments to this Resolution.

resolves

to urge administrations

1 to ensure that stations of services other than the maritime mobile service abstain from using frequencies in distress and safety channels and their guard bands and in the bands allocated exclusively to that service, except under the conditions expressly specified in Nos. **S4.4**, **S5.128**, **S5.129**, **S5.137** and **S4.13** to **S4.15**; and to ensure that stations of services other than the aeronautical mobile (R) service refrain from using frequencies allocated to that service except under the conditions expressly specified in Nos. **S4.4** and **S4.13**;

2 to make every effort to identify and locate the source of any unauthorized emission capable of endangering human life or property and the safe and regular conduct of aircraft operations, and to communicate their findings to the Radiocommunication Bureau;

3 to participate in the monitoring programmes that the Bureau may organize pursuant to this Resolution;

4 to make every effort to ensure that such emissions are made in appropriate bands allocated to services other than the maritime mobile service or the aeronautical mobile (R) service;

5 to request their competent authorities to take, within their respective jurisdiction, such legislative or regulatory measures which they consider necessary or appropriate in order to prevent stations from unauthorized use of distress and safety channels or operating in contravention of No. **S23.2**,

to invite the Bureau

1 to study possible solutions, technical and regulatory, to assist in mitigating HF interference;

~~1~~2 to continue to organize monitoring programmes, at regular intervals, in the maritime distress and safety channels and their guard bands and in the bands allocated exclusively to the maritime mobile service between 4 063 kHz and 27 500 kHz and to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz, with a view to ensuring the timely distribution of monitoring data and identifying the stations of other services operating on these channels or in these bands;

~~2~~3 to seek the cooperation of administrations in identifying the sources of those emissions by all available means and in securing the cessation of those emissions;

~~3~~4 when the station of another service transmitting in a band allocated to the maritime mobile service or to the aeronautical mobile (R) service has been identified, to inform the administration concerned,

to invite ITU-R and ITU-D

1 to conduct periodic regional awareness campaigns in an attempt to mitigate the HF interference, especially on distress and emergency channels;

2 to include the problem of interference to distress and emergency channels on the agenda of regional radiocommunication and development seminars,

requests administrations

to take all necessary steps in such cases to ensure the cessation of any transmissions contravening the provisions of the Radio Regulations on the frequencies or in the bands referred to in this Resolution.

Reasons: The proposed modifications are intended to increase awareness to the problem of interference to HF aeronautical and maritime communications and to task ITU-R to undertake mitigation studies.

MOD ASP/20/94

S15.37 § 29 An administration receiving a communication to the effect that one of its stations is causing harmful interference to a safety service shall promptly investigate the matter and take any necessary remedial action and respond in a timely manner.

Reasons: Section 1.2.3.1.1 of the CPM Report states that Article S15 of the Radio Regulations may state that administrations should respond in a timely manner.

Agenda item 1.8

1.8 to consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Submitted by the following administrations:

Brunei Darussalam, Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

The CPM Report notes that earth stations on board vessels (ESVs) can provide wideband services to cruise liners, passenger ships, naval vessels, seismic research and petroleum exploration vessels and other deep draft vessels. These installations are essentially mobile in nature and as such pose a new interference risk to 6 GHz fixed links.

The CPM Report proposed two options:

– a draft resolution giving regulatory text dealing with the operation of ESVs; and

– an alternative proposal that no change be made to the Radio Regulations, in which ESVs would continue to operate under S4.4.

The following APT proposal is based on the first option above.

MOD ASP/20/95

2 700-4 800 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
3 400-3 600 FIXED FIXED-SATELLITE (space-to-Earth) Mobile Radiolocation S5.431	**3 400-3 500** FIXED FIXED-SATELLITE (space-to-Earth) Amateur Mobile Radiolocation S5.433 S5.282 S5.432	
3 600-4 200 FIXED FIXED-SATELLITE (space-to-Earth) ADD S5.XXX Mobile	**3 500-3 700** FIXED FIXED-SATELLITE (space-to-Earth) MOBILE except aeronautical mobile Radiolocation S5.433 S5.435	
	3 700-4 200 FIXED FIXED-SATELLITE (space-to-Earth) ADD S5.XXX MOBILE except aeronautical mobile	

MOD ASP/20/96

5 830-7 550 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
5 925-6 700	FIXED FIXED-SATELLITE (Earth-to-space) ADD S5.XXX MOBILE S5.149 S5.440 S5.458	

ADD ASP/20/96*bis*

S5.XXX In the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz, transponders on space stations in the fixed-satellite service may be used, additionally, by earth stations on vessels. Such use is subject to the provisions specified in Resolution **ZZZ (WRC-2000)**.

Reasons: It is appropriate to add a footnote to the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz in Article S5. Resolution ZZZ should contain technical and operational requirements in addition to the procedures.

ADD ASP/20/97

DRAFT RESOLUTION ZZZ (WRC-2000)

Provisions to enable earth stations located on board vessels to operate in fixed-satellite service networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that there is a demand for global wideband satellite communication services on vessels;

b) that the technology exists that would permit the use of fixed-satellite services (FSS) networks by earth stations on board vessels (ESVs) operating in the 3 700-4 200 MHz and 5 925-6 425 MHz bands;

c) that ESVs have the potential to cause unacceptable interference to the fixed service (FS) systems in the band 5 925-6 425 MHz;

d) that FS systems have the potential to cause interference to ESVs in the 3 700-4 200 MHz band;

e) that ESVs operating in these bands require considerably less than the full bandwidth in this FSS allocation and only a portion of the visible geostationary arc;

f) that there are a limited number of geostationary FSS systems that have global coverage;

g) that in order to ensure the protection and future growth of the FS, the ESV must operate with certain technical and operational constraints;

h) that administrations may authorize radiocommunication stations on off-shore structures and platforms for which they are responsible;

i) that based on appropriate assumptions a minimum distance can be calculated beyond which the ESV will not have the potential to cause unacceptable interference to the fixed service in this band,

noting

a) that operation within the territorial sea is at the discretion of the administration with territorial authority, in which case the relevant procedures of that administration will apply;

b) that operation of earth stations on vessels from specified fixed points at locations outside the territorial sea but for which an administration has territorial jurisdiction is fully within the FSS,

resolves

1 that the administration that issues the radio licence for the use of ESVs in these bands (licensing administration) shall ensure that such stations do not cause unacceptable interference to stations in the fixed service;

2 that licensing administrations shall ensure that ESVs are capable of operating in compliance with the requirements of this Resolution;

3 that operators of ESVs shall comply with the conditions established by the licensing administration(s);

4 that ESVs shall not claim protection from fixed service station transmissions;

5 that any transmissions from ESVs within a distance of 370 km off the coast shall be based upon the prior agreement of that coastal administration;

6 that the coastal administration, in determining the contour with a distance of 370 km off the coast, should exclude those parts of its territory, such as remote small islands, where FS systems in the band 5 925-6 425 MHz are neither operating nor planned; however, the coastal administration may revise the above contour, if the modification of the future deployment plan for those parts of the territory requires such a revision;

7 that appropriate technical measures for identification of ESVs shall be available for the coastal as well as licensing administrations for such ESVs which continue to operate outside their predetermined geographic (see *resolves* 5) or operational limits. The licensing administration shall also be equipped with automatic mechanisms to terminate transmissions of such ESVs;

8 that ESVs shall be equipped so as to enable the licensing administration under the provisions of Article **S18** to verify earth station performance and to accomplish the switch off of the ESV transmission immediately upon request by an administration whose services may be affected;

9 that ESVs shall comply with additional technical and operational limits given in Annex 1 to this Resolution;

10 that when ESVs operating beyond the territorial sea but within 370 km off the coast of an administration fail to comply with the terms required by that administration pursuant to *resolves* 3 and 5, then that administration may:

– request the ESV to comply with such terms or cease operation immediately; or

– request the licensing administration to require such compliance or immediate cessation of the operation;

11 that any licensing authority that licenses ESVs shall agree to maintain at all times a point of contact, which shall be published in a circular of ITU, that may be contacted by an affected administration seeking assistance pursuant to *resolves* 3 and 5 above;

12 that this Resolution should be considered as provisional and should be placed on the agenda of the next world radiocommunication conference for review,

requests ITU-R

1 to continue studies on various aspects of ESV operation in the bands 3 700-4 200 MHz and 5 925-6 425 MHz;

2 to study the possible extension of the bands for ESV operation from 3 700-4 200 MHz and 5 925-6 425 MHz to 3 400-4 200 MHz and 5 925-6 725 MHz;

3 to develop appropriate technical measures for identification and radiomonitoring by coastal as well as licensing administrations of such ESVs which continue to operate outside their predetermined geographic or operational limits;

4 to study, as a complementary measure, the feasibility of an ESV system which operates in the bands 10.95-12.75 GHz and 13.75-14.5 GHz and/or a dual-band ESV system in which an ESV may operate either in the bands 3 700-4 200 MHz and 5 925-6 425 MHz or in the bands 10.95-12.75 GHz and 13.75-14.5 GHz depending on its location, and to study the sharing criteria and the coordination procedures of such ESV operation with the terrestrial services and the fixed-satellite service operating in these bands;

5 to report the results of the above studies to the next world radiocommunication conference through the conference preparatory meeting.

ANNEX 1 TO RESOLUTION ZZZ (WRC-2000)

Additional technical and operational limits on ESVs in the band 5 925-6 425 MHz

ESVs shall comply with the following additional technical and operational limits in the band 5 925-6 425 MHz:

– minimum diameter of ESV antenna: 2.4 m (NOTE 1);

– minimum elevation angle of ESV antenna: 10°;

– maximum tracking error of ESV antenna regardless of the sea conditions: 0.2°;

– ESV antenna side-lobe gain at the off-axis angle (ϕ) in the range of 10°-20° (including the effects of a radome): 29-25 log ϕ (dBi) or less;

– maximum necessary bandwidth per vessel: 2.5 MHz;

– maximum ESV transmitter power spectral density at the input of the antenna: 17 dB(W/MHz).

NOTE 1 - The ESV antenna half-power bandwidth of 1.5° required to protect adjacent satellites is consistent with the minimum antenna diameter of 2.4 m.

Reasons:

1 The value of X = 370 km was chosen from the CPM Report as an administrative value. Since the value of X must be sufficiently large in order to provide adequate protection of the FS, the candidate values are 370 km and 540 km, according to the CPM Report.

The value of X = 370 km is based on Document CPM99-2/69 submitted to CPM-99. This document adopted the interference assessment methodology as generally agreed to by Working Party 4-9S at its meeting in April 1999, but made a detailed examination on all assumptions and technical parameters adopted in that methodology and made calculations on the basis of revised assumptions and parameters. Therefore, it can be regarded as an improved version of the previous study by Working Party 4-9S. In addition, the assumptions include the following:

– the receiving antenna of an interfered-with FS station is directed towards the sea, perpendicular to the coastline;

– the ESV antenna elevation angle is as low as 10° and the satellite is located in the direction of the interfered-with FS station;

– the ESV is always active at the same frequency.

The above assumptions correspond to the worst case. For example, even if many FS stations are operating near the coast, many of their routes are along the coastline. In such a case, the minimum distance can be well below 100 km, due to the directivity of FS antennas. Only a very few stations will have receiving antennas directed towards the sea, perpendicular to the coastline. Therefore, the value of X = 370 km will adequately protect 6 GHz band FS systems and is appropriate on the basis of the best available information.

2 In some parts (such as remote small islands) of the territory of a coastal administration, 6 GHz FS systems may not operate. It is unnecessary to protect such areas. Therefore, new *resolves* 6 is proposed.

3 It should be noted that § 6.3.3.1 of the CPM Report states that "… agenda item 1.8 can be satisfied by incorporation of the necessary technical and operational constraints …" Therefore, in order to define some basic technical and operational limits of ESVs, it is proposed to add Annex 1 to Resolution ZZZ. The antenna side-lobe pattern is based on the pattern used in the study of Working Party 4-9S (see Document 4-9S/178). The maximum necessary bandwidth of 2.5 MHz is slightly larger than 2.346 MHz in the CPM Report. This takes into account some allowance for ambiguity in necessary bandwidth calculation, but will not increase interference from ESVs.

4 Resolution ZZZ should be a provisional one and should be reviewed at the next world radiocommunication conference. Therefore, new *resolves* 12 is proposed.

5 WRC-2000 should request ITU-R to continue studies on ESVs in the 4/6 GHz bands.

6 In view of a difficult sharing situation in the 4/6 GHz bands within a distance of 370 km off the coast, WRC-2000 should request ITU-R to study the feasibility of a complementary measure such as ESVs in the 11/14 GHz bands. The transponder bandwidths of one international satellite operator are 10.95-11.2 GHz, 11.45-11.7 GHz, 11.7-12.2 GHz (Region 2) and 12.5-12.75 GHz (Region 3) in the 10.95-12.75 GHz range (downlink), and 13.75-14.0 GHz and 14.0-14.5 GHz in the 13.75-14.5 GHz range (uplink), some transponders being on a regional basis.

The band 10.95-11.7 GHz is allocated on a co-primary basis to the FS, FSS and MS (except aeronautical mobile). In Region 2, the band 11.7-12.1 GHz is allocated on a co-primary basis to the FS and FSS, and the band 12.1-12.2 GHz is exclusive to the FSS. In Region 3, the band 12.5-12.75 GHz is allocated on a co-primary basis to the FS, FSS, MS (except aeronautical mobile) and BSS.

As far as the primary allocations are concerned, the band 13.75-14.0 GHz is allocated to the FSS and radiolocation and the band 14.0-14.3 GHz is allocated to the FSS and radionavigation on a worldwide basis. The band 14.3-14.4 GHz is allocated on a co-primary basis to the FS, FSS and MS (except aeronautical mobile), but the allocation in Region 2 is exclusive to the FSS. The band 14.4-14.5 GHz is allocated to the FS, FSS and MS (except aeronautical mobile) on a worldwide basis. Some footnotes make additional allocations of the band 13.75-14.3 GHz to the FS and MS in certain countries.

The coverage areas of the GSO satellites operating in the 11/14 GHz bands are not global, being continental coverages. Therefore, it is not possible to provide 11/14 GHz band operation to ESVs in the middle of oceans. The coverage areas are limited only to those areas close to continents. In addition, the coverages of these areas may not be guaranteed.

Therefore, if ESVs in the 11/14 GHz bands are to be considered, one possible way seems to introduce a dual-band ESV system, in which ESVs employ the 4/6 GHz band operation in the middle of oceans and the 11/14 GHz band operation near the coasts. This system will generally reduce interference to terrestrial services from ESVs. Alternatively, an ESV system which operates in the 11/14 GHz bands only may also offer an opportunity for wideband communication. However, further studies are required on:

– feasibility of the 11/14 GHz band ESV system and/or the dual-band ESV system;

– current and future FSS satellite coverage areas for 11/14 GHz band ESVs;

– interference to FS, radiolocation and radionavigation systems from ESVs in the 14 GHz band.

Finally it should be noted that, according to No. S5.502, the e.i.r.p. of an FSS earth station in the band 13.75-14 GHz shall be at least 68 dBW, and should not exceed 85 dBW, with a minimum antenna diameter of 4.5 m. These limits were established in order to protect the FSS from interference caused by radiolocation systems. ESVs may not be able to meet these requirements, which should be taken into account by the ITU-R study. However, APT proposes that prohibition of emissions less than 68 dBW be relaxed but such earth stations not be protected.

NOTE - The band 14-14.5 GHz is allocated to the mobile-satellite service (except aeronautical mobile-satellite service) on a secondary basis, but there is no such allocation in the band 10.95-12.75 GHz. In order to avoid a complicated discussion, it is suggested that for the 11/14 GHz band, ESV operation be regarded as a part of the fixed-satellite service.

Agenda item 1.9

1.9 to take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions **213 (Rev.WRC-95)** and **220 (WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

1 The band 1 559-1 567 MHz

This proposal addresses the issue of a possible allocation for MSS in the 1 559-1 567 MHz band.

APT administrations are strongly of the view that sharing between MSS and RNSS in the band 1 559-1 567 MHz is not feasible as concluded in the CPM Report. Accordingly, APT administrations support NOC for the existing allocations in this band, except to support the addition of the space-to-space direction to the RNSS allocation as per agenda item 1.15.2.

In addition, APT administrations support the suppression of Resolution 220 as studies on this matter by ITU-R have now been completed.

MOD ASP/20/98

(Refer to the frequency table for 1 559-1 610 MHz in relation to agenda item 1.15.2.)

Reasons: Frequency sharing between MSS and RNSS in this band is not feasible.

SUP ASP/20/99

RESOLUTION 220 (WRC-97)

Studies to consider the feasibility of use of a portion of the band 1 559-1 610 MHz by the mobile-satellite service (space-to-Earth)

Reasons: Resolution 220 can be suppressed as ITU-R has completed its studies on this matter.

Agenda item 1.10

1.10 to consider results of ITU-R studies carried out in accordance with Resolution **218 (WRC-97)** and take appropriate action on this subject

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Background

The generic MSS allocation, which was adopted at WRC-97, is intended to alleviate the current spectrum congestion for existing and planned MSS systems. Protection was afforded to the global maritime distress and safety system (GMDSS) and the aeronautical mobile-satellite (route) service by footnotes S5.353A and S5.357A respectively.

APT administrations recognize that additional regulatory procedures and appropriate operational measures are required, as a matter of urgency, to ensure priority access to the spectrum in these bands, during the progress of operations, as well as in the coordination phase by AMS(R)S and GMDSS (operations only), consistent with the protection for these safety of life services.

SUP ASP/20/100

RESOLUTION 218 (WRC-97)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

ADD ASP/20/101

DRAFT NEW RESOLUTION XXX (WRC-2000)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that prior to the World Radiocommunication Conference 1997 the bands 1 530-1 544 MHz, 1 545-1 555 MHz (space-to-Earth) and 1 626.5-1 645.5 MHz, 1 646.5-1 656.5 MHz (Earth-to-space) were allocated on an exclusive basis in most administrations to the mobile maritime satellite service and the aeronautical mobile-satellite (route) service (AMS(R)S);

b) that the World Radiocommunication Conference (Geneva, 1997) allocated these bands to the generic mobile-satellite service (MSS);

c) that the World Radiocommunication Conference (Geneva, 1997) adopted footnotes No. **S5.353A** giving priority to accommodating the spectrum requirements for distress, urgency and safety communications, and protection from unacceptable interference, to the global maritime distress and safety service (GMDSS) in the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz and No. **S5.357A** giving priority to accommodating the spectrum requirements, and protection from unacceptable interference, to the AMS(R)S providing transmission of messages with priority 1 to 6 in Article **S44** in the bands 1 545-1 555 MHz and 1 646.5-1 656.5 MHz,

considering further

d) that global and regional mobile-satellite systems are being coordinated in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz and that Section IIA of Article **S9** provides the international framework for coordination agreements;

e) that in these bands GSO satellite system operators presently use a capacity planning approach at multilateral coordination meetings, with the guidance and support of their administrations, to periodically coordinate access to the spectrum needed to accommodate their requirements, however, outside the multilateral process, coordination problems have occurred in some cases;

f) that in the bands to which Nos. **S5.353A** or **S5.357A** applies, the capacity planning approach, and other methods such as intra- and inter-system prioritization, pre-emption and interoperability may assist to accommodate the expanding spectrum requirements of the GMDSS and AMS(R)S;

g) that, as spectrum saturation is reached, MSS systems that do not carry GMDSS or AMS(R)S traffic and MSS systems that do not have the ability to provide prioritization, pre-emption within or between their networks or do not have interoperability with other MSS systems that are carrying GMDSS or AMS(R)S traffic, will be required to vacate these bands to conform with the requirements of Nos. **S5.353A** and **S5.357A**;

h) that the feasibility of prioritization, real-time pre-emptive access and interoperability between different mobile-satellite systems and systems providing GMDSS and AMS(R)S has yet to be adequately determined,

recognizing

a) that the Convention on International Civil Aviation requires that stations of the AMS(R)S shall be in compliance with the internationally agreed Standards and Recommended Practices and procedures for Air Navigation Services and that the ICAO has developed a global air traffic management system which requires interoperability between stations providing AMS(R)S communications with the priority message structure of Article **S44** and that each of these messages are safety related;

b) that the IMO may also place similar requirements of interoperability for those mobile-satellite systems providing GMDSS communications with the priority message structure of Article **S53**;

c) that Appendix **S15** of the Radio Regulations identifies the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz for distress and safety purposes in the GMDSS as well as for routine non-safety purposes;

d) that priority access and immediate availability of spectrum for maritime distress, urgency and safety communications of the GMDSS and AMS(R)S communications with priority 1 to 6 of Article **S44** is of vital importance for the safety of life,

noting

a) that maritime general communications is defined under the International Convention for the Safety of Life at Sea (SOLAS) as operational and public correspondence, other than distress, urgency and safety, conducted by radio;

b) that maritime distress, urgency and safety communications of the GMDSS in the bands 1 530-1 545 MHz and 1 626.5-1 645.5 MHz include communications with priority 1 to 3 and safety-related communications carried under priority 4 of Article **S53**,

resolves

1 that in frequency coordination procedures and agreements for the mobile-satellite services in the bands 1 530-1 544, 1 545-1 555 MHz and 1 626.5-1 645.5, 1 646.5-1 656.5 MHz, administrations shall ensure prompt and equitable allocation of spectrum between operators in order to meet the spectrum requirements for all distress, urgency and safety communications of the GMDSS as defined in Articles **S32** and **S33** in the bands where No. **S5.353A** applies and the AMS(R)S communications with priority 1 to 6 of Article **S44** in the bands where No. **S5.357A** applies;

2 that techniques such as prioritization and real-time pre-emptive access within a mobile-satellite network and between different mobile-satellite networks and interoperability between different mobile-satellite networks, for GMDSS or AMS(R)S communications over all other communications should be determined and, when necessary and where feasible, implemented in order to achieve the most flexible and practical use of the generic allocations;

3 administrations shall ensure that mobile-satellite service operators carrying non-safety related traffic yield capacity as and when necessary to accommodate the needs of the GMDSS communications as defined in Articles **S32** and **S33** and AMS(R)S communications with priority 1 to 6 of Article **S44**. This could be achieved in advance by the coordination process at *resolves* 1 above or through the implementation of techniques at *resolves* 2 above,

requests ITU-R

1 to complete studies as a matter of urgency, to determine the feasibility of prioritization and real-time pre-emptive access between different networks of mobile-satellite systems and interoperability between different mobile-satellite networks as referred to in *resolves* 2 above;

2 to study and establish the conditions and requirements for prioritization, pre-emption and interoperability within and between mobile-satellite networks operating in bands where Nos. **S5.353A** and **S5.357A** applies,

requests WRC-02/03

to take into account the outcome of ITU-R studies and take appropriate action on this subject,

invites

ICAO, IMO, IATA, administrations and other organizations concerned to participate in the studies identified in *requests ITU-R* 1 and 2 above.

Reasons: The proposed draft Resolution XXX (WRC-2000) redefines the studies requested in Resolution 218 and clarifies and strengthens the provisions of the Radio Regulations S5.353A and S5.357A.

APT proposes that Radio Regulations S5.353A and S5.357A be modified as follows:

MOD ASP/20/102

S5.353A In applying the procedures of ~~No. **S9.11A**~~frequency coordination under Section IIA of Article **S9** to the mobile-satellite service in the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz, priority shall be given to accommodating the spectrum requirements for distress, urgency and safety communications of the Global Maritime Distress and Safety System (GMDSS) as defined in Articles **S32** and **S33**. Maritime mobile-satellite distress, urgency and safety communications shall have priority access and immediate availability, by pre-emption if necessary, over all other mobile satellite communications operating within ~~a network~~these bands. Mobile-satellite systems shall not cause unacceptable interference to, or claim protection from, distress, urgency and safety communications of the GMDSS. Account shall be taken of the priority of safety-related communications in the other mobile-satellite services. (~~See Resolution **218 (WRC-97)**~~The provisions of Resolution **XXX (WRC-2000)** shall apply.)

MOD ASP/20/103

S5.357A In applying the procedures of ~~No. **S9.11A**~~frequency coordination under Section IIA of Article **S9** to the mobile-satellite service in the bands 1 545-1 555 MHz and 1 646.5-1 656.5 MHz, priority shall be given to accommodating the spectrum requirements of the aeronautical mobile-satellite (R) service providing transmission of messages with priority 1 to 6 in Article **S44**. Aeronautical mobile-satellite (R) service communications with priority 1 to 6 in Article **S44** shall have priority access and immediate availability, by pre-emption if necessary, over all other mobile-satellite communications operating within ~~a network~~these bands. Mobile-satellite systems shall not cause unacceptable interference to, or claim protection from, aeronautical mobile-satellite (R) service communications with priority 1 to 6 in Article **S44**. Account shall be taken of the priority of safety-related communications in the other mobile-satellite services. (~~See Resolution **218 (WRC-97)**~~The provisions of Resolution **XXX (WRC-2000)** shall apply.)

Reasons: To refer to Resolution XXX (WRC-2000) vice Resolution 218 (WRC-97) and to clarify and strengthen the footnotes.

Agenda item 1.11

1.11 to consider constraints on existing allocations and to consider additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions **214 (Rev.WRC-97)** and **219 (WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

The APT member countries consider that additional bands should not be allocated to the non-GSO MSS unless compatibility between the non-GSO MSS and services currently allocated to the bands is established and guaranteed.

Most administrations are in favour of new technologies as long as they do not cause harmful interference or other harmful impact to their existing services. Many administrations also submitted written as well as verbal proposals to have further studies for the above allocations - including those who requested NOC (no change) before the studies would be finalized.

NOC ASP/20/104

335.4-410 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
401-402	METEOROLOGICAL AIDS SPACE OPERATION (space-to-Earth) EARTH EXPLORATION-SATELLITE (Earth-to-space) METEOROLOGICAL-SATELLITE (Earth-to-space) Fixed Mobile except aeronautical mobile	
402-403	METEOROLOGICAL AIDS EARTH EXPLORATION-SATELLITE (Earth-to-space) METEOROLOGICAL-SATELLITE (Earth-to-space) Fixed Mobile except aeronautical mobile	
403-406	METEOROLOGICAL AIDS Fixed Mobile except aeronautical mobile	

410-470 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
450-455	FIXED MOBILE S5.209 S5.271 S5.286 S5.286A S5.286B S5.286C S5.286D S5.286E	
455-456 FIXED MOBILE S5.209 S5.271 S5.286A S5.286B S5.286C S5.286E	**455-456** FIXED MOBILE MOBILE-SATELLITE (Earth-to-space) S5.286A S5.286B S5.286C S5.209 S5.271	**455-456** FIXED MOBILE S5.209 S5.271 S5.286A S5.286B S5.286C S5.286E
456-459	FIXED MOBILE S5.271 S5.287 S5.288	
459-460 FIXED MOBILE S5.209 S5.271 S5.286A S5.286B S5.286C S5.286E	**459-460** FIXED MOBILE MOBILE-SATELLITE (Earth-to-space) S5.286A S5.286B S5.286C S5.209 S5.271	**459-460** FIXED MOBILE S5.209 S5.271 S5.286A S5.286B S5.286C S5.286E
460-470	FIXED MOBILE Meteorological-Satellite (space-to-Earth) S5.287 S5.288 S5.289 S5.290	

Reasons: The frequency bands below 1 GHz are heavily used in many countries for the services such as mobile service, fixed service, broadcasting service, meteorological aids service and meteorological-satellite service to which the bands are allocated for use. In addition, the usage of these services is expected to increase, and sharing feasibility between the non-GSO MSS and services currently allocated to the bands below 1 GHz is to be clarified.

ASP/20/105

APT recognizes that Resolution 219 (WRC-97) needs to be reviewed at WRC-2000.

ASP/20/106

The APT member countries agreed that further studies on sharing between the mobile-satellite services below 1 GHz for narrow-band data applications and the terrestrial services, in particular digital trunked systems are required, to ascertain that it will not cause harmful interference to these terrestrial services, before additional allocations for the uplink of the mobile-satellite service in part of the 450-460 MHz band or other suitable bands could be proposed to WRC-02/03 for consideration.

Agenda item 1.12

1.12 to consider the progress of studies on sharing between feeder links of non-GSO MSS networks and GSO FSS networks in the bands 19.3-19.7 GHz and 29.1-29.5 GHz, taking into account Resolution **121 (Rev.WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

APT supports the conclusions of ITU-R studies in a form of a draft new Recommendation on mitigation techniques which allows for the sharing between feeder links of non-GSO MSS networks and GSO FSS networks in the bands 19.3-19.7 GHz and 29.1-29.5 GHz.

SUP ASP/20/107

RESOLUTION 121 (Rev.WRC-97)

Continued development of interference criteria and methodologies for fixed-satellite service coordination between feeder links of non-geostationary satellite networks in the mobile-satellite service and geostationary-satellite networks in the fixed-satellite service in the bands 19.3-19.7 GHz and 29.1-29.5 GHz

Reasons: The result of ITU-R studies have met the requirements of Resolution 121 (Rev.WRC-97). Therefore, APT proposes that Resolution 121 (Rev.WRC-97) could now be suppressed.

Agenda item 1.13

1.13 on the basis of the results of the studies in accordance with Resolutions **130 (WRC-97)**, **131 (WRC-97)** and **538 (WRC-97)**;

1.13.1 to review and, if appropriate, revise the power limits appearing in Articles **S21** and **S22** in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services;

1.13.2 to consider the inclusion in other frequency bands of similar limits in Article **S21** and **S22**, or other regulatory approaches to be applied in relation to sharing situations

PART 1

Proposed modifications to Article S22

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

Resolution 130 (WRC-97) introduced provisional $epfd_{down}$ and aggregate power flux-density, apfd (which is redefined as $epfd_{up}$) limits for non-GSO FSS systems in certain bands intended to protect GSO FSS systems operating co-frequency and requested ITU-R to conduct the appropriate technical, operational and regulatory studies to review the regulatory conditions relating to the coexistence of non-GSO and GSO systems in the FSS.

Resolution 538 (WRC-97) introduced provisional epfd and apfd (which is redefined as $epfd_{up}$) limits for non-GSO FSS systems in certain bands intended to protect GSO BSS systems operating co-frequency, and requested ITU-R to conduct the appropriate technical, operational and regulatory studies to review the regulatory conditions relating to the coexistence of non-GSO FSS and GSO BSS systems.

Considering the ITU-R studies and the CPM Report, APT supports the conclusions of the studies undertaken by ITU-R in response to these two resolutions, as indicated in the CPM Report (Annex 1 to Chapter 3). In order to reflect these conclusions, APT proposes following modifications to Article S22.

ARTICLE S22

Space services[1]

Section II – Control of interference to geostationary-satellite systems

NOC ASP/20/108

S22.2 § 2 1) Non-geostationary-satellite systems shall not cause unacceptable interference to geostationary-satellite systems in the fixed-satellite service and the broadcasting-satellite service operating in accordance with these Regulations.

S22.3 2) Whenever the emissions from geostationary satellites in the inter-satellite service are directed towards space stations at distances from Earth greater than that of the geostationary-satellite orbit, the boresight of the antenna mainbeam of the geostationary satellite shall not be pointed within 15° of any point on the geostationary-satellite orbit.

S22.4 § 3 In the frequency band 29.95-30 GHz space stations in the earth exploration-satellite service on board geostationary satellites and operating with space stations in the same service on board non-geostationary satellites shall have the following restriction:

Whenever the emissions from the geostationary satellites are directed towards the geostationary-satellite orbit and cause unacceptable interference to any geostationary-satellite space system in the fixed-satellite service, these emissions shall be reduced to a level at or less than accepted interference.

S22.5 § 4 In the frequency band 8 025-8 400 MHz, which the Earth exploration-satellite service using non-geostationary satellites shares with the fixed-satellite service (Earth-to-space) or the meteorological-satellite service (Earth-to-space), the maximum power flux-density produced at the geostationary-satellite orbit by any Earth exploration-satellite service space station shall not exceed –174 dB(W/m^2) in any 4 kHz band.

S22.5A § 5 In the frequency band 6 700-7 075 MHz, the maximum aggregate power flux-density produced at the geostationary-satellite orbit and within ±5° of inclination around the geostationary-satellite orbit by a non-geostationary-satellite system in the fixed-satellite service shall not exceed –168 dB(W/m^2) in any 4 kHz band. The maximum aggregate power flux-density shall be calculated in accordance with Recommendation ITU-R S.1256.

SUP ASP/20/109

S22.5B

MOD ASP/20/110

S22.5C § ~~5~~6 1) The equivalent power flux-density[2], epfd$_{down}$ at any point on the Earth's surface visible from the geostationary-satellite orbit, produced by emissions from all the space stations of a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Tables ~~**S22-1**~~**S22-1A** to **S22-1D**, including emissions from a reflecting satellite, for all conditions and for all methods of modulation, shall not exceed the limits given in Tables ~~**S22-1**~~ **S22-1A** to **S22-1D** for the given percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Tables ~~**S22-1**~~**S22-1A** to **S22-1D**, for all pointing directions towards the geostationary-satellite orbit.

MOD ASP/20/110*bis*

---

2 **S22.5C.1, D.1, F.1** The equivalent power flux-density is defined as the sum of the power flux-densities produced at a ~~point~~ GSO receive station on the Earth's surface or in the geostationary orbit, as appropriate, by all ~~space~~ the transmit stations within a non-geostationary-satellite system, taking into account the off-axis discrimination of a reference receiving antenna assumed to be pointing ~~towards the geostationary-satellite orbit~~ in its nominal direction. The equivalent power flux-density is calculated using the following formula:

$$\cancel{epfd = 10 \cdot \log_{10} \left[\sum_{i=1}^{N_s} 10^{pfd_i/10} \cdot \frac{G_r(\theta_i)}{G_{max}} \right]}$$

$$epfd = 10 \cdot \log_{10} \left[\sum_{i=1}^{N_a} 10^{\frac{P_i}{10}} . \frac{G_t(\theta_i)}{4.\pi d_i^2} . \frac{G_r(\phi_i)}{G_{r,max}} \right]$$

where:

N_a: is the number of transmit stations in the non-geostationary-satellite system that are visible from the GSO receive station considered on the Earth's surface or in the geostationary orbit, as appropriate;

i: is the index of the transmit station considered in the non-geostationary-satellite system;

P_i: is the RF power at the input of the antenna of the transmit station, considered in the non-geostationary satellite system in dBW in the reference bandwidth;

θ_i: is the off-axis angle between the boresight of the transmit station considered in the non-geostationary satellite system and the direction of the GSO receive station;

$G_t(\theta_i)$: is the transmit antenna gain (as a ratio) of the station considered in the non-geostationary satellite system in the direction of the GSO receive station;

d_i: is the distance in metres between the transmit station considered in the non-geostationary satellite system and the GSO receive station;

ϕ_i: is the off-axis angle between the boresight of the antenna of the GSO receive station and the direction of the ith transmit station considered in the non-geostationary satellite system;

$G_r(\phi_i)$: is the receive antenna gain (as a ratio) of the GSO receive station in the direction of the ith transmit station considered in the non-geostationary satellite system;

$G_{r,max}$: is the maximum gain (as a ratio) of the antenna of the GSO receive station;

$epfd$: is the computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.

~~N_s: number of non-geostationary space stations visible from the point considered at the Earth's surface, within an elevation angle greater than or equal to 0°;~~

~~i: index of the non-geostationary space station considered;~~

~~pfd_i: power flux-density produced at the point considered on the Earth's surface in dB(W/m^2) in the reference bandwidth;~~

~~θ_i: angle between the direction considered towards the geostationary-satellite orbit and the direction of the interfering space station in the non-geostationary-satellite system;~~

~~$G_r(\theta_i)$: gain (as a ratio) of the receive reference antenna to be considered as part of a geostationary-satellite netwrk;~~

~~G_{max}: maximum gain (as a ratio) of the above receive reference antenna;~~

~~*epfd*: computed equivalent power flux-density in dB(W/m^2) in the reference bandwidth.~~

13 Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO BSS systems.

14 For BSS antenna diameters 180 cm, 240 cm and 300 cm, in addition to the single-entry limits shown in Table **S22-1D**, the following single-entry 100% of the time epfd_{down} limit also applies in the frequency band listed in Table **S22-1D**.

15 For each reference antenna the limit consists of the complete curve on a plot which is linear in decibels for the epfd levels and logarithmic for the time percentages, with straight lines joining the data points.

100% of the time epfd_{down} (dB(W/m^2) per 40 kHz)	**Latitude (North or South) (°)**
–160.0	$0 \leq \|\text{latitude}\| \leq 57.5$
–160.0 + 3.4 * (57.5 – $\|\text{latitude}\|$)/4	$57.5 \leq \|\text{latitude}\| \leq 63.75$
–165.3	$63.75 \leq \|\text{latitude}\|$

For BSS antenna diameter 240 cm, in addition to the above single-entry 100% of the time epfd_{down} limit, a –167(dB(W/m^2) per 40 kHz) single-entry 100% of the time operational epfd_{down} limit also applies to receive antennas located in Region 2, west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.]*

MOD ASP/20/115

S22.5~~G~~CA The limits given in Tables ~~**S22-1** and **S22-3**~~**S22-1A** to **S22-1D** may be exceeded on the territory of any country whose administration has so agreed.

(SUP) ASP/20/115*bis*

S22.5G

* This transitional regime would be applicable only if the pfd limits in section 5*c*) of Annex 1 to Appendix **S30** are sufficiently relaxed.

MOD ASP/20/116

S22.5D 2) The ~~aggregate~~ equivalent power flux-density~~2~~3, epfd$_{up}$, produced at any point in the geostationary-satellite orbit by emissions from all the earth stations in a non-geostationary-satellite system in the fixed-satellite service in the frequency bands listed in Tables **S22-2**, for all conditions and for all methods of modulation, shall not exceed the limits given in Table **S22-2** for the specified percentages of time. These limits relate to the equivalent power flux-density which would be obtained under free-space propagation conditions, into a reference antenna and in the reference bandwidth specified in Table **S22-2**, for all pointing directions towards the Earth's surface visible from any given location in the geostationary-satellite orbit.

~~3 **S22.5D.1** The aggregate power flux-density is defined as the sum of the power flux- densities produced at a point in the geostationary-satellite orbit by all the earth stations of a non-geostationary-satellite system. The aggregate power flux-density is computed by means of the following formula:~~

$$\cancel{apfd = 10 \cdot \log_{10}\left[\sum_{i=1}^{N_e} 10^{P_i/10} \cdot \frac{G_t(\theta_i)}{4\pi d_i^2}\right]}$$

~~where:~~

~~N_e: number of earth stations in the non-geostationary-satellite system with an elevation angle greater than or equal to 0°, from which the point considered in the geostationary-satellite orbit is visible;~~

~~i: index of the earth station considered in the non-geostationary-satellite system;~~

~~P_i: RF power at the input of the transmitting antenna of the earth station considered in the non-geostationary-satellite system in dBW in the reference bandwidth;~~

~~θ_i: off-axis angle between the boresight of the earth station considered in the non-geostationary-satellite system and the direction of the point considered in the geostationary-satellite orbit;~~

~~$G_t(\theta_i)$: transmit antenna gain (as a ratio) of the earth station considered in the non-geostationary-satellite system in the direction of the point considered in the geostationary-satellite orbit;~~

~~d_i: distance in metres between the earth station considered in the non-geostationary-satellite system and the point considered in the geostationary-satellite orbit;~~

~~$apfd$: aggregate power flux-density in dB(W/m^2) in the reference bandwidth.~~

~~NOTE – Tables **S22-1** to **S22-4** and Nos. **S22.26** to **S22.29** contain provisional limits corresponding to an interference level caused by one non-geostationary fixed-satellite service system in the frequency bands to be applied in accordance with Resolutions **130 (WRC-97)** and **538 (WRC-97)**. These provisional limits are subject to review by ITU-R and are subject to confirmation by WRC-99.~~

TABLE **S22-2**

~~**Frequency band (GHz)**~~	~~**Aggregate pfd dB(W/m²/4 kHz)**~~	~~**Percentage of time during which aggregate pfd level may not be exceeded**~~
~~17.3-18.1 in Regions 1 and 3 and 17.8-18.1 in Region 2~~	~~–163~~	~~100%~~

Limits to the $epfd_{up}$ radiated by non-GSO FSS systems in certain frequency bands

Frequency band (GHz)	**$epfd_{up}$ dB(W/m^2)**	**Percentage of time $epfd_{up}$ level may not be exceeded**	**Reference bandwidth (kHz)**	**Reference antenna beamwidth and reference radiation pattern**[16]
12.50-12.75 12.75-13.25 13.75-14.5	–160	100	40	4 degrees Rec. ITU-R S.672, Ls = –20[17]
17.3-18.1[*]	–160	100	40	4 degrees Rec. ITU-R S.672, Ls = –20[17]
27.5-28.6	–162	100	40	1.55 degrees Rec. ITU-R S.672, Ls = –10[17]
29.5-30.0	–162	100	40	1.55 degrees Rec. ITU-R S.672, Ls = –10[17]

[16] Reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO FSS systems.

[17] For the case of Ls = –10, the values a = 1.83 and b = 6.32 should be used in the equations in Annex 1 of Recommendation ITU-R S.672 for single-feed circular beams. In all cases of Ls, the parabolic main beam equation should start at zero.

* This $epfd_{up}$ limit applies to the bands 17.3-18.1 GHz (Regions 1 and 3) and 17.8-18.1 GHz (Region 2). It is proposed that the above-mentioned limit be also applicable to the frequency band 17.3-17.8 GHz (Region 2), in order to protect BSS feeder links in Region 2 from non-GSO FSS uplinks in Regions 1 and 3. See also section 3.2.2.

Introduction

Resolutions 130 (WRC-97) and 538 (WRC-97) introduced provisional epfd limits for non-GSO FSS systems in certain bands intended to protect GSO FSS and GSO BSS systems operating co-frequency and requested ITU-R to conduct the appropriate technical, operational and regulatory studies to review the regulatory conditions relating to the coexistence of non-GSO and GSO systems. In order to adequately protect GSO networks, an aggregate interference level from all non-GSO FSS systems, which individually meet the Table S22-1 limits and Table S22-4 limits, needs to be defined.

There is a need for assuring the compliance with the aggregate epfd limits and the operational limits given in Table S22-4. Therefore APT proposes to establish the following new resolution, based on the example Resolution WWW in the CPM Report, which includes the efficient and essential remedial measures.

ADD ASP/20/125

RESOLUTION WWW (WRC-2000)

Protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems and/or the operational equivalent power flux-density produced by a non-GSO FSS system in frequency bands where epfd limits have been adopted

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-97 has adopted, in Article **S22**, provisional epfd limits to be met by non-GSO FSS systems in order to protect GSO FSS and GSO BSS networks in parts of the frequency range 10.7-30 GHz;

b) that WRC-2000 has revised these limits to ensure that they provide adequate protection to GSO systems without causing undue constraints to any of the systems and services sharing these frequency bands;

c) that Article **S22** includes single-entry epfd limits which apply to non-GSO FSS systems in these bands;

d) that these single-entry limits have been derived from aggregate equivalent power flux-density (epfd) masks that are intended to protect GSO networks, assuming a maximum effective number of non-GSO FSS systems of 3.5;

e) that the aggregate interference caused by all co-frequency non-GSO FSS systems in these bands into GSO FSS systems should not exceed the maximum interference levels that are necessary to protect these GSO systems;

f) that WRC-97 decided, and WRC-2000 confirmed, that non-GSO FSS systems in these bands are to coordinate the use of these frequencies between themselves under the provisions of No. **S9.12** of the Radio Regulations;

g) that the orbital characteristics of such systems are likely to be inhomogeneous;

h) that as a result of this likely inhomogeneity, the aggregate epfd levels from multiple non-GSO FSS systems are not directly related to the number of actual systems sharing a frequency band, and the number of such systems operating co-frequency is likely to be small;

i) that the possible misapplication of single-entry limits should be avoided,

recognizing

a) that non-GSO FSS systems are likely to need to implement interference mitigation techniques to share frequencies among themselves;

b) that because the use of such interference mitigation techniques will likely keep the number of non-GSO systems small, the aggregate interference caused by non-GSO FSS systems into GSO systems will also likely be small;

c) that notwithstanding *considering d)*, there may be instances where the aggregate interference from non-GSO systems could exceed the interference levels given in Annex 1;

d) that administrations operating GSO systems may wish to ensure that the aggregate epfd produced by all operating co-frequency non-GSO FSS systems in the frequency bands referred to in *considering a)* above into GSO FSS and/or GSO BSS networks does not exceed the aggregate interference levels given in Annex 1,

resolves

1 that administrations operating or planning to operate non-GSO FSS systems, which individually meet the limits contained in Tables **S22-1** and **S22-4**, in the frequency bands referred to in *considering a)* above, individually or in collaboration, take all possible steps, including by means of appropriate modifications to their systems if necessary, to ensure that the actual aggregate interference into GSO FSS and GSO BSS networks caused by such systems operating co-frequency in these frequency bands does not cause the aggregate power levels shown in Annex 1 to be exceeded;

2 that, in the event that the aggregate interference levels in Annex 1 and/or the operational limits in the Tables **S22-4** are exceeded into an operational GSO earth station, administrations operating non-GSO FSS systems, which individually meet the limits contained in Tables **S22-1** and **S22-4**, in these frequency bands shall expeditiously take all necessary measures to reduce the aggregate epfd levels to those compatible with Annex 1 and/or the operational epfd levels or to reduce such interference to higher levels that are acceptable to the affected GSO administrations,

requests ITU-R

1 to develop, as a matter of urgency, and complete, in time for consideration by the next WRC, a methodology for calculating the aggregate epfd produced by all non-GSO FSS systems operating or planning to operate co-frequency in the frequency bands referred to in *considering a)* above into GSO FSS and GSO BSS networks and for comparing the calculated levels with the aggregate power levels shown in Annex 1;

2 to continue its studies on the accurate modelling of interference from non-GSO FSS systems into GSO FSS and GSO BSS networks in the frequency bands referred to in *considering a)* above in order to assist the administrations planning or operating non-GSO FSS systems in their efforts to limit the aggregate epfd levels produced by their systems into GSO networks;

3 to develop technical measures to identify the interference levels from non-GSO systems in excess of the "aggregate" limits given in Annex 1 of this Resolution and/or the "operational limits" given in RR Table **S22-4**, and to confirm compliance with these limits,

requests the Director of the Radiocommunication Bureau

to assist in the development of the methodology referred to in *requests ITU-R* 1 above.

ANNEX 1 TO RESOLUTION WWW (WRC-2000)

This Annex to Resolution **WWW** contains example tables of interference levels concerning aggregate interference from multiple non-GSO FSS systems, which individually meet the limits specified in Table **S22-1** and Table **S22-4,** into GSO FSS and GSO BSS systems. Studies are continuing in order to avoid unnecessary entries in this table and in order to provide maximum protection for the GSO FSS and GSO BSS.

TABLE **WWW-1A**[1, 3]

Limits to the aggregate epfd$_{down}$ radiated by non-GSO FSS systems in certain frequency bands

[1] Under this section, reference patterns are to be used only for the calculation of interference from non-GSO FSS systems into GSO BSS systems.

[2] For BSS antenna diameters 180 cm, 240 cm and 300 cm, in addition to the aggregate limit shown in Table **WWW-1C**, the following aggregate 100% of the time $epfd_{down}$ limit also applies:

100% of the time $epfd_{down}$ (dB(W/m^2) per 40 kHz)	**Latitude (North or South) (°)**
–160.0	0 < $\lvert$latitude$\rvert$ ≤ 57.5
–160.0 + 3.4 * (57.5 – $\lvert$latitude$\rvert$)/4	57.5 < $\lvert$latitude$\rvert$ ≤ 63.75
–165.3	63.75 ≤ $\lvert$latitude$\rvert$

For BSS antenna diameter 240 cm, in addition to the above aggregate 100% of the time $epfd_{down}$ limit, a –167 dB(W/m^2) per 40 kHz aggregate 100% of the time operational $epfd_{down}$ limit also applies to receive antennas located in Region 2, west of 140° W, north of 60° N, pointing toward GSO BSS satellites at 91° W, 101° W, 110° W, 119° W and 148° W with elevation angles greater than 5°. [This limit is implemented during a transition period of [15] years.]*

Reasons: There is a need for assuring the compliance with the aggregate epfd limits and the operational limits given in Table S22-4.

* This transitional regime would be applicable only if the pfd limits in section 5*c*) of Annex 1 to Appendix **S30** are sufficiently relaxed.

PART 3

Proposed modifications for coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antennas

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

Item e) in § 3.1.2.1.2 of the CPM Report states that some very large earth station antennas may not be adequately protected by the $\text{epfd}_{\text{down}}$ limits in proposed Annex 1 to Chapter 3 of the CPM Report and a coordination procedure may be necessary. Implementation of this coordination procedure may include additions or modifications to Articles S9 and S11 and Appendices S4 and S5. Annex 3 to Chapter 3 of the CPM Report contains the example regulatory and procedural text for coordination between non-GSO FSS transmitting space station and GSO receive earth station with very large antennas.

APT proposes the regulatory and procedural text for coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antennas, including additions and/or modifications to Articles S9 and S11, and Appendices S4 and S5.

ARTICLE S9

Sub-Section IIA – Requirement and request for coordination

ADD ASP/20/126

S9.7A *a1)*[12*bis*, 13*bis*] for a specific earth station within a geostationary-satellite network in the fixed-satellite service in certain frequency bands in respect of a non-geostationary-satellite system in the fixed-satellite service;

ADD ASP/20/127

S9.7B *a2)*[12*bis*, 13*bis*] for a non-geostationary-satellite system in the fixed-satellite service in certain frequency bands in respect of a specific earth station within a geostationary-satellite network in the fixed-satellite service;

ADD ASP/20/128

12*bis* **S9.7A.1** and **S9.7B.1** The coordination of a specific earth station under **S9.7A** or **S9.7B** shall remain within the authority of the administration having this station located on its territory.

ADD ASP/20/129

13*bis* **S9.7A.2** and **S9.7B.2** Coordination information relating to a specific earth station received by the Bureau prior to [date to be established by WRC-2000] is considered as complete **S9.7A** or **S9.7B** information from the date of receipt of complete information of the associated satellite network under **S9.7** provided that the characteristics of the specific earth stations are within the parameters of any typical earth station included in the GSO FSS network coordination request.

NOC ASP/20/130

12 **S9.8.1** and **S9.9.1** Application of this provision with respect to Articles 6 and 7 of Appendices **S30** and **S30A** is suspended pending a decision of WRC-99 on the revision of these two Appendices.

Reasons: GSO FSS earth stations with very large antennas may not be adequately protected by the $epfd_{down}$ limits contained in Table MOD S22-1 and case-by-case coordination of systems operating co-frequency, co-directional links in the space-to-Earth direction would then be required. The proposed ADD S9.7A and ADD S9.7B would require coordination between non-GSO FSS transmit satellites and GSO FSS receive earth stations with very large antennas. By referring to coordination provisions under S9.7A and S9.7B, the request for coordination would be sent by the requesting administration to the Bureau under S9.30. The Bureau would act under S9.34 to identify administrations with which coordination may need to be effected and publish the information in the Weekly Circular. Since coordination between a non-GSO FSS space station and very large GSO FSS earth stations is a new type of coordination that does not currently exist in Article S9, it is necessary to add two new entry points in Article S9:

- One entry point to enable the non-GSO space station administration to request coordination with administrations having specific very large earth station antennas located on their territory.
- Another entry point to enable the reciprocal coordination to take place, i.e. the possibility for an administration planning to implement a specific very large GSO earth station stations located on their territory to request coordination with administrations having non-GSO FSS transmit space.

ARTICLE S11

Section II – Examination of notices and recording of frequency assignments in the Master Register

MOD ASP/20/131

S11.32A *c)* with respect to the probability of harmful interference that may be caused to or by assignments recorded with a favourable finding under Nos. **S11.36** and **S11.37** or **S11.38**, or recorded in application of No. **S11.41**, or published under Nos. **S9.38** or **S9.58** but not yet notified, as appropriate, for those cases for which the notifying administration states that the procedure for coordination under Nos. **S9.7, S9.7A** or **S9.7B** could not be successfully completed (see also No. **S9.65**);[10] or

MOD ASP/20/132

---

[10] **S11.32A.1** The examination of such notices with respect to any other frequency assignment for which a request for coordination under Nos. **S9.7, S9.7A** or **S9.7B** has been published under No. **S9.38** but not yet notified shall be effected by the Bureau in the order of their publication under the same number using the most recent information available.

Reasons: The insertion of a coordination trigger related to $epfd_{down}$ level radiated by the non-GSO FSS system into the earth station employing the very large antenna considered when this earth station is pointed to the wanted GSO satellite provides a mechanism to examine the notice with respect to the probability of harmful interference that may be caused to or by above-listed assignments, and therefore S11.38 and S11.41 are applicable.

ANNEX 2B

Table of characteristics to be submitted for space and radio astronomy services

C – Characteristics to be provided for each group of frequency assignments for a satellite antenna beam or an earth station antenna

(The modifications in either column two or column three need to be incorporated into the full table.)

X Mandatory information

O Optional information

C This information need only be furnished when it has been used as a basis to effect coordination with another administration

[11] Information mandatory for coordination under No. ADD **S9.7A**.

NOTE - Additional characteristics to be provided may include A.4.c, A.1.e.1, A.1.e.2, C.4, B.5 and C.5.b. As a result of decisions that may be made at WRC-2000, these additional characteristics may replace C.10.a, C.10.b, C.10.c.1, C.10.c.2 and C.10.c.5 in the notification or coordination of an earth station column.

Reasons: This is consequential to ADD S9.7A and ADD S9.7B. Administrations will need to submit specific earth station information for earth stations associated with geostationary-satellite networks in the fixed-satellite service meeting the conditions in the proposed addition to Appendix S5.

D – Overall link characteristics

TABLE S5-1

Technical conditions for coordination
(see Article **S9**)

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.7A** GSO earth station/ non-GSO system	A specific earth station in a geostationary-satellite network in the fixed-satellite service in respect of a non-geostationary-satellite system in the fixed-satellite service	The following frequency bands: 10.7-11.7 GHz (space-to-Earth) 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3 12.5-12.75 GHz (space-to-Earth) in Region 1 17.8-18.6 GHz (space-to-Earth) and 19.7-20.2 GHz (space-to-Earth)	Conditions: i) The frequency bands overlap; and ii) the satellite network using the geostationary-satellite orbit has specific receive earth stations and meets all of the following conditions: a) Earth station antenna maximum isotropic gain greater than or equal to 64 dBi for the frequency bands 10.7-12.75 GHz or 68 dBi for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; b) G/T_1 of 44 dB/K or higher; c) space station emission bandwidth of 250 MHz or higher for the	i) Compare frequency bands; ii) use the maximum antenna gain of the specific receive earth station (Appendix **S4** C.10 *c)* 2)), the lowest equivalent satellite link noise temperature (Appendix **S4** C.10 *c)* 5)), and the space station emission bandwidth (Appendix **S4** C.7 *a)*) in the geostationary-satellite network as given in Appendix **S4** data; and iii) use the $epfd_{down}$ radiated by the non-GSO FSS system into the earth station employing the very large antenna when this antenna is pointed towards the wanted GSO satellite	The threshold/condition for coordination do not apply to typical receive earth stations operating in satellite networks using the geostationary-satellite orbit.

			frequency bands 10.7-12.75 GHz or 800 MHz or higher for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; iii) the $epfd_{down}$ from the satellite system using the non-geostationary orbit exceeds: a) either –174.5 dB(W/m^2) per 40 kHz for any percentage of time or [x] dB(W/m^2) per 40 kHz for [y]% of the time in the frequency band 10.7-12.75 GHz; b) either –151 dB(W/m^2) per 1 MHz for any percentage of time or [x'] dB(W/m^2) per 1 MHz for [y']% of the time in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz		

No. **S9.7B** non-GSO system/GSO earth station	A non-geostationary-satellite system in the fixed-satellite service in respect of a specific earth station in a geostationary-satellite network in the fixed-satellite service	The following frequency bands: 10.7-11.7 GHz (space-to-Earth) 11.7-12.2 GHz (space-to-Earth) in Region 2 12.2-12.75 GHz (space-to-Earth) in Region 3 12.5-12.75 GHz (space-to-Earth) in Region 1 17.8-18.6 GHz (space-to-Earth) and 19.7-20.2 GHz (space-to-Earth)	Conditions: i) The frequency bands overlap; and ii) the satellite network using the geostationary-satellite orbit has specific receive earth stations and meets all of the following conditions: a) Earth station antenna maximum isotropic gain greater than or equal to 64 dBi for the frequency bands 10.7-12.75 GHz or 68 dBi for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz; b) G/T_1 of 44 dB/K or higher; c) space station emission bandwidth of 250 MHz or higher for the frequency bands 10.7-12.75 GHz or 800 MHz or higher for the frequency bands 17.8-18.6 GHz and 19.7-20.2 GHz;	i) Compare frequency bands; ii) use the maximum antenna gain of the specific receive earth station (Appendix **S4** C.10 *c)* 2)), the lowest equivalent satellite link noise temperature (Appendix **S4** C.10 *c)* 5)), and the space station emission bandwidth (Appendix **S4** C.7 *a)*) in the geostationary-satellite network as given in Appendix **S4** data; and iii) use the $epfd_{down}$ radiated by the non-GSO FSS system into the earth station employing the very large antenna when this antenna is pointed towards the wanted GSO satellite	The threshold/condition for coordination do not apply to typical receive earth stations operating in satellite networks using the geostationary-satellite orbit

			iii) the epfd$_{down}$ from the satellite system using the non-geostationary orbit exceeds: a) either –174.5 dB(W/m^2) per 40 kHz for any percentage of time or [x] dB(W/m^2) per 40 kHz for [y]% of the time in the frequency band 10.7-12.75 GHz; b) either –151 dB(W/m^2) per 1 MHz for any percentage of time or [x'] dB(W/m^2) per 1 MHz for [y']% of the time in the frequency bands 17.8-18.6 GHz or 19.7-20.2 GHz		

NOTE - Further study is required for determination of the values within [ ].

Reasons: This is consequential to ADD S9.7A and ADD S9.7B.

PART 4

Proposed modifications to Article S21

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

Resolution 131 (WRC-97) invites ITU-R to study the appropriate pfd values to be applied to non-GSO networks in the bands 10.7-12.75 GHz and 17.7-19.3 GHz to ensure protection of the fixed service without unduly constraining the development of either type of networks. Additionally, text is needed to reflect *resolves* 2 of Resolution 131 (WRC-97) in Article S21. APT proposes the following modifications of Article S21, Table S21-4 including consideration of *resolves* 2 of Resolution 131 (WRC-97).

MOD ASP/20/136

TABLE **S21-4** *(continued)*

Frequency band	**Service***	**Limit in dB(W/m²) for angle of arrival (δ) above the horizontal plane**			**Reference bandwidth**
		0°-5°	**5°-25°**	**25°-90°**	
10.7-11.7 GHz	Fixed-satellite (space-to-Earth), geostationary-satellite orbit	–150 ~~14~~	–150 + 0.5(δ – 5) ~~14~~	–140 ~~14~~	4 kHz
	Fixed-satellite (space-to-Earth), non-geostationary-satellite orbit	–126	–126 + 0.5(δ – 5)	–116	1 MHz

11.7-12.2 GHz[7] (Region 2)[**] 12.2-12.~~5~~75 GHz[7] (Region 3) 12.5-12.75 GHz[7] (Region 1 ~~and Region 3~~ countries listed in Nos. **S5.494** and **S5.496**)	Fixed-satellite (space-to-Earth), geostationary-satellite orbit	–148 ~~[14]~~	–148 + 0.5(δ – 5) ~~[14]~~	–138 ~~[14]~~	4 kHz
15.43-15.63 GHz	Fixed-satellite (space-to-Earth)	–127	5°-20°: –127 20°-25°: –127 + 0.56(δ – 20)^2	25°-29°: –113 29°-31°: –136.9 + 25 log (δ – 20) 31°-90°: –111	1 MHz
17.7-19.3 GHz[7, 8]	Fixed-satellite (space-to-Earth) Meteorological-satellite (space-to-Earth)	–115 [*12bis*] or ~~–125~~ –115 – X [12]	–115 + 0.5 (δ – 5) [*12bis*] or ~~–125 + (δ – 5)~~ –115 – X((10 + X)/20)(δ – 5) [12]	–105 [*12bis*] or –105 [12]	1 MHz
19.3-19.7 GHz 22.55-23.55 GHz 24.45-24.75 GHz 25.25-27.5 GHz	Fixed-satellite (space-to-Earth) Earth exploration-satellite (space-to-Earth) Inter-satellite	–115	–115 + 0.5(δ – 5)	–105	1 MHz

[**] This modification reflects the Approach 1 of section 7.6 of the CPM Report (see also Annex 6 to Chapter 7 of the Report). In case that the other Approach in section 7.6 of the CPM Report is adopted Annex 4 to Chapter 3 of the CPM Report is retained as it is.

MOD ASP/20/137

[12] **S21.16.6** ~~These values shall apply provisionally only to emissions of space stations on non-geostationary satellites in networks operating with a large number of satellites, that is systems operating with more than 100 satellites (see Resolution **131 (WRC-97)**).~~ The function X is defined as a function of the number, N, of satellites in the non-GSO FSS constellation as follows:

– for $N \leq 50$ $X = 0$ (dB)

– for $50 < N \leq 288$ $X = \frac{5}{119}(N - 50)$ (dB)

– for $N > 288$ $X = \frac{1}{69}(N + 402)$ (dB)

In the band 18.8-19.3 GHz, these limits apply to emissions of any space station in a non-geostationary FSS system for which complete coordination or notification information, as appropriate, has been received by the Radiocommunication Bureau after 17 November 1995, and which was not operational by that date.

Reasons: The above regulatory text maintains the original limits for non-GSO FSS systems in the band 18.8-19.3 GHz that were notified or operational prior to the end of WRC-95 per the decision in Resolution 131 (WRC-97). In the band 17.7-18.8 GHz, the new limits would apply to all non-GSO systems irrespective of the date of receipt of information or date of bringing into operation.

ADD ASP/20/138

[12*bis*] **S21.16.6*bis*** These limits apply to emissions of a space station on a meteorological-satellite and on a geostationary FSS satellite. These limits also apply to emissions of any space station in a non-geostationary FSS system in the band 18.8-19.3 GHz for which complete coordination or notification information has been received by the Radiocommunication Bureau by 17 November 1995, or are in operation by that date.

Reasons: The above regulatory text reflects the date-specific provisions currently in Resolution 131 (WRC-97).

NOC ASP/20/139

[13] **S21.16.7** These power flux-density limits are subject to review by ITU-R and shall apply until they are revised by a competent world radiocommunication conference.

SUP ASP/20/140

[14] **S21.16.8**

SUP ASP/20/141

[15] **S21.16.9**

PART 5

Proposed modifications to Resolutions 130 (WRC-97) and 538 (WRC-97)

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

The existing text in the Radio Regulations (e.g. those Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97) (incorporated by reference), and Articles S5, S9, S11, S21 and S22, and Appendices S4 and S5) was reviewed and some possible options were identified for modifications to these provisions in ITU-R.

APT proposes the suppression of the *resolves* 6 of Resolution 130 provided that the suitable text is reflected in the relevant footnotes.

RESOLUTION 130 (WRC-97)

Use of non-geostationary systems in the fixed-satellite service in certain frequency bands

SUP ASP/20/142

resolves

6

Reasons: APT agrees with the suppression of the *resolves* 6 of Resolution 130 provided that suitable text is reflected in the relevant footnotes.

PART 6

Proposed modifications to footnotes in Article S5 (Resolutions 130 (WRC-97) and 538 (WRC-97))

6.1 Proposed modifications to footnotes based on Resolution 130 (WRC-97) and Resolution 538 (WRC-97)

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

Section 3.1.2.4.1 of the CPM Report notes that as a result of the modifications for Resolutions 130 and 538, consequential changes would be required to footnotes in Article S5. APT agrees to modify footnotes in Article S5 based on Option 1A of Annex 6 of the CPM Report.

MOD ASP/20/143

S5.441 The use of the bands 4 500-4 800 MHz (space-to-Earth), 6 725-7 025 MHz (Earth-to-space) by the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by geostationary-satellite systems in the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by a non-geostationary-satellite system~~s~~ in the fixed-satellite service ~~shall be in accordance with the provisions of Resolution **130 (WRC-97)**~~is subject to the application of the provision of No. **S9.12** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO FSS systems and of the complete coordination information for the GSO networks.

MOD ASP/20/144

S5.484A The use of the bands 10.95-11.2 GHz (space-to-Earth), 11.45-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 13.75-14.5 GHz (Earth-to-space), 17.8-18.6 GHz (space-to-Earth), 19.7-20.2 GHz (space-to-Earth), 27.5-28.6 GHz (Earth-to-space), 29.5-30 GHz (Earth-to-space) by a non-geostationary~~- and geostationary-~~satellite system~~s~~ in the fixed-satellite service is subject to application of the provisions of ~~Resolution **130 (WRC-97)**. The use of the band 17.8-18.1 GHz (space-to-Earth) by non-geostationary fixed-satellite service systems is also subject to the provisions of Resolution **538 (WRC-97)**.~~ No. **S9.12** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO FSS systems and of the complete coordination information for the GSO networks.

MOD ASP/20/145

S5.487A *Additional allocation:* in Region 1, the band 11.7-12.5 GHz, in Region 2, the band 12.2-12.7 GHz and, in Region 3, the band 11.7-12.2 GHz, are also allocated to the fixed-satellite service (space-to-Earth) on a primary basis, limited to non-geostationary systems and subject to the provisions of ~~Resolution **538 (WRC-97)**~~No. **S9.12** for coordiniation with other non-geostationary-satellite systems in the fixed-satellite service. Non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service operating in accordance with the Radio Regulations, irrespective of the dates of receipt by the Bureau of the complete notification information for the non-GSO FSS systems and of the complete coordination information for the GSO networks.

Reasons: They are consequential changes to suppression of the *resolves* 6 of Resolution 130.

6.2 Proposed modifications to footnotes S5.488 and S5.491 to reflect relevant RRB Rule of Procedure

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

It was noted that footnotes S5.488 and S5.491 currently restrict the use by FSS (space-to-Earth) of certain bands in the 12 GHz range to national and subregional systems. In 1998, the Radio Regulations Board adopted a Rule of Procedure on subregional systems, which states that "in the case where a service area covers a territory under the jurisdiction of other administrations, it shall be limited to the territories of the administrations concerned and it shall be notified by one of the participating administrations on behalf of other administrations."

APT considers that these limitations lead to significant burden to the administrations and the Bureau, and unnecessary constraints on the development of GSO and non-GSO FSS systems, without clear advantage since those administrations associated with the subregional system keep the same rights as those which are not associated.

APT also considers that Option 2C would have the advantage of avoiding any unnecessary constraints on the development of both GSO and non-GSO FSS systems in the corresponding bands in both Regions 2 and 3.

APT agrees to support Option 2C of the CPM Report.

MOD ASP/20/146

S5.488 The use of the band~~s 11.7-12.2 GHz by the fixed-satellite service in Region 2 and~~ 12.2-12.7 GHz by the broadcasting-satellite service in Region 2 is limited to national and subregional systems. The use of the band 11.7-12.2 GHz by the fixed-satellite service in Region 2 is subject to ~~previous agreement between the administrations concerned and those having services, operating or planned to operate in accordance with the Table, which may be affected (see Articles **S9** and **S11**)~~the provisions of Article **S21**, Table **S21-4**[**]. For the use of the band 12.2-12.7 GHz by the broadcasting-satellite service in Region 2, see Appendix **S30**.

MOD ASP/20/147

S5.491 *Additional allocation:* in Region 3, the band 12.2-12.5 GHz is also allocated to the fixed-satellite (space-to-Earth) service on a primary basis~~, limited to national and sub-regional systems~~. The power flux-density limits in Article **S21**, Table **S21-4** shall apply to this frequency band. The introduction of the service in relation to the broadcasting-satellite service in Region 1 shall follow the procedures specified in Article 7 of Appendix **S30**, with the applicable frequency band extended to cover 12.2-12.5 GHz.

Reasons: The limitations contained in footnotes S5.488 and S5.491 lead to significant burden to the administrations and the Bureau, and unnecessary constraints on the development of GSO and non-GSO FSS systems without clear advantage.

[**] Concerning the need specified by **S5.488** for previous agreement from administrations which services may be affected, it is to be noted that it might also be waived for GSO FSS systems if pfd limits were to be introduced in Article **S21** (see also section 7.6 of the CPM Report) to ensure the protection of terrestrial services. APT countries proposes the consequential modification based on Approach 1 (introduction of pfd hard limits).

PART 7

Proposed additional data items required in Appendix S4 for the epfd calculations

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

Based on the work in ITU-R, APT proposes the following additions to Appendix S4, Annex 2A.

1 Section A.4 *b)*

ADD ASP/20/148

In addition, if the stations operate in a frequency band subject to the provisions of Resolution **130 (WRC-97)** or Resolution **538 (WRC-97)**:

6) new data elements required to characterize properly the orbital operation of the non-GSO satellite systems:

a) for each range of latitudes provide:

– the maximum number of non-GSO satellites operating their downlinks co-frequency to any location; and

– the associated latitude range;

b) the minimum height of the space station above the surface of the Earth at which any satellite will be used to provide a service;

c) where the space station uses station keeping to maintain a repeating ground track, the time in seconds that it takes for the constellation to return to its starting position, i.e. such that all satellites are in the same location with respect to the Earth and each other;

d) an indicator identifying if the space station should be modelled with a specific precession rate of the ascending node of the orbit instead of the J_2 term;

e) for a space station that is to be modelled with a specific precession rate of the ascending node of the orbit instead of the J_2 term, the precession rate in degrees/day, measured counter-clockwise in the equatorial plane;

f) the longitude of the ascending node for the *j*-th orbital plane, measured counter-clockwise in the equatorial plane from the Greenwich meridian to the point where the satellite makes its south-to-north crossing of the equatorial plane ($0° \leq \Omega_j < 360°$) (NOTE 1);

g) the time at which the satellite is at the location defined by Ω_j (NOTE 1);

h) the longitudinal tolerance of the longitude of the ascending node.

NOTE 1 - Currently non-GSO space stations are referenced by the "right ascension of ascending node" (A.4 *b)* 5) Ω_j) to the first point of Aries. However, for the evaluation of epfd a reference to a point on the Earth is used and hence the "longitude of the ascending node" is required.

2 Section A.4 *b)*

ADD ASP/20/149

7) new data elements required to characterize properly the performance of the non-GSO satellite systems:

a) the maximum number of non-GSO satellites receiving simultaneously co-frequency from the associated earth stations within a given cell;

b) the average number of associated earth stations operating co-frequency per square kilometre within a cell;

c) the average distance between co-frequency cells;

d) for the exclusion zone about the geostationary orbit provide:

– the type of zone;

– the width of the zone in degrees.

3 Section A.14

ADD ASP/20/150

A.14 Spectrum masks

For stations operating in a frequency band subject to the provisions of Resolution **130 (WRC-97)** or Resolution **538 (WRC-97)**:

a) for each e.i.r.p. mask used by the non-GSO space station provide:

– the type of mask;

– the mask identification code;

– the mask pattern defined in terms of the power in the reference bandwidth for a series of off-axis angles with respect to a specified reference point;

– the lowest frequency for which the mask is valid;

– the highest frequency for which the mask is valid;

b) for each associated earth station e.i.r.p. mask provide:

– the type of mask;

– the mask identification code;

– the mask pattern defined in terms of the power in the reference bandwidth for a series of off-axis angles with respect to a specified reference point;

- the lowest frequency for which the mask is valid;
- the highest frequency for which the mask is valid;
- the minimum elevation angle at which any associated earth station can transmit to a non-GSO satellite;
- the minimum separation angle between the GSO arc and the associated earth station beam-axis at which the associated earth station can transmit towards a non-GSO satellite;

c) for each pfd mask used by the non-GSO space station provide:

- the mask identification code;
- the mask pattern of the power flux-density defined in three dimensions;
- the lowest frequency for which the mask is valid;
- the highest frequency for which the mask is valid.

4 Section C.9

ADD ASP/20/151

d) for stations operating in a frequency band subject to the provisions of Resolution **130 (WRC-97)** or Resolution **538 (WRC-97)**, provide:

- the type of mask;
- the mask identification code.

Reasons: APT supports the conclusions in ITU-R.

PART 8

Proposed modification to Article S5

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of)

Introduction

The band 13.75-14 GHz is allocated on a co-primary basis to FSS and RLS. It is also allocated, in some countries, to FS and MS (Nos. S5.499 and S5.500) and to RNS (No. S5.501). GSO systems of SRS use this band in accordance with No. S5.503. Additionally, non-GSO SRS and EESS operate with protection from FSS (No. S5.503A) until 1 January 2000. After 2001 the DRS system is the only space research system that will remain in the band on a co-primary basis with FSS.

These technical analyses have led to possible solutions which will maintain the present balance in the sharing conditions between RLS, SRS and FSS, and accommodate non-GSO FSS systems within the 13.75-14 GHz band.

With reference to No. S5.502, reduction or suppression of the minimum e.i.r.p. requirement for FSS earth stations coupled with the introduction of appropriate regulatory measures to address the concerns of RLS, could achieve this objective. Under the current provisions, provided radar observes the restriction put on its maximum e.i.r.p. averaged over 1 second, the FSS cannot claim protection from RLS regardless of the FSS earth station e.i.r.p. used.

APT proposes to suppress the minimum e.i.r.p. restriction prescribed in S5.502 of the Radio Regulations, but to retain the limitation of the minimum antenna diameter in order to maintain the balance between services allocated in this frequency band.

MOD ASP/20/152

S5.502 In the band 13.75-14 GHz, the e.i.r.p. of any emission from an earth station in the fixed-satellite service ~~shall~~should be at least 68 dBW, and should not exceed 85 dBW~~,~~. The earth station shall transmit with a minimum antenna diameter of 4.5 m. In addition the e.i.r.p., averaged over one second, radiated by a station in the radiolocation or radionavigation services towards the geostationary-satellite orbit shall not exceed 59 dBW.

Reasons: As the adjacent frequency spectrum is congested, removal of minimum e.i.r.p. restriction will maintain the present balance could lead to efficiently utilization of frequency spectrum. APT believes that above proposal could satisfy the requirement of all the services allocated to this frequency band. APT also believes that removal of minimum antenna size restriction would be required after further study at relevant ITU-R study groups.

PART 9

Interference from non-GSO FSS systems to GSO FSS and GSO BSS services

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

APT has reviewed Chapter 3 of the CPM Report and developed regulatory text for a new article to ensure operational compliance of non-GSO FSS systems with the operational $\text{epfd}_{\text{down}}$ limits.

ADD ASP/20/153

ARTICLE S15A

ADD ASP/20/154

Interference from non-GSO FSS systems to GSO FSS and GSO BSS services

ADD ASP/20/155

Section I – Procedure for assuring operational compliance with aggregate epfd limits

ADD ASP/20/156

S15A.1 When an administration operating a GSO network in accordance with the Radio Regulations identifies epfd levels from non-GSO systems in excess of the "aggregate" limits[1]:

ADD ASP/20/156*bis*

---

[1] **S15A.1.1** See Resolution **WWW (WRC-2000)**.

ADD ASP/20/157

S15A.2 *a)* the affected administration shall immediately send a letter, by fax or other mutually agreed electronic means, to the administrations concerned and request immediate corrective action. It shall provide the necessary evidence identifying the excess interference and the source of such interference. A copy of the request shall be sent to BR;

ADD ASP/20/158

S15A.3 *b)* upon receipt of the request, the interfering administrations shall immediately reduce emissions, equitably, to the required levels pending final determination of solutions to the problem and acknowledge receipt within [X] days. A copy of the acknowledgement and confirmation of the action taken shall be sent to BR;

ADD ASP/20/159

S15A.4 *c)* the non-GSO parties concerned work together thereafter in order to find a permanent solution to the problem, within an additional [30] days;

ADD ASP/20/160

S15A.5 *d)* if after [30] days a solution cannot be found, then any of the parties may request the assistance of BR;

ADD ASP/20/161

S15A.6 *e)* BR will study the matter and report its conclusion to the parties involved, recommending its solution to the problem within an additional [30] days. The affected administration may elect to accept the higher level of interference received;

ADD ASP/20/162

S15A.7 *f)* if an interfering administration fails to respond within the [X]-day period in *c)* above, the affected administration shall send a reminder fax requesting response within an additional [X] days;

ADD ASP/20/163

S15A.8 *g)* if any administration fails to respond within that period, the affected administration may request the assistance of the Bureau, who will promptly send a fax to the concerned administrations;

ADD ASP/20/164

S15A.9 *h)* if the interfering administrations fails to implement BR's recommendations in accordance with *e)* above, BR shall enter a note in the MIFR to the effect that:

- [administration names] have failed to implement the BR recommendation in relation to the use of the frequency assignments of the non-GSO systems causing the interference; and
- the entries do not meet the requirements of Resolution **WWW (WRC-2000)**,

BR shall also add the following statements to the relevant MIFR entries: "The problem of interference caused by this frequency assignment into the services operated by the administration of [name of administration] has not been resolved";

ADD ASP/20/165

S15A.10 *i)* the interfering administrations and the affected administration shall be informed by fax or other agreed electronic means of the action taken by BR. A copy of this advice shall be sent to all ITU Members drawing their attention to the action taken;

ADD ASP/20/166

S15A.11 *j)* when the problem of interference has been resolved, either as in *e)* above or by other means acceptable to all the parties, BR shall modify the entries in the MIFR to reflect the final outcome and inform all ITU Members.

ADD ASP/20/167

Section II – Procedure for assuring compliance with single-entry operational limits

ADD ASP/20/168

S15A.12 When an administration operating a GSO network in accordance with the Radio Regulations identifies epfd levels from non-GSO systems in excess of the "operational limit" given in Tables **S22-4**, as determined by the use of ITU-R agreed measurement techniques or until such ITU-R agreed measurement techniques are available by use of the actual earth station monitoring capability:

ADD ASP/20/169

S15A.13 *a)* that administration first attempts to identify the source of the excess epfd;

ADD ASP/20/170

S15A.14 *b)* if the source of the excess epfd is readily identifiable, the administration may proceed to *g)* below;

ADD ASP/20/171

S15A.15 *c)* in case, after *a)* above, an administration is unable to determine the source of interference, it shall send a request for cooperation to all administrations responsible for non-GSO systems using over-lapping frequency bands, providing all relevant details. A copy of the request shall be sent to BR;

ADD ASP/20/172

S15A.16 *d)* the requested administrations shall acknowledge receipt immediately and dispatch to the requesting administration within [y] days, with a copy to BR, the information which may be used to identify the source of the problem;

ADD ASP/20/173

S15A.17 *e)* if an administration fails to respond within [y] days, the affected administration may request the assistance of BR, in which case BR shall immediately send a fax to the administration responsible for the non-GSO system, requesting action within an additional [z] days;

ADD ASP/20/174

S15A.18 *f)* if the administration fails to respond to BR, BR shall take action as in *i)* to *l)* below, as if the administration had failed to implement recommendations of BR;

ADD ASP/20/175

S15A.19 *g)* once the sources of the excess epfd are identified, the affected administration sends a letter, by fax or other mutually agreed electronic means, to the administrations concerned and requests immediate corrective action. It shall provide the necessary evidence identifying the amount of excess epfd and the source of such interference. A copy of the request shall be sent to BR;

ADD ASP/20/176

S15A.20 *h)* upon receipt of the request, the interfering administration shall immediately reduce emissions to the required levels pending final determination of solutions to the problem and, within [y] days, so advise the administration whose network is affected. A copy of the acknowledgement and confirmation of the action taken shall be sent to BR;

ADD ASP/20/177

S15A.21 *i)* BR will study the matter within an additional [30] days, and report its conclusion to the parties involved, recommending its solution to the problem;

ADD ASP/20/178

S15A.22 *j)* if the interfering administrations fails to implement BR's recommendations in accordance with *e)* above, BR shall enter a note in the MIFR to the effect that:

- [administration names] have failed to implement the BR recommendation in relation to the use of the frequency assignments of the non-GSO systems causing the interference; and
- the entries do not conform with the operational limits in Tables **S22-4** of Article **S22**,

BR shall also add the following statements to the relevant MIFR entries: "The problem of interference caused by this frequency assignment into the services operated by the administration of [name of administration] has not been resolved";

ADD ASP/20/179

S15A.23 *k)* the administration that fails to respond or the interfering administration and the affected administration shall be informed by fax or other agreed electronic means of the action taken by BR. A copy of this advice shall be sent all ITU Members drawing their attention to the action taken;

ADD ASP/20/180

S15A.24 *l)* when the problem of interference has been resolved, either as in *i)* above or by other means acceptable to all the parties, BR shall modify the entries in the MIFR to reflect the final outcome and inform all ITU Members.

Reasons: APT considers that procedures to assure compliance with the epfd limits should be included in the Radio Regulations.

Agenda item 1.14

1.14 to review the results of studies on the feasibility of implementing non-GSO MSS feeder links in the 15.43-15.63 GHz bands in accordance with Resolution **123 (WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

APT supports the conclusions of ITU-R that it should be possible to implement non-GSO mobile-satellite service feeder links in the band 15.43-15.63 GHz taking into account the protection of the radio astronomy service in the band 15.35-15.4 GHz by means of limiting out-of-band emissions. APT therefore proposes the suppression of Resolution 123 (WRC-97).

SUP ASP/20/181

RESOLUTION 123 (WRC-97)

Feasibility of implementing feeder links of non-geostationary satellite networks in the mobile-satellite service in the band 15.43-15.63 GHz (space-to-Earth) while taking into account the protection of the radio astronomy service, the Earth exploration-satellite (passive) service and the space research (passive) service in the band 15.35-15.4 GHz

Reasons: The conducted studies comply with the Resolution 123 (WRC-97) provisions completely and hence cover all issues related to the agenda item concerned. Taking into account that Resolution 123 (WRC-97) has attained the assigned objectives and aims, APT considers it would be appropriate to suppress it at WRC-2000.

Agenda item 1.15.1

1.15.1 to consider new allocation to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

APT administrations recognize the need for appropriate new allocations for RNSS in the bands between 1-6 GHz. The band 960-1 215 MHz (space-to-Earth) and the band 5 000-5 030 MHz (Earth-to-space) are candidate bands for new allocation to RNSS.

However, further consideration is required of the potential interference mechanisms between RNSS and existing services in other candidate bands for new allocations to RNSS. In particular, when considering a new allocation for RNSS in the band 1 300-1 350 MHz, potential interference from existing services to RNSS should be taken into account and no restrictions should be taken into account and no restrictions should be imposed on existing services operating in accordance with the Table of Frequency Allocations. Necessary bandwidth is expected to be studied in the long term.

MOD ASP/20/182

890-1 350 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
960-1 215	AERONAUTICAL RADIONAVIGATION MOD S5.328	

MOD ASP/20/183

S5.328 The band 960-1 215 MHz is reserved on a worldwide basis for the use and development of airborne electronic aids to air navigation and any directly associated ground-based and satellite-borne facilities. A portion of this band is also allocated to the radionavigation-satellite service (space-to-Earth) on a primary basis. In this band, the radionavigation-satellite service shall not cause harmful interference to, nor claim protection from, stations of the aeronautical radionavigation and aeronautical radionavigation-satellite services.

Reasons: Parts of the band of 960-1 215 MHz are investigated for the worldwide new need of RNSS (space-to-Earth) allocations. The operation of the ARNS in the band 960-1 215 MHz should be preserved in all with sufficient bandwidth for accommodating necessary frequency transition of the ARNS operating in the band which would be allocated to the new RNSS. The ITU-R study has also concluded that the priority should be given to the ARNS over the RNSS in order to satisfy current and future requirement of the ARNS.

MOD ASP/20/184

4 800-5 830 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
5 000-~~5 150~~5 030	AERONAUTICAL RADIONAVIGATION S5.367 S5.444 S5.444A ADD S5.444B	

ADD ASP/20/184*bis*

S5.444B The band 5 000-5 030 MHz is also allocated to the radionavigation-satellite service (Earth-to-space) on a primary basis.

Reasons: According to the new needs of RNSS (Earth-to-space) allocations, the band 5 000-5 030 MHz can be considered as a candidate due to the study results that the band is lightly used and is not planned for use by the international standard MLS. The nearby RAS band can be protected by a separation distance between the beacons and the RAS sites.

Agenda item 1.15.2

1.15.2 to consider the addition of the space-to-space direction to the radionavigation-satellite service allocations in the bands 1 215-1 260 MHz and 1 559 -1 610 MHz

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

APT administrations support the addition of the space-to-space direction to the RNSS in the 1 215-1 260 MHz and 1 559-1 610 MHz bands, subject to the provision that space-borne radionavigation receivers shall not seek protection from other existing radionavigation-satellite systems or existing terrestrial radiolocation systems operating in accordance with the Table of Frequency Allocations.

MOD ASP/20/185

890-1 350 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 215-1 240	EARTH EXPLORATION-SATELLITE (active) RADIOLOCATION RADIONAVIGATION-SATELLITE (space-to-Earth) S5.329 <u>RADIONAVIGATION-SATELLITE (space-to-space) ADD S5.3XX</u> SPACE RESEARCH (active) S5.330 S5.331 S5.332	
1 240-1 260	EARTH EXPLORATION-SATELLITE (active) RADIOLOCATION RADIONAVIGATION-SATELLITE (space-to-Earth) S5.329 <u>RADIONAVIGATION-SATELLITE (space-to-space) ADD S5.3XX</u> SPACE RESEARCH (active) Amateur S5.330 S5.331 S5.332 S5.334 S5.335	

ADD ASP/20/186

S5.3XX The radionavigation-satellite service (space-to-space) oprating in the band 1 215-1 260 MHz shall not claim protection from, or impose constraints on operation or development of existing radiolocation services operating in this band.

Reasons: The new allocation for the RNSS in this band would be appropriate in the condition that the stations of the RNSS shall not claim protection from, impose constraints on operation or development of the existing radiolocation services.

MOD ASP/20/187

1 525-1 610 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**

Reasons: To provide frequencies for space-to-space applications such as spacecraft positioning, velocity determination, leading to give better precision of timing and positioning for users according to the results of ITU-R studies.

Agenda item 1.16

1.16 to consider allocation of frequency bands above 71 GHz to the earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution **723 (WRC-97)**

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

In accordance with Resolution 723 (WRC-97), modification of the allocation tables above 71 GHz is proposed to accommodate the present and future requirements for the Earth exploration-satellite (passive), space research (passive) and radio astronomy services. It will ensure an outcome supportive of the operations of these services consistent with the needs of other services. The modifications are based on a plan developed by an international group of science service and other experts who regularly attend ITU-R Working Party meetings. They are consistent with the guidelines discussed in Chapter 4 of the CPM Report to WRC-2000. The major aim was to maintain the aggregate amount of spectrum allocated to the displaced services and provide wideband blocks to accommodate future multimedia systems, while taking into account differences in atmospheric attenuation and appropriate separation between services.

MOD ASP/20/188

66-86 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
71-74	FIXED FIXED-SATELLITE (~~Earth-to-space~~space-to-Earth) MOBILE MOBILE-SATELLITE (~~Earth-to-space~~space-to-Earth) ~~S5.149 S5.556~~	

Reasons: MSS and FSS uplinks and downlinks in the 71-74 GHz and 81-84 GHz bands are interchanged to avoid satellite downlinks in bands needed by RAS. The atmospheric absorption is only slightly higher in the 71-74 GHz band than in the 81-84 GHz band. The RAS footnotes S5.149 and S5.556 are deleted and references to the 72.77-72.91 GHz band in the footnotes are deleted.

MOD ASP/20/189

74-75.5	BROADCASTING SATELLITE FIXED FIXED-SATELLITE (~~Earth-to-space~~space-to-Earth) MOBILE Space research (space-to-Earth) MOD S5.561

MOD ASP/20/190

75.5-76	~~AMATEUR~~ ~~AMATEUR-SATELLITE~~ BROADCASTING-SATELLITE FIXED FIXED-SATELLITE (space-to-Earth) MOBILE Space research (space-to-Earth) MOD S5.561 ADD S5.EEE

Reasons: The BSS currently allocated to the 84-86 GHz band is relocated in this band to protect proposed RAS allocations in the 84-86 GHz band. The atmospheric absorption is only slightly higher in the 74-76 GHz band than in the 84-86 GHz band. The AS and ASS allocations are shifted to 77.5-78 GHz. A new footnote S5.EEE protects existing AS and ASS operations in the 75.5-76 GHz band until the year 2010. The FSS (Earth-to-space) allocation is moved to the 84-86 GHz band. The proposed allocations in the 74-84 GHz range preserve a contiguous 10 GHz SRS downlink (secondary) allocation that is required for space VLBI purposes. Footnote S5.561 is modified to recognize the change in the BSS allocations.

MOD ASP/20/191

76-~~81~~77.5	RADIO ASTRONOMY RADIOLOCATION Amateur Amateur-satellite Space research (space-to-Earth) MOD S5.149 ~~S5.560~~

MOD ASP/20/192

~~76-81~~77.5-78	AMATEUR AMATEUR SATELLITE ~~RADIOLOCATION~~ ~~Amateur~~ ~~Amateur-satellite~~ Radio astronomy Space research (space-to-Earth) ~~S5.560~~

MOD ASP/20/193

~~76~~78-81	RADIO ASTRONOMY RADIOLOCATION Amateur Amateur-satellite Space research (space-to-Earth) MOD S5.149 ~~S5.560~~

Reasons: The RAS allocations in the 76-77.5 GHz and 78-81 GHz bands satisfy the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. The RAS is added as a secondary allocation in the 77.5-78 GHz band. The frequencies of the AS and ASS primary bands are increased by 2 GHz to enable the BS, FSS and MSS downlinks to be relocated at lower frequencies, and to avoid sharing with the vehicular radars which some administrations have authorized to operate in the 76-77 GHz band. The RAS bands are added to those listed in S5.149. S5.560 does not apply to the 76-77.5 and 77.5-78 GHz bands and is deleted.

MOD ASP/20/194

81-84	FIXED FIXED-SATELLITE (~~space-to-Earth~~Earth-to-space) MOBILE MOBILE-SATELLITE (~~space-to-Earth~~Earth-to-space) RADIO ASTRONOMY Space research (space-to-Earth) MOD S5.149 ADD S5.DDD

Reasons: The directions of MSS and FSS downlinks are reversed to allow radio astronomy observations and have downlink pairs in the 71-74 GHz band. The RAS allocation satisfies the radio astronomy requirements for spectral line and wide band continuum observations from remote locations worldwide. S5.DDD has been added to maintain the current amount of secondary allocated AS and ASS spectrum. This band has been added to S5.149.

MOD ASP/20/195

84-86	FIXED FIXED-SATELLITE (Earth-to-space) ADD S5.PPP MOBILE BROADCASTING ~~BROADCASTING-SATELLITE~~ RADIO ASTRONOMY MOD S5.149 ~~S5.561~~

Reasons: The BSS allocation is relocated in the 74-76 GHz band. The direction of the satellite downlinks has been reversed to allow radio astronomy observations. The new uplink is paired with downlinks in the 74-76 GHz band. The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. This band has been added to S5.149. S5.561 is no longer relevant to this band and is deleted. A new country footnote, S5.PPP, is added to constrain the FSS use in Japan.

MOD ASP/20/196

86-119.98 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
86-92	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340	

Reasons: This band is of importance to the SRS (passive) and EESS (passive) as a comparison band for observations of atmospheric oxygen at 118.75 GHz. No active services are acceptable in this band.

MOD ASP/20/197

92-94	FIXED ~~FIXED-SATELLITE (Earth-to-space)~~ MOBILE RADIO ASTRONOMY RADIOLOCATION MOD S5.149 ~~S5.556~~

Reasons: The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. S5.556 identified previous RAS interest, and is no longer needed; it is deleted from the band and modified appropriately. The FSS (Earth-to-space) allocation is relocated in the 81-86 GHz band. This band has been added to those listed in S5.149.

MOD ASP/20/198

94-94.1	EARTH EXPLORATION-SATELLITE (active) RADIOLOCATION SPACE RESEARCH (active) Radio astronomy S5.562

Reasons: The RAS allocation is secondary. Except for its introduction, no change in sharing between services is proposed.

MOD ASP/20/199

94.1-95	FIXED ~~FIXED-SATELLITE (Earth-to-space)~~ MOBILE RADIO ASTRONOMY RADIOLOCATION MOD S5.149

Reasons: The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. The FSS (Earth-to-space) allocation is relocated in the 81-86 GHz band. S5.556 is no longer relevant and is deleted. This band has been added to those listed in S5.149.

MOD ASP/20/200

95-100	FIXED MOBILE ~~S5.553~~ ~~MOBILE-SATELLITE~~ RADIO ASTRONOMY RADIOLOCATION RADIONAVIGATION RADIONAVIGATION-SATELLITE ~~Radiolocation~~ MOD S5.149 MOD S5.553 MOD S5.554 ~~S5.555~~

Reasons: The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations. The RLS is upgraded to primary. The MSS is deleted because it cannot share with the RLS. S5.555, which allocates the 97.88-98.08 GHz band to the RAS, is not needed and is deleted; the footnote is modified appropriately. S5.553 is modified to include stations in the FS. This band is added to those listed in S5.149.

MOD ASP/20/201

100-102	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ ~~MOBILE~~ RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340 S5.341

Reasons: The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. The band is used by the EESS (passive) for microwave limb sounding of atmospheric constituents. This band is added to those listed in S5.340.

MOD ASP/20/202

102-105	FIXED ~~FIXED-SATELLITE (space-to-Earth)~~ MOBILE RADIO ASTRONOMY MOD S5.149 S5.341

Reasons: The FSS allocation is relocated in the 71-76 GHz band, to enable radio astronomy observations in the 102-105 GHz band. The atmospheric absorption in these two windows is similar. The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. This band is added to those listed in S5.149.

MOD ASP/20/203

105-~~116~~109.5	~~EARTH EXPLORATION-SATELLITE (passive)~~ FIXED MOBILE RADIO ASTRONOMY SPACE RESEARCH (passive) ADD S5.CCC MOD S5.149 ~~S5.340~~ S5.341

Reasons: The EESS (passive) has no specific use for the band 105-109.5 GHz and the allocation is deleted. The FS and MS are added, relocated from the 116-122.5 GHz band where removal of these services is needed to protect essential passive sensor operations. Since the band is no longer passive in nature, S5.340 is deleted. S5.CCC is added to limit the SRS (passive) allocation to space-based radio astronomy. This band is added to those in S5.149, to reflect the need to protect the RAS in a band that is no longer passive.

MOD ASP/20/204

109.5-111.8	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340 S5.341

Reasons: It is essential to maintain this band passive, and no change is proposed to the allocations (the MOD merely reflects a change in band limits). This band is of particular importance to the EESS because it contains an ozone line at 110.8 GHz, used for microwave limb sounding, and also to the RAS because it contains carbon monoxide lines at 109.8 and 110.2 GHz.

MOD ASP/20/205

111.8-114.25	~~EARTH EXPLORATION-SATELLITE (passive)~~ FIXED MOBILE RADIO ASTRONOMY SPACE RESEARCH (passive) ADD S5.CCC MOD S5.149 ~~S5.340~~ S5.341

Reasons: The EESS (passive) does not need the band 111.8-114.25 GHz and is deleted. FS and MS are added, relocated from the 116-122.5 GHz band where deletion of these services is needed to protect essential passive sensor operations. The addition of S5.CCC limits the SRS (passive) allocation to space-based radio astronomy. S5.340 is no longer relevant and is deleted; its list of bands is modified appropriately. This band is added to those in S5.149 to reflect the need to protect the RAS in a band that is no longer passive.

MOD ASP/20/206

~~105~~114.25-116	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340 S5.341

Reasons: It is essential to maintain this band passive, and no change is proposed to the allocations (the MOD merely reflects a change in band limits). The band is of vital importance to the RAS for observations of the 115.27 GHz line of carbon monoxide. It is the first portion of the 114.25-122.25 GHz oxygen absorption band (with peak absorption at 118.75 GHz) which is required for remote sensing.

MOD ASP/20/207

116-119.98	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ INTER-SATELLITE ADD S5.XXX ~~MOBILE S5.558~~ SPACE RESEARCH (passive) S5.341

MOD ASP/20/208

119.98-158 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
119.98-120.02	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ INTER-SATELLITE ADD S5.XXX ~~MOBILE S5.558~~ SPACE RESEARCH (passive) ~~Amateur~~ S5.341	

MOD ASP/20/209

120.02-~~126~~122.25	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ INTER-SATELLITE ADD S5.XXX ~~MOBILE S5.558~~ SPACE RESEARCH (passive) MOD S5.138

Reasons: These bands are of vital importance to the EESS (passive), as they are the major part of the 114.25-122.25 GHz oxygen absorption band, with peak absorption at 118.75 GHz. The FS and MS are relocated in the 105-109.5 GHz and 111.8-114.25 GHz bands, because sharing with passive sensors would severely restrict the services. The ISS needs to be limited by footnote S5.XXX to links between GSO satellites only, with pfd limits as specified in sharing studies involving passive sensors. The secondary allocation to the AS in the 119.98-120.02 GHz band is also moved to the 122.25-123 GHz band. S5.138 is modified so as to expand the designated bands for industrial, scientific and medical applications.

MOD ASP/20/210

122.25-123	~~EARTH EXPLORATION-SATELLITE (passive)~~ FIXED INTER-SATELLITE MOBILE MOD S5.558 ~~SPACE RESEARCH (passive)~~ Amateur MOD S5.138

Reasons: The passive sensor allocations are not required in this band and are deleted. A secondary AS allocation has been added to compensate for the deletion in the 119.98-120.02 GHz band. S5.138 is modified so as to expand the designated bands for industrial, scientific and medical applications.

MOD ASP/20/211

~~120.02~~123-126	~~EARTH EXPLORATION-SATELLITE (passive)~~ FIXED FIXED-SATELLITE (space-to-Earth) INTER-SATELLITE MOBILE MOD S5.558 MOBILE-SATELLITE RADIONAVIGATION RADIONAVIGATION-SATELLITE ~~SPACE RESEARCH (passive)~~ Radio astronomy ~~S5.138~~

Reasons: An allocation for passive sensor operations is not needed and is deleted. Satellite downlinks in the frequency range 141-153 GHz are moved to 123-130 GHz to avoid interference to proposed RAS operations at the higher frequencies. The RAS is added on a secondary basis for possible use in wideband continuum observations. Sharing conditions between the ISS and the FSS, MSS, RNS and RNSS services need to be developed, but no imminent use of the band by these services is contemplated. The MSS directional indicator is left undefined. Footnote S5.138 does not apply to this band and are deleted.

MOD ASP/20/212

126-~~134~~130	~~FIXED~~ FIXED SATELLITE (space-to-Earth) ~~INTER-SATELLITE~~ ~~MOBILE S5.558~~ MOBILE SATELLITE ~~RADIOLOCATION S5.559~~ RADIONAVIGATION RADIONAVIGATION-SATELLITE Radio astronomy ADD S5.QQQ MOD S5.149 MOD S5.554

Reasons: Satellite downlinks in the frequency range 141-153 GHz are moved to 123-130 GHz to avoid interference to proposed RAS operations at the higher frequencies. The RAS is added on a secondary basis for possible spectral line and wideband continuum observations. S5.149 is added to highlight RAS observations of silicon monoxide lines in the 128.33-128.59 GHz and 129.23-129.49 GHz bands; the bands are added to this footnote. The FS, MS, ISS and RLS allocations are relocated to improve sharing conditions. Sharing conditions between the FSS, MSS, RNS and RNSS services need to be developed, although no imminent use of the band by these services is contemplated. The MSS directional indicator remains undefined. This band is included in S5.554. A new country footnote, S5.QQQ, is added.

MOD ASP/20/213

~~126~~130-134	FIXED INTER-SATELLITE MOBILE MOD S5.558 RADIO ASTRONOMY ADD S5.QQQ ~~RADIOLOCATION S5.559~~ MOD S5.149

Reasons: The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. Sharing conditions between the RAS and the ISS need to be developed. S5.558 is modified to reflect the new MS band limit. The RLS is relocated to improve sharing conditions. S5.149 is added appropriately modified. A new country footnote, S5.QQQ, is added.

MOD ASP/20/214

134-~~142~~136	AMATEUR AMATEUR-SATELLITE ~~MOBILE S5.553~~ ~~MOBILE-SATELLITE~~ ~~RADIONAVIGATION~~ ~~RADIONAVIGATION-SATELLITE~~ Radio astronomy ~~Radiolocation~~ ~~S5.149 S5.340 S5.554 S5.555~~

Reasons: The AS and ASS are relocated from the 142-144 GHz band to avoid interference to proposed RAS operations in the band. The RAS has a secondary allocation. All footnotes are deleted from the band because they are not relevant; they are modified in accordance with the changes.

MOD ASP/20/215

136-141	~~MOBILE S5.553~~ ~~MOBILE-SATELLITE~~ RADIO ASTRONOMY RADIOLOCATION ~~RADIONAVIGATION~~ ~~RADIONAVIGATION-SATELLITE~~ Amateur Amateur-satellite ~~Radiolocation~~ MOD S5.149 ~~S5.340 S5.554 S5.555~~

Reasons: The AS and ASS are relocated from 144-149 GHz. The secondary allocation to the RLS is upgraded to primary to partially compensate for its loss in other bands. The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. Since the band is no longer passive, it is removed from S5.340. S5.340, S5.554 and S5.555 are no longer relevant and are deleted. This band is added to S5.149.

MOD ASP/20/216

~~134~~141-142	FIXED MOBILE~~ S5.553~~ ~~MOBILE-SATELLITE~~ RADIO ASTRONOMY RADIOLOCATION ~~RADIONAVIGATION~~ ~~RADIONAVIGATION-SATELLITE~~ ~~Radiolocation~~ MOD S5.149~~ S5.340 S5.554 S5.555~~

MOD ASP/20/226

158-202 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
158-16~~4~~58.5	EARTH EXPLORATION-SATELLITE (passive) ADD S5.AAA FIXED ~~FIXED-SATELLITE (space-to-Earth)~~ MOBILE RADIO ASTRONOMY SPACE RESEARCH (passive) ADD S5.CCC MOD S5.149 ADD S5.BBB	

Reasons: To satisfy current and imminent EESS (passive) operations a 3 GHz band centered at 157 GHz is allocated for use in conjunction with 183.31 GHz water vapour observations. This allocation is required only until 2018, by which time all operations will have transferred to the 148.5-151.5 GHz band and EESS operations will no longer require protection in these bands. The FSS (space-to-Earth) allocation is incompatible with RAS requirements and is relocated. The addition of the RAS allocations satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. The SRS (passive) allocation is limited to space-based radio astronomy. The 3 GHz band is added to S5.149.

MOD ASP/20/227

158.5-164	FIXED FIXED-SATELLITE (space-to-Earth) MOBILE MOBILE-SATELLITE (space-to-Earth)

Reasons: The MSS allocation is added to partially compensate for the loss of the 134-142 GHz band.

MOD ASP/20/228

164-16~~8~~7	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340

Reasons: This 3 GHz band together with the 148.5-151.5 GHz band is intended as a reference band for passive sensor observations of the 183.31 GHz water vapour line. It is also used for limb sounding observations of the 164.38 GHz ClO line. It is essential to maintain the band passive. The MOD proposal status refers only to a band-limit change and the associated modification of S5.340, because no change is proposed to the allocations.

MOD ASP/20/229

1647-168	~~EARTH EXPLORATION-SATELLITE (passive)~~ FIXED FIXED-SATELLITE (space-to-Earth) INTER-SATELLITE MOBILE MOD S5.558 ~~RADIO ASTRONOMY~~ ~~SPACE RESEARCH (passive)~~

Reasons: The entire 174.8-191.8 GHz band is of vital importance for passive sensing of the water vapour absorption line centred at 183.31 GHz. Sharing with FS and MS is not practical and these services are relocated. The ISS needs to be limited to links between GSO satellites and to a pfd limit as specified in sharing studies. Footnote S5.YYY is added to reflect this requirement. S5.149, S5.341 and S5.385 are deleted. Active services and associated footnote S5.554 are moved from the 190-191.8 GHz band to facilitate the addition of passive sensor allocations, and MOD S5.340 is added to the proposed passive bands. All footnotes are appropriately modified to reflect the changes in the bands.

MOD ASP/20/238

19~~0~~1.8-200	FIXED INTER-SATELLITE MOBILE ~~S5.553~~ MOD S5.558 MOBILE-SATELLITE RADIONAVIGATION RADIONAVIGATION-SATELLITE MOD S5.149 S5.341 MOD S5.553 MOD S5.554

Reasons: The FS and ISS are added to compensate for deletions from other bands. S5.553 and S5.554 are modified to reflect the proposed changes. MOD S5.149 draws attention to an important spectral-line transition of carbon monosulphide in the frequency range 195.75-196.15 GHz; the band has been added to the footnote.

MOD ASP/20/239

200-202	EARTH EXPLORATION-SATELLITE (passive) ~~FIXED~~ ~~MOBILE~~ RADIO ASTRONOMY SPACE RESEARCH (passive) MOD S5.340 S5.341 ADD S5.RRR

MOD ASP/20/240

Allocation to services		
Region 1	**Region 2**	**Region 3**
231.5-232	FIXED ~~FIXED-SATELLITE (space-to-Earth)~~ MOBILE Radiolocation	

Reasons: It is essential to maintain the entire 226-231.5 GHz band passive, and the FS, FSS (space-to-Earth) and MS are deleted from the 231-231.5 GHz band. The FSS (space-to-Earth) in the band 231.5-232 GHz is relocated to free up the band from satellite downlinks, avoiding interference problems with the adjacent lower band, which is quite important for radio astronomy. Passive sensors require the bands for microwave limb sounding of atmospheric constituents. In addition, the bands provide a 5.5 GHz reference band for water vapour measurements near 345 GHz. The 226-231.5 GHz band is of vital importance to the RAS for observations of the 230.54 GHz carbon monoxide line. MOD S5.340 is modified to reflect the changes in the passive band limits and added to the second band. S5.341 is not relevant to the bands and is deleted.

MOD ASP/20/246

Region 1	**Region 2**	**Region 3**
241-248	MOBILE RADIO ASTRONOMY RADIOLOCATION Amateur Amateur-satellite MOD S5.138 MOD S5.149	

Reasons: The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. MS is added to partially compensate its loss in other frequency bands. This band is added to those listed in S5.149. S5.138 is modified so as to expand the designated bands for industrial, scientific and medical applications.

MOD ASP/20/251

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
248-250	AMATEUR AMATEUR-SATELLITE Radio astronomy	

Reasons: An RAS allocation is added on a secondary basis.

MOD ASP/20/252

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
250-252	EARTH EXPLORATION-SATELLITE (passive) RADIO ASTRONOMY SPACE RESEARCH (passive) ~~S5.149 S5.555~~ MOD S5.340 ADD S5.RRR	

Reasons: The EESS (passive) requires this band for limb sounding of nitrous oxide near 251 GHz. The RAS is added to other passive services and its addition does not alter the sharing scenario. The references to S5.149 and S5.555 are consequentially deleted and the band lists in these footnotes are appropriately modified. S5.340 is added to highlight the passive nature of the band. S5.RRR is added to note the use by ground-based passive sensors.

MOD ASP/20/253

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
252-265	FIXED MOBILE MOBILE-SATELLITE (Earth-to-space) RADIO ASTRONOMY RADIONAVIGATION RADIONAVIGATION-SATELLITE MOD S5.149 ~~S5.385~~ MOD S5.553 S5.554 ~~S5.555 S5.564~~	

Reasons: The FS is relocated to this band as a consequence of allocation actions in other bands. The addition of the RAS allocation satisfies the radio astronomy requirements for spectral-line and wideband continuum observations from remote locations worldwide. The directional indicator is added to the MSS allocation, which is paired with a downlink allocation in the 190-200 GHz band. The atmospheric absorption in the 252-265 GHz band is somewhat higher than in the paired band. This band is added to S5.149, and deleted from S5.385 and S5.555 (which are no longer relevant to the band). Consequent to the worldwide RAS primary allocation, S5.564 is no longer needed.

MOD ASP/20/254

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
265-275	FIXED FIXED-SATELLITE (Earth-to-space) MOBILE RADIO ASTRONOMY MOD S5.149 ADD S5.RRR	

Reasons: No changes are proposed (apart from the text of S5.149 of course). S5.RRR is added to note the use by ground-based passive sensors.

MOD ASP/20/255

202-~~400~~1 000 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
275-~~400~~1 000	(Not allocated) MOD S5.565	

Reasons: The change of the upper limit for applicability of footnote S5.565 is to account for passive service needs above 275 GHz that have been identified by administrations; many spectral-line and wide continuum bands are required for radio astronomy observations and passive remote sensing of the Earth.

MOD ASP/20/256

S5.138 The following bands:

6 765-6 795 kHz	(centre frequency 6 780 kHz),
433.05-434.79 MHz	(centre frequency 433.92 MHz) in Region 1 except in the countries mentioned in No. **S5.280**,
61-61.5 GHz	(centre frequency 61.25 GHz),
~~122~~120.02-123 GHz	(centre frequency ~~122.5~~121.5 GHz), and
~~244~~241-~~246~~248 GHz	(centre frequency ~~245~~244.5 GHz)

are designated for industrial, scientific and medical (ISM) applications. The use of these frequency bands for ISM applications shall be subject to special authorization by the administration concerned, in agreement with other administrations whose radiocommunication services might be affected. In applying this provision, administrations shall have due regard to the latest relevant ITU-R Recommendations.

MOD ASP/20/257

are allocated (* indicates radio astronomy use for spectral line observations), administrations are urged to take all practicable steps to protect the radio astronomy service from harmful interference.

Emissions from spaceborne or airborne stations can be particularly serious sources of interference to the radio astronomy service (see Nos. **S4.5** and **S4.6** and Article **S29**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/258

S5.340 All emissions are prohibited in the following bands:

1 400-1 427 MHz,	
2 690-2 700 MHz,	except those provided for by Nos. **S5.421** and **S5.422**,
10.68-10.7 GHz,	except those provided for by No. **S5.483**,
15.35-15.4 GHz,	except those provided for by No. **S5.511**,
23.6-24 GHz,	
31.3-31.5 GHz,	
31.5-31.8 GHz,	in Region 2,
48.94-49.04 GHz,	from airborne stations,
50.2-50.4 GHz[2],	except those provided for by No. **S5.555A**,
52.6-54.25 GHz,	
86-92 GHz,	
100-102 GHz,	
~~105-116 GHz,~~	
109.5-111.8 GHz,	
114.25-116 GHz	
~~140.69-140.98 GHz,~~	~~from airborne stations and from space stations in the space-to-Earth direction,~~
148.5-151.5 GHz,	
164-167 GHz,	
182-185 GHz,	except those provided for by No. **S5.563**,
190-191.8 GHz,	
200-209 GHz,	
~~217-231 GHz.~~	
226-231.5 GHz,	
250-252 GHz.	

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

NOC ASP/20/259

S5.341 In the bands 1 400-1 727 MHz, 101-120 GHz and 197-220 GHz, passive research is being conducted by some countries in a programme for the search for intentional emissions of extraterrestrial origin.

Reasons: This informational footnote is still accurate.

MOD ASP/20/260

S5.385 *Additional allocation:* the band~~s~~ 1 718.8-1 722.2 MHz~~, 150-151 GHz, 174.42-175.02 GHz, 177-177.4 GHz, 178.2-178.6 GHz, 181-181.46 GHz, 186.2-186.6 GHz and 257.5-258 GHz are~~ is also allocated to the radio astronomy service on a secondary basis for spectral line observations.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/261

S5.553 In the bands 43.5-47 GHz, 66-71 GHz, 95-100 GHz,~~ 134-142 GHz,~~ ~~190~~191.8-200 GHz and 252-265 GHz, stations in the fixed and land mobile service may be operated subject to not causing harmful interference to the space radiocommunication services to which these bands are allocated (see No. **S5.43**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/262

S5.554 In the bands 43.5-47 GHz, 66-71 GHz, 95-100 GHz, 126-130 GHz, ~~134-142 GHz, 190~~191.8-200 GHz and 252-265 GHz, satellite links connecting land stations at specified fixed points are also authorized when used in conjunction with the mobile-satellite service or the radionavigation-satellite service.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/263

S5.555 *Additional allocation:* the band~~s~~ 48.94-49.04 GHz~~, 97.88-98.08 GHz, 140.69-140.98 GHz, 144.68-144.98 GHz, 145.45-145.75 GHz, 146.82-147.12 GHz, 250-251 GHz and 262.24-262.76 GHz are~~ is also allocated to the radio astronomy service on a primary basis.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/264

S5.556 In the bands 51.4-54.25 GHz, 58.2-59 GHz~~,~~ and 64-65 GHz~~, 72.77-72.91 GHz and 93.07-93.27 GHz,~~ radio astronomy observations may be carried out under national arrangements.

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/265

S5.558 In the bands 55.78-58.2 GHz, 59-64 GHz, 66-71 GHz, ~~116-134 GHz,~~ 122.25-126 GHz, 130-134 GHz, ~~170-182 GHz and~~ 167-174.8 GHz ~~185-190 GHz,~~and 191.8-200 GHz stations in the aeronautical mobile service may be operated subject to not causing harmful interference to the inter-satellite service (see No. **S5.43**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocations.

MOD ASP/20/266

S5.559 In the band~~s~~ 59-64 GHz ~~and 126-134 GHz~~, airborne radars in the radiolocation service may be operated subject to not causing harmful interference to the inter-satellite service (see No. **S5.43**).

Reasons: The changes to this footnote are consequential to the changes made to the related allocation. The radiolocation and inter-satellite services are no longer co-allocated in this spectral region.

NOC ASP/20/267

S5.560 In the band 78-79 GHz radars located on space stations may be operated on a primary basis in the Earth exploration-satellite service and in the space research service.

Reasons: No change is required to this footnote.

MOD ASP/20/268

S5.561 In the band ~~84-86~~ 74-76 GHz, stations in the fixed~~,~~ and mobile ~~and broadcasting~~ services shall not cause harmful interference to broadcasting-satellite stations operating in accordance with the decisions of the appropriate frequency assignment planning conference for the broadcasting-satellite service.

Reasons: The broadcasting-satellite allocations have been transferred to the 74-76 GHz band.

NOC ASP/20/269

S5.562 The use of the band 94-94.1 GHz by the Earth exploration-satellite (active) and space research (active) services is limited to spaceborne cloud radars.

Reasons: This footnote was the result of allocation decisions made at WRC-97 and no change is needed.

SUP ASP/20/270

S5.564

Reasons: The radio astronomy allocation is now worldwide in the 261-265 GHz band, therefore a country footnote is no longer needed.

MOD ASP/20/271

S5.565 The frequency band 275-~~400~~1 000 GHz may be used by administrations for experimentation with, and development of, various active and passive services. In this band a need has been identified for the following spectral line measurements for passive services:

– radio astronomy service: ~~278-280 GHz and 343-348 GHz~~275-323 GHz, 327-371 GHz, 388-424 GHz, 426-442 GHz, 453-510 GHz, 623-711 GHz and 795-909 GHz;

– Earth exploration-satellite service (passive) and space research service (passive): 275-277 GHz, ~~300-302 GHz, 324-326 GHz, 345-347 GHz, 363-365 GHz and 379-381 GHz~~ 294-306 GHz, 316-334 GHz, 342-349 GHz, 363-365 GHz, 371-389 GHz, 416-434 GHz, 442-444 GHz, 496-506 GHz, 546-568 GHz, 624-629 GHz, 634-654 GHz, 659-661 GHz, 684-692 GHz, 730-732 GHz, 851-853 GHz and 951-956 GHz.

Future research in this largely unexplored spectral region may yield additional spectral lines and continuum bands of interest to the passive services. Administrations are urged to take all practicable steps to protect these passive services from harmful interference until the next competent world radiocommunication conference.

Reasons: These additional bands have been identified by various administrations as bands that are, or will be, used for radio astronomy observations and spaceborne passive remote sensing.

ADD ASP/20/272

S5.AAA In the band 155.5-158.5 GHz, the allocation to the Earth exploration-satellite (passive) and space research (passive) services shall terminate on 1 January 2018.

Reasons: This allocation will not be needed by passive sensors after the termination date. By the termination date, all passive sensors will have transferred to the 148.5-151.5 GHz band.

ADD ASP/20/273

S5.BBB The date of entry for the allocation to the fixed and mobile services in the band 155.5-158.5 GHz shall be 1 January 2018.

Reasons: Passive sensors require the use of this band until 1 January 2018.

ADD ASP/20/274

S5.CCC Use of this allocation is limited to space-based radio astronomy only.

Reasons: This band is a likely candidate for a future space-based radio astronomy mission. No other space research use is contemplated.

ADD ASP/20/275

S5.DDD The 81-81.5 GHz band is also allocated to the amateur and amateur-satellite services on a secondary basis.

Reasons: Required amateur allocation.

ADD ASP/20/276

S5.EEE The band 75.5-76 GHz is also allocated to the amateur and amateur-satellite services on a primary basis until the year 2010.

Reasons: To protect existing use in an amateur allocation proposed for relocation.

ADD ASP/20/277

S5.YYY Use of the bands 174.8-182 GHz and 185-190 GHz by the inter-satellite service is limited to satellites in the geostationary-satellite orbit. The single-entry power flux-density, at all altitudes from 0 km to 1 000 km above the Earth's surface and in the vicinity of all geostationary orbital positions occupied by passive sensors, produced by a station in the inter-satellite service, for all conditions and for all methods of modulation, shall not exceed –144 dBW/m^2/MHz for all angles of arrival.

Reasons: This footnote is required to protect passive sensors operating in this band.

ADD ASP/20/278

S5.XXX Use of the bands 116-122.25 GHz by the inter-satellite service is limited to satellites in the geostationary-satellite orbit. The single-entry power flux-density, at all altitudes from 0 km to 1 000 km above the Earth's surface and in the vicinity of all geostationary orbital positions occupied by passive sensors, produced by a station in the inter-satellite service, for all conditions and for all methods of modulation, shall not exceed –148 dBW/m^2/MHz for all angles of arrival.

Reasons: This footnote is required to protect passive sensors operating in this band.

ADD ASP/20/279

S5.PPP In Japan, use of the band 84-86 GHz, as the fixed-satellite service (Earth-to-space) is limited to the feeder link by the broadcasting-satellite service in the geostationary-satellite.

Reasons: This footnote is required to compensate the deletion of the broadcasting-satellite service in the band 84-86 GHz in Japan.

ADD ASP/20/280

S5.QQQ *Additional allocation*: In Korea (Republic of), the bands 128-131 GHz, 171-171.6 GHz, 172.2-172.8 GHz and 173.3-174 GHz are allocated to the radio astronomy service in a primary basis until 2015.

Reasons: This footnote is required to protect the radio astronomy service operating in the Republic of Korea, since current operational instruments are already in these bands and these bands are of vital importance to the radio astronomy service for simultaneous observations of the silicon monoxide (SiO) molecule and its isotopic variants. The impact of co-primary allocations to the terrestrial/satellite services and the RAS in these bands is expected to be very limited, since current observations in the Republic of Korea may be finished until 2015 and these primary allocations will not be needed by the RAS after 2015. By 2015, all of these applications will have transitioned to the secondary service.

ADD ASP/20/281

S5.RRR In the bands 200-209 GHz, 235-238 GHz, 250-252 GHz and 265-275 GHz, ground-based passive atmospheric sensing is carried out to monitor atmospheric constituents.

Reasons: The bands are suitable to monitor atmospheric constituents related with ozone depletion by ground-based passive sensors.

ADD ASP/20/282

RESOLUTION XXX (WRC-2000)

Consideration by a future competent world radiocommunication conference of issues dealing with sharing and adjacent band compatibility above 71 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-2000 has made changes to the Table of Frequency Allocations above 71 GHz; following consideration of science service issues;

b) that several bands above 71 GHz are already used by the Earth exploration-satellite (passive) and space research (passive) services because they are unique bands for deriving specific atmospheric parameters;

c) that radio astronomy observations are already carried out in many bands above 71 GHz;

d) that in order to ensure the protection of passive services above 71 GHz, WRC-2000 avoided co-allocations of certain active and passive services to prevent potential sharing problems;

e) that there are several co-primary active services in some bands above 71 GHz in the Table of Frequency Allocations as revised by WRC-2000;

f) that several satellite downlink allocations have been made within bands adjacent to those allocated to the radio astronomy service;

g) that sharing between multiple co-primary active services may hinder the development of each active service in bands above 71 GHz,

noting

a) that preliminary sharing studies between active and passive services performed by ITU-R have not yet reached final conclusions because the technical characteristics of the active services above 71 GHz are not yet known;

b) that sharing studies between active services have not yet been performed;

c) that interference criteria for passive sensors have been developed and are given in Recommendation ITU-R SA.1029;

d) that interference criteria for radio astronomy have been developed and are given in Recommendation ITU-R RA.769-1,

resolves

1 that spectrum requirements and sharing criteria for active services be developed in bands above 71 GHz;

2 that further studies be conducted:

2.1 to determine if and under what condition sharing is possible between terrestrial active services and passive services (EESS and SR) in the bands 116-122.25 GHz, 174.8-182 GHz, 185-190 GHz, 200-209 GHz and 235-238 GHz;

2.2 to determine if and under what condition sharing is possible between active services in bands above 71 GHz;

2.3 on adjacent-band interference from space services (downlinks) into radio astronomy in bands above 71 GHz;

3 that the necessary studies be completed as soon as the technical characteristics of the active services in these bands are known;

4 that a future conference should review, if necessary, the allocations above 71 GHz in the light of the studies performed under *resolves* 1, 2 and 3,

invites ITU-R

to develop recommendations specifying sharing criteria for those bands where sharing is feasible,

instructs the Secretary-General

to bring this Resolution to the attention of the international and regional organizations concerned.

Agenda item 1.17

1.17 to consider possible worldwide allocation for the earth exploration-satellite (passive) and space research (passive) services in the band 18.6 - 18.8 GHz, taking into account the results of the ITU-R studies

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Sri Lanka (Democratic Socialist Republic of)

Introduction

This agenda item requires WRC-2000 to consider possible worldwide allocation for the Earth exploration-satellite (passive) service in the band 18.6-18.8 GHz. This was unresolved at WRC-97 because of concerns by fixed service and fixed-satellite operators, however the final CPM for WRC-2000 developed a technical compromise based on power flux-density limitations.

This compromise involves WRC-2000 considering establishing common worldwide primary allocations for the Earth exploration-satellite (passive) and space research (passive) services. Constraints on the characteristics of GSO FSS and FS systems as well as on the operation of the passive sensors would be required.

Co-primary allocation should be made worldwide to EESS passive in the band 18.6-18.8 GHz and footnotes shall be inserted into the Radio Regulations as follows:

These limits should not apply retroactively.

MOD ASP/20/283

18.6-22.21 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
18.6-18.8 EARTH EXPLORATION-SATELLITE (passive) FIXED S5.YYY FIXED-SATELLITE (space-to-Earth) ~~S5.523~~ S5.XXX MOBILE except aeronautical mobile ~~Earth exploration-satellite (passive)~~ ~~Space research (passive)~~ SPACE RESEARCH (passive) S5.522	**18.6-18.8** EARTH EXPLORATION-SATELLITE (passive) FIXED S5.YYY FIXED-SATELLITE (space-to-Earth) ~~S5.523~~ S5.XXX MOBILE except aeronautical mobile SPACE RESEARCH (passive) S5.522	**18.6-18.8** EARTH EXPLORATION-SATELLITE (passive) FIXED S5.YYY FIXED-SATELLITE (space-to-Earth) ~~S5.523~~ S5.XXX MOBILE except aeronautical mobile ~~Earth exploration-satellite (passive)~~ ~~Space research (passive)~~ SPACE RESEARCH (passive) S5.522

Note that this modification will align the allocations across all three Regions. Therefore the table can be included in Article S5 as:

18.6-22.21 GHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
18.6-18.8	EARTH EXPLORATION-SATELLITE (passive) FIXED S5.YYY FIXED-SATELLITE (space-to-Earth) S5.XXX MOBILE except aeronautical mobile SPACE RESEARCH (passive)	
	S5.522	

SUP ASP/20/284

S5.523

Reasons: Replaced by S5.XXX.

ADD ASP/20/285

S5.XXX In the band 18.6-18.8 GHz the power flux-density produced by a fixed-satellite system at the Earth's surface shall be limited to a value of –95 dB(W/m^2) across the 18.6-18.8 GHz band, allowing a 3 dB exceedance for 5% of the time everywhere.

ADD ASP/20/286

S5.YYY In the band 18.6-18.8 GHz the total input power delivered to the antenna of a fixed-service station shall be limited to 0 dBW across the 200 MHz band. Additionally fixed service stations should use transmitting antennas with good radiation patterns taking into account Recommendation ITU-R F.699.

Agenda item 1.19

1.19 to consider the report of the Inter-conference Representative Group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

A Principles for consideration of BSS replanning

Submitted by the following administrations:

Bhutan (Kingdom of), Brunei Darussalam, China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

Introduction

The above-mentioned administrations have the following observations related to consideration of BSS replanning at WRC-2000:

- The replanning studies presented to the final meeting of the Inter-conference Representative Group (IRG-5) provide a good indication that BSS-BSS compatibility can be satisfactorily addressed for Region 3 countries. Some further refinement of these studies to take account of the orbit position preferences indicated in Circular Letter CR/132 can be expected before WRC-2000.
- The IRG-5 studies have however indicated a number of, as yet, unresolved compatibility issues in relation to other services and other Region compatibility.

  To allow administrations to evaluate the impact of any potential incompatibility identifications, reports on other service and other Region compatibility studies shall be provided before WRC-2000. In the case of FSS networks, this identification should be provided down to FSS network level.

  ASP/20/287

It is proposed that WRC-2000 should decide that it can undertake BSS replanning for Regions 1 and 3.

If the Conference decides to perform BSS replanning:

1 For Region 3 countries (for which the downlink band 11.7-12.2 GHz is allocated for BSS) replanning should provide 12 channels.

2 The Asia-Pacific Telecommunity (APT) supports the use of the channel raster b) in general for BSS replanning for Region 3 countries [p. 54 of Document IRG99-5/24(Rev.4)]. In some cases the use of channel raster d) might be necessary.

3 The APT supports the use of channel bandwidths larger than the reference bandwidth of 27 MHz, while retaining the existing channel spacing (i.e. 38.36 MHz) provided that there is no adverse impact on adjacent channel protection and the protection of space operation in the guardband.

4 Planning should be based on digital operation (except for “existing” analogue assignments).

5 Under principle 3 of Annex 1 to Resolution 532 (WRC-97) existing systems should be protected during any replanning.

6 The APT propose the adoption of orbital offsets of ±0.2 degrees from the initial orbital position in order to achieve a substantial reduction in the feeder-link incompatibilities. The offset orbital position should be deemed as the assigned nominal orbital position.

7 In the BSS-77 and BSS-97 (WRC-97) Plans, many large countries have multiple beams. APT supports the use of composite beams for the purpose of BSS replanning on the basis of specific advice from the concerned administrations.

8 The APT supports protection of the existing BSS systems prior to WRC-97 at the same levels as adopted at WARC SAT-77, that after WRC-97 prior to WRC-2000 at the level as adopted at WRC-97, and the reduced protection ratios for digital BSS systems as shown in Table 1.

TABLE 1

Protection ratios for replanning

Category	**Type of wanted emission**	**Applicable protection ratios (overall/down/up in dB)**			
		Interfering analogue		**Interfering digital**	
		Co-channel	**Adjacent channel**	**Co-channel**	**Adjacent channel**
“Existing” systems prior to WRC-97	**Analogue**	30/31/40	14/15/21	30/31/40	14/15/21
(Prior to 27/10/97)	**Digital**	30/31/40	14/15/21	30/31/40	
“Existing” systems after WRC-97	**Analogue**	23/24/30	15/16/22	23/24/30	15/16/22
Prior to WRC-2000	**Digital**	23/24/30	15/16/22	23/24/30	-
Plan assignments at WRC-2000	**Digital**	23/24/30	15/16/22	20/21/27	-

9 The APT supports the conclusion in IRG regarding the allowable EPM degradation, as under:

a) in the case of “existing” assignments/systems, no positive reference EPM is degraded below –0.45 dB and no negative reference EPM is degraded by more than 0.45 dB. The reference EPM values are those of the WRC-97 reference situation as evolved since;

b) in case of “planned” assignments, no negative reference EPM below –0.45 dB.

Test points with very low EPM (less than about –10 dB) can be ignored for the purpose of the replanning.

10 The APT supports the idea that the interference levels into the plateau of the antenna radiation patterns, which is for example below –35 dB, is negligible and they should not be taken into account in the BSS-BSS interference calculation.

Reasons: The APT is in agreement with the methodology developed by IRG for replanning of the BSS-97 Plan. This is reflected in the above proposal.

11 The APT supports the methodology in selecting the orbital position, channel arrangement and polarization that IRG has developed [Document IRG99-5/24(Rev.4)]. The draft Plan developed according to the IRG methodology starting from the orbital positions described in Circular Letter CR/132 (5 January 2000) should be the baseline Plan at the Conference. It should be noted that the orbital positions for feeder link and downlink have to be aligned.

12 In addition to “existing systems” (as defined in Principle 3 of Annex 1 to Resolution 532), systems which have completed Part B of Appendices S30/S30A and which have provided Due Diligence information in accordance with Resolution 49 (WRC-97) prior to a cut-off date (to be defined during WRC-2000) should be taken into account in replanning.

It may also be possible to take into account a limited number of Part A published, but still under coordination, Appendices S30/S30A Article 4 networks which are already in operation (or in final stages of implementation) for which Due Diligence information in accordance with Resolution 49 (WRC-97) has been received by the Bureau. Such networks may only enter the Plans after completing coordination. The consideration of such networks needs to take into account the impact on the possibility of achieving a successful outcome to the replanning.

13 Planning should ensure compatibility between the BSS in Regions 1 and 3 and services having allocations in the planned bands in all three Regions. In particular Region 3 administrations are of the opinion that the compatibility issue between Region 1 BSS to Region 3 FSS in the band 12.2-12.5 GHz should be adequately addressed.

14 Should WRC-2000 decide to adopt any revisions to the BSS Plans, consideration should be given to the need to develop an acceptable mechanism to deal with any “unresolved cases” of incompatibility identified during this replanning. Draft Resolution [ASP/XXX] is in the attachment.

15 Should WRC-2000 decide to adopt any revisions to the BSS Plans, networks filed under Article 4 of Appendices S30/S30A which were not included in the replanning shall continue to be processed after WRC-2000 in the same date order of receipt which they had prior to the replanning.

16 It may be acceptable to consider a mechanism to permit the adjustment of these filings as a result of changes brought about by the replanning.

17 In considering proposals WRC-2000 should consider both the technical and regulatory aspects of the proposals.

ATTACHMENT 1

ADD ASP/20/288

DRAFT RESOLUTION [ASP/XXX] (WRC-2000)

Consequential action related to Regions 1 and 3 BSS replanning following WRC-2000

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-97 has adopted a revision of the broadcasting-satellite service (BSS) Plans for Regions 1 and 3 providing capacity for all new countries in accordance with Resolutions **524 (WARC-92)** and **531 (WRC-95)**;

b) that several countries requested that a replanning be undertaken in order to increase the Plan capacity so as to provide a channel capacity large enough to permit the economical development of a broadcasting-satellite system;

c) the large number of applications which have been submitted under Article 4 of Appendices **S30/S30A** for modifications involving additions to the Plans;

d) the rights of all Member States to equitable access to the spectrum allocated to satellite broadcasting, and that Article 44 of the Constitution provides, *inter alia*, that “Members shall bear in mind that radio frequencies and the geostationary-satellite orbit are limited natural resources and that they must be used rationally, efficiently and economically, in conformity with the provisions of the Radio Regulations, so that countries or groups of countries may have equitable access to both”,

noting

that WRC-2000 has undertaken replanning of BSS assignments in the Appendices **S30/S30A** Plan of Regions 1 and 3 in accordance with decisions taken at WRC-2000,

resolves

1 that consideration should be given to the need to develop an acceptable mechanism to deal with any “unresolved cases” of incompatibility identified during this replanning;

2 that guidelines to govern this mechanism are contained in Annex 1 (to be developed by WRC-2000 based on contributions by administrations);

3 that networks filed under Article 4 of Appendices **S30/S30A** which were not included in the replanning shall continue to be processed after WRC-2000 in the same date order of receipt which they had prior to the replanning.

B Other issues related to agenda item 1.19

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Viet Nam (Socialist Republic of)

ASP/20/289

1 Capacity for future requirements

A significant proportion of the BSS orbital and frequency resource should be kept free from planning. This resource, to be earmarked for future additional requirements, should be distributed all over the orbital arc to the extent possible, so as to be easily accessible by all countries.

2 Maintenance of Section A 2) *c)* of Annex 7 of Appendix S30

The use of the 12.2-12.7 GHz band is allocated to different service applications in Regions 2 and 3, some of which would have sharing difficulties. The APT feels that subsection A 2) *c)* of Annex 7 of Appendix S30 serves a useful purpose and should not be suppressed.

3 Subregional systems

The APT view is that planning in Region 3 should be based on Resolution 532 (WRC-97). Many APT member countries support subregional systems, however, a definition for such systems could not be agreed. The APT noted the difficulties encountered by WRC-97 in defining such systems and agreed that a specific definition was not a prerequisite for the implementation of these systems.

C Regions 1 and 3 compatibility issues

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Compatibility between Region 1 BSS and Region 3 FSS

ASP/20/290

No additional BSS assignments of Region 1 in the band 12.2-12.5 GHz (after WRC-97) shall be located at orbital positions in the range from 34° E to 200° E.

Some limited exceptions might need to be made for additional assignments to a strictly limited number of Region 1 administrations viz. TKM, KAZ and KGZ (all at 44° E), MNG (74° E) and RUS (110° E)[1] which already have WRC-97 Plan assignments in this frequency range and which may receive additional assignments under Resolution 532 (WRC-97).

Reasons: Increasing BSS channel assignments in Region 1 could increase usage of the 12.2-12.5 GHz band. If this occurs it will translate into more constraints on the use of FSS in this band in Region 3

Compatibility issues were intensively discussed in WRC-97. Resolution 73 (WRC-97) asks BR to identify incompatibility issues between Region 1 BSS and Region 3 FSS. However it does not guarantee compatibility between Region 1 BSS and Region 3 FSS. In view of this, the participants from Region 3 at IRG-2 meeting raised this issue. The IRG-2 (Document IRG98-2/10) decision on the issue is reproduced in the following:

*5.4.3 In selecting orbital positions/channels, considerations to be given to the sharing issues between BSS and FSS in Region 3, in particular, to attempt not to put any further constraints to the present use and to attempt not to impose undue constraints on future development of FSS in that Regions. (See also Resolution **73 (WRC-97)**.)*

It is noted that application of this limitation would assist in reducing the number of potential Region 1 BSS-Region 3 FSS incompatibility cases identified in the Resolution 532 (WRC-97) replanning studies.

[1] A limited additional number of Region 1 BSS assignments (i.e. SEY, POL, and UAE as proposed by IRG99-5) may be accepted for the purpose of the replanning provided that these assignments are fully compatible with the existing Region 3 FSS assignments.

ASP/20/291

“Super primary” status given in S5.487 of the Radio Regulations to Region 1 BSS assignments eastward than 34° E (after WRC-97) against Region 3 FSS in the band 12.2-12.5 GHz should be removed.

Some limited exceptions should be made for existing assignments and additional assignments made in the replanning process to a strictly limited number of Region 1 administrations viz. TKM, KAZ, KGZ (all at 44° E), MNG (74° E) and RUS (110° E)[2] which already have WRC-97 Plan assignments in this frequency range.

Reasons: S5.487 states that:

“In the band 11.7-12.5 GHz in Regions 1 and 3, the fixed, fixed-satellite, mobile, except aeronautical mobile, and broadcasting services, in accordance with their respective allocations, shall not cause harmful interference to broadcasting-satellite stations operating in accordance with the provisions of Appendix ***S30****.”*

This footnote for Regions 1 and 3, appear to provide a “super-primary” status to the broadcasting-satellite service over the other primary services sharing the same band (FSS, BS, FS), in that they require the latter services not to cause harmful interference on the broadcasting-satellite stations operating in accordance with the provisions of Appendix S30. This footnote is also the subject of a Rule of Procedure, which concludes that, if, despite the application of the procedures of Appendix S30, harmful interference is actually caused on a broadcasting-satellite station, the station in the other service shall cease this interference (see also S5.43).

On the other hand the provision No. 4.3.17 of Article 4 of Appendix S30 states:

“The Bureau shall publish in a special section of its weekly circular the information received under § 4.3.14 together with the names of any administrations with which the provisions of this Article have been successfully applied. The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan.”

It is understood that footnote S5.487 is applicable to the modifications/additions to the BSS Plans which are in conformity with Appendix S30 and also provides super primary status for Region 1 BSS systems against Region 3 unplanned services (including FSS). This means that Region 1 Article 4 systems may cause more constraints for future Region 3 FSS. (See also S5.43.)

---

2 A limited additional number of Region 1 BSS assignments (i.e. SEY, POL, and UAE as proposed by IRG99-5) may be accepted for the purpose of the replanning provided that these assignments are fully compatible with the existing Region 3 FSS assignments.

D Regions 1 and 3 BSS-BSS compatibility/Region 3 BSS arc concept

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

ASP/20/292

No additional BSS assignments of Region 1 in the band 11.7-12.2 GHz (after WRC-97) should be located in the orbital location from 34° E to 200° E (160° W) during the replanning process.

Some limited exceptions might need to be made for additional BSS assignments under Resolution 532 (WRC-97) to a limited number of Region 1 administrations viz. BLR (38° E), UKR (38° E), MDA (44° E), TJK (38.2° E), UZB (44° E), KGZ (44° E), TKM (44° E), KAZ (44° E), RUS (110° E) and MNG (74° E)[3] which already have WRC-97 Plan assignments in this frequency range in the orbital location from 34° E to 200° E.

Reasons: Increasing channel assignments for BSS replanning exercise in Region 1 might mean that the 11.7-12.2 GHz band is heavily used. Eastward expansion of Region 1 BSS would place additional constraints on Region 3 BSS. This might translate into more constraints for BSS in this band in Region 3.

[3] A limited additional number of Region 1 BSS assignments (i.e. FIN, LVA, LTU and TUR as proposed by IRG99-5) may be accepted for the purpose of the replanning, provided that these assignments are fully compatible with the Region 3 BSS assignments.

E Concept of Region 3 arc for BSS Plan

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

ASP/20/293

Although there is no definition of the Region 3 orbital arc in ITU texts, it is proposed to define the Region 3 arc in the orbital position from 34° E to 200° E (160° W), noting that some orbital locations within this arc have been assigned to some Region 1 and 2 countries.

In establishing a buffer between Regions 1 and 3, the following procedures should be established:

- No new Article 4 systems of Region 1 and using a frequency in the band 11.7-12.5 GHz should occupy a nominal orbital position further east than 34° E.
- If an Article 4 system of a Region 1 country is to be located within the orbital arc from 34° E to 200° E (160° W) on an orbital position not coincident with any nominal orbital position in the WRC-BSS-97 Plan, it shall not include any Region 3 country in the service area and shall involve a reduction in the e.i.r.p. compared to that appearing in the Plan for the assignment before the modification similar to that which was applied in deriving Table 3 of the Rules of Procedure related to Annex 7 of Appendix S30.

Agenda item 1.20

1.20 to consider the issues related to the application of Nos. **S9.8, S9.9** and **S9.17** and the corresponding parts of Appendix **S5** with respect to Appendices **S30** and **S30A**, with a view to possible deletion of Articles 6 and 7 of Appendices **S30** and **S30A**, also taking into consideration Recommendation **35 (WRC-95)**

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Viet Nam (Socialist Republic of)

Introduction

The above APT Members support Approach A and the example given in Annex 1 of Chapter 5 of the CPM Report, with the exception of the modifications to the Report as shown in the following proposals:

MOD ASP/20/294

S9.17 *f)*~~[13]~~ for any specific earth station or typical mobile earth station in frequency bands above 1 GHz allocated with equal rights to space and terrestrial services, in respect of terrestrial stations, where the coordination area of the earth station includes the territory of another country, with the exception of the coordination under No. **S9.15** and Article 4 of Appendix S**30A** and the coordination of earth stations in the broadcasting-satellite service which are subject to Appendix **S30** Plans;

Reasons: Clarification as to the actual coordination requirements.

MOD ASP/20/295

TABLE S5-1 *(continued)*

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.17** GSO, non-GSO/ terrestrial	A specific earth station or a typical mobile earth station in frequency bands above 1 GHz allocated with equal rights to space and terrestrial services in respect of terrestrial stations, where the coordination area of the earth station includes the territory of another country, with the exception of the coordination under No. **S9.15** and Article 4 of Appendix **S30A** and the coordination of earth stations in the broadcasting-satellite service which are subject to Appendix **S30** Plans	Any frequency band allocated to a space service, except those mentioned in the Plans in Appendix **S30A**	The coordination area of the earth station covers the territory of another administration	Appendix **S7** (for earth stations in the radiodetermination-satellite service (RDSS) in the bands: 1 610-1 626.5 MHz, 2 483.5-2 500 MHz and 2 500-2 516.5 MHz, see Remarks column) 1) The coordination area of aircraft earth stations is determined by increasing the service area by 1 000 km with respect to the aeronautical mobile service (terrestrial) or 500 km with respect to terrestrial services other than the aeronautical mobile service	NOTE – For RDSS earth stations, a uniform coordination distance of 400 km corresponding to an airborne earth station shall be used. In cases where the earth stations are all ground-based, a coordination distance of 100 km shall be used

Reasons: Clarification as to the actual coordination requirements.

MOD ASP/20/296

S9.18 *h)* for any ~~transmitting~~ station of a terrestrial service in the bands referred to in No. **S9.17** within the coordination area of an earth station, in respect of this earth station, with the exception of the coordination under Nos. **S9.16** and **S9.19**;

Reasons: In order to include receiving terrestrial station in the procedure of coordination with respect to the transmitting earth station.

MOD ASP/20/297

6.1.1 Before notifying to the Bureau a frequency assignment to a terrestrial transmitting station or to a transmitting earth station in the fixed-satellite service, an administration shall initiate coordination with any other administration having a frequency assignment to a broadcasting-satellite station in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated if:

– the necessary bandwidths of the two transmissions overlap; *and*

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

MOD ASP/20/298

7.1.4 If, after studying the information published under § 7.1.3, any administration is of the opinion that interference which may be unacceptable may be caused to its frequency assignments in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated, it shall, within ~~three~~ four months after the date of the Weekly Circular publishing the information listed in Appendix **S4**, Annexes 2A and 2B, send its comments to the administration concerned. A copy of these comments shall also be sent to the Bureau. If no such comments are received from an administration within the period mentioned above, it may be assumed that that administration has no basic objections to the planned fixed-satellite or broadcasting-satellite network(s) of that system of which details have been published.

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

MOD ASP/20/299

7.2.1 Before an administration notifies to the Bureau or brings into use any frequency assignment to a space station in the fixed-satellite service (space-to-Earth), or in the broadcasting-satellite service not subject to a Plan, it shall seek the agreement of any other administration having a frequency assignment in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated, if:

a) any portion of the necessary bandwidth proposed for the space station in the fixed-satellite or broadcasting-satellite service falls within the necessary bandwidth associated with the frequency assignment to the broadcasting-satellite station; *and*

b) the power flux-density which would be produced by the proposed fixed-satellite or broadcasting-satellite assignment exceeds the value specified in Annex 4.

For this purpose, the administration seeking agreement shall send to any other such administration the information listed in Appendix **S4**, Annexes 2A and 2B.

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

MOD ASP/20/300

7.2.3 An administration seeking coordination under § 7.2.1 shall at the same time send to the Bureau a copy of the request for coordination together with the information listed in Appendix **S4**, Annexes 2A and 2B and the name(s) of the administration(s) whose agreement is sought. The Bureau shall determine on the basis of Annex 4 which frequency assignments in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated are considered to be affected. The Bureau shall include the names of those administrations with the information received from the administration seeking coordination and shall publish this information in a special section of its Weekly Circular, together with a reference to the Weekly Circular in which details of the satellite system were published in accordance with Section I of this Article. When the Weekly Circular contains such information, the Bureau shall so inform all administrations by circular telegram.

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

MOD ASP/20/301

7.3.1 Any frequency assignment to a space station in the fixed-satellite or in the broadcasting-satellite service not subject to a Plan shall be notified to the Bureau:

a) if the use of the frequency concerned is capable of causing harmful interference to a frequency assignment of another administration which is in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated[10]; *or*

b) if it is desired to obtain international recognition of the use of the frequency.

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

MOD ASP/20/302

7.4.5.2 where appropriate, with respect to its conformity with the provisions of § 7.2.1, relating to the coordination of the use of the frequency assignment with the other administrations concerned having a frequency assignment in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated;

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

MOD ASP/20/303

7.4.9.1 Where the Bureau finds that the coordination procedures mentioned in § 7.4.5.2 have been successfully completed with all administrations whose frequency assignments in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated may be affected, the frequency assignment shall be recorded in the Master Register. The date of receipt by the Bureau of the notice shall be entered in Column 2d.

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

[10] The attention of administrations is specifically drawn to the application of § 7.2.1 above.

MOD ASP/20/304

7.4.9.4 Where the notifying administration resubmits the notice and the Bureau finds that the coordination procedure mentioned in § 7.4.5.2 has been successfully completed with all administrations whose frequency assignments in conformity with the appropriate Regional Plan or for which corresponding Plan modification procedure has been initiated may be affected, the frequency assignment shall be recorded in the Master Register. The date of receipt of the original notice by the Bureau shall be entered in Column 2d. The date of receipt by the Bureau of the resubmitted notice shall be entered in the Remarks Column.

Reasons: Article 4 modifications should be included in the procedure. See Resolution 73 (WRC-97).

Agenda item 1.21

1.21 to consider the Report from the Radiocommunication Bureau on results of the analysis in accordance with Resolution **53 (WRC-97)** and take appropriate actions

Submitted by the following administrations:

Bhutan (Kingdom of), China (People's Republic of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

ASP/20/305

The APT supports achievement of compatibility in all three Regions. The APT supports the Bureau analysing fully the effect of all assignments which were received before 27 October 1997 but which had not been processed at the time of WRC-97.

The APT will determine its position after analysing the Report of the Radiocommunication Bureau under Resolution 53 (WRC-97).

Agenda item 4

4 in accordance with Resolution **95 (WRC-97)**, to review the resolutions and recommendations of previous conferences with a view to their possible revision, replacement or abrogation

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

Introduction

The APT has reviewed resolutions and recommendations of past conferences and offers the following proposals to suppress resolutions and recommendations.

SUP ASP/20/306

RESOLUTION 5

Relating to technical cooperation with the developing countries in the study of propagation in tropical areas[1]

Reasons: This is a very old Resolution of 1979, and should be abrogated in view of BDT activities.

SUP ASP/20/307

RESOLUTION 8 (Rev.Mob-87)

Implementation of the changes in allocations in the bands between 4 000 kHz and 27 500 kHz[1]

Reasons: Obsolete. All actions completed on 31 December 1998.

SUP ASP/20/308

RESOLUTION 14

Relating to the transfer of technology[1]

Reasons: Obsolete in view of the current BDT activities.

SUP ASP/20/309

RESOLUTION 23 (WRC-95)

Provisions applicable to the frequency assignments in the non-planned bands below 28 000 kHz

Reasons: Obsolete as from 1 January 1999 (date of entry of the simplified RR).

SUP ASP/20/310

RESOLUTION 24 (WRC-95)

Review of the provisions of the Constitution relating to revisions of the Radio Regulations

Reasons: Obsolete in view of the action taken by PP-98.

SUP ASP/20/311

RESOLUTION 46 (Rev.WRC-97)

Interim procedures for the coordination and notification of frequency assignments of satellite networks in certain space services and the other services to which certain bands are allocated[1]

Reasons: Obsolete as from 1 January 1999 (matter covered by Article S9 and Appendix S5), provided that appropriate revision may be necessary on the following texts, which contain references to Resolution 46: Appendix S5, Resolutions 27, 49, 70, 121, 127, 130, 132, 215, 219, 538, 716, 728, Recommendation 104 and other relevant resolutions/recommendations.

SUP ASP/20/312

RESOLUTION 50 (WRC-97)

Interval between world radiocommunication conferences

Reasons: Obsolete in view of PP-98 action.

SUP ASP/20/313

RESOLUTION 52 (WRC-97)

Provisional application of Nos. S11.24 and S11.26 of the Radio Regulations adopted by WRC-97 with regard to high altitude platform stations

Reasons: Obsolete as from 1 January 1999.

SUP ASP/20/314

RESOLUTION 54 (WRC-97)

Implementation of Resolution 46 (Rev.WRC-97)

Reasons: Obsolete as from 1 January 1999.

SUP ASP/20/315

RESOLUTION 63

Relating to the protection of radiocommunication services against interference caused by radiation from industrial, scientific and medical (ISM) equipment[1]

Reasons: Obsolete, action completed (see Recommendation ITU-R SM.1056).

SUP ASP/20/316

RESOLUTION 70 (WARC-92)

Establishment of standards for the operation of low-orbit satellite systems

Reasons: Obsolete in view of current situation.

NOC ASP/20/317

RESOLUTION 132 (WRC-97)

Use of the bands 18.8-19.3 GHz and 28.6-29.1 GHz by networks operating in the fixed-satellite service

Reasons: Transitional measure as this is still current.

SUP ASP/20/318

RESOLUTION 411 (WARC-92)

Implementation of the new provisions applicable in the frequency bands allocated exclusively to the aeronautical mobile (OR) service between 3 025 kHz and 18 030 kHz[1]

Reasons: Obsolete from 15 December 1997.

SUP ASP/20/319

RESOLUTION 518 (Orb-88)

Country/geographical area symbols used in Appendices S30/30 and S30A/30A

Reasons: Obsolete (in current practices).

SUP ASP/20/320

RESOLUTION 524 (WARC-92)

Future consideration of the Plans for the broadcasting-satellite service in the band 11.7-12.5 GHz (Region 1) and the band 11.7-12.2 GHz (Region 3) in Appendix S30/30 and the associated feeder-link Plans in Appendix S30A/30A

Reasons: SUP seems to have been satisfied by the WRC-97 Plan revision.

SUP ASP/20/321

RESOLUTION 534 (WRC-97)

Implementation of Annex 5 to Appendix S30 and Annex 3 to Appendix S30A of the Radio Regulations

Reasons: All activities completed.

SUP ASP/20/322

RECOMMENDATION 32 (Orb-88)

International monitoring of emissions originating from space stations[1]

Reasons: This is an old text adopted in 1988. Recommendation 36 (WRC-97) covers the same subject. ITU-R studies are well under way (see Recommendation ITU-R SM.1054). Recommendation 32 can be abrogated.

SUP ASP/20/323

RECOMMENDATION 61

Relating to technical standards for the assessment of harmful interference in the frequency bands above 28 MHz[1]

Reasons: Only Recommendation ITU-R S.1150 established, but no other since 1979. Recommendation 61 should be abrogated.

SUP ASP/20/324

RECOMMENDATION 316 (Rev.Mob-87)

Use of ship earth stations within harbours and other waters under national jurisdiction[1]

Reasons: Obsolete (INMARSAT MoU).

SUP ASP/20/325

RECOMMENDATION 503 (Rev.WRC-97)

High-frequency broadcasting

Reasons: Obsolete (implemented, observed by administrations).

SUP ASP/20/326

RECOMMENDATION 518 (HFBC-87)

HF broadcast receivers

Reasons: Obsolete in view of current practices.

SUP ASP/20/327

RECOMMENDATION 521 (WRC-95)

Technical parameters for use in the revision of Appendices S30/30 and S30A/30A in response to Resolution 524 (WARC-92)

Reasons: Agree WRC-97 revision used these values and appropriate modification to Annex 5 of Appendix 30 and Annex 3 of Appendix 30A were performed.

SUP ASP/20/328

RECOMMENDATION 606 (Mob-87)

The possibility of reducing the band 4200-4400 MHz used by radio altimeters in the aeronautical radionavigation service[1]

Reasons: Studies complete.

SUP ASP/20/329

RECOMMENDATION 720 (WRC-95)

The flexible and efficient use of the radio spectrum by fixed and some mobile services in the MF and HF bands using block allocations for adaptive systems

Reasons: Obsolete, Recommendations ITU-R SM.1266 and F.1337 approved.

Agenda item 7.2

7.2 to recommend to the Council items for inclusion in the agenda for the next WRC, and to give its views on the preliminary agenda for the subsequent Conference and on possible agenda items for future conferences

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Iran (Islamic Republic of), Japan, Malaysia, Maldives (Republic of), Mongolia, Myanmar (Union of), Pakistan (Islamic Republic of), Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of)

Introduction

APT proposes the agenda for WRC-02/03 and the preliminary agenda for the WRC-04/05 as follows:

SUP ASP/20/330

RESOLUTION 721 (WRC-97)

Agenda for the 1999 World Radiocommunication Conference

SUP ASP/20/331

RESOLUTION 722 (WRC-97)

Preliminary agenda for the 2001 World Radiocommunication Conference

ADD ASP/20/332

RESOLUTION [XXX] (WRC-2000)

Agenda for the 2002/03 World Radiocommunication Conference

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that, in accordance with Nos. 118 and 126 of the Convention (Geneva, 1992), the general scope of the agenda for a world radiocommunication conference should be established four years in advance and a final agenda shall be established two years before the conference;

b) Article 13 of the Constitution (Geneva, 1992) regarding the competence and scheduling of world radiocommunication conferences and Article 7 of the Convention (Geneva, 1992) regarding their agendas;

c) the relevant resolutions and recommendations of previous world administrative radio conferences (WARCs) and world radiocommunication conferences (WRCs),

recognizing

a) that this Conference has identified a number of urgent issues requiring further examination by WRC-02/03;

b) that in preparing this agenda, many proposals from administrations could not be included and have had to be deferred to future conference agendas,

resolves

to recommend to the Council that a world radiocommunication conference be held in 2002/03 for a period of four weeks, with the following agenda:

1 to take appropriate action in respect of those urgent issues that were specifically requested by WRC-2000;

2 on the basis of proposals from administrations and the Report of the Conference Preparatory Meeting, taking account of the results of WRC-2000, and with due regard to the requirements of existing and future services in the bands under consideration, to consider and take appropriate action in respect of the following topics:

2.1 requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, taking into account Resolution **26 (Rev.WRC-97)**;

2.2 consideration of Article **S25** concerning the amateur and amateur-satellite services;

Reasons: The member societies have after lengthy consultation reached agreement on a draft text for a new Article S25.

2.3 issues related to Appendix **S3**:

2.3.1 to consider the results of studies regarding the boundary between spurious and out-of-band emissions;

2.3.2 to consider the inclusion of general limits for out-of-band emissions in the Radio Regulations, in particular with regard to whether it is appropriate to do so, taking into account the results of ITU-R studies;

2.4 review of the frequency and channel arrangements in the MF and HF bands allocated on a primary basis to the maritime mobile service, taking into account the use of new digital technology, in accordance with Resolution **347 (WRC-97)**;

2.5 review of allocations to the space research service (deep space) (space-to-Earth) and the inter-satellite service in the frequency range 32-32.3 GHz with a view to improving the sharing conditions between these services;

2.6 to consider Appendix **S13** and Resolution **331 (Rev.WRC-97)** with a view to their deletion and, if appropriate, consider related changes to Chapter **SVII** and other provisions of the Radio Regulations as necessary, taking into account the continued transition to the Global Maritime Distress and Safety System (GMDSS) and the review of the operational procedures after the introduction of the GMDSS;

Reasons: The GMDSS was fully implemented on 1 February 1999. However, false distress alerts and unnecessary relays frequently take place with regard to satellite EPIRB, DSC, etc. Especially false distress alert and unnecessary relays from ship stations by HF band's DSC are frequently reported.

2.7 to consider the results of studies, and take necessary actions relating to:

2.7.1 the exhaustion of the maritime mobile service identity numbering resource (Resolution **344 (WRC-97)**);

2.7.2 shore-to-ship distress communication priorities (Resolution **348 (WRC-97)**);

2.8 consideration of the need to realign the allocations to the amateur, amateur-satellite and broadcasting services around 7 MHz on a worldwide basis, taking into account Recommendation **718 (WARC-92)**;

Reasons: This matter has been deferred since WARC-92.

2.9 examination of the adequacy of the frequency allocations for HF broadcasting from about 4 MHz to 10 MHz, taking into account the seasonal planning procedures adopted by WRC-97, and to consider bringing forward the date of availability of the HF bands allocated by WARC-92 to the broadcasting service in response to Resolution **29 (WRC-97)** and Resolution **537 (WRC-97)**;

2.10 to consider the regulatory and technical provisions for the quasi-geostationary-satellite networks;

2.11 to examine the spectrum requirements for telemetry, tracking, and telecommand of FSS networks operating with service links in the frequency bands above 17 GHz;

2.12 to consider the provision of up to 3 MHz of frequency spectrum for the implementation of telecommand links in the space research and space operation services in the frequency range between 100 MHz and 1 GHz, taking into account Resolution **723 (WRC-97)**;

2.13 to consider provision of up to 6 MHz of frequency spectrum to the Earth exploration-satellite service (active) in the frequency band 420-470 MHz, in accordance with Resolution **727 (WRC-97)**;

2.14 to consider the possible allocations in the frequency bands above 275 GHz, taking into account Resolution **[AAA] (WRC-2000)**;

Reasons: This item has already been considered by Working Party 7D and studies will be completed by the year 2002.

2.15 to consider the preferred frequency bands and allocation for future mobile communication systems beyond IMT-2000, e.g. the fourth generation system;

Reasons: The studies of the fourth generation system have already been started by ITU-R Working Party 8F. Similar to the study activities at Task Group 8/1, the studies will be conducted intensively and promptly. Therefore, the early completion of the studies on the preferred frequency bands and the bandwidth for the fourth generation systems is expected before WRC-02/03.

2.16 to consider the allocations on a worldwide basis for feeder links in bands around 1.4 GHz to the non-GSO MSS with service links operating below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolution **127 (WRC-97)**;

Reasons: ITU-R studies under Resolution 127 (1.4 GHz), showed that sharing in the 1 390-1 393 MHz and 1 429-1 432 MHz bands was theoretically feasible, but the study group requested hardware testing be performed to validate the theory. These tests will be completed prior to WRC-02/03 at which time allocations should be considered.

2.17 to consider the additional allocations on a worldwide basis for downlinks in the 401-406 MHz to the non-GSO MSS, taking into account the results of ITU-R studies conducted in response to Resolution **219 (WRC-97)**;

Reasons: It is timely to consider the studies and allocations at WRC-02/03. The band sharing study is expected to be complete prior to WRC-02/03 and it will be ready to review at that WRC.

2.18 to consider regulatory provisions and possible frequency allocations for various services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution **122 (Rev.WRC-2000)** and Resolution **[XXX] (WRC-2000)** relating to frequency bands above 3 GHz allocated exclusively for terrestrial radiocommunications;

Reasons: ITU-R has concluded the urgency of additional allocation for HAPS in Region 3 and regulatory considerations regarding the operating procedure of HAPS and further studies for allocations can be considered. The studies according to the Resolution 122 and Resolution [XXX] are expected to be complete prior to WRC-02/03.

2.19 to review footnote **S5.332** in the frequency band 1 215-1 300 MHz concerning the Earth exploration-satellite (active) service and other services, taking into account Resolution **[BBB] (WRC-2000)**;

Reasons: ITU-R studies shows that sharing between spaceborne SAR and the radionavigation satellite-service is feasible and that sharing between spaceborne SAR and radiolocation service (ground radar not including wind profiler radar (WPR)) is feasible. Recent ITU-R studies show that there is a possibility that mitigation techniques could be applied to WPR. This study will have been completed by 2002.

2.20 to review all EESS and SRS allocations between 35-38 GHz in accordance with Resolutions **[CCC] (WRC-2000)**, **[DDD] (WRC-2000)** and **[EEE] (WRC-2000)**;

Reasons:

– ITU-R studies have shown the feasibility of sharing between spaceborne radio altimeter and scatterometer and radiolocation systems. Currently, sharing between spaceborne precipitation radar and radiolocation systems is being studied, and it is prospected that this study will have been completed by 2002. It is necessary to review exclusion of footnote S5.551A from the spectrum that is used for spaceborne precipitation radar among 35.5-35.6 GHz which had not any restriction before WRC-97.

– ITU-R studies shows that protection criteria for spaceborne passive sensor in 36-37 GHz is established. However, the sharing condition is not defined and spaceborne sensor is not properly protected. This study for sharing conditions will have been completed by 2002.

– ITU-R studies show that pfd limits in 37.5-38 GHz defined by FSS and FS sides have much impact on some SRS earth stations. Sharing studies have been conducted in ITU-R and they will have been completed by 2002.

2.21 to consider results of ITU-R studies in accordance with Resolution **[ZZZ] (WRC-2000)** and take appropriate action on this subject;

Reasons: It is necessary to take appropriate actions by WRC-2000 in accordance with Resolution [ZZZ] to ensure spectrum availability and protection for AMS(R)S in the bands where No. S5.357A applies and GMDSS in the bands where No. S5.353A applies.

2.22 to consider the additional allocations to MSS in the 1-3 GHz band;

Reasons: ITU-R studies under Resolution 220, showing that the frequency band 1 559-1 567 MHz can not be shared co-frequency between MSS (space-to-Earth) and RNSS. In order to respond to Resolution 213, which requires matching downlink allocation, consideration should be given for an alternative downlink allocation to the MSS at WRC-02/03.

3 to examine the revised ITU-R Recommendations incorporated by reference in the Radio Regulations which have been communicated by the 2002/03 Radiocommunication Assembly, in accordance with Resolution **28 (WRC-95)**; and decide whether or not to update the corresponding references in the Radio Regulations, in accordance with the principles contained in the Annex to Resolution **27 (Rev.WRC-97)**;

4 to consider such consequential changes and amendments to the Radio Regulations as may be necessitated by the decisions of the Conference;

5 in accordance with Resolution **95 (WRC-97)**, to review the resolutions and recommendations of previous conferences with a view to their possible revision, replacement or abrogation;

6 to review, and take appropriate action on, the Report from the Radiocommunication Assembly submitted in accordance with Nos. 135 and 136 of the Convention (Geneva, 1992);

7 to identify those items requiring urgent action by the radiocommunication study groups in preparation for WRC-04/05;

8 in accordance with Article 7 of the Convention (Geneva, 1992):

8.1 to consider and approve the Report of the Director of the Radiocommunication Bureau on the activities of the Radiocommunication Sector since WRC-2000;

8.2 to recommend to Council items for inclusion in the agenda for WRC-04/05, and to give its views on the preliminary agenda for the 2006/07 World Radiocommunication Conference and on possible agenda items for future conferences,

invites Council

to finalize the agenda and arrange for the convening of WRC-02/03 and to initiate as soon as possible the necessary consultation with Member States,

instructs the Director of the Radiocommunication Bureau

to make the necessary arrangements to convene meetings of the Conference Preparatory Meeting and to prepare a Report to WRC-02/03,

instructs the Secretary-General

to communicate this Resolution to concerned international and regional organizations.

ADD ASP/20/333

RESOLUTION [YYY] (WRC-2000)

Preliminary agenda for the 2004/05 World Radiocommunication Conference

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that, in accordance with Nos. 118 and 126 of the Convention (Geneva, 1992), the general scope of the agenda for the WRC-2004/05 should be established four years in advance;

b) Article 13 of the Constitution (Geneva, 1992) regarding the competence and scheduling of world radiocommunication conferences and Article 7 of the Convention (Geneva, 1992) regarding their agendas;

c) the relevant resolutions and recommendations of previous world administrative radio conferences (WARCs) and world radiocommunication conferences (WRCs),

resolves to give the view

that the following items should be included in the preliminary agenda of WRC-04/05, to be held in late 2004/05:

1 to take appropriate action in respect of those urgent issues that were specifically requested by WRC-02/03;

2 on the basis of proposals from administrations and the Report of the Conference Preparatory Meeting, and taking account of the results of WRC-02/03, to consider and take appropriate action in respect of the following topics:

2.1 Resolution **528 (WARC-92)**;

2.2 potential for sharing around 4 300 MHz between radio altimeters and space-based passive earth sensors;

2.3 additional allocations on a worldwide basis for the non-GSO MSS with service links operating below 1 GHz in accordance with Resolution **728 (WRC-97)**;

2.4 use of frequency adaptive systems in the MF/HF bands in accordance with Resolution **729 (WRC-97)**;

2.5 allocation of the frequency band 14.5-14.8 GHz to the FSS (Earth-to-space) in Region 3 (expansion of FSS to include other than feeder links of the broadcasting-satellite service);

3 to examine the revised ITU-R Recommendations incorporated by reference in the Radio Regulations which have been communicated by the 2004/05 Radiocommunication Assembly, in accordance with Resolution **28 (WRC-95)**; and decide whether or not to update the corresponding references in the Radio Regulations, in accordance with the principles contained in the Annex to Resolution **27 (Rev.WRC-97)**;

4 to consider such consequential changes and amendments to the Radio Regulations as may be necessitated by the decisions of the Conference;

5 in accordance with Resolution **95 (WRC-97)**, to review the resolutions and recommendations of previous conferences with a view to their possible revision, replacement or abrogation;

6 to review, and take appropriate action on, the Report from the Radiocommunication Assembly submitted in accordance with Nos. 135 and 136 of the Convention (Geneva, 1992);

7 to identify those items requiring urgent action by the radiocommunication study groups;

8 in accordance with Article 7 of the Convention (Geneva, 1992):

8.1 to consider and approve the Report of the Director of the Radiocommunication Bureau on the activities of the Radiocommunication Sector since WRC-02/03;

8.2 to recommend to Council items for inclusion in the agenda for the 2006/07 World Radiocommunication Conference,

invites Council

to consider the views given in this Resolution,

instructs the Director of the Radiocommunication Bureau

to make the necessary arrangements to convene meetings of the Conference Preparatory Meeting and to prepare a Report to WRC-04/05,

instructs the Secretary-General

to communicate this Resolution to concerned international and regional organizations.

ADD ASP/20/334

RESOLUTION [AAA] (WRC-2000)

Possible frequency allocations above 275 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that there is no Table of Frequency Allocations in the region above 275 GHz;

b) that the radio astronomy service and services to use spaceborne and terrestrial sensing systems for Earth observation needs to receive signals in the frequency region above 275 GHz to satisfy scientific demands;

c) that the radio astronomy service and services to use spaceborne and terrestrial sensing systems for Earth observation have already developed techniques to receive radio signals above 275 GHz;

d) that the frequency range above 275 GHz may be useful for active services in the future;

e) that, although active services have no actual demands to use the frequency range above 275 GHz at present, when active services have actual demands frequency allocations should be made to those services so as to satisfy their purpose in a similar way below 275 GHz;

f) that the frequency allocations needed above 275 GHz has already been considered by ITU-R, and the CPM Report for WRC-2000 describes that the studies will be completed by the year 2002,

resolves

that, on the basis of proposals from administrations and taking into account the results in ITU-R study groups and the Conference Preparatory Meeting (CPM-02/03), the 2002/03 World Radiocommunication Conference should consider the allocation of frequency bands above 275 GHz,

invites ITU-R study groups

to complete the necessary studies, as a matter of urgency, taking into account the present and future frequency needs, with a view to presenting, at the appropriate time, the technical information likely to be required as a basis for the work of the Conference,

instructs the Secretary-General

to bring this Resolution to the attention of the international and regional organizations concerned.

ADD ASP/20/335

RESOLUTION [BBB] (WRC-2000)

Use of the frequency band 1 215-1 300 MHz by spaceborne synthetic aperture radar

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the frequency band 1 215-1 300 MHz is allocated to the primary service of radiolocation service;

b) that the frequency band 1 215-1 260 MHz is allocated to the primary service of the radionavigation satellite (space-to-Earth);

c) that the frequency band 1 215-1 300 MHz is allocated to primary services of the Earth exploration-satellite (active) and the space research (active) services with footnote **S5.332**;

d) that performance criteria and interference criteria for spaceborne synthetic aperture radar (SAR) within 1 215-1 300 MHz is included in Recommendation ITU-R SA.1166-2;

e) that the sharing between spaceborne SAR and radionavigation satellite is feasible based upon Recommendation ITU-R SA.1347;

f) that the sharing between spaceborne SAR and terrestrial radar is feasible based upon Recommendation ITU-R SA.516-1;

g) that co-frequency sharing with wind profiler radar (WPR) is not feasible and frequency modulated pulsed WPR should be outside 1 215-1300 MHz based upon Recommendation ITU-R SA.1282;

h) that guidelines for the appropriate selection of design parameters for active spaceborne sensors are contained in Recommendation ITU-R SA.1280;

i) that the Report of the CPM to WRC-97 concluded that sharing between spaceborne SAR and terrestrial radar not including WPR is feasible;

j) that recent ITU-R studies show the possibility that filtering techniques can be applied not only to terrestrial radar but also to WPR;

k) that spaceborne SAR is a very useful tool to monitor Earth environment and disaster with day-and-night and all-weather observation capability;

l) that the application of spaceborne SAR is to monitor Earth environment and disaster such as forest including tropical rain forest, land use, earth resources, disaster areas such as flood, sea ice extent, oil contamination, deformation of land surface due to earthquakes and volcano eruptions, observation under dry surfaces and others,

resolves

1 to invite ITU-R to study sharing between spaceborne SAR and other services including mitigation techniques so that spaceborne SAR can be operated with good quality data processing, worldwide observation and continuity of observation and so that other services can be operated satisfactorily;

2 that WRC-02 would review the results of these studies and consider revision of footnote **S5.332**.

ADD ASP/20/336

RESOLUTION [CCC] (WRC-2000)

Use of the frequency band 35.5-35.6 GHz by spaceborne precipitation radar

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the frequency band 35.5-36.0 GHz is expanded from 35.5-35.6 GHz with footnote **S5.551** and allocated to the Earth exploration-satellite (active) service as a primary service with footnote **S5.551A** and allocated to meteorological aids and radiolocation services on a primary basis;

b) that the frequency band 35.5-35.6 GHz is allocated to radars located on spacecraft on a primary basis with no restriction based upon **S5.551** before WRC-97;

c) that performance criteria and interference criteria for spaceborne precipitation radar within 35.5-36.0 GHz is included in Recommendation ITU-R SA.1166-2;

d) that spaceborne precipitation radar is very important to measure rain rate globally and study global water circulation;

e) that minimum observable rain rate around 35 GHz is less than 0.2 mm/h;

f) that combination between part of 35.5-35.6 GHz and 13.4-13.75 GHz is very useful to measure rain rate precisely;

g) that studies have shown that sharing between spaceborne active sensors and radiolocation systems in 35.5-36 GHz is feasible as shown in section 5.7.2.1 of Chapter 5 of the CPM-97 Report,

resolves

1 to invite ITU-R to study sharing between the spaceborne precipitation radar and other services in 35.5-35.6 GHz;

2 that WRC-02 would review the results of these studies and consider exclusion of footnote **S5.551A** in 35.5-35.6 GHz used for spaceborne precipitation radar.

ADD ASP/20/337

RESOLUTION [DDD] (WRC-2000)

Sharing between spaceborne passive sensors and other services in 36-37 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that 36-37 GHz is allocated to the Earth exploration-satellite service (passive) as a primary service;

b) that 36-37 GHz is also allocated to fixed and mobile services as a primary service;

c) that 36-37 GHz is very important to study global water circulation;

d) that performance and the interference criteria for satellite passive sensing near 37 GHz are contained in Recommendations ITU-R SA.1028-1 and ITU-R SA.1029-1,

requests ITU-R

1 to develop the technical and operational characteristics of the passive spaceborne sensor systems in this band;

2 to develop the criteria by which passive spaceborne sensor systems can share with other services in 36-37 GHz,

resolves

1 that the results of the studies be included in one or more recommendation(s);

2 that the results of above studies would be reflected at WRC-02/03.

ADD ASP/20/338

RESOLUTION [EEE] (WRC-2000)

Sharing criteria and mitigation technique between the space research service and the fixed-satellite service in the 37.5-38 GHz bands

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the 37-38 GHz and 40-40.5 GHz bands are allocated to the space research service on a primary basis;

b) that 37.5-40.5 GHz is allocated to the fixed-satellite service (FSS) (space-to-Earth) on a primary basis;

c) that frequency sharing between the space research services and other services in the 37-38 GHz and 40-40.5 GHz bands is shown in Question ITU-R 211/7 (1993);

d) that studies on sharing between the fixed service and other services in the band 37-40 GHz are requested to determine whether the power flux-density limits included in Article **S21** of the Radio Regulations adequately protect terrestrial services from FSS networks in Resolution **133 (WRC-97)**;

e) that space research systems will be implemented in the 37-38 GHz and 40-40.5 GHz bands;

f) that protection criteria for the space research service in the 37-38 GHz and 40-40.5 GHz bands is shown in Recommendation ITU-R SA.1396;

g) that more than 500 MHz is needed for high data rate transmission systems between the moon and the Earth;

h) that the CPM-99 Report indicates that there may be interference from FSS to some space research service earth stations which can receive data more than 500 Mbps from the moon and, if required, studies on mitigation techniques shall be brought to the attention of a competent conference,

resolves

1 to invite ITU-R to study, as a matter of urgency, appropriate sharing criteria and mitigation techniques in the case of the moon-to-Earth data transmission system which send more than 500 Mbps;

2 that the results of above studies should be reflected at WRC-02/03.

RESOLUTION 86

Coordination and notification procedures for satellite networks

Introduction

Resolution 86 (PP-98) resolves to request WRC-2000 and subsequent WRCs to continually review and update the advance publication, coordination and notification procedures, including the associated technical characteristics, and the related Appendices of the Radio Regulations, so as to ensure that they reflect the latest technologies, as well as to achieve additional simplification and cost savings for the Radiocommunication Bureau and administrations.

Submitted by the following administrations:

Bhutan (Kingdom of), Korea (Republic of), Indonesia (Republic of), Japan, Maldives (Republic of), Mongolia, Myanmar (Union of), New Zealand, Papua New Guinea, Philippines (Republic of the), Democratic People's Republic of Korea, Singapore (Republic of), Sri Lanka (Democratic Socialist Republic of), Thailand, Tonga (Kingdom of), Viet Nam (Socialist Republic of)

ADD ASP/20/339

Appendix S30, Article 11, Section 11.3 - Below the table showing correspondence between channel numbers and assigned frequencies, **add**:

NOTE - Assigned frequency = 11 708.3 + 19.18*n (MHz) where n is channel number.

ADD ASP/20/340

Appendix S30, Article 10, Table 4 - Below the table showing correspondence between channel numbers and assigned frequencies, **add**:

NOTE - Assigned frequency = 12 209.42 + 14.58*n (MHz) where n is channel number.

Submitted by the following administrations:

ADD ASP/20/341

RESOLUTION EEE (WRC-2000)

Use of the broadcasting-satellite service (sound) in the 2 535-2 655 MHz band in Region 3 by non-GSO satellite systems

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the band 2 535-2 655 MHz is allocated to the broadcasting-satellite service (sound) in certain Region 3 countries (WARC-92);

b) that satellite technology has now advanced to the stage where systems are technically and economically feasible using highly elliptical orbits where the operational arc is restricted to small windows of the sky by operational means, thereby ensuring that service is provided to countries in medium to high latitudes using elevation angles that are higher than would be provided from the geostationary orbit;

c) that for medium to high latitude countries, satellite systems in the broadcasting-satellite service in highly elliptical orbits can be used for the delivery of high quality, spectrally efficient broadcasting-satellite (sound) service to portable and mobile terminals;

d) that systems in the broadcasting-satellite service (sound) in the 2 535-2 655 MHz band in Region 3 using the orbit type described in *considering b)* have been communicated to ITU and are expected to be brought into use in the near future;

e) that, in general, interference between non-GSO satellites using the type of orbit described in *considering b)* and terrestrial services is reduced as the elevation angle from the service area to the satellite is increased;

f) that there are other co-primary allocations in this frequency band for which no coordination criteria and methodology has been established,

resolves

1 that any broadcasting-satellite service (sound) using non-GSO orbits brought into operation in the 2 535-2 655 MHz band in Region 3 shall be limited to those employing highly elliptical orbits, as described in *considering b)*;

2 that the use of the band 2 535-2 655 MHz by the broadcasting-satellite service (sound) for which advance publication information has been received after the end of WRC-2000 is subject to the application of the provisions of Nos. **S9.12** and **S9.13**, and **S22.2** does not apply except in the cases identified in *resolves* 3;

3 that in the band 2 535-2 655 MHz, the provisions of **S22.2** shall continue to apply between non-geostationary systems and geostationary networks for which complete Appendix **S4** coordination information, or notification information, is considered as having been received by the Bureau by the end of WRC-2000. Administrations having geostationary-satellite networks under coordination prior to the end of WRC-2000 shall cooperate to the maximum extent possible to coordinate pursuant to No. **S9.13** with non-geostationary satellite networks for which notification information has been received by the Bureau prior to that date, with a view to reaching results acceptable to all the parties concerned;

4 that systems in the broadcasting-satellite service (sound) using non-GSO satellites shall be limited to national services unless prior approval has been received to extend the service area to include the territories of other administrations;

5 that the calculation methodology and interference criteria to be employed in evaluating the interference shall be based upon relevant ITU-R Recommendations or as agreed to by concerned administrations,

invites ITU-R

to conduct the necessary studies in *resolves* 5 and report the results to the next conference.

MOD ASP/20/342

APPENDIX S5

Identification of administrations with which coordination is to be effected or agreement sought under the provisions of Article S9

TABLE S5-1

Technical conditions for coordination
(see Article **S9**)

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.11** GSO~~,~~ non-GSO /terrestrial	~~A~~ For a space station in the ~~BSS~~ broadcasting-satellite service in any band shared on an equal primary basis with terrestrial services and where the ~~BSS~~ broadcasting-satellite service is not subject to a Plan, in respect of terrestrial services	620-790 MHz 1 452-1 492 MHz 2 310-2 360 MHz 2 520-2 655 MHz 2 655-2 670 MHz 12.5-12.75 GHz (Region 3) 17.7-17.8 GHz (Region 2) 21.4-22 GHz (Region 1 and 3) 40.5-42.5 GHz 84-86 GHz	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	
No. **S9.19** Terrestrial/ GSO~~,~~ non-GSO	A transmitting station in a terrestrial service in a frequency band shared on an equal primary basis with the BSS, except where the service is subject to the Plans in Appendix **S30**	Bands listed in No. **S9.11**	i) Necessary bandwidths overlap; and ii) the pfd of the terrestrial station at the edge of the BSS service area exceeds the permissible level	Check by using the assigned frequencies and bandwidths	

Reasons: As discussed in the CPM Report the provisions of Nos. S9.11 and S9.19 specify the coordination procedure between “a space station” and the terrestrial services, however Table S5-1 in Appendix S5 indicates the procedures only between “GSO/terrestrial”. This proposal is consistent with the solution provided in the CPM Report to resolve this inconsistency by modifying the reference to “GSO/terrestrial” in the first column of Table S5-1 of Appendix S5 for Nos. S9.11 and S9.19 to “GSO, non-GSO/terrestrial”. These modified provisions could be applied to satellite networks for which the API or the request for coordination has been received after a specific date.

MOD ASP/20/343

TABLE S5-1 (*continued*)

Reference of Article S9	Case	Frequency bands (and Region) of the service for which coordination is sought	Threshold/condition	Calculation method	Remarks
No. **S9.12** 1) Non-GSO/ non-GSO	A station in a satellite network using a non-geostationary-satellite orbit in the frequency bands for which a footnote refers to **S9.11A** or **S9.12** in respect of any other satellite network using a non-geostationary-satellite orbit, with the exception of coordination between earth stations operating in the opposite direction of transmission	2 535-2 655 MHz See also Table S5-2	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	
No. **S9.12** 2) Non-GSO/ GSO	A station in a satellite network using a non-geostationary-satellite orbit in the frequency bands for which a footnote refers to **S9.11A** or **S9.12** in respect of any other satellite network using the geostationary-satellite orbit, with the exception of coordination between earth stations operating in the opposite direction of transmission	2 535-2 655 MHz See also Table S5-2	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	
No. **S9.13** GSO/non-GSO	A station in a satellite network using the GSO in the frequency bands for which a footnote refers to No. **S9.11A** or **S9.13** in respect of any other satellite network using a non-GSO, with the exception of coordination between earth stations operating in the opposite direction of transmission	2 535-2 655 MHz See also Table S5-2	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	

Reasons: Consequential changes…

PROPOSALS FOR THE WORK OF THE CONFERENCE

ALLOCATIONS OF THE BANDS 1.5/1.6 GHz TO THE MOBILE-SATELLITE SERVICE (AGENDA ITEM 1.10)

1 Introduction

At WRC-2000, in agenda item 1.10, the delegations will be invited to consider the results of ITU-R studies carried out in accordance with Resolution 218 (WRC-97), "Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service" and to take appropriate action on this subject.

Resolution 218 was adopted at WRC-97 in order to achieve the most flexible and practical use of the generic MSS allocations in the 1.5/1.6 GHz bands, while satisfying the spectrum requirements for distress, urgency and safety communications. Resolution 218 requested ITU-R to study the future spectrum requirements of the GMDSS and the AMS(R)S and the feasibility of prioritization, real time pre-emptive access and, if necessary, interoperability between different mobile-satellite systems providing or with the potential to provide the GMDSS and the AMS(R)S.

No conclusion was reached in ITU-R Working Party 8D on the future spectrum needed for AMS(R)S communications with priority 1 to 6 of Article S44, two different figures are given in the CPM-99 text taken from the results of two studies. No studies were carried out on the future spectrum requirements for distress, urgency and safety communications of the GMDSS. Furthermore, no studies have been carried out regarding the feasibility of implementing prioritization and pre-emption between different MSS networks. However, it has been concluded and recorded in the CPM-99 text that the capacity planning approach, adopted in the multilateral coordination process, satisfactorily provides the spectrum requirements of the GMDSS and the AMS(R)S.

2 Proposal

In order to ensure that future spectrum requirements of AMS(R)S communications with priority 1 to 6 of Article S44 and for distress, urgency and safety GMDSS communications will be made available, the UAE Administration proposes to replace Resolution 218 with a new Resolution (Resolution XXX) to be incorporated by a new reference in the present footnotes S5.353A and

S5.357A. The UAE Administration also proposes no further modifications to the relevant provisions S5.353A and S5.357A and to keep the existing priority for safety services unchanged in the bands where provisions S5.353A and S5.357A apply. These existing provisions ensure ample spectrum for the GMDSS and the AMS(R)S.

MOD UAE/21/1

S5.353A In applying the procedures of No. **S9.11A** to the mobile-satellite service in the bands 1 530-1 544 MHz and 1 626.5-1 645.5 MHz, priority shall be given to accommodating the spectrum requirements for distress, urgency and safety communications of the Global Maritime Distress and Safety System (GMDSS). Maritime mobile-satellite distress, urgency and safety communications shall have priority access and immediate availability over all other mobile satellite communications operating within a network. Mobile-satellite systems shall not cause unacceptable interference to, or claim protection from, distress, urgency and safety communications of the GMDSS. Account shall be taken of the priority of safety-related communications in the other mobile-satellite services. (~~See Resolution **218 (WRC-97)**.)~~The provisions of Resolution **XXX (WRC-2000)** shall apply.)

MOD UAE/21/2

S5.357A In applying the procedures of No. **S9.11A** to the mobile-satellite service in the bands 1 545-1 555 MHz and 1 646.5-1 656.5 MHz, priority shall be given to accommodating the spectrum requirements of the aeronautical mobile-satellite (R) service providing transmission of messages with priority 1 to 6 in Article **S44**. Aeronautical mobile-satellite (R) service communications with priority 1 to 6 in Article **S44** shall have priority access and immediate availability, by pre-emption if necessary, over all other mobile-satellite communications operating within a network. Mobile-satellite systems shall not cause unacceptable interference to, or claim protection from, aeronautical mobile satellite (R) service communications with priority 1 to 6 in Article **S44**. Account shall be taken of the priority of safety-related communications in the other mobile-satellite services. (~~See Resolution **218 (WRC-97)**.)~~The provisions of Resolution **XXX (WRC-2000)** shall apply.)

Reasons: The coordination process is satisfactorily providing spectrum for the GMDSS and AMS(R)S currently and is expected to do so in the future. The strengthening of current provisions through a new resolution will provide for the required priority for safety services in the bands where provisions S5.353A and S5.357A apply.

ADD UAE/21/3

RESOLUTION XXX (WRC-2000)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that the World Radiocommunication Conference (Geneva, 1997) allocated the bands 1 525-1 559 MHz (space-to-Earth) and 1 626.5-1 660.5 MHz (Earth-to-space) to the mobile-satellite service (MSS) to facilitate the assignment of spectrum to multiple mobile-satellite systems in a flexible and efficient manner;

b) that the World Radiocommunication Conference (Geneva, 1997) adopted footnotes Nos. **S5.353A** and **S5.357A** giving priority to accommodating the spectrum requirements for distress, urgency and safety communications of the Global Maritime Distress and Safety System (GMDSS) and the aeronautical mobile-satellite (R) service communications AMS(R)S with priority 1 to 6 of Article **S44**;

c) that the results of the studies conducted by ITU-R pursuant to Resolution **218 (WRC-97)** were inconclusive with regard to the spectrum needed for future AMS(R)S traffic;

d) that the technical considerations for sharing satellite network resources between the MSS (other than the AMS(R)S) and the AMS(R)S service have been developed by ITU-R (see Recommendation ITU-R M.1233),

further considering

e) that global and regional mobile-satellite systems are being multilaterally coordinated in the bands 1 525-1 559 MHz (space-to-Earth) and 1 626.5-1 660.5 MHz (Earth-to-space) and that the ITU Radio Regulations provide the framework for such multilateral agreements;

f) that such coordination agreements are currently based on the capacity planning approach, under which administrations periodically coordinate access to the amount of spectrum needed to accommodate their validated requirements;

g) that the capacity planning approach is currently satisfying the spectrum requirements of the GMDSS and the AMS(R)S and will continue to do so in the future;

h) that in the long term, to ensure that the actual validated spectrum requirements of the GMDSS and the AMS(R)S are met, it might be necessary to enforce the coordination priority provided to accommodate the spectrum requirements for distress, urgency and safety communications of GMDSS and AMS(R)S communications with priority 1 to 6 of Article **S44**, under footnotes **S5.353A** and **S5.357A** by the provisions of a resolution,

recognizing

a) that Appendix **S15.2** identifies the use of the bands 1 530-1 544 MHz (space-to-Earth) and 1 626.5-1 645.5 MHz (Earth-to-space) for distress and safety purposes in the maritime mobile-satellite service as well as for routine non-safety purposes;

b) that priority access and immediate availability of spectrum for distress, urgency and safety communications of the GMDSS and AMS(R)S communications with priority 1 to 6 of Article **S44** is important for the safety of life;

c) that setting aside dedicated spectrum segments for distress, urgency and safety communications will lead to the inefficient usage of spectrum, since the allocated spectrum would only be used on rare occasions;

d) that the coordination process currently allows for the orderly development of MSS systems and applications while meeting the requirements for distress, urgency and safety communications of GMDSS and for the transmission of messages with priority 1 to 6 of Article **S44** of AMS(R)S;

e) that administrations are urged during the coordination to limit the spectrum used to the minimum needed to provide in a satisfactory manner the necessary services and that Members shall endeavour to apply the latest technical advances as soon as possible, as stated in No. 195 of the Constitution of the International Telecommunication Union (Geneva, 1992),

resolves

1 that in the frequency coordination of the mobile-satellite services in the bands 1 525-1 559 and 1 626.5-1 660.5 MHz, administrations will ensure accommodation of the verified spectrum needed for distress, urgency and safety communications of the Global Maritime Distress and Safety System (GMDSS) of Article **S32** and **S33** in the bands where **S5.353A** applies and the aeronautical-mobile-satellite (R) service AMS(R)S communications with priority 1 to 6 of Article **S44** in the bands where **S5.357A** applies;

2 that administrations will ensure the use of the latest technical advances in order to reduce the total spectrum required and thus maximize the spectral efficiency of the MSS.

SUP UAE/21/4

RESOLUTION 218 (WRC-97)

Use of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz by the mobile-satellite service

Reasons: One option identified by CPM-99 to ensure that future spectrum requirements for the AMS(R)S and the GMDSS will be available is by adding or modifying the relevant regulatory provisions. Strengthening the provisions (S5.353A and S5.357A) through the incorporation by reference of the new resolution (Resolution XXX) would achieve the most efficient use of the generic allocations in 1.5/1.6 GHz.

Considering the effect of strengthening of current provisions by the proposed Resolution XXX and the workable procedure of capacity planning, the need to determine the spectrum requirements of GMDSS and AMS(R)S or to further study the feasibility of inter-system prioritization and pre-emption becomes no longer required. Therefore, Resolution 218 is suppressed.

PROPOSALS FOR THE WORK OF THE CONFERENCE

ADDITIONAL ALLOCATION FOR MSS IN 1-3 GHz RANGE
(AGENDA ITEM 1.9)

1 Introduction

The need for additional spectrum for the MSS in the 1-3 GHz range has been one of the main issues at the last two conferences. Studies have been submitted to the ITU-R that provide estimates for the MSS spectrum requirements in the 1-3 GHz range.

A study, based on conservative assumptions for MSS traffic growth and for realistic MSS spectral efficiency, includes a forecast for the minimum demand for MSS spectrum of between 2 x 125 MHz and 2 x 145 MHz by year 2010, depending on the geographic region selected. These forecasts are consistent with the estimates of spectrum demand presented in Report ITU-R [IMT.SPEC]. Report ITU-R [IMT.SPEC] deals with the satellite component of IMT-2000.

All studies indicate that there is a requirement for additional MSS spectrum in the 1-3 GHz frequency range to meet the demand for the future MSS, including the satellite component of IMT-2000, and, therefore, all existing worldwide MSS allocations should be retained for MSS use.

The current allocations for the MSS in the 1-3 GHz band are about 2 x 115 MHz, with some variations among the ITU regions. It should, however, be noted that most of these allocations are used by other services in most countries, significantly reducing the actual availability of those allocations for the MSS, and, in many countries, these allocations are not available for the MSS.

This issue was addressed at WARC-92 by the adoption of Resolution 213. The ITU-R is requested in Resolution 213 to study the feasibility of allocating parts of the bands 1 675-1 710 MHz (space-to-Earth) and 1 492-1 525 MHz (Earth-to-space) to the MSS. In Region 2, these bands are already allocated to the MSS.

2 Provisions of Resolution 213 (Rev.WRC-95)

The study proposed in Resolution 213 is divided into two parts consisting of:

1) Technical and operational studies of the feasibility of sharing between the MSS (Earth-to-space) and the meteorological satellite (space-to-Earth) (MetSat), meteorological aids (MetAids), fixed and mobile services (FS and MS) in the band 1 675-1 710 MHz.

2) Identification and investigation of a potentially suitable MSS downlink band that may assist in meeting the spectrum requirements of the MSS.

2.1 Sharing feasibility in the band 1 675-1 710 MHz

It has been concluded in the ITU-R studies that sharing is feasible between MSS (Earth-to-space) and the MetSat (space-to-Earth), MetAids, FS and MS services in the band 1 675-1 690 MHz. The results of the ITU-R studies were reported to WRC-95 and the ITU-R concluded that it was feasible to make limited worldwide allocations to the MSS in this band. However, the resolution was revised at WRC-95 to increase the range of frequency band options for the complementary downlink allocations. The ITU-R studies to date have reconfirmed the above results and the ITU-R concluded that MSS uplink allocations can be made specifically in the band 1 683-1 690 MHz where no MetAids operations take place. However, appropriate separation distances will be required between MetSat and MSS earth stations in the band 1 683-1 690 MHz, as determined by coordination under No. S9.11A.

2.2 Suitable matching MSS downlink allocation

As a result of Resolution 213, two potential bands (1 517-1 525 MHz) and (1 559-1 567 MHz) were identified at WRC-97 for consideration as complementary MSS downlink allocations.

2.2.1 Use of the band 1 559-1 567 MHz as an associated downlink band for MSS operations within the band 1 675-1 710 MHz

Due to the lack of formal ITU-R studies at the conference, Resolution 220 was approved at WRC-97 and the ITU-R directed to study the feasibility of using portions of the band 1 559-1 610 MHz as a possible MSS downlink allocation complementing the uplink allocation 1 675-1 710 MHz.

The frequency range under consideration, 1 559-1 567 MHz, is currently allocated on a co-primary basis to the RNSS (space-to-Earth) and the ARNS. Additionally, the band is allocated to the FS in some countries.

It has been concluded, in up-to-date studies conducted in response to Resolution 220 (WRC-97), that a finding of sharing feasibility between the MSS (space-to-Earth) and the ARNS/RNSS cannot be made without imposing conditions on the MSS. A complete and acceptable demonstration is needed:

- of how the MSS signals would be monitored;
- of how aircraft would be notified of the ensuing anomalies arising from MSS interference;
- and of the manner in which the MSS signal parameters would be recorded and archived.

The ITU-R studies also examined the matter of burden sharing between the ARNS/RNSS and the MSS (space-to-Earth) and concluded that the burden sharing concept is not applicable in the 1 559-1 610 MHz band, particularly due to the fact that the ARNS/RNSS are safety services.

2.2.2 Use of the band 1 517-1 525 MHz as an associated downlink band for MSS operations within the band 1 675-1 710 MHz

One of the methods used to identify potential downlink bands is to examine the existing regional MSS allocations and to assess the feasibility of extending these bands to other regions. Therefore, this allocation of 1 517-1 525 MHz was considered since it is part of a Region 2 MSS allocation in the band 1 492-1 525 MHz.

Currently, the band 1 492-1 525 MHz is allocated to the FIXED and MOBILE services on a primary basis worldwide; however, the aeronautical mobile service is excluded from mobile services in Region 1 only. In Region 2, the use of the band by the aeronautical mobile service for telemetry has been given priority over other uses by the MS, as recorded in footnote S5.343.

In order to consider the band 1 517-1 525 MHz as a suitable downlink MSS allocation, the sharing feasibility with other co-primary services can be determined by reviewing the results of relevant ITU-R sharing studies.

1) Sharing with fixed services

The sharing scenario between the MSS (space-to-Earth) and the terrestrial fixed services (FS) would involve only two methods of interference:

1) MSS transmitters interfering into FSS receiver;

2) FS transmitters interfering into MSS receiver.

Recommendations ITU-R M.1141-1 and ITU-R M.1142-1 are applicable for the first mode of interference and summarize the resultant coordination thresholds and coordination procedures to be followed in the event that the thresholds are exceeded. Also Recommendation ITU-R M.1319 gives detailed methodology for frequency coordination between MSS (space-to-Earth) and FS receivers. In the case of the MS, RR No. S5.348 specifies, for Japan, the coordination threshold as a power flux spectral density of –150 dBW/m^2/4 kHz (for all angles of arrival) in order to protect the use of the MS in Japanese territory.

The second mode of interference can be minimized to an acceptable level by maintaining a certain separation distance between FS transmitters and MES. In any case, there will be interference to the MES but this should not be a cause for objections by the FS operators.

2) Sharing with aeronautical telemetry

Relevant studies have shown that the power flux spectral density (pfsd) generated by MSS satellites at aeronautical telemetry receiving stations must be limited to low levels in order to protect the telemetry receivers. As Recommendation ITU-R M.[8B/XA] (Document 8/53) provides the provisional coordination triggers for low and high satellite elevation angles, therefore, co-frequency, non-co-coverage operation is definitely possible since sufficient separation can be achieved between the operational areas of the aeronautical telemetry systems and the MSS coverage areas.

3 Proposal

In view of the above conclusions, the UAE Administration proposes additional MSS allocations of 2 x 7 MHz in the bands 1 492-1 525 MHz (space-to-Earth) and 1 675-1 690 MHz (Earth-to-space) as shown in the following modified frequency tables:

MOD UAE/22/1

1 350-1 525 MHz

1 492-1 525 FIXED MOBILE except aeronautical mobile MOBILE-SATELLITE (space-to-Earth) ADD S5.XXX S5.341 S5.342	**1 492-1 525** FIXED MOBILE S5.343 MOBILE-SATELLITE (space-to-Earth) S5.348A S5.341 S5.344 S5.348	**1 492-1 525** FIXED MOBILE MOBILE-SATELLITE (space-to-Earth) ADD S5.YYY S5.341 S5.348A

ADD UAE/22/2

S5.XXX The band 1 518-1 525 MHz is also allocated to the mobile-satellite (space-to-Earth) service on a primary basis.

S5.YYY The use of the band 1 518-1 525 MHz by the mobile-satellite service is subject to the condition that the power flux spectral density of emissions from MSS geostationary satellites at the aeronautical telemetry receiving station shall not exceed the pfsd levels given in the Recommendation ITU-R M.[8B/XA] (Document 8/53).

MOD UAE/22/3

1 660-1 710 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 675-1 690 METEOROLOGICAL AIDS FIXED METEOROLOGICAL-SATELLITE (space-to-Earth) MOBILE except aeronautical mobile MOBILE-SATELLITE (Earth-to-space) S5.341 ADD S5.ZZZ	**1 675-1 690** METEOROLOGICAL AIDS FIXED METEOROLOGICAL-SATELLITE (space-to-Earth) MOBILE except aeronautical mobile MOBILE-SATELLITE (Earth-to-space) S5.341 S5.377	**1 675-1 690** METEOROLOGICAL AIDS FIXED METEOROLOGICAL-SATELLITE (space-to-Earth) MOBILE except aeronautical mobile MOBILE-SATELLITE (Earth-to-space) S5.341 ADD S5.ZZZ

ADD UAE/22/4

S5.ZZZ Mobile-satellite systems operating in the band 1 683-1 690 MHz shall not cause harmful interference to earth stations of the meteorological-satellite service. To avoid causing harmful interference, mobile earth stations shall not operate except in a non-interfering signalling channel within the exclusion zones around the meteorological earth stations defined in Recommendation ITU-R SA.1158-2. The mobile-satellite system shall have position determination capabilities to ensure compliance with this provision.

Reasons: The need for additional allocation for MSS between the 1-3 GHz was highlighted in Resolution 213 (Rev.WRC-95) that has been on the agenda of subsequent World Radiocommunication Conferences. Moreover, CPM-99 has also indicated that if a suitable MSS downlink allocation cannot be found through the studies conducted under Resolution 220 (WRC-97), then every effort should be made to find a suitable MSS downlink allocation, taking into account the results of already available ITU-R relevant sharing studies. For WRC-2000, the preparatory work done on two agenda items namely 1.6.1 and 1.9, as reflected in the CPM Report, clearly points to the foreseen shortfall of 2 x 8 MHz of MSS spectrum by the year 2005.

Studies concluded prior to the earlier two WRCs have indicated the feasibility of making allocation in the 1 675-1 690 MHz for the MSS (Earth-to-space). Studies have also identified that sharing between MSS (space-to-Earth) and other existing services in the band 1 517-1 525 MHz is feasible taking into account the results of already available relevant ITU-R Recommendations concerning sharing criteria.

PROPOSALS FOR THE WORK OF THE CONFERENCE

CONTENTS

Proposals for agenda item 1.13.2

Agenda item 1.13.2 - To consider the inclusion in other frequency bands of similar limits in Articles S21 and S22, or other regulatory approaches to be applied in relation to sharing situations

Background

In accordance with the provisions of Resolutions 130 and 538, ITU-R has carried out technical studies of the power limits appearing in Articles S21 and S22 in relation to the sharing considerations among non-GSO and GSO FSS and GSO BSS systems. These studies were for satellite systems operating in the 10-30 GHz frequency range. The results of these studies are contained in Chapter 3 of the CPM Report to WRC-2000.

It is now evident that there is a growing interest in operating GSO and non-GSO systems in the frequency range 37.5-50.2 GHz. It is therefore timely, under agenda item 1.13.2, for WRC-2000 to address this matter.

Discussion

In section 3.2.4 of the CPM Report, the issue of GSO/non-GSO sharing outside of the frequency range 10-30 GHz is briefly discussed. In this brief discussion in section 3.2.4, the following salient points are made:

- in the frequency bands above 30 GHz, in the absence of current and imminent use by GSO and non-GSO systems, both types of operators should expect to exhibit flexibility in achieving the appropriate balance in the sharing environment;
- studies are required outside of the 10-30 GHz range which include both technical and regulatory approaches to establish the conditions for sharing between GSO and non-GSO systems.

Based on this advice in the CPM Report, and taking into account that there is an emerging interest in satellite systems to operate in the 40-50 GHz range, WRC-2000 should initiate studies for the GSO/non-GSO shared use of frequency bands in the 37.5-50.2 GHz range.

ADD CAN/24/115

RESOLUTION EEE (WRC-2000)

Frequency sharing in the range 37.5-50.2 GHz between GSO and non-GSO fixed-satellite systems

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that this Conference has made provisions for the operation of GSO and non-GSO satellite systems in the 10-30 GHz frequency range;

b) that there is an emerging interest in operating GSO and non-GSO satellite systems in the 37.5-50.2 GHz frequency range;

c) that there is a need to provide for the orderly development and implementation of new satellite technologies in the 37.5-50.2 GHz frequency range;

d) that systems based on the use of new technologies associated with both GSO and non-GSO satellite systems are capable of providing the most isolated regions of the world with high-capacity and low-cost means of communication;

e) that there should be equitable access to the radio-frequency spectrum and orbital resources in a mutually acceptable manner that allows for new entrants in the provision of services;

f) that the Radio Regulations must be sufficiently flexible to accommodate the introduction and implementation of innovative technologies as they evolve;

g) that the Radio Regulations state that in applying the provisions of Article **S22**, the level of accepted interference shall be fixed by agreement between the administrations concerned, using the relevant ITU-R Recommendations as a guide, but that these Recommendations have not yet been developed;

h) that the CPM Report to WRC-2000 stated that in the bands 37.5-50.2 GHz where there has been little or no deployment of satellite systems to date, both GSO and non-GSO operators should be expected to exhibit flexibility in achieving the appropriate balance in the sharing environment,

resolves

to urge administrations, in the application of Article **S22** to their GSO and non-GSO systems in the 37.5-50.2 GHz frequency range prior to WRC-03, to seek balanced sharing arrangements between these systems,

requests ITU-R

1 as a matter of urgency, to undertake the appropriate technical, operational and regulatory studies of sharing arrangements which achieve the appropriate balance between GSO and non-GSO systems;

2 to report the results of these studies to WRC-03.

Reasons: Due to the foreseen emergence of GSO and non-GSO satellite systems for operation in the 37.5-50.2 GHz frequency range, it is timely for ITU-R to undertake appropriate sharing studies.

PROPOSALS FOR THE WORK OF THE CONFERENCE

CONTENTS

Proposals for agenda item 1.2

Agenda item 1.2: To finalize remaining issues in the review of Appendix **S3** to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation **66 (Rev.WRC-97)** and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services.

Additional proposal for the modification of Recommendation 66

Background information

Canada supports the proposal to modify Recommendation 66 (Rev.WRC-97) that was submitted by CITEL (see proposal CAN/24/36). The following proposals by Canada are intended to recommend other revisions to clarify other aspects of the recommendation.

At WRC-97, Recommendation 66 was revised, including the concerns of the safety services. Following WRC-97, in carrying out the studies specified in Recommendation 66, ITU-R Task Group 1/5 advised the representatives of the safety services in Study Groups 4 and 8 of the need to undertake the requested studies related to the safety services. Representations of the safety services in Study Groups 4 and 8 concluded that because there is an ongoing programme to deal with interference to the safety services on a case-by-case basis, there is no need to participate in the studies flowing from Recommendation 66. Consequently, in updating the recommendation, the references to the safety services should be deleted.

Proposals

The following additional proposals are considered important to ensure that Recommendation 66 (Rev.WRC-97) is updated to reflect the needs of wireless technologies.

NOTE - The proposal for the revision of Recommendation 66 (Rev.WRC-97) shown below contains additional revisions to those proposed by CITEL and by CAN/24/36.

RECOMMENDATION 66 (Rev.WRC-~~97~~2000)

Studies of the maximum permitted levels of unwanted emissions

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that Appendix **S3** specifies the maximum permitted levels of spurious emissions, in terms of the mean power level of any spurious component supplied by a transmitter to the antenna transmission line;

b) that the principal objective of Appendix **S3** is to specify the maximum permitted levels of spurious emissions that, while being achievable, provide protection against harmful interference;

c) that excessive levels of unwanted emissions may give rise to harmful interference;

SUP CAN/24/82

d)

Reasons: The suppression of *considering d)* is consequential to the suppression of *recommends* 9 contained in IAP/14/83.

~~*e)*~~*d)* that while Appendix **S3** applies generally to the mean power of a transmitter and its spurious emissions, it also takes account of a variety of emissions where interpretation of the term "mean power", and thus its measurement, would be difficult, particularly in the cases of digital modulation broadband systems, pulsed modulation and narrow-band high-power transmitters;

f)

Reasons: See IAP/14/76.

~~*g)*~~*e)* that unwanted emissions from transmitters operating in space stations may cause harmful interference, particularly emissions from wideband amplifiers which cannot be adjusted after launch;

MOD CAN/24/83

~~*h)*~~*f)* that unwanted emissions may cause harmful interference to ~~safety services and~~ radio astronomy and space services using passive sensors;

Reasons: For the safety services, the studies and the resolution of problems which are related to interference by unwanted emissions are dealt with on a case-by-case basis as part of an ongoing programme in the ITU-R study groups. It is, therefore, not necessary to include the safety services in this Recommendation. Also, see IAP/14/77.

MOD CAN/24/84

~~*i)*~~*g)* that, for technical or operational reasons, more stringent spurious emission limits than the general limits in Appendix **S3** may be required to protect specific services, such as ~~safety services and~~ passive services in specific bands or situations;

Reasons: See the reason for the suppression of *considering d)*. Also, see IAP/14/78.

~~*j)*~~*h)* that broadband digital modulation may cause unwanted emissions at frequencies far from the carrier frequency,

noting

MOD CAN/24/85

a) that ~~safety services and~~ passive services have in many cases been allocated frequencies adjacent or close to those of services employing high-power transmitters;

Reasons: See the reason for the deletion of *considering f).*

b) that some administrations have adopted more stringent limits for spurious emissions than those specified in Appendix **S3**,

recommends that ITU-R

SUP CAN/24/86

1

Reasons: See IAP/14/80.

SUP CAN/24/87

2

Reasons: See IAP/14/81.

~~3~~1 continue the study of spurious emission levels in all frequency bands, emphasizing the study of those frequency bands, services and modulation techniques not presently covered by Appendix **S3**;

~~4~~2 study the question of unwanted emissions resulting from transmitters of all services and all modulation methods, and, on the basis of those studies, develop a Recommendation or Recommendations for maximum permitted levels of spurious emissions and out-of-band emissions;

~~5~~3 establish appropriate measurement techniques for unwanted emissions, where those techniques do not currently exist, including the determination of reference levels for wideband transmissions as well as the applicability of reference measurement bandwidths;

~~6~~4 study the reasonable boundary of spurious emissions and out-of-band emissions with a view to defining such a boundary in Article **S1**;

MOD CAN/24/88

~~7~~5 study those frequency bands and instances where, for technical or operational reasons, more stringent spurious emission limits than the general limits in Appendix **S3** may be required to protect ~~safety services and~~ passive services such as radio astronomy, and the impact on all concerned services of implementing or not implementing such limits;

Reasons: See the reason for the modification of *considering f).*

MOD CAN/24/89

~~8~~6 study those frequency bands and instances where, for technical or operational reasons, out-of-band limits may be required to protect ~~safety services and~~ passive services such as radio astronomy, and the impact on all concerned services of implementing or not implementing such limits;

Reasons: See the reason for the modification of *considering f)*. Also, see IAP/14/82.

SUP CAN/24/90

9

Reasons: See IAP/14/83.

MOD CAN/24/91

~~10~~7 report the results of studies under *recommends that ITU-R* ~~6, 7 and 8~~4, 5 and 6 above to a competent world radiocommunication conference(s).

Reasons: See IAP/14/84.

Proposals for agenda item 1.3

Agenda item 1.3: To consider the results of ITU-R studies in respect of Appendix **S7/28** on the method for the determination of the coordination area around an earth station in frequency bands shared among space services and terrestrial radiocommunication services, and take the appropriate decisions to revise this Appendix.

Proposal for the revision of Appendix S7

Background information

ITU-R developed draft new Recommendation ITU-R SM.[1/1004], entitled "Determination of the coordination area around an earth station in frequency bands between 100 MHz and 105 GHz", which consolidates in a single recommendation methods for determining coordination areas. The Recommendation includes revised propagation models, draws upon the methods contained in Recommendations ITU-R IS.847-1, ITU-R IS.848-1 and ITU-R IS.849-1, and uses methodologies and parameter values provided by the relevant ITU-R Study Groups. The following proposals provide an outline of the principles supported by Canada in the revision of Appendix S7.

Canada supports the use of essential text from this Recommendation as the basis for the revision of Appendix S7. It is proposed to replace the text of Appendix S7 with text from Recommendation ITU-R SM.[1/1004] describing the different methodologies which must be used to calculate the size of the coordination area around an earth station in order to determine the need for international coordination as required by Appendix S5. In considering Recommendation ITU-R SM.[1/1004], it is clear that not all the material found in the Recommendation is essential to determine the need to coordinate with the stations of a neighbouring administration, in other words, to yield a regulatory finding. In particular, the Recommendation contains features which could facilitate the coordination process through the use of additional methods and contours (supplementary and auxiliary). These contours described in sections 1.6.1 and 1.6.2, as well as the Time Variant Gain (TVG) method of section 2.2.2 may assist in bilateral discussions, and as such have a place in the revised Appendix S7. Canada supports the inclusion of such texts with the clear understanding of the role of this material in the regulatory process. Finally, the Recommendation contains example calculations which are not appropriate for a treaty text and therefore should not be incorporated in the revised Appendix S7.

To facilitate the application of coordination procedures between earth stations and terrestrial stations, the CPM Report proposes that all the material relating to the determination of coordination areas be contained in a single appendix. Canada supports the relocation of information on predetermined coordination distances from Appendix S5 to Appendix S7.

APPENDIX S7

MOD CAN/24/92

Method for the determination of the coordination area around an earth station in frequency bands between ~~1 GHz and 40 GHz shared between space and terrestrial radiocommunication services~~ <u>100 MHz and 105 GHz</u>

Reasons: To reflect the changes introduced by new Recommendation ITU-R SM.[1/1004]. A revised Appendix S7 based on this draft new Recommendation is able to cover a broader range of frequency bands.

MOD CAN/24/93

1) Replace the entire text of Appendix S7 with the substance of Recommendation ITU-R SM.[1/1004] except as proposed below.

2) Indicate through a footnote against sections 1.6.1, 1.6.2 and 2.2.2 (and the associated Annexes) that such material is included to facilitate bilateral discussions during the coordination process.

3) Make consequential changes to section 2.2.

4) Delete all example calculations found in Recommendation ITU-R SM.[1/1004].

5) Transfer the predetermined coordination distances from Annex 1 of Appendix S5 as shown in Annex 1 to Chapter 7 of the CPM Report.

Reasons: After considerable effort, ITU-R has largely completed its studies related to Appendix S7 and has developed draft new Recommendation ITU-R SM.[1/1004] on the methods for determination of the coordination area around an earth station in frequency bands between 100 MHz and 105 GHz. Replacement of the existing Appendix S7 as proposed will incorporate the essential regulatory material from the new Recommendation to make a regulatory determination and provide guidance on the use of additional methods and contours which may be used to facilitate the coordination process in bilateral discussions. This proposal also moves the predetermined coordination distances into Appendix S7, consolidating the determination of earth station coordination distances in a single location. This approach also avoids certain inconsistencies between the existing regulatory provisions and the more generalized text within the Recommendation.

Since a detailed proposal has been made to WRC already, Canada will not attach a detailed proposal. This will be left to Committee 4 and its working groups.

Process to ensure Appendix S7 is maintained up to date

Background

ITU-R has undertaken considerable work since WRC-97 to develop a new Recommendation which could serve as the basis to update Appendix S7 with current methodologies by which an administration determines whether the proposed operation of an earth station might affect, or be affected by, the radiocommunication services of another administration sharing the same frequency band. Appendix S7 is also dependent on several tables of system parameters assumed in the determination of coordination distance. Despite this extensive effort, the work is not complete, particularly with respect to the tables of system coordination parameters. It is expected that ITU-R will continue to study the new technologies and developments of earth stations (whether part of a GSO or a non-GSO satellite network) and new applications or types of terrestrial stations, sharing the same frequency band. Notably, some of the entries in the tables of system coordination parameters for various services in Annex II of a revised Appendix S7 are blank, pending further study. Furthermore, each WRC might make allocation decisions requiring the updating of the system parameter values.

The need to keep Appendix S7 relatively current has been recognized by the CPM and by some proposals to this Conference. However, how to achieve this objective is less than clear without initiating a very long process to add an agenda item to permit a WRC to consider the item. Canada proposes to build upon the existing obligation by the Director, Radiocommunication Bureau, to report to a WRC as a means to update this Appendix while maintaining certain checks and balances to ensure any update is considered necessary by ITU-R as a whole.

ADD CAN/24/94

RESOLUTION [CAN/24/ABC] (WRC-2000)

The process to keep the tables of system parameters of Appendix S7 current

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that Appendix **S7** to the Radio Regulations is the method to determine the coordination area of an earth station, which requires assumed technical coordination parameters for the unknown terrestrial station or earth station;

b) that these technical coordination parameters are contained in Tables 1, 2 and 3 of Annex II of Appendix **S7 (Rev.WRC-2000)**;

c) that these technical coordination parameter tables are based directly on recommendations of ITU-R;

d) that ITU-R studies on radiocommunication systems are continuing, and the conclusions of these studies could lead to the revision of Appendix **S7**;

e) that the technical coordination parameter tables may also need to be modified when changes are made to the Table of Frequency Allocations at future WRCs;

f) that the technical coordination parameter tables do not include values for all the necessary parameters of certain space radiocommunication services and terrestrial radiocommunication services sharing frequency bands with equal rights,

recognizing

a) that Recommendation ITU-R SM.[Doc. 1/1004] was developed by ITU-R as a basis for the revision of Appendix **S7**;

b) that there is a need for future WRCs to keep Appendix **S7** current with the latest techniques and to ensure protection of other radiocommunication services sharing the same frequency bands with equal rights, particularly the revision of the tables of technical coordination parameters,

invites ITU-R

to recommend values for the missing entries in the tables of technical coordination parameters (Annex II of Appendix **S7**), and to maintain the relevant ITU-R texts in a format which would facilitate the future revision of Appendix **S7**,

resolves

1 that when the ITU-R Study Groups come to the conclusion that a revision of Appendix **S7** is warranted, based on their latest studies on the values of technical coordination parameters, the matter shall be considered by the Radiocommunication Assembly;

2 that, if the Radiocommunication Assembly confirms the proposal by the ITU-R Study Groups, the Director, Radiocommunication Bureau, shall identify the matter in the Director's Report to the upcoming WRC,

requests

1 that WRC consider the revision of Appendix **S7** in light of the recommendation of the Radiocommunication Assembly, pursuant to *resolves* 1 and 2 above; and,

2 that each WRC, when modifying the Table of Frequency Allocations, consider any consequential changes to the technical coordination parameters of Annex II of Appendix **S7**, and if necessary request ITU-R to study the matter.

Reasons: This new Resolution recognizes the importance of keeping Appendix **S7** up to date without the need to instigate a long process to have the Appendix updated. The need to have a complete set of technical coordination parameters is important to administrations to enable them to fulfil their obligations under Article **S9** of the Radio Regulations.

Related and consequential proposals

APPENDIX S5

ANNEX 1

SUP CAN/24/95

3

Reasons: Consequential change to CAN/24/93. The relevant material with appropriate modifications will now be found in Appendix S7.

ARTICLE S1

Terms and definitions

Section VII – Frequency sharing

MOD CAN/24/96

S1.171 *coordination area:* When determining the need for coordination, ~~T~~the area associated with surrounding an *earth station* outside of which a *terrestrial station* sharing the same frequency band neither causes nor is subject to interfering *emissions* greater than a permissible level sharing the same frequency band with terrestrial stations, or surrounding a transmitting earth station sharing the same bidirectionally allocated frequency band with receiving earth stations, beyond which the permissible level of interference will not be exceeded.

MOD CAN/24/97

S1.173 *coordination distance:* ~~Distance on a given azimuth from an *earth station* beyond which a *terrestrial station* sharing the same frequency band neither causes nor is subject to interfering *emissions* greater than a permissible level.~~When determining the need for coordination, the distance on a given azimuth from an *earth station* sharing the same frequency with terrestrial stations, or from a transmitting earth station sharing the same bidirectionally allocated frequency band with receiving earth stations, beyond which the permissible level of interference will not be exceeded.

Reasons: Consequential change identified in the CPM Report to align the text of the definitions with the text of the ITU-R Recommendation.

SUP CAN/24/98

RESOLUTION 60

Relating to information on the propagation of radio waves used in the determination of the coordination area

Canada supports the CITEL Inter-American proposal IAP/14/85 (Addendum 1 to Document WRC2000/14, 27 March 2000) to suppress this Resolution.

Reasons: Resolution 60 addressed the need to update the propagation models used in Appendix S7 (former Appendix 28). This has served its purpose and could be deleted.

Proposals for agenda item 1.6.1

Agenda item 1.6.1: Review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Proposal for the use of high altitude stations in IMT-2000 terrestrial systems

Background information

This proposal addresses the option to use the high altitude platform stations (HAPS) for the delivery of terrestrial IMT-2000 within the bands that WARC-92 identified for terrestrial IMT-2000 in S5.388, subject to licensing, technical, sharing, coordination and implementation regulations by administrations. It addresses regulatory issues relating to HAPS in the context of IMT-2000 and is not related to the issue of providing more spectrum for the terrestrial component of IMT-2000.

A high altitude platform station (HAPS) is defined in S1.66A as “A station located on an object at an altitude of 20 to 50 km and at a specified, nominal, fixed point relative to the Earth.” Each HAPS deploys a multibeam antenna capable of projecting numerous spot beams within its coverage area. The Radio Regulations, under S4.15A, state that “Transmissions to or from high altitude platform stations shall be limited to bands specifically identified in **S5**”. The only bands currently identified for use by HAPS in Article S5 are in footnote S5.552A that states that “The allocation to the fixed service in the bands 47.2-47.5 GHz and 47.9-48.2 GHz is designated for use by high altitude platform stations. The use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz is subject to the provisions on Resolution **122 (WRC-97)**”.

ITU-R TG 8/1 completed extensive studies regarding the ability of HAPS to provide IMT-2000 services within Regions 1 and 3 utilizing the bands 1 885-2 025 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz and within Region 2 utilizing the bands 1 885-1 980 MHz and 2 110-2 160 MHz identified for IMT-2000. These studies address, among other things, the ability of HAPS to coordinate and share with IMT-2000 stations operating in neighbouring administrations and with certain stations operating in other services in adjacent bands. Draft new Recommendation ITU-R M.[8/115], as approved by ITU-R Study Group 8 for adoption by correspondence, considers certain sharing and coordination requirements associated with the use of HAPS as a base station within a terrestrial IMT-2000 system. The current Resolution HAPS refers to minimum performance characteristics from ITU-R M.[8/115].

This proposal recognizes that in accordance with footnote S5.388, administrations may use the bands identified for IMT-2000, including the bands noted herein, for stations of other primary services to which they were allocated.

As with all other types of base stations operating as a base station in an IMT-2000 system, the proposal also recognizes the need for additional future studies on the compatibility of HAPS operating as a base station in an IMT-2000 system and other stations operating in the same and adjacent frequency bands.

This proposal calls for a footnote in RR S5 identifying HAPS as an optional method of delivery within an IMT-2000 system in the frequency bands identified for Regions 1 and 3, the bands 1 885-2 025 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz and for Region 2, the bands 1 885-1 980 MHz and 2 110-2 160 MHz, identified for IMT-2000, subject to the Resolution HAPS and national regulation.

ADD CAN/24/100

S5.BBB In Regions 1 and 3, the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz, and in Region 2 the bands 1 885-1 980 MHz and 2 110-2 160 MHz, may be used by high altitude platform stations as base stations to provide IMT-2000. These bands are allocated to the fixed, mobile and the mobile-satellite services, and the use by IMT-2000 applications using high altitude platform stations as an IMT-2000 base station in these bands shall not constrain the use of these bands by other stations of the primary services to which they are allocated. Resolution **HAPS (WRC-2000)** provides guidance on sharing and coordination matters for administrations considering deployment of HAPS stations.

Reasons: Radio Regulation S4.15A limits transmissions to and from HAPS to bands specifically identified in the Table of Frequency Allocations. The addition of S5.BBB to the Table of Frequency Allocations will provide administrations with the option to utilize HAPS for IMT-2000 services within the identified bands subject to not constraining the use of these bands by other stations of the primary services to which they are allocated.

ADD CAN/24/101

RESOLUTION HAPS (WRC-2000)

Use of high altitude platform stations providing IMT-2000 in the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 MHz in Region 2

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WARC-92 identified the bands 1 885-2 025 MHz and 2 110-2 200 MHz, intended for use on a worldwide basis for IMT-2000, including the bands 1 980-2 010 MHz and 2 170-2 200 MHz for the satellite component of IMT-2000, in No. **S5.388**;

b) that a high altitude platform station (HAPS) is defined in **S1.66A** as “A station located on an object at an altitude of 20 to 50 km and at a specified, nominal, fixed point relative to the Earth”;

c) that HAPS may offer a new means of providing IMT-2000 services with minimal network build out as it is capable to provide service to a large footprint together with a dense coverage;

d) that, in accordance with MOD **S5.388**, administrations may use the bands identified for IMT-2000, including the bands noted herein, for stations of other primary services to which they were allocated;

e) that these bands are allocated to the fixed, mobile and mobile-satellite services;

f) that ITU-R did not address sharing and coordination between HAPS and some existing systems, such as PCS and MMDS, currently operating in some administrations in the bands 1 885-2 025 MHz and 2 110-2 200 MHz;

g) that in accordance with **S5.BBB**, HAPS is allowed to be used as a base station of terrestrial IMT-2000 in the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 MHz in Region 2, which are allocated to the fixed, mobile and the mobile-satellite services,

resolves

1 that administrations wishing to implement HAPS implemented in **S5.BBB** within a terrestrial IMT-2000 system should use as a guideline the minimum performance characteristics and operational conditions given in Recommendation ITU-R M.[8/115], until future studies relating to the compatibility of HAPS with systems other than IMT-2000 are completed;

2 that for the purpose of protecting stations operating in neighbouring administrations from co-channel interference, administrations using HAPS as base stations to IMT-2000 could use the specific pfd values at or beyond the boundary of the neighbouring administration in Recommendation ITU-R M.[8/115] as a guideline, subject to the agreement of the neighbouring administration,

invites ITU-R

to complete additional studies of HAPS sharing and coordination criteria with, between and into other systems in the bands 1 885-1 980 MHz, 2 010-2 025 MHz and 2 110-2 170 MHz in Regions 1 and 3 and 1 885-1 980 MHz and 2 110-2 160 in Region 2, and in adjacent bands.

Reasons: To specify how HAPS systems are to be used in the bands.

Proposals for agenda item 4

Agenda item 4: In accordance with Resolution **95 (WRC-97)**, to review the resolutions and recommendations of previous conferences with a view to their possible revision, replacement or abrogation

Proposal for modification to Resolution 51 (WRC-97)

Background information

Resolution 51 (WRC-97) was adopted at WRC-97 to bring into force amendments to certain provisions of the Radio Regulations immediately after the Conference. *Resolves* 3 of this resolution was adopted to maintain the maximum allowed time between the advanced publication of information (API) and the date of bringing into use of a satellite network to the regime that applied before WRC-97 (6+3 years) for those networks that were filed prior to 22 November 1997.

Resolves 3 of Resolution 51 (WRC-97) which maintains this timeline states:

"3 that, for satellite networks for which the API has been received by the Bureau prior to 22 November 1997, the maximum allowed time period from the date of receipt of the API to bring the relevant frequency assignments into use shall be six years plus the extension pursuant to No. **1550** (see also Resolution **49 (WRC-97)**);"

The extension under No. 1550 that was allowed prior to WRC-97 was three years. However, the six plus three year period was counted from the **date of publication** of the API and not the date of receipt, as evidenced by the text of No. 1550:

"**1550**
Orb-88 (4) The notified date of bringing into use of the first assignment of a satellite network shall not be later than six years following the date of publication of the special section of the weekly circular referred to in No. **1044**. This notified date of bringing into use will be extended at the request of the notifying administration by no more than three years."

Therefore, there is an inconsistency within *resolves* 3 which quotes the extension allowed under No. 1550, but makes this extension apply as of the date of receipt. To resolve the ambiguity created by the current language in *resolves* 3 of Resolution 51 (WRC-97), Canada proposes to correct this provision to align the time periods with those applicable at the time the API filings were communicated to the Bureau and thereby avoiding the accidental retroactive application of regulatory changes.

MOD CAN/24/102

RESOLUTION 51 (Rev.WRC-~~97~~2000)

Provisional application of certain provisions of the Radio Regulations as modified by WRC-97 and transitional arrangements

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that as a result of the review under Resolution 18 (Kyoto, 1994), a number of provisions relating to the advance publication, coordination and notification of assignments for satellite networks have been modified and these should be applied provisionally as soon as possible;

b) that it was decided to reduce the regulatory time-frame for bringing a satellite network into use, and to delete the advance publication information (API) if not followed by the coordination data within 24 months of the date of receipt of the API;

c) that there are a number of satellite networks for which the relevant information has been communicated to ITU prior to the end of this Conference, and it is necessary to provide for some transitional measures for the treatment of this information by the Radiocommunication Bureau,

resolves

1 that the provisions of Sections I, IA and IB of Article **S9** and provisions of Article **S11** (Nos. **S11.43A**, **S11.44**, **S11.44B** to **S11.44I, S11.47** and **S11.48**), as revised by this Conference, shall be applied by the Bureau and by administrations on a provisional basis as of 22 November 1997;

2 that, for satellite networks which are subject to coordination for which the API has been received by the Bureau prior to 22 November 1997 but the coordination data has not been received by the Bureau prior to this date, the responsible administration shall have until 22 November 1999 or the end of the period pursuant to the application of No. **1056A**, whichever date comes earlier, to submit the coordination data in accordance with the applicable provisions of the Radio Regulations; otherwise the Bureau shall cancel the relevant API in accordance with No. **1056A** or No. **S9.5D** as applicable;

3 that, for satellite networks for which the API has been received by the Bureau prior to 22 November 1997, the maximum allowed time period from the date of ~~receipt~~ publication of the API to bring the relevant frequency assignments into use shall be six years plus the extension pursuant to No. **1550** (see also Resolution **49 (WRC-97)**);

4 that the revised Appendix **S4** with respect to the API for satellite networks which are subject to coordination under Section II of Article **S9** shall be applied as of 22 November 1997;

5 that, for those networks which are subject to coordination for which the API has been received but not yet published prior to 22 November 1997, the Bureau shall publish only the information of the revised Appendix **S4** as modified by this Conference.

Reasons: Align the conditions in *resolves* 3 with those that were contained in RR No. 1550 which was in force at the time the APIs were submitted to the Bureau.

RESOLUTION 644 (WRC-97)

Background

WRC-97 adopted Resolution 644 “Telecommunication resources for disaster mitigation and relief operations”.

The ITU Plenipotentiary Conference (Minneapolis, 1998) endorsed Resolution 644 and adopted Resolution 36 (Rev.Minneapolis, 1998) which instructed the Secretary-General and urged Member States to undertake appropriate action on telecommunications in the service of humanitarian assistance. Thus, Resolution 644 should be updated by WRC-2000 to reflect these developments.

MOD CAN/24/103

RESOLUTION 644 ~~(WRC-97)~~(Rev.WRC-2000)

Telecommunication resources for disaster mitigation and relief operations

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ITU, in the same spirit as reflected in Articles 40 and 46 of its Constitution and in Resolution **209 (Mob-87)**, has specifically recognized the importance of the international use of radiocommunications in the event of natural disasters, epidemics, famines and similar emergencies;

b) that the Plenipotentiary Conference of the International Telecommunication Union ~~(Kyoto, 1994)~~(Minneapolis, 1998), in endorsing Resolution ~~7~~19 of the World Telecommunication Development Conference ~~(Buenos Aires, 1994)~~(Valetta, 1998), adopted Resolution 36 (Rev.Minneapolis, 1998) on ~~telecommunications for disaster mitigation and disaster relief operations~~in the service of humanitarian assistance;

c) that administrations have been urged to take all practical steps to facilitate the rapid deployment and effective use of telecommunication resources for disaster mitigation and disaster relief operations by reducing and, where possible, removing regulatory barriers and strengthening transborder cooperation between States,

recognizing

a) the potential of modern telecommunication technologies as an essential tool for disaster mitigation and relief operations and the vital role of telecommunications for the safety and security of relief workers in the field;

b) the particular needs of developing countries and the special requirements of the inhabitants of remote areas;

c) the progress made in the implementation of Resolution 36 (Rev.Minneapolis, 1998) with respect to the preparation of the Convention on the Provision of Telecommunication Resources for Disaster Mitigation and Relief Operations,

noting

~~with appreciation the scheduling of~~ the Intergovernmental Conference on Emergency Telecommunications (ICET-98) from 16 to 18 June 1998 in Tampere, Finland, which ~~is expected to~~ adopted the Convention referred to in *recognizing c)* above,

resolves

to invite the ITU~~-R~~ Radiocommunication Sector to continue to study, as a matter of urgency, those aspects of radiocommunications that are relevant to disaster mitigation and relief operations, such as decentralized means of communications that are appropriate and generally available, including amateur radio facilities and mobile and portable satellite terminals,

requests the Director of the Radiocommunication Bureau

to support administrations in their work towards the implementation of Resolution 36 (Rev.Minneapolis, 1998),

instructs the Secretary-General

to work closely with the United Nations Emergency Relief Coordinator with a view to further increasing the Union's involvement in, and support to, disaster communications, and ~~to report on the outcome of the Tampere Conference to the 1998 Plenipotentiary Conference so that that Conference or the Council may take any action that it deems necessary,~~ to take any action deemed appropriate to implement the provisions of the Tampere Convention,

invites

the United Nations Emergency Relief Coordinator and the Working Group on Emergency Telecommunications to collaborate closely with ITU in further work towards the implementation of Resolution 36 (Rev.Minneapolis, 1998), and in particular the adoption of the Convention on the Provision of Telecommunication Resources for Disaster Mitigation and Relief Operations,

urges administrations

to give their full support to the adoption of the said Convention and its national implementation.

Reasons: Resolution 644 should be updated to reflect the decisions of the ITU Plenipotentiary Conference (Minneapolis, 1998) in Resolution 36 (Rev.Minneapolis, 1998) and the Tampere Convention.

Proposals for agenda item 7.1

Agenda item 7.1: To consider and approve the Report of the Director of the Radiocommunication Bureau on the activities of the Radiocommunication Sector since WRC-97

Proposal for modification to provision S5.43 (operations subject to not causing harmful interference)

Background information

One important element of the Report of the Director of the Radiocommunication Bureau on the activities of the Radiocommunication Sector since WRC-97 will be the section dealing with the Rules of Procedure (RoP) developed by the Radio Regulations Board (RRB). During the period since WRC-97, the RRB developed a RoP on S5.43. This RoP treats the application of S5.43 in all cases as meaning that service subject to not causing harmful interference means that the service in question must protect all services in the band, including secondary services, and cannot claim protection from these services. In essence, when a service is subject to S5.43, either explicitly such as in S5.282 or implicitly such as S5.268, it is often indicated that the service in question can operate subject to not causing harmful interference to another specified service or services, or even to another application in the same service. However, the RoP treats the application of S5.43 as meaning that the service subject to its application cannot cause harmful interference to any other services in the band, including secondary services. This has far-reaching consequences.

For convenience, the text of provision S5.43 is reproduced below:

“**S5.42** *Miscellaneous provisions*

S5.43 1) Where it is indicated in these Regulations that a service may operate in a specific frequency band subject to not causing harmful interference, this means also that this service cannot claim protection from harmful interference caused by other services to which the band is allocated under Chapter **SII** of these Regulations.”

Also for convenience, the text of the RoP on this Radio Regulation is provided below:

“**S5.43**

1 As this provision is similar in its wording to **S5.29** and **S5.30**, very often allocations on a non-interference basis are considered equivalent to a secondary service. This is correct when only a primary service is concerned, but this is not the case when a secondary service is concerned, because this provision refers to “services to which the band is allocated” and consequently an allocation on a non-interference basis shall not cause interference to or claim protection from even a secondary service. The respective statuses of the different allocations are summarized in the following table.

Assignment	has equality of rights with	shall not cause interference to or claim protection from
primary	primary	
secondary	secondary	primary
No. **S5.43**	No. **S5.43**	Primary Secondary
No. **S4.4**	No. **S4.4**	Primary Secondary No. **S5.43**

2 This provision covers only the case of allocations which are made subject to not causing harmful interference. In some cases, such as No. **S5.429**, the allocation is made without the right to claim protection. The Board is of the view that such allocations are also deemed not to cause harmful interference and this provision applies to them."

As can be seen from the above, any service which is subject to provision S5.43, is treated as "tertiary", meaning that it cannot cause interference or claim protection from any other services allocated in the same frequency bands, including secondary services. This is sufficient in cases where the service is allocated subject to not causing interference to all other services in the band, but not when the allocation to this service is subject to that service not causing harmful interference to one or more specific other services.

There are **three cases** where provision S5.43 can be invoked:

1) Service A is allocated subject to S5.43 with respect to all other services allocated in the band;

2) Service A is allocated subject to S5.43 with respect to one or more services allocated in the band;

3) Service A is allocated subject to S5.43 with respect to another usage of the same service.

Furthermore, the RRB in its RoP decided that where a service is allocated subject to not claiming protection from interference, the same treatment would apply as if the allocation was subject to not causing harmful interference.

There are several footnotes in Article S5 which specify that the allocations are subject to "not causing harmful interference" or "not claiming protection from interference", and where S5.43 would therefore apply either explicitly or implicitly. In the majority of cases, a service is subject to this regulation per case 2) above. A fewer number of cases appear that fit cases 1) or 3) above. Since in the majority of cases, the allocation is subject to not causing harmful interference into a single other service, it does not appear reasonable to make the allocation subject to not causing harmful interference to all other services sharing the band. For example, under the RoP for S5.43, in bands governed by S5.558, the aeronautical mobile service would need to protect and could not claim protection from many services, whereas the allocation was subject to these conditions only with respect to the inter-satellite service.

The difficulty probably stems from the language in provision S5.43 itself. The first part of this provision, which states "that a service may operate in a specific frequency band subject to not causing harmful interference," does not differentiate between the three possible cases described previously; the second part, which states "this means also that this service cannot claim protection from harmful interference caused by other services to which the band is allocated under Chapter **SII** of these Regulations," uses the generic form of services sharing the band. This leads to the understanding that an allocation that is made subject to not causing interference to a single other service or even another usage in the same service, will need to protect all other services in the band. Canada believes that where it is indicated that a service shall not cause harmful interference to another service, it should not be subject to protecting all other services allocated in the band.

The following modification to provision S5.43 would limit its application only between those services that are stated in the relevant provisions (footnotes). The addition of a new provision S5.43A, would cover the reciprocal procedure that is currently subject of the Rules of Procedure.

MOD CAN/24/104

S5.43 1) Where it is indicated in these Regulations that a service or stations in a service may operate in a specific frequency band subject to not causing harmful interference to another service or to another station in the same service, this means also that ~~this~~ the service which is subject to not causing harmful interference cannot claim protection from harmful interference caused by this other ~~services~~ service or other stations in the same service~~to which the band is allocated under Chapter **SII** of these Regulations~~.

Reasons: Clarify the application of S5.43 where its scope is limited to one or more services but not all services to which the band is allocated.

ADD CAN/24/105

S5.43A 1*bis*) Where it is indicated in these Regulations that a service or stations in a service may operate in a specific frequency band subject to not claiming protection from another service or from another station in the same service, this means also that the service which is subject to not claiming protection cannot cause harmful interference to this other service or other stations in the same service.

Reasons: Add reciprocal procedure to provision S5.43.

Proposals for agenda item 7.2

Agenda item 7.2: To recommend to the Council items for inclusion in the agenda for the next WRC, and to give its views on the preliminary agenda for the subsequent Conference and on possible agenda items for future conferences

Proposals regarding the agenda for WRC-03

Background

The agenda for the next WRC (WRC-03) will be drafted during WRC-2000 for consideration by Council. Sections 8.1.1 and 8.1.2 of the CPM text respectively outline the items included in Resolution 722 (WRC-97) and the items formally identified in Resolution 721 (WRC-97). Canada makes the following proposals regarding the items contained in these sections of the CPM text, as well as regarding new items. As far as the preliminary agenda for the subsequent Conference (WRC-05) is concerned, Canada has no formal proposal at this time.

RESOLUTION 722 (WRC-97)

SUP CAN/24/106

Preliminary agenda for the 2001 World Radiocommunication Conference

Reasons: A new resolution containing the agenda items for WRC-03 should replace Resolution 722 (WRC-97).

SUP CAN/24/107

2.3

2.3.1

2.3.2

Reasons: Open-ended agenda items, like these, are potentially sweeping in nature and are better dealt with in ITU-R Recommendations rather than at a WRC. Having studies of unwanted emissions carried out in ITU-R would also allow time to gain experience using the technical Recommendations resulting from these studies.

NOC CAN/24108

2.12 consideration of the need to realign the allocations to the amateur, amateur-satellite and broadcasting services around 7 MHz on a world-wide basis, taking into account Recommendation **718 (WARC-92)**;

Reasons: WRC-97 considered the need for a subsequent WRC to take action on this long-standing incompatibility between services around 7 MHz; namely amateur, broadcasting and fixed, and thus included this matter under Resolution 722 (WRC-97).

Resolution 641 (Rev.HFBC-87) and Recommendation 718 (WARC-92) recognize this incompatibility problem together with the desirability to have worldwide exclusive allocations for these services.

There has been increasing pressure to harmonize and balance the spectrum needs of the amateur and broadcasting services as well as responding to the fixed service requirements in support of many national and international applications, including those of humanitarian aid and disaster relief.

It is therefore considered essential that this agenda item be maintained for WRC-03 in order to respond effectively to the above services and facilitate better planning and efficient spectrum utilization around 7 MHz.

ADD CAN/24/109

2.14 consider the need for interregional regulatory provisions, including power flux-density limits, to protect the fixed service in the bands 17.7-17.8 GHz (in Regions 1 and 3) and 21.4-22 GHz (in Region 2) from BSS systems in Region 2 and Regions 1 and 3, respectively;

Reasons: At WARC-92 the broadcasting-satellite service received regional allocations for the delivery of HDTV, namely at 17.3-17.8 GHz in Region 2 and at 21.4-22 GHz in Regions 1 and 3. The allocations to the BSS come into effect 1 April 2007 in accordance with RR S5.517 and S5.530. The sub-band 17.7-17.8 GHz and the band 21.4-22 GHz are also allocated worldwide on a primary basis to the fixed service.

Pfd limits on the BSS are not desirable in principle. Nevertheless, it is important to protect the fixed service (FS) in Region 2 in the band 21.4-22 GHz from unintentional, and potentially unacceptable, levels of interference emitted by the BSS in Regions 1 and 3. Similarly, FS systems operating in the band 17.7-17.8 GHz in Regions 1 and 3 will require protection from Region 2 BSS operation.

There are a variety of existing and planned FS systems in this spectrum range including broadband, high spectral efficiency point-to-point back-haul and wireless access systems carrying Internet and multimedia services. The pfd limits in the 17 and 22 GHz spectrum ranges in RR S21 (–115/–105 dBW/m^2 in any 1 MHz) were developed over 25 years ago. While Recommendation ITU-R F.760-1 confirmed the adequacy of these limits in 1992 for point-to-point FS operation, Resolution 525 (WARC-92) considers RR S21 pfd limits to be coordination triggers for the band 21.4-22 GHz in Regions 1 and 3 prior to 1 April 2007. It may not be desirable or acceptable to simply treat the current RR S21 limits as trigger values to protect the FS in Region 2. Furthermore, alternative regulatory provisions may need to be developed to ensure protection of the FS on an interregional basis without constraining the development of BSS systems. Note that in Region 2 the FS does not share the band 21.4-22 GHz with a space service; thus avoidance of the GSO is not a requirement for the FS. It is important that ITU-R study this matter, including a review of Recommendation ITU-R F.760-1, and provide recommendations addressing interregional sharing conditions in time for the next WRC, to ensure that BSS systems will incorporate the most current provisions of the Radio Regulations into system designs.

ADD CAN/24/110

2.15 to consider allocation of additional spectrum for the Earth exploration-satellite service (EESS) around 5 GHz;

Reasons: Systems currently being designed to operate in the EESS at 5.25-5.46 GHz will be capable of achieving higher imaging resolution. These new performances will require a frequency bandwidth greater than what is currently available. As these systems are operating on a worldwide basis, a global primary allocation is required to protect their operation. The band 5.46-5.57 GHz should be studied to provide an extension of the existing EESS allocation.

SUP CAN/24/111

3.1

Reasons: Resolution 528, adopted at WARC-92, calls for a conference to be convened preferably not later than 1998 for the planning of BSS sound in the 1-3 GHz band, and the development of procedures for the complementary terrestrial broadcasting.

At WRC-97 a proposal was made that called for convening a planning conference by the year 2002. However, after discussion at WRC-97, it was agreed to include the consideration of the results of studies related to Resolution 528 in agenda item 3 of Resolution 722.

Satellite transmission of digital sound broadcasting has not developed as fast as it was anticipated in 1992 mainly due to the very high up-front cost associated with satellite systems and the non-availability of receivers. Added to this are reasons unique to each administration such as the current use of the bands by fixed and mobile services and the saturation of terrestrial sound broadcasting in all parts of a country. A further complication is the fact that there are three frequencies being covered by Resolution 528, namely the 1.5 GHz band, the 2.3 GHz band and the 2.56 GHz band.

JWP 10-11S, in conjunction with WP 9D, has studied the feasibility of frequency sharing with FS in certain situations but the studies are not conclusive and more work is needed to cover all the situations and all frequency bands. Also, if the APT proposal is adopted, a whole new area of study will open up related to non-GSO BSS sound. In the meantime, JWP 10-11S recently approved a Recommendation providing guidelines for the orderly implementation of satellite digital sound broadcasting (DSB) in the absence of a planning conference.

It is therefore Canada's view that the review of studies related to Resolution 528 as stated in agenda item 3.1 of Resolution 722 should not take place before WRC-05.

SUP CAN/24/112

3.2

Reasons: Canada believes that it is premature to extend the table of allocation beyond 275 GHz at this time. The requirements of the radio services in this portion of the spectrum are not sufficiently known to ensure their fair treatment. Furthermore, the existing footnote S5.565 is believed to be sufficient to protect the operation of the scientific passive services above 275 GHz.

SUP CAN/24/113

3.4

Reasons: Resolution 728 (WRC-97) calls for studies in the band 470-862 MHz. Canada is of the view that consideration of proposals to implement MSS in this frequency range could negatively impact on the implementation of digital TV and the reuse of a part of this frequency band for other services in the longer time-frame. This agenda item could also complicate any future WRC general consideration of the allocations in the upper portion of this band.

SUP CAN/24/114

3.5

Reasons: There is no known requirement to obtain feeder-link spectrum for MSS in this frequency range. There is also a concern that such an allocation may cause interference to the radioastronomy allocation in the band 1 400-1 427 MHz and to the fixed service applications in this spectrum range.

Proposals for agenda item 1.1

Agenda item 1.1: Requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution **26 (Rev.WRC-97)**.

Addition of country names of Region 2 in the footnotes to Tables S5.293 and S5.480 of the ITU Radio Regulations

Background information

Footnote S5.293 raises the status of the fixed and mobile services to a primary basis in nine countries in Region 2 in the bands 470-512 MHz and 614-806 MHz. The use of those services is subject to agreement under No. S9.21. Canada anticipates that with the full implementation of digital television, less spectrum will be required for television services than presently. By joining footnote S5.293, Canada would have the option of implementing fixed and mobile in some parts of the frequency bands specified in the footnote, subject to agreement under No. S9.21.

CAN/24/35

In addition to CAN/24/2 (Document WRC2000/24, 16 February 2000), Canada also supports the Inter-American proposal IAP/14/74 (Addendum 1 to Document WRC2000/14, 27 March 2000) as it is consistent with the Canadian proposal (i.e. open footnote S5.293 to enable countries in Region 2 to add their names).

Proposals for agenda item 1.2

Agenda item 1.2: To finalize remaining issues in the review of Appendix **S3** to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation **66 (Rev.WRC-97)** and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services.

Proposal to modify Recommendation 66 (Rev.WRC-97)

Background information

Recommendation **66** is being modified to reflect the current status of this document. Work has been completed on space service spurious emissions, consequently Canada is supporting CITEL Inter-American proposals (IAP/14/75 to IAP/14/84). These proposals include the suppression of *considering f), recommends* 1 and 2, editing "*recognizing i)"* to conform to the concept in the *recommends* that limits may be needed for specific situations. In addition, the CITEL proposals include the suppression of *recommends* 9 based on the TG 1/5 finding that OOB emission limits are not appropriate at this time.

CAN/24/36

Canada supports the CITEL Inter-American proposals IAP/14/75 to IAP/14/84 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.4

Agenda item 1.4: To consider issues concerning allocations and regulatory aspects related to Resolutions **126 (WRC-97)**, **128 (WRC-97)**, **129 (WRC-97)**, **133 (WRC-97)**, **134 (WRC-97)** and **726 (WRC-97)**.

Proposal addressing the use of the frequency range 37-43.5 GHz by the fixed service and other allocated services (Resolution 133, 128, 726 and 134)

Background information

WRC-97 added co-primary allocations for the fixed-satellite service (FSS) (space-to-Earth) in Regions 2 and 3 and some countries of Region 1 in the band 40.5-42.5 GHz and upgraded worldwide secondary allocations to the fixed service (FS) to co-primary status. Canada has also added the FS on a co-primary basis in the band 40.5-42.5 GHz in its domestic allocations. Also, this band is allocated on a co-primary basis to the broadcasting service and broadcasting-satellite service (BSS).

Resolution 134 (WRC-97) makes the date of the provisional application of the allocation to the FSS in Regions 1 and 3 in the band 40.5-42.5 GHz 1 January 2001, and calls for review of the allocation and provisional application date. On the basis of studies conducted in ITU-R, it is appropriate to advance the date of the application of the FSS allocation in Regions 1 and 3 to 2 June 2000 (upon the conclusion of WRC-2000), and to extend the allocation to all of Region 1 (thereby enabling the removal of Nos. S5.551C, S5.551D and S5.551E, and the suppression of Resolution 134 (WRC-97)).

The use of FSS allocations is subject to the ITU-R studies referred to in Resolutions 128 and 129. Since HDFS and ubiquitously deployed FSS and BSS terminals cannot share the same spectrum in the same area, it is necessary to identify regulatory solutions to meet the spectrum requirements for HDFS (both point-to-point and point-to-multipoint), and FSS (both global and regional) in the range 37-51.4 GHz. Further, it should be recognized that the next allocation to the FSS, above the 40/50 GHz bands, is near 80 GHz. In this frequency range, physical factors such as high propagation losses may affect implementation of FSS systems. To date, no studies in ITU-R have addressed the feasibly of implementation of FSS systems in frequency bands near 80 GHz.

Resolution 133 deals with sharing of the FS with other services in the range 37-40 GHz. Many administrations have authorized high-density fixed systems (point-to-point and point-to-multipoint systems) in parts of the 37-40 GHz band. It is expected that the new broadband operators will deploy point-to-multipoint and point-to-point systems in urban areas. HDFS deployments can make sharing difficult with FSS systems, depending on the population of earth station receivers and the nature of the business plan. It is recognized that economy of scale is a key factor in the success of high-density deployments of FS and FSS systems and that this will be enhanced by the degree of global spectrum harmonization.

A number of administrations are actively seeking spectrum for high-density FS and FSS systems in the 37-42.5 GHz frequency range. Given the system characteristics, service requirements and the need to provide global spectrum for FSS systems, it is anticipated that approximately 2 GHz of spectrum is required to meet future needs of high-density FSS systems in this frequency range. Within the frequency range 37-42.5 GHz, it is proposed to use the band 37-40 GHz by high-density FS applications and the band 40-42 GHz for high-density FSS applications. The allocations to FS and FSS are retained in the range 37.5-42.5 GHz in order to provide flexibility to administrations to implement lower density applications subject to certain constraints. Furthermore, it should be noted that, as a result of this proposal, an appropriate pairing of 2 GHz will be needed for high-density

FSS near 50 GHz for earth-to-space transmissions, taking into account existing allocations in that band. The band 48.2-50.2 GHz appears at this time to be suitable for that purpose.

It should also be noted that high-density FSS applications are similar in nature to BSS systems, particularly in the delivery of multimedia and inter-active services. Taking this into account, it is proposed to align the broadcast satellite allocation with the high-density FSS allocation in the 40-42 GHz band. This results in a new allocation to the BSS in the band 40-40.5 GHz. The alignment of FSS and BSS in the 40-42 GHz band also presents an opportunity to make available additional HDFS spectrum in the 42-43.5 GHz band.

It is proposed that the protection of the radio astronomy service in the frequency band 42.5-43.5 GHz be dealt with under the provisions of Resolution 128 (Rev.WRC-2000).

In order to provide the opportunity for the deployment of high-density FS and FSS systems it is necessary to develop a regulatory means that recognizes the ubiquitous nature of these systems while at the same time ensuring that other allocated services continue to have access to the spectrum, subject to certain constraints. To meet this goal, an approach referred to as “soft partitioning” appears to be the most suitable. The soft partitioning approach employs footnotes to indicate that a band is available for high-density applications in either terrestrial or space services. It does not involve removal or downgrading of any of the currently allocated services. In the proposal outlined below, the bands 37-40 GHz and 42-43.5 GHz have been identified through footnote S5.547 as being available for high-density applications in the fixed service. In addition, the band 40-42 GHz has been identified through footnote S5.55X for high-density FSS applications. None of the currently allocated services are removed from these bands.

CAN/24/37

Canada supports the CITEL Inter-American proposals IAP/14/86 to IAP/14/106 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposal to address issues related to the fixed service and Earth exploration-satellite (passive) service in the 55.78-56.26 GHz band

Background information

Footnote S5.547 indicates that the band 55.78-59 GHz (among others) is available for high-density applications in the fixed service. Resolution 726 (WRC-97) resolves that administrations should take into account that this band is available for high-density application in the fixed service, when considering allocations or other regulatory provisions in relation to this band.

ITU-R studied the sharing situation between the fixed service and the Earth exploration-satellite (passive) service in the 55.78-56.26 GHz band without reaching a conclusion on the requirement of a power limit on emissions from stations in the fixed service. The CPM Report supports two methods to address the sharing issue: The first method indicates that no further limits are necessary in this band. The second method imposes some limitations on the fixed service in this band. Within the second method, three possible limits are proposed. In addition some of the subsequent ITU-R studies produced alternate power limits.

Due to this lack of firm conclusions, Canada believes that it is premature to impose a power limit on the fixed service in the band 55.78-56.26 GHz based on studies to date. Consequently it is proposed to maintain the current allocation table and address this matter through the development of appropriate ITU-R Recommendations.

Proposals for agenda item 1.5

Agenda item 1.5: To consider regulatory provisions and possible additional frequency allocations for services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution **122 (WRC-97)**.

Proposal to modify Resolution 122, high altitude platform stations in the fixed service

Background information

Resolution 122 (WRC-97), “Use of the bands 47.2-47.5 GHz and 47.9-48.2 GHz by high altitude platform stations in the fixed service and by other services”, instructs the Director of the Radiocommunication Bureau, that from 22 November 1997, to accept notices in the 47.2-47.5 GHz and 49.2-48.2 GHz only for high altitude platform stations in the fixed service and for feeder links for the broadcasting-satellite services pending review of sharing studies between co-primary services in the band. On the basis of studies conducted in ITU-R, it is appropriate to modify Resolution 122 (WRC-97) to take account of draft new Recommendation ITU-R [4-9S/AAX] that establishes the performance parameters for certain FSS antennas that can share with HAPS systems and to take account of the need for continued studies.

CAN/24/39

Canada supports the CITEL Inter-American proposal IAP/14/107 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.6.1

Agenda item 1.6.1: Review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary.

Proposal to identify additional spectrum for IMT-2000

CAN/24/40

In addition to CAN/24/6 to CAN/24/13 (Document WRC2000/24, 16 February 2000), Canada also supports the Inter-American proposals IAP/14/108 to IAP/14/110 (Addendum 1 to Document WRC2000/14, 27 March 2000).

The CITEL Inter-American proposals IAP/14/108 to IAP/14/110 (Addendum 1 to Document WRC2000/14, 27 March 2000) indicate that the frequency range 1 710-1 885 MHz should be identified worldwide for additional spectrum for advance mobile applications in the context of IMT-2000. This is consistent with the Canadian proposal found in Document WRC2000/24, 16 February 2000.

Proposals for agenda item 1.10

Agenda item 1.10: To consider results of ITU-R studies carried out in accordance with Resolution **218 (WRC-97)** and take appropriate action on this subject.

Proposal to modify footnotes S5.353A and S5.357A

Background information

In order to accommodate AMS(R)S traffic, it would be necessary that all MSS systems using this spectrum, within a certain geographical area, be technically able to release all, or parts, of the spectrum to any MSS operator that has a requirement for priority 1 to 6 AMS(R)S traffic. The technical and operational requirements for achieving such transfer of AMS(R)S spectrum resources would have to be developed by ICAO and the MSS system operators, and then implemented by MSS operators according to agreed upon specifications. Only MSS systems compliant with these requirements should have access to the 10 MHz identified in S5.357A of paired generic MSS spectrum to ensure the availability of this spectrum to satisfy AMS(R)S priority 1 to 6 communications.

The proposed resolution is intended to replace Resolution 218 and calls for ITU-R to study and develop the technical and operational requirements and specifications for intra-system and inter-system prioritization and pre-emption methods.

CAN/24/41

Canada supports the CITEL Inter-American proposals IAP/14/112 to IAP/14/117 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.13.1

Agenda item 1.13.1: To review and, if appropriate, revise the power limits appearing in Articles **S21** and **S22** in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services.

Modifications to Section II of Article S22 in relation to the sharing conditions among non-GSO FSS, FSS and GSO BSS services

Background information

Resolution 130 (WRC-97) and Resolution 538 (WRC-97) each requested ITU-R to conduct a) “appropriate technical, operational and regulatory studies” to review the regulatory conditions relating to the coexistence of non-GSO FSS and GSO FSS and GSO BSS systems, in order to ensure that undue constraints are not placed on the development of non-GSO FSS, GSO FSS and GSO BSS systems, and b) the development of a methodology for calculating the power levels produced by non-GSO FSS systems and the compliance of these levels with the applicable limits established pursuant to Resolutions 130 and 538. Joint Task Group 4-9-11 was established by ITU-R to pursue these mandates and to determine the necessary technical bases.

At CPM-99, a compromise was reached on a number of the key technical criteria that would provide adequate protection to GSO FSS and GSO BSS systems without unduly constraining non-GSO FSS systems. Many of the elements of this compromise are reflected in Chapter 3 of the CPM Report. The CPM Report recognizes, however, that there are other essential elements of the compromise package which have yet to be developed. CITEL has made proposals to address these other essential elements. Taking into account the work of ITU-R and CPM-99 on this matter, the following is proposed:

CAN/24/42

Canada supports the CITEL Inter-American proposals IAP/14/242 to IAP/14/268 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposed modifications to APS4

Background information

CPM-99, to facilitate introduction of non-GSO FSS systems while affording protection to GSO FSS and BSS, agreed to three types of $efpd_{down}$ limits. These are: validation limits, to be verified by the Radiocommunication Bureau using an agreed software tool; operational limits, to provide operational GSO earth stations protection from synchronization loss; and additional operational limits to ensure protection to operational 3 m and 10 m. GSO FSS earth stations operating in the 10.7-12.75 GHz bands. The operational limits, which are single values for 100 per cent of the time, provide an opportunity for development of regulatory procedures to be implemented by the BR which would afford GSO systems a means of redress in the event such limits are exceeded by non-GSO FSS systems. The additional operational limits are specified values associated with periods of time. Such limits, as with the operational limits, must be met in practice, by each non-GSO FSS system. With regard to the additional operational $epfd_{down}$ limits, an administration proposing a non-GSO FSS system would have to commit that the proposed system will meet these additional operational limits. The administrations propose that this requirement be met by the inclusion of an additional data entry in Appendix S4.

CAN/24/43

Canada supports the CITEL Inter-American proposals IAP/14/269 to IAP/14/270 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Revisions to Articles S9, S11 and Appendix S5 for non-GSO systems which are subject to S22.2

Proposals for advanced publication under Article S9

Background information

In order to provide for the advanced publication of information for non-GSO systems, a new footnote is required for Article S9, Sub-Section IB, and a reference point for this footnote added to No. S9.5B.

CAN/24/44

Canada supports the CITEL Inter-American proposals IAP/14/271 to IAP/14/276 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Additions and/or modifications to Articles S9, S11, S22 and Appendices S4 and S5 to require coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large antenna

Background information

WRC-97 adopted provisional power flux-density limits in certain frequency bands which would apply to non-GSO FSS systems to protect GSO FSS networks, and GSO BSS networks. Resolution 130 (WRC-97), *Use of non-geostationary systems in the fixed-satellite service in certain frequency bands*, and Article S22 of the Radio Regulations contain limits corresponding to an interference level caused by one non-GSO system in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz, and 19.7-20.2 GHz. Studies demonstrate that neither the WRC-97 provisional $epfd_{down}$ limits and associated percentages of time nor the proposed modifications agreed during ITU-R studies adequately protect existing GSO FSS networks with very large earth station antennas. Section 3.1.2 of the CPM Report for WRC-2000 concludes that transmissions to earth stations with very large antennas need to be protected and that an additional regulatory procedure would be necessary. Coordination triggers based on the characteristics of the satellite network using the GSO were agreed by ITU-R and confirmed by CPM-99. In addition to the GSO network triggers, it was decided to include the condition of the $epfd_{down}$ radiated by the non-GSO FSS system. CPM-99 decided that two values would be needed in each band and that exceeding either $epfd_{down}$ value would trigger coordination. WP 4A completed the studies on the $epfd_{down}$ thresholds to trigger coordination. Annex 3 to Chapter 3 of the CPM Report contains example regulatory and procedural text and the coordination triggers agreed by WP 4A. Building on the CPM Report text, this proposal includes additions and/or modifications to Articles S9, S11 and S22 and Appendices S4 and S5 to require coordination between non-GSO FSS transmitting space stations and GSO receive earth stations with very large earth station antennas.

CAN/24/45

Canada supports the CITEL Inter-American proposals IAP/14/277 to IAP/14/286 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where epfd limits have been adopted

Background information

ITU-R and CPM-99 agreed that “[t]here is a need to provide a regulatory mechanism that would ensure protection of GSO FSS and GSO BSS networks from the maximum aggregate equivalent power flux-density produced by multiple non-GSO FSS systems in frequency bands where equivalent power flux-density (epfd) limits have been adopted.", see CPM-99 Report, section 3.1.1.3.2. With respect specifically to the GSO BSS, section 3.1.3.3 of the CPM-99 Report to WRC-2000 states that "[t]here is a need to ensure that the aggregate epfd produced by all co-frequency non-GSO FSS systems does not exceed the maximum interference levels, as determined by the agreed to aggregate epfd masks, that are necessary to protect these GSO BSS systems." This agreement can be implemented by including aggregate $epfd_{down}$ limits annexed to a WRC-2000 resolution. Such a resolution is proposed below based on the agreement reached within ITU-R.

In addition to the single-entry $epfd_{down}$ limits (validation, operational and additional operational), CPM-99 agreed that a mechanism was needed which would provide assurance to GSO FSS and GSO BSS systems that the aggregate interference from all non-GSO FSS systems would not exceed that determined as an acceptable level. Aggregate validation limits had already been developed within ITU-R based on the single-entry validation limits and are contained in Table WWW-1A to WWW-1D below.

Canada is supporting the IAP proposal for the aggregate epfd down levels. Canada is making proposals regarding the suppression of Resolutions 130 and 538. As a result, there would be a need to review and revise the changes made in IAP/14/287 from the CPM text.

CAN/24/46

Canada supports the CITEL Inter-American proposal IAP/14/287 (Addendum 1 to Document WRC2000/14, 27 March 2000) noting the comments in the background information.

Proposed new Section VII for Article S15

Background information

The CPM-99 Report indicated the need for regulatory procedures to implement the operational and additional operational $epfd_{down}$ limits which identify non-GSO systems exceeding the operational/additional operational limits and ensure immediate reduction of the interference level to the operational/additional operational limits by any non-GSO system exceeding those limits. CITEL Administrations in IAP/14/288 identified certain options for possible procedures, which would form a new Section VII to Article S15. This additional proposal puts forward one of the options of IAP/14/288 which involves removal of S15.60 and revision to S15.59.

Canada proposes to modify the CITEL Inter-American proposal IAP/14/288 (Addendum 1 to Document WRC2000/14, 27 March 2000) as follows:

ARTICLE S15

Interferences

ADD CAN/24/47

Section VII – Assuring compliance with operational limits and additional operational limits in Article S22

S15.47 § 35 When an administration identifies $epfd_{down}$ levels in excess of the applicable operational $epfd_{down}$ limits or additional operational $epfd_{down}$ limits of Tables **S22-4A** and **S22-4B**

and footnote 3 to Table **S22-1D** of the Radio Regulations, it shall first attempt to identify the source of the excess $\text{epfd}_{\text{down}}$ levels.

S15.48 § 36 If the administration operating the affected geostationary-satellite network is able to identify the source of the excess $\text{epfd}_{\text{down}}$ interference, the administration may proceed to No. **S15.56** below.

S15.49 § 37 An administration that is unable to determine the source of the excess $\text{epfd}_{\text{down}}$ interference it is experiencing, shall, send a request for cooperation to all administrations operating non-geostationary fixed-satellite service systems in the band(s) where excess $\text{epfd}_{\text{down}}$ interference was experienced. The request should provide all relevant details, such as the location and operating frequencies of the affected geostationary earth station, and provide the dates, times, and, if available, levels of the excess $\text{epfd}_{\text{down}}$ interference experienced. A copy of the request shall be sent concurrently to the Bureau and to the non-GSO FSS operators, where possible.

S15.50 § 38 Each administration receiving the request shall acknowledge receipt, within five days. The administration receiving the request is urged to provide, with its acknowledgement, any information that may be used to identify the source of the excess $\text{epfd}_{\text{down}}$ interference. A copy of the acknowledgment and associated information shall be provided concurrently to the Bureau.

S15.51 § 39 If any administration fails to respond to a request made within five days, the Bureau shall send, by the close of the next business day, each such non-responding administration the acknowledgment called for in No. **S15.50** to be provided within three days thereafter. The Bureau shall provide copies of the request to the requesting administration and all recipients of the initial request.

S15.52 § 40 Once an administration has acknowledged receipt of the request made in No. **S15.49** above, it shall, within an additional three days thereafter, provide the requesting administration, the Bureau, and all other recipients of the initial request pursuant to No. **S15.49** above either with an admission that a non-geostationary fixed-satellite service system for which it is responsible is the cause of the excess $\text{epfd}_{\text{down}}$ interference or with information indicating that no non-geostationary fixed-satellite service system for which it is responsible could have caused the excess $\text{epfd}_{\text{down}}$ interference experienced by the network of the requesting administration.

S15.53 § 41 If any administration receiving a request pursuant to No. **S15.51** above fails to respond within the specified three-day period, the Bureau shall immediately include the following statement in the "Remarks" column of the Master Register for the relevant frequency assignments for the subject non-geostationary fixed-satellite service system: "The use of these frequency bands by [name of system/name of administration] is the subject of an unresolved complaint of excess interference."

S15.54 § 42 The statement shall remain in the Master Register until such time as the responsible administration either provides information pursuant to No. **S15.52** above indicating that its non-geostationary fixed-satellite system is not the cause of the excess interference or, if it is the source of the excess $\text{epfd}_{\text{down}}$ interference, that it has complied with the obligations set forth in **S15.57**. The Bureau shall include notice of this entry in the Master Register in the Weekly Circular.

S15.55 § 43 If any administration fails to provide a timely and complete response pursuant to No. **S15.51** above, the remedial measures of Nos. **S15.52** and **S15.53** shall apply.

S15.56 § 44 Once the source of the excess $\text{epfd}_{\text{down}}$ interference has been identified, the administration operating the affected GSO satellite network shall, inform the administration operating the non-geostationary fixed-satellite service system causing the excess interference of the excess, and request immediate corrective action. The notification/request for corrective action should provide all relevant details such as the amount and source of the excess $epfd_{down}$ interference received, and shall be copied to the Radiocommunication Bureau.

S15.57 § 45 Upon receipt of a request for corrective action made pursuant to No. **S15.56** above, the administration operating the non-geostationary fixed-satellite service system causing the excess interference shall immediately reduce emissions of the subject system to the levels required in Table **S22-4A** or Table **S22-4B** or footnote 3 to Table **S22-1D**, as appropriate, and, within five days of receipt of the request, so advise the administration whose network is affected. A copy of the acknowledgement and confirmation of the action taken shall be sent to the Bureau.

S15.58 § 46 Within five days after receipt of a request for corrective action made pursuant to No. **S15.56** above, in cases where the procedures in Nos. **S15.49** through **S15.55** above had not previously been applied, the administration receiving the request may, as an alternative to reducing emissions in the manner set forth in No. **S15.57**, provide the requesting administration and the Bureau with information indicating that no non-geostationary fixed-satellite service system for which it is responsible could have caused the excess $epfd_{down}$ interference experienced by the network of the requesting administration. In such a case, the procedures in Nos. **S15.49** through **S15.55** shall be applied.

S15.59 § 47 If any administration fails to comply with No. **S15.57** above, the Bureau shall request that administration to take steps immediately to reduce the emissions of its non-GSO system to a level that is within the limits contained in Tables **S22-4**.

Reasons: The procedures provide a means to assure compliance by non-GSO systems with the operational limits contained in Table S22-4.

Proposed suppression of Resolution 130 (WRC-97)

Background information

The proposals below are submitted since the limits in the Annex to this Resolution have been revised and are to be included in Article S22 and Article S5 has been modified to reflect the remaining provisions of Resolution 130.

CAN/24/48

Canada proposes the suppression of Resolution 130 and its associated Annex 1 as proposed in IAP/14/289 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Suppression of Resolution 538 (WRC-97)

Background information

The proposals below are submitted since the limits in the Annex to this Resolution have been revised and are to be included in Article S22 and Article S5 has been modified to reflect the remaining provisions of Resolution 538.

CAN/24/49

Canada proposes the suppression of Resolution 538 and its associated Annex 1 as proposed in IAP/14/290 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposed modifications to Article S5 to reflect the provisions of Resolutions 130 and 538

ARTICLE S5

MOD CAN/24/50

S5.441 The use of the bands 4 500-4 800 MHz (space-to-Earth), 6 725-7 025 MHz (Earth-to-space) by the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by geostationary-satellite systems in the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by a non-geostationary-satellite systems in the fixed-satellite service ~~shall be in accordance with the provisions of Resolution **130 (WRC-97)**~~is subject to the application of the provisions of MOD **S9.10** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. In these bands, non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service.

MOD CAN/24/51

S5.484A The use of the bands 10.95-11.2 GHz (space-to-Earth), 11.45-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 13.75-14.5 GHz (Earth-to-space), 17.8-18.6 GHz (space-to-Earth), 19.7-20.2 GHz (space-to-Earth), 27.5-28.6 GHz (Earth-to-space), 29.5-30 GHz (Earth-to-space) by a non-geostationary~~- and geostationary~~-satellite system~~s~~ in the fixed-satellite service is subject to application of the provisions of ~~Resolution **130 (WRC-97)**. The use of the band 17.8-18.1 GHz (space-to-Earth) by non-geostationary fixed-satellite service systems is also subject to the provisions of Resolution **538 (WRC-97)**~~MOD **S9.10** for coordination with other non-geostationary-satellite systems in the fixed-satellite service. In these bands, non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service.

MOD CAN/24/52

S5.487A *Additional allocation:* in Region 1, the band 11.7-12.5 GHz, in Region 2, the band 12.2-12.7 GHz and, in Region 3, the band 11.7-12.2 GHz, are also allocated to the fixed-satellite service (space-to-Earth) on a primary basis, limited to non-geostationary systems and subject to the application of the provisions of ~~Resolution **538 (WRC-97)**~~MOD **S9.10** for coordination between non-geostationary-satellite systems in the fixed-satellite service. In these bands, non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from GSO networks in the broadcasting-satellite service.

MOD CAN/24/53

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) in Regions 1 and 3 and 17.8-18.1 GHz (Earth-to-space) in Region 2 by non-geostationary-satellite systems in the fixed-satellite service is subject to the provisions of ~~Resolution **538 (WRC-97)**~~MOD **S9.10** for coordination between non-geostationary-satellite systems in the fixed-satellite service. In these bands, non-geostationary-satellite systems in the fixed-satellite service shall not claim protection from geostationary-satellite networks in the fixed-satellite service. The use of the band 17.3-17.8 GHz in Region 2 by systems in the fixed-satellite service (Earth-to-space) is limited to geostationary satellites.

Reasons: These modifications to Article S5 are to replace the references to Resolutions 131 and 538 with references to MOD S9.10 in Article S9. Additional text on No. S5.516 to clarify the intent that there is no allocation in the band 17.3-17.8 GHz in Region 2 for non-GSO FSS (Earth-to-space). The possibility of an allocation was to be based on sharing studies between the non-GSO FSS and the existing and planned services. Studies show that sharing between radiolocation stations and non-GSO FSS networks and non-GSO FSS networks is not feasible due to severe interference from operational radiolocation stations and these services are not compatible. In addition, the band 17.3-17.8 GHz in Region 2 is allocated to BSS beginning 1 April 2007. Studies show that transmit non-GSO FSS earth stations are not compatible with receive BSS earth stations.

Methodologies for ensuring compliance with operational and additional operational $\mathbf{epfd_{down}}$ limits

Background information

CPM-99, to facilitate introduction of non-GSO FSS systems while affording protection to GSO FSS and BSS, agreed to three types of $epfd_{down}$ limits. These are: validation limits, to be verified by the Radiocommunication Bureau using an agreed software tool; operational limits, to provide operational GSO earth stations protection from synchronization loss; and additional operational limits to ensure protection to operational 3 m and 10 m GSO FSS earth stations operating in the 10.7-12.75 GHz bands. The operational limits, which are single values for 100 per cent of the time, provide an opportunity for development of regulatory procedures to be implemented by the BR which would afford GSO systems a means of redress in the event such limits are exceeded by non-GSO FSS systems. The additional operational limits are specified values associated with periods of time. Such limits, as with the operational limits, must be met in practice, by each non-GSO FSS system.

With regard to both the operational limits and the additional operational limits, ITU-R has initiated studies on how to ascertain whether these limits are exceeded. At the recent meeting of WP 4A (20-29 February 2000), a preliminary draft new recommendation was developed concerning measurement techniques which can be used to determine if the operational limits are exceeded into operating GSO earth stations. As for the additional operational limits, preliminary views of WP 4A are that such limits cannot be measured, but rather, a detailed computer simulation of an non-GSO FSS system, utilizing operational assumptions, including traffic distribution and beam loading is required. Work is continuing in both these areas. Proposed Resolution CEA (WRC-2000) is responding to this requirement.

ADD CAN/24/54

RESOLUTION CEA (WRC-2000)

Development of methodologies for assuring compliance by non-geostationary satellite systems in the fixed-satellite service in certain frequency bands with the operational epfd$_{down}$ and additional operational epfd$_{down}$ limits in Article S22

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-2000 adopted a number of epfd limits that apply to non-geostationary-satellite systems in the fixed-satellite service in certain frequency bands between 10.7 and 30.0 GHz;

b) that compliance with the validation epfd limits adopted by WRC-2000 will be verified by the Radiocommunication Bureau before a non-geostationary fixed-satellite service system would be eligible for a favourable finding under the procedures in Article **S11** of the Radio Regulations;

c) that the operational epfd$_{down}$ limits and additional operational epfd$_{down}$ limits adopted by WRC-2000 in No. **S22.5G** of the Radio Regulations and associated Tables **S22-4A** and **S22-4B** and footnote 3 to Table **S22-1D** apply only to operational non-geostationary fixed-satellite service systems, and compliance with these limits is not subject to validation by the Radiocommunication Bureau in order for a non-geostationary fixed-satellite service system to receive a favourable finding under the procedures in Article **S11** of the Radio Regulations;

d) that the operational epfd$_{down}$ limits and the additional operational epfd$_{down}$ limits provide protection from unacceptable interference to operational geostationary fixed-satellite service and broadcasting-satellite service networks from co-frequency non-geostationary fixed-satellite service systems in the subject frequency bands;

e) that administrations operating geostationary fixed-satellite service and/or broadcasting-satellite service networks in frequency bands where operational epfd$_{down}$ limits and/or additional operational epfd$_{down}$ limits have been established require reliable means of ascertaining that operational non-geostationary fixed-satellite service systems are in compliance with the applicable limits;

f) that administrations operating non-geostationary fixed-satellite service systems in frequency bands where operational epfd$_{down}$ limits and/or additional operational epfd$_{down}$ limits have been established require reliable means of ascertaining the validity of assertions from administrations operating geostationary fixed-satellite service and/or broadcasting-satellite service systems that a particular non-geostationary fixed-satellite service system is operating in violation of the applicable limits;

g) that studies within ITU-R are an appropriate means for developing the methodologies and/or associated assessment techniques that administrations may use to ascertain compliance by a non-geostationary fixed-satellite service system with the operational $epfd_{down}$ limits and additional operational $epfd_{down}$ limits,

recognizing

a) that geostationary-satellite networks in the fixed-satellite service and broadcasting-satellite service are operational or will be operational in the frequency bands where operational $epfd_{down}$ limits and additional operational $epfd_{down}$ limits apply, and that non-geostationary fixed-satellite service systems subject to the limits are planned for operation in the same bands;

b) that No. **S22.5F** provides that non-geostationary fixed-satellite service system for which complete notification or coordination information, as appropriate, has been received by the Bureau after 21 November 1997 shall be subject to the power limits in Article **S22**, as adopted by WRC-2000;

c) that pursuant to No. **S22.5G** of the Radio Regulations, any exceedance of the operational $epfd_{down}$ limits or additional operational $epfd_{down}$ limits by a non-geostationary fixed-satellite service system to which the limits apply is a violation of No. **S22.2** of the Radio Regulations;

d) that in view of the importance of the protection that the operational $epfd_{down}$ limits and additional operational $epfd_{down}$ limits are intended to provide to geostationary-satellite networks, and because there is to be no validation by the Bureau of compliance with these limits, it is important to discourage violations of the operational $epfd_{down}$ limits and additional operational $epfd_{down}$ limits by a non-geostationary fixed-satellite service system; if a violation nevertheless occurs, it should be corrected in the most expeditious manner,

resolves to instruct ITU-R

1 to study as a matter of urgency, and develop methodologies that will permit administrations operating geostationary fixed-satellite service, geostationary broadcasting-satellite service, or non-geostationary fixed-satellite service networks in the frequency bands to which the operational $epfd_{down}$ limits and/or additional operational $epfd_{down}$ limits in Article **S22** apply:

a) to assess the interference levels (through either measurement or simulation) produced by operational non-geostationary fixed-satellite service systems in the same bands;

b) to ensure that non-geostationary fixed-satellite service systems comply with the applicable limits; and

c) to develop appropriate methods, such as software tools, to be used by administrations in determining whether a proposed non-geostationary fixed-satellite service system complies with the additional operational limits;

2 to develop, as a matter of urgency, an appropriate mechanism and format for administrations operating non-GSO FSS systems to make available their satellite ephemeris data and update such data on a regular basis.

Proposed modifications to Section VI of Article S22

Background information

The CPM Report contains options to deal with earth stations off-axis e.i.r.p. limits. WRC-97 adopted such limits in Article S22, Section VI, for parts of the frequency band 12.75-14.5 GHz. These provisions, however, were suspended pending the review of these limits by WRC-2000. Canada proposes the suppression of Section VI of Article S22.

ARTICLE S22

Section VI – Earth station off-axis power limitations in the fixed-satellite service~~11~~

MOD CAN/24/55

S22.26 § 9 ~~The level of equivalent isotropically radiated power (e.i.r.p.) emitted by an earth station shall not exceed the following values for any off-axis angle φ which is 2.5° or more off the main-lobe axis of an earth station antenna:~~The level of equivalent isotropically radiated power (e.i.r.p.) emitted by an earth station at angles in all directions off the main beam axis has a significant impact on interference caused to other geostationary-satellite networks and non-geostationary-satellite networks. Enhanced utilization and easier coordination would be attained by minimizing such off-axis radiation and administrations are encouraged to achieve the lowest values practicable bearing in mind the latest ITU-R Recommendations. Minimizing such levels is particularly important in intensively used uplink bands.

~~*Off-axis angle*~~	~~*Maximum e.i.r.p.*~~
~~2.5° ≤ φ ≤ 7°~~	~~(39 – 25 log φ) dB(W/40 kHz)~~
~~7° < φ ≤ 9.2°~~	~~18 dB(W/40 kHz)~~
~~9.2° < φ ≤ 48°~~	~~(42 – 25 log φ) dB(W/40 kHz)~~
~~48° < φ ≤ 180°~~	~~0 dB(W/40 kHz)~~

SUP CAN/24/56

S22.27 to S22.29

SUP CAN/24/57

---

[11] S22.VI.1

Reasons: Canada proposes a hybrid approach of Options 1 and 3 from Annex 7 to Chapter 3 of the CPM Report. Under the hybrid approach, sections S22.27 through S22.29 of Section VI of Article S22 would be suppressed. Additionally, section S22.26 would be modified to indicate that administrations operating GSO FSS networks should comply with the e.i.r.p. density levels contained in the appropriate Recommendation. The advantage to this approach is that, as technology evolves, it allows ITU-R recommended levels to be assessed and modified within ITU-R in a timely manner. Further, it points administrations to the technical guidelines that have been developed within ITU-R. At the same time, it provides guidance to the non-GSO FSS designer on the level of interference from co-frequency GSO FSS systems that would be present.

Proposals for agenda item 1.15.1

Agenda item 1.15.1: To consider new allocations to the radionavigation-satellite service in the range from 1 GHz to 6 GHz required to support developments.

Proposal for RNSS allocation (space-to-Earth) in the upper part of the band 960-1 215 MHz

Background information

Additional radionavigation-satellite service (RNSS) signals will greatly enhance the accuracy, reliability and robustness of the civil global positioning system (GPS) by enabling more effective corrections to be made for the time delay effects of the ionosphere on the signals from space. The International Civil Aviation Organization (ICAO) has stated the requirement for an additional civil signal to support global navigation satellite system (GNSS) requirements and for space-based augmentation systems. A requirement for aeronautical users is to have the protected signal operate within radio spectrum allocated to the aeronautical radionavigation service (ARNS), which would also include the possibility of terrestrial augmentation systems.

However, studies show that airborne RNSS receivers at altitudes of 10 000 ft and above may not be compatible with the existing environment in certain geographic areas. The band 1 151-1 215 MHz has been identified by CITEL to accommodate additional spectrum for an international civil aviation safety-of-life service. The DME/TACAN constitutes the primary source of interference but because of its importance to civil aviation navigation, it must be protected for continued use for the foreseeable future.

Sharing of the same spectrum by two or three different RNSS networks would require compatible power levels and signal types in the design and operation of the different networks. Use of independent spectrum by each RNSS network would decrease the chance of a single interference incident affecting more than one network. Therefore, the allocation should accommodate the spectrum requirement of two or three different RNSS systems.

Canada supports the CITEL proposal for a new allocation to RNSS in the band 1 164-1 212 MHz with appropriate regulatory measures to protect the current use and the development of airborne electronic aids to air navigation and any directly associated ground-based facilities.

CAN/24/58

Canada supports the CITEL Inter-American proposals IAP/14/125 to IAP/14/126 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposal for RNSS allocation (space-to-Earth) in the upper part of the band 1 260-1 300 MHz

Background information

The band 1 260-1 300 MHz is allocated on a primary basis to the radiolocation, to the Earth exploration-satellite (active) and to the space research (active) services. Domestic footnotes allocate this band on a primary basis in several countries to the fixed and mobile services and to the radionavigation service. In Canada and the United States, the band 1 240-1 300 MHz is also allocated to the aeronautical radionavigation service on a primary basis. The band 1 260-1 300 MHz is also allocated to the amateur service on a secondary basis.

Footnote S5.282 allows the use of the amateur-satellite service (Earth-to-space) on a non-protection no-interference basis with respect to other services operating in this band in accordance with the table (see S5.43). The usage of this band by the amateur satellite service is expected to increase.

Similar to the band 1 215-1 260 MHz, the band 1 260-1 300 MHz is used by radars. Furthermore, this band is used for high-power wind profiler radars. It is not suitable for safety of life applications, similarly to the RNSS usage in the band 1 215 to 1 260 MHz.

Canada supports the CITEL proposal regarding a new allocation in the band 1 260-1 300 MHz, (space-to-Earth) for RNSS non-safety-of-life applications.

CAN/24/59

Canada supports the CITEL Inter-American proposals IAP/14/127 to IAP/14/128 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposal for RNSS (Earth-to-space) 5 000-5 010 MHz and (space-to-Earth) 5 010-5 030 MHz

Background information

In accordance with the ITU Radio Regulations, the band 5 000-5 250 MHz is allocated on a primary basis to the aeronautical radionavigation service in all three ITU Regions. The band 5 000-5 030 MHz is not used nor intended to be used for the international standard MLS system.

Results of ITU-R studies show that with the 10 MHz of separation and the use of adequate and existing filter technology by the RNSS, the protection requirements of the radio astronomy service as contained in Recommendation ITU-R RA.769-1 are met.

The use of RNSS (space-to-Earth) is compatible with the MLS operations in the band 5 030-5 150 MHz if the pfd at the surface of the Earth does not exceed –124.5 dB(W/m^2), in a 150 kHz band, as specified by ICAO. The use of RNSS (Earth-to-space) is compatible with the MLS operations through careful location of the radiobeacons.

Canada supports the CITEL proposal regarding the allocation to RNSS in the band 5 010-5 030 MHz (space-to-Earth), and the allocation to RNSS in the band 5 000-5 010 MHz (Earth-to-space).

CAN/24/60

Canada supports the CITEL Inter-American proposals IAP/14/129 to IAP/14/131 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposal for RNSS (Earth-to-space) in the band 1 300-1 350 MHz

Background information

The band 1 300-1 350 MHz is allocated worldwide on a primary basis to the aeronautical radionavigation service and on a secondary basis to the radiolocation service. New allocations for RNSS are required to support developments and some proposed RNSS systems would require a limited number of terrestrial radio beacons for synchronization. Footnote S5.149 indicates spectral line observations by the radio astronomy service and that precautions should be taken to protect the RA service from harmful interference.

Careful location of the radiobeacons should protect the RA astronomy service.

Results of ITU-R studies show that the required separation distance between radars and terrestrial beacons would be less than 60 km to protect the radars.

By making the radiolocation allocation primary, equal status would be given to both the RNSS (Earth-to-space) and the radiolocation radars, which would need to be coordinated. A footnote would preserve the higher status of the aeronautical radionavigation service.

CAN/24/61

Canada supports the CITEL Inter-American proposals IAP/14/132 to IAP/14/133 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.15.2

Agenda item 1.15.2: To consider the addition of the space-to-space direction to the radionavigation-satellite service allocations in the bands 1 215-1 260 MHz and 1 559-1 610 MHz.

Proposal for the addition of a space-to-space direction to the RNSS allocations in the bands 1 215-1 260 MHz and 1 559-1 610 MHz

Background information

Canada supports the Inter-American proposals (IAP/14/134-135) on this agenda item. This proposal is intended to clarify the implementation aspect of the IAP proposals.

The IAP recognizes that no additional protection for spaceborne receivers will be required for the reception of signals from radionavigation satellites. However, it does not include any regulatory provisions in Article S5 to reflect this understanding. Consequently, Canada is proposing a new footnote to ensure that the RNSS (space-to-space) service does not impose additional constraints on the mobile satellite service operating in adjacent bands.

CAN/24/62

Canada supports the CITEL Inter-American proposals IAP/14/134 to IAP/14/135 (Addendum 1 to Document WRC2000/14, 27 March 2000).

In addition, Canada proposes the following:

MOD CAN/24/63

1 525-1 610 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 559-1 610	AERONAUTICAL RADIONAVIGATION RADIONAVIGATION-SATELLITE (space-to-Earth) (space-to-space) S5.341 S5.355 S5.359 S5.363 ADD S5.XYZ	

ADD CAN/24/64

S5.XYZ Space-borne radionavigation receivers operating in the 1 559-1 610 MHz shall not impose additional constraints on the use of the bands 1 525-1 559 MHz and 1 610-1 660.5 MHz by systems in the mobile-satellite service.

Reasons: Provide an allocation for space-to-space use for RNSS while not imposing additional constraints on MSS stations in the bands 1 610-1 660.5 MHz and 1 525-1 559 MHz.

Proposals for agenda item 1.16

Agenda item 1.16: To consider allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution **723 (WRC-97)**.

Proposal to modify the allocations of frequency bands above 71 GHz

Background information

Canada has reviewed the requirements of the passive and active services in the frequency bands above 71 GHz. This review included specific Canadian requirements, the requirements of the international EES, SR and RA communities and the spectrum needs of the active services. Based on this review, Canada supports the CITEL Inter-American proposals IAP/14/137 to IAP 14/228.

Canada recognizes that the requirements of the active services in this range of the spectrum are not well defined and it is expected that they will not be known until the technology for these frequency bands matures. To ensure accommodation of the spectrum needs of the active services requirements when they become known, Canada supports the adoption of Resolutions XXX (WRC-2000) and YYY (WRC-2000) as shown in the CITEL Inter-American proposals. These Resolutions recognize the need for future world radiocommunication conferences to review and revise as appropriate the allocations above 71 GHz in order to meet the requirements of the active services. In addition, these Resolutions request ITU-R to develop means of equitably distributing the burden of sharing among the active and passive services.

CAN/24/65

Canada supports the CITEL Inter-American proposals IAP/14/137 to IAP/14/228 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.19

Agenda item 1.19: To consider the report of the Inter-conference Representative Group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system.

Ensuring the protection of other radiocommunication services and Region 2 BSS against interference from any revisions to the Regions 1 and 3 Plan, and not requiring these services to provide greater protection to Regions 1 and 3 BSS than at present

Background information

WRC-97 updated the Regions 1 and 3 BSS and feeder-link Plans, including the relevant technical criteria, and provided assignments for all new countries. However, there was general dissatisfaction with the number of channels assigned (five for Region 1 and four for Region 3). The new replanning is intended to provide for each Region 1 and 3 country an amount of spectrum that permits the economical development of BSS systems.

To prepare for this, WRC-97 adopted Resolution 532, which created the IRG (Inter-conference Representative Group) and the associated GTE (Group of Technical Experts). The same Resolution specified in Annex 1 the principles that will govern the studies of the IRG and GTE. The IRG and GTE studied the feasibility of increasing to around ten the number of 27 MHz channels per country provided in the WRC-97 Plan for Regions 1 and 3. Under agenda item 1.19 as originally adopted at WRC-97, WRC-99 (now WRC-2000) would then use the results of the IRG/GTE studies to decide whether or not a subsequent WRC should revise the WRC-97 Plan.

However, the 1998 meeting of ITU Council amended agenda item 1.19 to its present form. The goal of “around ten channels” was replaced by “an amount of spectrum that permits the development of an economical BSS system”. And the purpose of the IRG/GTE studies was changed from determining the feasibility of the goal, to providing the basis for a subsequent conference to construct a new Plan. Nonetheless, the IRG/GTE planning studies are still constrained to observe the eight “principles” set forth in Annex 1 to Resolution 532, including those intended to ensure compatibility with other services and to preserve the integrity of the Region 2 Plan.

These guiding principles (see Annex 1 to Resolution 532) include the following:

7 Ensure that the integrity of the Region 2 Plan and its associated provisions is preserved, by providing the same protection to the assignments contained in those Plans as is now received under the relevant provisions of the Radio Regulations, and by not requiring more protection from assignments in the Region 2 Plan than that currently provided under the Radio Regulations.

8 Ensure compatibility between the BSS in Regions 1 and 3 and services having allocations in the planned bands in all three Regions.

At the final IRG meeting a report was prepared on the results of the technical, planning feasibility and regulatory studies. This report will be submitted by the Director, BR, to WRC-2000.

CAN/24/66

Canada supports the CITEL Inter-American proposal IAP/14/229 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Annex 7 to Appendix S30. Ensuring continued future access for Region 2 FSS networks to the GSO arc segment 37° W to 10° E in the band 11.7-12.2 GHz as currently provided by Annex 7 of Appendix S30

Background information

In addition to inviting ITU-R to study the technical possibilities for increasing the minimum capacity assigned to all Region 1 and 3 countries in the BSS Plan for those Regions, Resolution 532 (WRC-97) requested the IRG "to examine Annex 7 [of Appendix S30/30] in the light of its studies for possible revision of the BSS Plans and with respect to the decisions taken by WRC-97, such as the reduction of the downlink e.i.r.p." In response, the IRG and its associated Group of Technical Experts (GTE) examined Annex 7 in considerable detail.

The examination focused principally on Section A 3) of Annex 7, quoted here in its entirety.

"Any new orbital position in the Regions 1 and 3 Plan in the range of the orbital arc between 37° W and 10° E associated with a new assignment, or resulting from a modification of an assignment in the Plan, shall be coincident with, or within 1° to the east of, a nominal orbital position in the Region 1 and 3 Plan at the date of entry into force of the Final Acts of the 1977 Conference (in force on 1 January 1979).

In the event of a modification to an assignment in the Regions 1 and 3 Plan, the use of a new nominal orbital position not coincident with any nominal orbital position in the Plan at the date of entry into force of the Final Acts of the 1977 Conference (in force on 1 January 1979) shall involve an 8 dB reduction in the e.i.r.p. compared to that appearing in the Regions 1 and 3 Plan for the assignment before modification."

The need for such restrictions was agreed at WARC SAT-77 to take four facts into account: a) the band 11.7-12.2 GHz is allocated on a primary basis to the FSS in Region 2, the BSS in Regions 1 and 3, and the terrestrial services (FS, MS, and BS) in all three Regions; b) the GSO arc segment 37° W to 10° E is of common interest to the Region 2 FSS and the Region 1 BSS; c) the BSS Plan adopted at WARC SAT-77 utilized "nominal orbital positions" at regular 6° intervals beginning with, and moving eastward from, 37° W; and, d) in 1977, the e.i.r.p. of a typical FSS satellite was over 20 dB lower than that assumed for the BSS satellites in the Plan.

One obvious consequence was that, in order to serve Region 2 from the orbital arc in question, future FSS systems would necessarily have to operate from positions between adjacent BSS orbital positions in the Plan. Technical studies at WARC SAT-77 showed that, for an FSS network serving eastern South America and a BSS Plan assignment serving western Africa, such operation required a minimum orbital separation of about 2.5° between the FSS and the BSS satellites. Accordingly, the first paragraph of Section A 3) ensures that future additions to the BSS Plan will not reduce the separation between adjacent BSS positions below 5°.

Another consequence was that, to facilitate sharing with both terrestrial services and the Region 2 FSS, it would be desirable to use lower satellite e.i.r.p. for additions to the BSS Plan at positions different from those in the original Plan. For this reason, the second paragraph of Section A 3) of Annex 7 specifies an 8 dB e.i.r.p. reduction when the Plan modification involves a new orbital position. It should be noted that this constraint is not confined to the arc 37° W to 10° E.

The technical examination by ITU-R of the orbital position and e.i.r.p. constraints of Annex 7 led to the following main conclusions:

1) Despite the fact that the technical characteristics of both FSS and BSS networks have changed considerably since 1977 (higher e.i.r.p.s and smaller antennas for the FSS; lower e.i.r.p.s and even smaller antennas for the BSS; the use of digital modulation,

lower system noise temperatures, and antennas with improved side lobe levels in both), all of the technical studies conclude that the worst-case minimum required separation between a Region 2 FSS and a Region 1 BSS satellite remains at about 2 to 2.5°.

2) With the general reduction of 5 dB in the satellite e.i.r.p. assumed in revising the original BSS Plan at WRC-97, the 8 dB reduction for in the second paragraph of Section A 3) of Annex 7 is no longer required to protect the terrestrial services.

3) The sharing criteria of Annex 1 of Appendix S30 (for protecting Region 2 FSS networks that have been notified or are in coordination from modifications to the Regions 1 and 3 Plans) and the corresponding criteria of Annex 4 of Appendix S30 (to protect the Plan from new Region 2 FSS systems) are not, in themselves, sufficient to ensure either access by Region 2 FSS networks or appropriate interference protection to both FSS and BSS in the orbital arc 37° W to 10° E.

4) The results of the IRG planning feasibility studies demonstrated that compliance with the Annex 7 orbit position limitations was not a barrier to the successful elaboration of a Plan for Regions 1 and 3 providing the desired 10 channels for each country (12 channels for Region 3 countries).

In addition to the foregoing technical conclusions, it was observed that, although the countries of North America have made heavy use of the GSO at positions west of about 60° W for FSS networks providing national coverage, the countries of South America have not yet made significant use of more easterly orbital positions. Indeed, although several planned “international” FSS networks include the 11.7-12.2 GHz band at positions in the orbital arc identified in Annex 7, only one such network is in operation, and none of them seek to use the full band or to offer a representative range of services. It can therefore be argued that, just as the WRC-97 Plan provides long-term guarantees of orbit-spectrum access for national-coverage BSS systems for the developing countries of Regions 1 and 3, the developing countries of Latin America continue to need provisions that will allow them to implement future national or multinational FSS systems. The need for such provisions is probably greater today than it was in 1977 precisely because of the heavy FSS use of more westerly orbital positions.

CAN/24/67

Canada supports the CITEL Inter-American proposals IAP/14/295 to IAP/14/298 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.19*bis*

Agenda item 1.19*bis*: In accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board’s Rules of Procedure relating to the application of RR 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference.

Radio Regulations Board’s Rules of Procedure relating to the application of RR 2674/S23.13

Background information

No. S23.13 (RR 2674) states that, “In devising the characteristics of a space station in the broadcasting-satellite service, all technical means available shall be used to reduce, to the maximum, the radiation over the territory of other countries unless an agreement has been previously reached with such countries.” No. S23.13 (RR 2674) was adopted at WARC-71. It was intended as a statement of good engineering practice to reduce BSS interference with the terrestrial services outside of the intended service area.

At WRC-95, however, some countries sought to have the interpretation of No. S23.13 (RR 2674) revised to require, as a condition for registration, the approval of other countries within the service area of a BSS system proposed as a plan modification. After thorough debate, WRC-95 instructed the RRB to revise its Rules of Procedures to reflect the results of its debate. The decision reached by WRC-95 reflected a difficult compromise on the parts of all parties involved. The RRB made the revisions, but further concerns were raised at WRC-97. These concerns led WRC-97 to adopt Resolution 536, which resolves that: “in addition to observing No. **S23.13/2674**, and before providing satellite broadcasting services to other administrations, administrations originating the services should obtain the agreement of those other administrations.”

Still dissatisfied after a review of the RRB Rules for RR S23.13 under the “review of finding” procedures of Article S14, the concerned countries persuaded the 1998 meeting of the ITU Council to adopt new agenda item 1.19*bis*.

CAN/24/68

Canada supports the CITEL Inter-American proposal IAP/14/230 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 1.20

Agenda item 1.20: To consider the issues related to the application of Nos. **S9.8**, **S9.9** and **S9.17** and the corresponding parts of Appendix **S5** with respect to Appendices **S30** and **S30A**, with a view to possible deletion of Articles 6 and 7 of Appendices **S30** and **S30A**, also taking into consideration Recommendation **35 (WRC-95)**.

pfd limits in Annex 1 to Appendix S30 (Sections 5 *b)* and 5 *c)*)

Background information

Annex 1 to Appendix S30 of the Radio Regulations specifies limits for determining whether a service is affected by a proposed modification to the BSS Plan (i.e., when it is necessary to seek the agreement of any other administration). Section 5 of Annex 1 specifies limits to the change in the pfd to protect the terrestrial services of administrations in Regions 1 and 3 from modifications to the Region 2 Plan. In particular, section 5 *c)* specifies the pfd limits for administrations in Region 1 east of longitude 30° E. Further, through section 8 *a)*, the pfd limits in section 5 *b)* of Annex 1 apply to protect terrestrial services in Regions 1 and 3 from modifications to the Regions 1 and 3 BSS Plan.

This pfd limit is very stringent at low angles of elevation. For example, in order to meet this pfd limit the BSS spacecraft power must be significantly lower in remote areas of a Region as compared to other areas in the center of the Region. As a result, the provision of BSS service to these areas requires larger BSS receive dishes, in some cases as large as 2.4 m.

A relaxation in the pfd limit in section 5 *c)* of Annex 1 of Appendix **S30**, as proposed below, would allow the use of 60 cm BSS receive dishes in these areas for BSS service. ITU-R studied possible modifications to the limits in sections 5 *b)* and 5 *c)* of Annex 1. Section 5.2.3.5 of the CPM Report contains a proposed change to these limits. Consistent with the CPM Report, the following changes to section 5 of Annex 1 of Appendix S30 are proposed. As a result of these modifications to sections 5 *b)* and 5 *c)*, Table 3 of Article 10 of Appendix S30 should be reviewed and revised appropriately.

CAN/24/69

Canada supports the CITEL Inter-American proposal IAP/14/231 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Application of footnotes S5.487 and S5.490

Background information

One of the issues related to the application of Articles 6 and 7 (or S9) of Appendices S30 and S30A, is the scope of footnotes S5.487 and S5.490. Footnote S.5.487 relates to Regions 1 and 3 and states that other services in the 11.7-12.5 GHz band in Regions 1 and 3 shall not cause harmful interference to BSS operating "in accordance with the provisions of Appendix **S30**". Footnote S5.490 relates to Region 2 in the band 12.2-12.7 GHz and states that existing and future terrestrial radiocommunication services shall not cause interference to BSS operating "in conformity with the broadcasting-satellite Plan for Region 2 contained in Appendix **S30**".

The question that has been raised in this regard is whether these footnotes apply only to assignments in the Plan or also to assignments that are in operation as a result of successful application of Article 4 procedures. This situation was discussed at the CPM and alternative arguments are presented in section 5.2.3.5 of Chapter 5 of the CPM Report. Some views were expressed that these provisions provide a super-primary status to the BSS over other co-primary services in the band, in that it requires the other services not to cause harmful interference to the broadcasting-satellite stations operating in accordance with the provisions of Appendix S30. From this some expressed the view that these footnotes should not apply to modifications to the Plans.

However, when administrations agreed to the BSS Plans they did so with the understanding that modification procedures would be available to provide administrations with the flexibility of modifying their assignments to suit their future needs and/or take advantage of currently available technology. Further, administrations understood and agreed that assignments which have been implemented after successful completion of the Article 4 modification procedures would be entitled to the same rights as the original assignments in the Plan. This is clearly stated in section 4.3.17 of Appendix S30 where it states in this regard: "The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan". The text establishes the link with S5.487 and S5.490 concerning assignments in conformity with the plans or their provisions.

CAN/24/70

Canada supports the CITEL Inter-American proposals IAP/14/300 to IAP/14/301 (Addendum 2 to Document WRC2000/14, 29 March 2000).

Retention of Articles 6 and 7 in Appendices S30 and S30A

Background information

At present, Appendices S30 and S30A are self-contained insofar as the procedures for coordinating assignments to other services with those in the BSS Plans are concerned. For example, Article 6 of Appendices S30 and S30A covers the coordination, notification, and recording of terrestrial stations in the BSS and feeder-link bands respectively, and Article 7 plays a similar role for FSS assignments. The main purpose of agenda item 1.20 is to decide whether to suppress Articles 6 and 7 and replace them by the general coordination procedures of Article S9 and the notification and recording procedures of Article S11. Related to this issue are various sharing situations, which need to be addressed. In addition certain Regions 1 and 3 administrations believe that modifications under Article 4 cannot be considered under this agenda item.

A wide-ranging discussion on these issues took place at the CPM. The results are reflected in section 5.2 of the CPM Report, Chapter 5 and its Annexes 1 and 2 where the two approaches concerning the procedures are included. Annex 1 contains the text for Approach A which calls for retaining the procedures in Article 6 and 7 and provides updates to address certain new sharing situations which have been identified. Annex 2 contains approach B, which calls for suppressing Articles 6 and 7 and moving their contents to Articles S9 and S11 which contain the procedures for all other services.

After careful review of the situation, including the relevant text of the CPM, it is evident that the relocation of Articles 6 and 7 to Articles S9 and S11, with subsequent complex and significant changes which run the risk of unintended consequences is not necessary to improve the current situation. The existing Articles 6 and 7 have been used for 20 years and no problems have arisen that could not be corrected by updating these Articles. This has been amply demonstrated in Annex 1 of Chapter 5 of the CPM Report (Approach A) which contains updates of the existing procedures in the appendices to meet new situations that have been identified in recent studies and applications.

Keeping all the procedures relating to BSS in one place in the Radio Regulations, i.e. in Appendices S30 and S30A, would continue to make them simpler to use and update when necessary.

CAN/24/71

Canada supports retention and updating of Articles 6 and 7 as detailed in Inter-American proposals IAP/14/302 to IAP/14/361 (Addendum 2 to Document WRC2000/14, 29 March 2000).

Reasons: To ensure appropriate and user-friendly procedures for use in BSS applications.

pfd limits in Annex 1 to Appendix S30 (Section 8 *b)*)

Background information

Chapter 5 of the CPM Report addresses issues associated with Appendices S30 and S30A of the Radio Regulations. Specifically section 5.2.3.5 covers issues related to protection of the terrestrial service from modifications to the Appendix S30 BSS Plans. Sections 4, 5 and 8 of Annex 1 of Appendix S30 specifies power flux-density (pfd) limits to determine if terrestrial services may be affected by modifications to the Plans.

The CPM Report addresses in detail Sections 5 *b)* and 5 *c)* of Annex 1 (pfd limits to protect terrestrial services in Regions 1 and 3) and proposes modifying those pfd limits to be consistent with the pfd limits contained in Table S21-4 of Article S21 for the protection of the fixed service from the fixed-satellite service. Additionally, section 5.2.3.5 of the CPM Report encourages review of the pfd limits to protect terrestrial services in sections 4, 5 and 8 of Annex 1 of Appendix S30 for possible modification or consolidation.

This proposal addresses section 8 *b)* of Annex 1, which provides the pfd limit to determine if terrestrial services in Region 2 may be affected by a modification to the Region 2 BSS Plan. The current limit is a single pfd value that does not vary as a function of arrival angle as is typical of pfd limits to protect terrestrial services in the Radio Regulations. After review of the existing limit it is proposed that the power flux-density limit in 8 *b)* be modified to bring it into alignment with the pfd limits to protect the fixed service in other parts of the Radio Regulations. This proposal is consistent with the proposal contained in the CPM Report regarding pfd limits to protect terrestrial services in Regions 1 and 3.

Proposals for agenda item 7

Agenda item 7: In accordance with Article 7 of the Convention (Geneva, 1992).

Proposals for agenda item 7.1

Agenda item 7.1: To consider and approve the report of the Director of the Radiocommunication Bureau on the activities of the Radiocommunication Sector since WRC-97.

Update of Appendix S5 for the simplification of the Radio Regulations

Background information

Resolution 86 of the 1998 Plenipotentiary Conference (PP-98) calls for proposals to WRC-2000 for the simplification of the coordination and notification procedures contained in Articles S9 and S11, and *inter alia* Appendix S5, of the Radio Regulations. The CPM-99 Report contains a section dealing with this agenda item in section 7.5.2.10. This section of the CPM-99 Report describes example modifications to Appendix S5 of the Radio Regulations to establish the coordination regime between space stations and terrestrial stations in bands where S9.11A applies and also to correct certain editorial deficiencies.

One of the main deficiencies of Appendix S5 is the lack of clarity regarding the relationship between space stations of non-GSO FSS or non-GSO MSS, including its feeder links, and terrestrial services under Article S9.14. In particular, section 2 of Annex 1 to Appendix S5 contains “hard limits” which have to be met and which are intended to protect terrestrial services, thereby eliminating the need for coordination between these services and space stations. Unfortunately, the language in Appendix S5 is not explicit and could lead to misinterpretation. To avoid such possibilities, CPM-99 proposed to remove section 2 of that Appendix and to add clarifying language to make it unambiguous that coordination is not required between the space stations and terrestrial services when Article S21 “hard limits” apply in bands covered by S9.14. Canada supports the CPM-99 text and proposes to delete the text of section 2 of the Annex, which is redundant since the specific pfd limits are already contained in Articles S21 and S22. Furthermore, because these limits are not used to determine the need for coordination, which is the “raison d’être” of Appendix S5, there are no reasons to include “hard limits” in Appendix S5. This would also avoid potential problems such as the current differences between the text in Annex 1 to Appendix S5 and that of Article S21. Canada has further reviewed the text contained in the CPM-99 Report and believes that there are a few additional areas that need to be considered and these are described in detail in the proposal section.

This CPM-99 Report also proposes changes to Appendix S5 of the Radio Regulations to correct certain editorial discrepancies. Canada supports the CPM in this regard.

Finally, since Appendix S7 will likely be updated by WRC-2000 based on the new Recommendation (SM.XX) developed by ITU-R Task Group 1/6, further simplification of Appendix S5 can be achieved. References to Recommendations ITU-R IS.847, IS.848 and IS.849 should be replaced by references to the updated Appendix S7. It is expected that RA-2000 will adopt the new Recommendation (SM.XX). Also, the totality of sections 2 and 3 of Annex 1 of Appendix S5 could be deleted as a result.

CAN/24/74

Canada supports the CPM-99 example changes to Appendix S5 to clarify the application of S9.14. However, Canada believes that it is necessary to evaluate all possible cases to ensure that the Radio Regulations are complete and unambiguous in this respect.

The following describes the possible cases under S9.14 and the solution proposed by Canada:

1) Where “hard” pfd limits are included in Article S21 or in an Article S5 footnote and there is no coordination threshold in Appendix S5.

2) Where there are no “hard” pfd limits in either Article S21 or in an Article S5 footnote, but there is a coordination threshold in Appendix S5.

3) Where there are neither “hard” pfd limits in Article S21 and in Article S5 footnotes, nor is there a coordination threshold in Appendix S5 (the concern raised at the CPM by one administration).

4) Where “hard pfd limits” are included in Article S21 or in an Article S5 footnote, and there is also a coordination threshold in Appendix S5.

Cases 1) and 2) above are adequately treated in the example CPM text; however, further consideration is required for cases 3) and 4). For case 3), in bands where there are no limits in Articles S21 or in S5 footnotes and where there are no coordination thresholds, Canada proposes to use band overlap as the trigger for coordination. There are such precedents in the current Appendix S5, for example in the case of S9.12 and S9.13. For case 4), there is a single situation in the current Radio Regulations, as described in the Annex to this proposal, in the 15.43-15.63 GHz band. Canada proposes changes to the language in Table S5-1 of Appendix S5 to make it complete and precise.

The treatment of this issue is clear with regards to coordination of space stations transmissions in the space-to-Earth direction with respect to terrestrial services. However, the coordination of space station receivers in the Earth-to-space direction and terrestrial services is not so clear. For instance, there is no procedure for the coordination of terrestrial services with a space station (i.e., there is no provision like S9.14 for the reverse coordination). To avoid unintended consequences, it is proposed to limit this application to the space-to-Earth direction only.

Also, under agenda item 1.13, Canada proposes a modification to S9.10 for the coordination between non-GSO FSS systems in bands covered by Resolutions 130 and 538. Therefore, for clarity, the reference will be changed in Table S5-1A to this modified provision.

APPENDIX S5

Identification of administrations with which coordination is to be effected or agreement sought under the provisions of Article S9

Only those relevant portions of the text of relevant Tables and the Annex 1 to Appendix S5 have been reproduced.

MOD CAN/24/75

TABLE S5-1 (*continued*)

Reference of Article S9	**Case**	**Frequency bands (and Region) of the service for which coordination is sought**	**Threshold/condition**	**Calculation method**	**Remarks**
No. **S9.12** 1) Non-GSO/ non-GSO	A station in a satellite network using a non-geostationary-satellite orbit in the frequency bands for which a footnote refers to **S9.11A** in respect of any other satellite network using a non-geostationary-satellite orbit, with the exception of coordination between earth stations operating in the opposite direction of transmission	See Table S5-~~2~~1A	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	
No. **S9.12** 2) Non-GSO/ GSO	A station in a satellite network using a non-geostationary-satellite orbit in the frequency bands for which a footnote refers to **S9.11A** in respect of any other satellite network using the geostationary-satellite orbit, with the exception of coordination between earth stations operating in the opposite direction of transmission	See Table S5-21A	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	

Reasons: Frequency bands where S9.11A applies are in Table S5-1A, not Table S5-2.

TABLE S5-1 (*continued*)

Reference of Article S9	**Case**	**Frequency bands (and Region) of the service for which coordination is sought**	**Threshold/condition**	**Calculation method**	**Remarks**
No. **S9.13** GSO/non-GSO	A station in a satellite network using the GSO in the frequency bands for which a footnote refers to No. **S9.11A** in respect of any other satellite network using a non-GSO, with the exception of coordination between earth stations operating in the opposite direction of transmission	See Table S5-~~2~~1A	Condition: bandwidths overlap	Check by using the assigned frequencies and bandwidths	
No. **S9.14** Non-GSO/ terrestrial, GSO/terrestrial	For a space station in a satellite network in the frequency bands for which a footnote refers to No. **S9.11A** in respect of stations of terrestrial services where threshold(s) is (are) exceeded	See Table S5-~~2~~1A	~~See § 1 of Annex 1 of this Appendix~~Three cases exist: 1) There are pfd limits in Article **S21** or in footnotes to Article **S5**, but no threshold(s) in § 1 of Annex 1 of this Appendix, so coordination is not required 2) The threshold(s) of § 1 of Annex 1 of this Appendix is(are) exceeded 3) There are no pfd limits in Article **S21** nor in footnotes to Article **S5**, and no threshold(s) in § 1 of Annex 1 of this Appendix, so condition is bandwidth overlap	~~See § 1 of Annex 1 of this Appendix~~ Case 1: Coordination is not required Case 2: See § 1 of Annex 1 of this Appendix Case 3: Check by using the assigned frequencies and bandwidths	

TABLE S5-1 (*continued*)

No. **S9.15** Non-GSO/ terrestrial	A specific earth station or a typical earth station in respect of terrestrial stations in frequency bands for which a footnote refers to No. **S9.11A** allocated with equal rights to space and terrestrial services, where the coordination area of the earth station includes the territory of another country	See Table S5-~~2~~1A	The coordination area of the earth station covers the territory of another administration	See ~~§ 2 of Annex 1 of this~~ Appendix **S7**	

Reasons: Frequency bands where S9.11A applies are in Table S5-1A, not Table S5-2. Under S9.14, **Case 1)** applies when there are no coordination thresholds but there are "hard limits", so coordination is not required. **Case 2)** applies when there is a coordination threshold and it is exceeded, then coordination is required even if there is a "hard limit" in Articles S21 or in a footnote of Article S5. **Case 3)** applies when there are no coordination thresholds and no "hard limits" so that coordination is required when there is bandwidth overlap.

TABLE S5-1 (*continued*)

Reference of Article S9	**Case**	**Frequency bands (and Region) of the service for which coordination is sought**	**Threshold/condition**	**Calculation method**	**Remarks**
No. **S9.16** Terrestrial/ non-GSO	A transmitting station in a terrestrial service within the coordination area of an earth station in a non-GSO network in frequency bands for which a footnote refers to No. **S9.11A**	See Table S5-~~2~~1A	Transmitting terrestrial station is situated within the coordination area of a receiving earth station	See ~~§ 2 of Annex 1 of this~~ Appendix **S7**	The coordination area of the affected earth station has already been determined using the calculation method of No. **S9.15**
No. **S9.17A** GSO, non-GSO/ GSO, non-GSO	A specific earth station in respect of other earth stations operating in the opposite direction of transmission in frequency bands allocated with equal rights to space radiocommunication services in both directions of transmission, where the coordination area of the earth station includes the territory of another country or the earth station is located within the coordination area of a coordinated earth station, with the exception of the frequency bands subject to the Plans in Appendix **S30A**	Any frequency band allocated to a space service	The coordination area of the earth station covers the territory of another administration or the earth station is located within the coordination area of an earth station	~~i) For bands in Table S5-2, see § 2 of Annex 1 of this Appendix~~ ~~ii)~~ See Appendix **S7** ~~Recommendations ITU-R IS.847, ITU-R IS.848 and ITU-R IS.849~~	

Reasons: Frequency bands where S9.11A applies are in Table S5-1A, not Table S5-2. Under S9.17A, reference to Recommendations ITU-R IS.847, IS.848 and IS.849 are replaced by Appendix S7 assuming that it gets updated with the material from Recommendation ITU-R SM.XX which is pending approval by RA-2000.

MOD CAN/24/76

TABLE S5-1A

Applicability of No. S9.11A for space services

NOTE – Section 1 of Annex 1 contains the relevant coordination thresholds for sharing between the mobile-satellite service (MSS) (space-to-Earth) and terrestrial services~~ as well as the relevant coordination areas for mobile earth stations operating below 3 GHz~~. It also contains the relevant coordination thresholds for sharing between non-GSO MSS feeder links (space-to-Earth) and terrestrial services~~ as well as the relevant coordination areas for earth stations providing feeder links for non-GSO satellites operating in the MSS and for non-GSO FSS earth stations~~.

PP-98 Resolution 86 - Separation of uplink and downlink data

Background information

Appendix S4 of the Radio Regulations contains lists of characteristics to be supplied to effect the coordination process. Characteristics of satellite networks are listed in Annex 2A to Appendix S4. Specifically, Section D of Annex 2A to Appendix S4 applies to simple frequency-changing ("bent pipe") transponders. Appendix S8 contains the method of calculation for determining if coordination is required between GSO satellite networks sharing the same frequency bands. Under this method, if the increase in equivalent noise temperature for the entire satellite link ("ΔT/T") exceeds a percentage threshold value of 6%, coordination is required. In order to apply the method of Appendix S8, it is necessary to consider all possible combinations of uplink and downlink frequencies and test each combination against the ΔT/T threshold.

Although it is expected that on-board processing capability will increasingly become a part of spacecraft designs, the overwhelming majority of existing satellites, and of spacecraft currently in the design and construction stages, use "bent-pipe" designs. At the same time, technological advances, the allocation of additional bands to satellite services, and the economics of satellite network design have led to increasingly complex satellite designs which employ multiple frequency bands and satellite antenna beams. To increase flexibility, and for a variety of technical and regulatory reasons, cross-strapping capability is often included, so that a mapping between uplink and downlink frequencies is possible. This cross-strapping information is incorporated in the information supplied pursuant to Appendix S4. As the number of cross-strapping possibilities increases, the amount of calculation under Appendix S8 increases geometrically.

The current situation imposes a burden on those filing satellite networks and in particular on the resources of BR, thereby contributing to the backlog of satellite filings. It is proposed to simplify the process by calculating the ΔT/T values independently for uplinks and downlinks. The values of ΔT/T calculated for both the uplink and downlink would each be compared with the threshold value of 6%, as is now the case when there is a change in modulation on board the satellite. This proposal may result in some increase in the number of satellite networks identified, for example when the ΔT/T threshold is exceeded only on the uplink in a network that is heavily downlink limited, and vice versa. However, such cases should quickly be resolved during the coordination process.

APPENDIX S4

Consolidated list and tables of characteristics for use in the application of the procedures of Chapter SIII

ANNEX 2A

Characteristics of satellite networks or earth or radio astronomy stations[2]

SUP CAN/24/81

D Overall link characteristics

With consequential modifications to Appendix S8.

Reasons: Separation of the uplink and downlink ΔT/T calculations would simplify the preparation of filings and reduce the workload of the BR. If this change were made, the information listed in Section D of Annex 2A to Appendix S4 would no longer be required. As a consequence of this change, Appendix S8 would also require some modification.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

PLENARY MEETING

Canada

PROPOSALS FOR THE WORK OF THE CONFERENCE

CONTENTS

Proposals for agenda item 1.8

Agenda item 1.8: To consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands.

Proposal for communications by earth stations on board vessels using frequencies allocated to the fixed-satellite service and used by existing space segment in the fixed-satellite service

CAN/24/16

The following proposals replace CAN/24/16 (Document WRC2000/24, 16 February 2000) to align with the set of IAPS on this agenda item:

1) Canada supports the CITEL Inter-American proposals IAP/14/42 to IAP/14/43 (Document WRC2000/14, 18 January 2000).

2) Canada supports the CITEL Inter-American proposals IAP/14/44 to IAP/14/45 (Corrigendum 1 to Document WRC2000/14, 21 March 2000).

Proposals for agenda item 1.11

Agenda item 1.11: To consider constraints on existing allocations and to consider additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions **214 (Rev.WRC-97)** and **219 (WRC-97)**.

Proposal addressing constrains on existing allocation for non-geostationary (non-GSO) MSS below 1 GHz

CAN/24/18 to
CAN/24/20

The following proposals replace CAN/24/18 to CAN/24/20 (Document WRC2000/24, 16 February 2000):

Canada supports the CITEL Inter-American proposals IAP/14/237 to IAP/14/241 (Addendum 1 to Document WRC2000/14, 27 March 2000).

NOTE - Canada continues to support CAN/24/21 (Document WRC2000/24, 16 February 2000).

Proposals for agenda item 1.13.1

Agenda item 1.13.1: To review and, if appropriate, revise the power limits appearing in Articles **S21** and **S22** in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services.

Resolution 131 (WRC-97): Power flux-density limits applicable to non-geostationary fixed-satellite service systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz

CAN/24/23 to
CAN/24/28

The following proposals replace CAN/24/23 to CAN/24/28 (Document WRC2000/24, 16 February 2000):

Canada supports the CITEL Inter-American proposals IAP/14/118 to IAP/14/128 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Reasons: The proposals in Document WRC2000/24, 16 February 2000) are aligned with the CITEL Inter-American proposals addressing Resolution 131 (WRC-97).

Proposals for agenda item 1.13.2

Agenda item 1.13.2: To consider the inclusion in other frequency bands of similar limits in Articles **S21** and **S22**, or other regulatory approaches to be applied in relation to sharing situations.

CAN/24/29

The following proposal replaces CAN/24/29 (Document WRC2000/24, 16 February 2000):

Canada supports the CITEL Inter-American proposal IAP/14/124 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Reasons: The proposal in Document WRC2000/24, 16 February 2000 is aligned with the CITEL Inter-American proposal IAP/14/124 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Proposals for agenda item 2

Agenda item 2: To examine the revised ITU-R recommendations incorporated by reference in the Radio Regulations in accordance with Resolution **28 (WRC-95)**; and decide whether or not to update the corresponding references in the Radio Regulations, in accordance with principles contained in the Annex to Resolution **27 (Rev.WRC-97)**.

Proposals to modify Resolution 27 (Rev.WRC-97) and Resolution 28 (WRC-95)

CAN/24/33 to
CAN/24/34

The following proposals replace CAN/24/33 to CAN/24/34 (Document WRC2000/24, 16 February 2000):

Canada supports the CITEL Inter-American proposals IAP/14/232 to IAP/14/233 (Addendum 1 to Document WRC2000/14, 27 March 2000).

Reasons: The proposals in Document WRC2000/24, 16 February 2000 are aligned with the CITEL Inter-American proposals IAP/14/232 to IAP/14/233 (Addendum 1 to Document WRC2000/14, 27 March 2000).

PROPOSALS FOR THE WORK OF THE CONFERENCE

CONTENTS

* Pursuant to Resolution 26 (Rev.WRC-97) the Secretariat notes that this contribution was received on 15 February 2000.

Introduction

The Administration of Canada is pleased to have the opportunity to submit proposals in support of the work of the World Radiocommunication Conference (Istanbul, 2000). These proposals represent the collective views of a joint government and industry WRC preparatory committee.

In a rapidly changing environment stimulated by such developments as the WTO Agreement on trade in telecommunication services, new competitive service offerings are now forming the basis for proposals to facilitate choice to the consumer of radiocommunication products and services. In Canada's view, the Radio Regulations should create the conditions, which favour the orderly evolution of radiocommunication technology, and should not deter it through a rigid protection of the status quo. Older radio technologies should be protected for as long as they remain a significant and appropriate component of a given telecommunication infrastructure, but the Regulations should permit upgrading of the infrastructure through the introduction of new technologies when required.

When the Conference considers changes to the Regulations, it must take into account all of the needs of the service requiring such changes, and the needs of other services sharing the band. Therefore, the Canadian proposals place particular emphasis on the need for the Conference to agree on appropriate technical sharing criteria, the development of appropriate coordination mechanisms, and on the determination of suitable transition arrangements. Furthermore, in Canada's view it is absolutely imperative that the Conference should resolve issues to the maximum extent possible. Otherwise, ever-changing Regulations create a climate of uncertainty that discourage the use and development of new radiocommunication systems. Moreover, a lack of resolve to take decisions can overburden the agendas of subsequent conferences through the deferral of certain items, and therefore complicate decision-making even further in the future. The budgetary consequences of WRC decisions also need to be taken into account, particularly in terms of the post-Conference work, which the Radiocommunication Bureau is obliged to undertake. This is especially critical with regard to the impact of such work on the ongoing programmes and activities of the ITU-R, given the current climate of financial constraint, which prevails in the Union as a whole.

In addressing the agenda of WRC-2000, Canada has taken into account recent ITU-R studies and Recommendations, the results of CPM-99, new developments in radiocommunication technology, related service issues and consequential regulatory changes that are necessary for the success of the Conference. The following summary represents the first package of proposals to be submitted by Canada to support the work of the Conference, followed by a substantive presentation of each item. Subsequent proposals may be submitted as addenda.

Proposals for agenda item 1.1

Agenda item 1.1: Requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution **26 (Rev.WRC-97)**.

Proposal for suppression of footnote S5.124 (broadcast services in the band 3 950-4 000 kHz)

Background information

Canada supports administrations taking the initiative to review and propose the deletion of country footnotes that are no longer required. Having reviewed the ITU Table of Frequency Allocations country footnotes applicable to Canada, the footnote S5.124 pertaining to broadcasting services in the band 3 950-4 000 kHz is no longer necessary. The footnote states that in Canada this band is also allocated to the broadcasting service on a primary basis. No broadcasting services are operating or planning to operate in this band and it is no longer allocated to broadcasting services.

SUP CAN/24/1

S5.124

Reasons: Footnote S5.124 is no longer required.

Proposal for modification of footnote S5.293 to include the Administration of Canada

Background information

Footnote S5.293 raises the status of the fixed and mobile services to a primary basis in nine countries in Region 2 in the bands 470-512 MHz and 614-806 MHz. The use of those services is subject to agreement under No. S9.21. Canada anticipates that with the full implementation of digital television, less spectrum will be required for television services than at present. By joining footnote S5.293, Canada would have the option of implementing fixed and mobile in some parts of the frequency bands specified in the footnote, subject to agreement under No. S9.21.

MOD CAN/24/2

S5.293 *Different category of service:* in Canada, Chile, Colombia, Cuba, the United States, Guyana, Honduras, Jamaica, Mexico and Panama, the allocation of the bands 470-512 MHz and 614-806 MHz to the fixed and mobile services is on a primary basis (see No. **S5.33**), subject to agreement obtained under No. **S9.21**.

Proposals for agenda item 1.2

Agenda item 1.2: To finalize remaining issues in the review of Appendix S3 to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation **66 (Rev.WRC-97)** and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services.

Proposal to modify Appendix S3

Background information

Recommendation 66 (Rev.WRC-97) directs the ITU-R to submit a report to WRC-2000 with a view to finalizing the space services spurious emission limits in Appendix S3 of the Radio Regulations. Canada along with the other CITEL Administrations propose text that would remove the “design objectives” designation from the space services spurious emission limits and make related appropriate modifications applicable to deep-space systems, satellites with spurious emissions falling within the necessary bandwidth of another transmitter on the same satellite, and amateur earth stations below 30 MHz. Also, it is proposed to adequately recognize the case of very narrowband and unmodulated signals, particularly for the space services. Furthermore, it is proposed to correct an oversight in Appendix S3 regarding limits for the radiodetermination service, and specify that spurious emission levels for radar systems be determined from radiated emissions.

CAN/24/3

Canada supports the CITEL Inter-American Proposals IAP/14/1 to IAP/14/8
(Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.4

Agenda item 1.4: To consider issues concerning allocations and regulatory aspects related to Resolutions **126 (WRC-97)**, **128 (WRC-97)**, **129 (WRC-97)**, **133 (WRC-97)**, **134 (WRC-97)** and **726 (WRC-97)**.

Proposal for the confirmation of the fixed service allocation in the 31.8-33.4 GHz frequency range (Resolutions 126 and 726)

Background information

Resolutions 126 and 726 invite the ITU-R to address, among other issues, sharing between high-density fixed systems (HDFS) and other radiocommunication services sharing spectrum in the bands 31.8-33.4 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz.

The term “high-density” applications in the fixed service (HDFS) describes a significant level of deployment of point-to-point and/or point-to-multipoint systems within a given area. In bands above 30 GHz propagation conditions, availability of small, light-weight components and a high degree of frequency reuse are key factors in permitting the deployment of a large population of fixed systems. The term “high density” refers a large number of terminals operating within a small geographical area. It does not refer to population density, although there is a strong correlation between high population centres and the deployment of HDFS.

At WRC-97, a number of frequency bands above 30 GHz were identified through Resolution 726 as available for the deployment of high-density fixed systems. Included in Resolution 726 is the frequency range 31.8-33.4 GHz. WRC-97 amended the table of frequency allocations to include the fixed service on a primary basis in the 31.8-33.4 GHz range subject to conditions found in Resolution 126. The first condition stipulated that this allocation to the fixed service would not go into force until 1 January 2001. Secondly, this allocation would be reviewed at WRC-2000 taking into account the results of sharing studies and the future requirements of the other allocated services. The frequency range 31.8-33.4 GHz also has primary allocations to the radionavigation, space research (space-to-Earth) (deep space) and the inter-satellite services.

The ITU-R, through various working parties, has studied the sharing potential between the fixed service (high-density applications) and the other primary services. With regard to sharing between the fixed and radionavigation services, studies indicated that sharing is possible through the use of practical mitigation and operational measures, recognizing that fixed systems may receive unintentional emissions from airborne radionavigation systems. However, actual interference events are expected to be rare. The CPM Report recommended that sharing between the fixed and radionavigation services could be addressed through the development of appropriate ITU-R Recommendations. Sharing between the fixed service and the space research deep space facilities is considered practical as there are only a few deep space sites in the world and coordination with the fixed stations is feasible. Studies have also concluded that interference levels from high-density fixed stations into inter-satellite receivers are well within acceptable limits.

CAN/24/4

Canada supports the CITEL Inter-American Proposals IAP/14/9 to IAP/14/14 (Document WRC2000/14, 18 January 2000).

Proposal addressing high-density applications in the fixed service in bands above 50 GHz (Resolution 726)

Background information

The band 51.4-52.6 GHz is allocated to the fixed and mobile services on a primary basis with the radio astronomy service allocated by No. S5.556. Furthermore, the RAS shares the band 58.2-59 GHz with the FS, the MS, the EESS (passive) and the SRS (passive) and the band 64-65 GHz with the FS, the MS and the ISS by No. S5.556. In addition, the FS, MS, ISS, EESS (passive) and SRS (passive) share the bands 55.78-58.2 GHz and 65-66 GHz on a primary basis. No. S5.547 provides for the introduction of high-density FS applications into these bands.

While there are currently no known uses of the bands by RAS, sharing between HDFS and RAS is deemed to be a national issue. Although sharing is considered under Recommendation ITU-R SA.1259, there are currently no plans for the space research service allocation in the bands.

There is currently no planned use for EESS in the band 65-66 GHz and no studies have been completed. In the band 55.78-59 GHz studies have indicated that sharing is feasible; however, concern has subsequently been expressed for the sub-band 55.78-56.26 GHz band. Work is continuing in the ITU-R to consider this matter.

CAN/24/5

With regard to the bands 51.4-52.6 GHz, 55.78-59 GHz, and 64-66 GHz, RR S5.547 should not be modified.

Reasons: The review and, if necessary, revision of sharing criteria between spaceborne passive sensors in the EESS and HDFS can be accomplished within the ITU-R through the development of Recommendations.

Proposals for agenda item 1.6.1

Agenda item 1.6.1: Review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary.

Proposal to identify additional spectrum for IMT-2000

Background information

In Canada, cellular and PCS services are experiencing significant growth, and there is strong interest in the evolution of these services towards IMT-2000. In view of the present PCS use of the 2 GHz band and the MSS allocations in the frequency spectrum currently identified for IMT-2000 by RR S5.388, there is limited clear spectrum available for the implementation of IMT-2000.

In order to consider additional requirements for the terrestrial component of IMT-2000, current PCS and cellular services should be able to evolve to IMT-2000 in existing bands to the extent possible. ITU-R Task Group 8/1 (TG 8/1) efforts towards global harmonization of technology and spectrum, and in particular, the forecast of 160 MHz of additional spectrum beyond that currently in the bands used for first and second generation mobile systems (e.g. cellular and PCS in Region 2) to implement IMT-2000 should be supported.

Proposals to identify frequency bands to accommodate the additional forecasted requirements should take into account the principles of placing priority on the selection of bands already allocated to the mobile service and of taking into consideration the impact on existing uses of the spectrum. Also, consideration should be given to the possibility of achieving harmonization through all or parts of the identified band(s) with other regions of the world.

Considering current and planned uses of spectrum for other radio services and, taking into account the review by TG 8/1 of possible candidate bands for IMT-2000, it is proposed that the frequency band 1 710-1 885 MHz be identified as additional spectrum for the terrestrial component of IMT-2000. According to the Task Group 8/1 survey results, most administrations in Region 1 (CEPT countries, South Africa), Region 2 (Brazil, Canada, United States) and certain administrations in Region 3 (Australia, China, Japan, Korea, Malaysia, New Zealand) have either already allocated various portions of the band 1 710-1 855 MHz to the mobile service or have identified them as possible candidates for IMT-2000.

In some administrations, the band 1 710-1 850 MHz, is currently used by the fixed service. Transition issues related to the use of this band by other services have been studied. Fixed systems operating in or near to IMT-2000 service areas may re-establish service in other bands including 2 025-2 110 MHz and 2 200-2 290 MHz.

In cases where there is concern about potential interference to space operations and space research uplinks operating in parts of the band 1 710-1 850 MHz, a number of options could be available. It is recommended that the ITU-R develops Recommendations to identify practical mitigation techniques. In addition, where aggregate interference problems are anticipated, it is recommended that these space facilities migrate to the 2 025-2 110 MHz band as spacecraft and ground transmitters are replaced. It should be noted that WARC-92 identified this band for space operations, space research and Earth exploration-satellite (Earth-to-space). Furthermore, WRC-97 adopted S5.391, which prevents this band from being used by high-density mobile systems, thus providing protection to spacecraft receivers. The band, 1 710-1 850 MHz, has the advantages of being immediately adjacent to the spectrum currently identified for IMT-2000 and is also used today in parts of ITU Region 1 for PCS, increasing the possibility of harmonization with other regions.

The frequency range 1 710-1 885 MHz should be identified worldwide for additional spectrum for advanced mobile applications in the context of IMT-2000 through a modification of footnote S5.388.

The CPM Report to WRC-2000 suggests a means of implementation of HAPS in the bands currently identified or IMT-2000 by the use of a footnote. Canada is of the view, that until studies are complete to demonstrate the feasibility of sharing, it would be premature to adopt any specific regulatory provisions for HAPS in these bands.

With respect to the satellite component of IMT-2000, consideration has been given to identifying some of the existing mobile-satellite allocations in the 1-3 GHz range for IMT-2000. Additional designation of certain mobile-satellite bands for satellite IMT-2000 applications is proposed, through the new footnote S5.XXX shown below.

MOD CAN/24/11

S5.388 The bands 824-849 MHz, 869-894 MHz, 1 710-1 885 MHz, 1 885-2 025 MHz and 2 110-2 200 MHz are intended for use, on a worldwide basis, by administrations wishing to implement International Mobile Telecommunications-2000 (IMT-2000). Such use does not preclude the use of these bands by other services to which they are allocated. The bands should be made available for IMT-2000 in accordance with Resolution **212 (Rev.WRC-~~97~~2000)**.

ADD CAN/24/12

S5.XXX The bands 1 610-1 626.5 MHz, 1 980-2 010 MHz, 2 170-2 200 MHz, and 2 483.5-2 500 MHz allocated to the MSS on a worldwide basis and the bands 2 010-2 025 MHz, and 2 160-2 170 MHz allocated to MSS in Region 2, are available for use for the satellite component of IMT-2000. The bands should be made available for IMT-2000 in accordance with Resolution **212 (Rev.WRC-2000)**.

Reasons: The frequency range 1 710-1 885 MHz has, in many parts of the world, already been impacted by the introduction of earlier generation (pre-IMT-2000) personal mobile systems. For example, the introduction of GSM1800 in Europe and other parts of the world in the frequency range 1 710-1 785/1 805-1 880 MHz and of PCS in the Americas in 1 850-1 990 MHz has resulted in the displacement of many fixed systems specifically in these sub-bands and more generally in the range 1 710-1 885 MHz. In the 1 610-1 626.5 MHz and 2 483.5-2 500 MHz, new mobile-satellite service systems are being deployed, providing global coverage and pre-IMT-2000 services. These pre-IMT-2000 systems are expected to have the capability to evolve to IMT-2000. In addition, this frequency range, 1 710-1 885 MHz is adjacent to the spectrum currently identified for IMT-2000, thus providing a large block of contiguous spectrum for future IMT-2000 systems. These attributes will facilitate cost-effective expansion of existing systems to meet advanced mobile applications in the context of IMT-2000 requirements.

MOD CAN/24/13

RESOLUTION 212 (Rev.WRC-~~97~~2000)

Implementation of International Mobile Telecommunications-2000 (IMT-2000)*

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ITU-R has recommended the 1-3 GHz band as the most suitable for IMT-2000;

~~*b)* that ITU-R has recommended approximately 60 MHz for use by personal stations and approximately 170 MHz for use by mobile stations;~~

~~*c)* that ITU-R has recognized that space techniques are an integral part of IMT-2000;~~

~~*d)* that, in No. **S5.388**, this Conference has identified bands to accommodate this future service,~~

b) that WARC-92 identified 230 MHz for IMT-2000 by regulatory provision of **S5.388**;

c) that ITU-R identified a further requirement of 160 MHz in addition to the spectrum identified in **S5.388** and also the spectrum currently used by earlier generations of personal communications;

d) that ITU-R has recognized that space techniques are an integral part of IMT-2000;

e) that WARC-92 identified the worldwide allocations for the mobile-satellite service as part of the satellite component of IMT-2000;

f) that ITU-R has completed the development of recommendations on detailed specifications of the radio interface of IMT-2000;

g) that harmonized worldwide bands for IMT-2000 are desirable to achieve benefits of economies of scale,

considering further

~~*a)* that ITU-R has not completed its studies regarding duplexing methods, modulation techniques, channelling arrangements, signalling or communication protocols;~~

~~*b)* that no worldwide intersystem numbering plan currently exists that would facilitate worldwide roaming,~~

h) that WRC-2000 identified XXX MHz of additional spectrum for the terrestrial component of IMT-2000;

i) that WRC-2000 identified the bands for the satellite component of IMT-2000,

* IMT-2000 was previously known as Future Public Land Mobile Telecommunication Systems (FPLMTS).

noting

a) that the implementation of the terrestrial component of IMT-2000 ~~in the bands 1 885-2 025 MHz and 2 110-2 200 MHz~~ is expected to commence around the year 2000, subject to market and technical considerations;

b) that the availability of the satellite component of IMT-2000 ~~in the bands 1 980-2 010 MHz and 2 170-2 200 MHz simultaneously with the terrestrial component of IMT-2000 in the bands identified in No.~~ ~~**S5.388**~~ would improve the overall implementation and the attractiveness of IMT-2000 to both developed and developing countries~~,~~;

c) that ITU-R has identified additional work to address further developments in advanced mobile systems including IMT-2000 applications and applications beyond IMT-2000,

~~*invites administrations*~~

~~to give due consideration to the accommodation of other services currently operating in these bands when implementing IMT-2000,~~

invites ITU-R

to continue its studies ~~with a view to developing suitable and acceptable technical characteristics for IMT-2000 that will facilitate worldwide use and roaming,~~ on further enhancements of IMT-2000 including the provision of Internet Protocol (IP) based applications and optimized arrangements for the harmonized use of spectrum identified for IMT-2000, and ensure that IMT-2000 can also meet the telecommunication needs of the developing countries and rural areas,

invites ITU-T

a) to complete its studies of signalling and communication protocols;

b) to develop a common worldwide intersystem numbering plan and associated network capabilities that will facilitate worldwide roaming,

resolves

that administrations which implement IMT-2000:

a) should make the necessary ~~frequencies~~spectrum available for system development;

b) should use those frequencies when IMT-2000 is implemented;

c) should use the relevant international technical characteristics, as identified by ITU-R and ITU-T Recommendations.

Reasons: Resolution 212 was modified to make it generally applicable to any band designated for IMT-2000 systems under RR S5.388.

Proposals for agenda item 1.6.2

Agenda item 1.6.2: Identification of a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000.

Proposal for the identification of a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000

Background information

At the time that the WRC-2000 agenda was established, studies were under way within TG 8/1 to examine whether global roaming could be accomplished by identifying one or more global radio control channels that could allow radios to be tuned to the appropriate frequency band. Identifying a "physical" channel was preferred in favour of using other approaches that could include the development of a "logical" channel structure for this purpose.

Based on discussions to date within TG 8/1, it has been determined that facilitation of multimode terminal operation and worldwide roaming of IMT-2000 is possible without a specific physical global radio control channel.

CAN/24/14

Canada supports the CITEL Inter-American Proposal IAP/14/15 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.7

Agenda item 1.7: Review of the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting operational, distress and safety communications, taking into account Resolution **346 (WRC-97)**.

Proposal to protect the operational, distress and safety communications in the HF bands used by the aeronautical mobile (R) and maritime mobile services

Background information

Working Party 8B and the CPM (Geneva, 1999) have identified two issues comprising this agenda item:

1) HF bands allocated for distress and safety communications of the maritime and aeronautical mobile (R) services have been subjected to an increase in harmful interference caused by unauthorized use. It is essential for the safety-of-life and property that these distress and safety channels are kept free from unauthorized use and harmful interference;

2) several maritime HF distress and safety frequencies are also used for international routine calling. The routine calling can cause interference to distress and safety communications due to the caller not being aware of ongoing traffic on the ship-calling frequency since the ship is tuned to a different receive frequency for coast station calls and replies.

In addition, both the CPM Report and the report of the SCRPM to the CPM address the issue of interference in the HF bands by providing possible methods to satisfy this agenda item. One method proposes the modification of Resolution 207 (Mob-87), where administrations would be drawn towards the fact that the interference is often due to unauthorized sources and to study solutions in assisting the mitigation of this interference. Another method calls upon the ITU-R to study the future technical and operational needs of the maritime mobile and aeronautical mobile (R) services in particular solutions providing effective and efficient distress and safety communications. Therefore, Canada and other CITEL Administrations propose the modification of Resolution 207 and the addition of new Resolution [HF].

Maritime issues

The protection of maritime HF distress and safety frequencies, in particular the frequencies 12 290 kHz and 16 420 kHz, is addressed in Resolution 346 (WRC-97). A significant source of interference to distress traffic on these frequencies is due to their use as calling frequencies. Resolution 346 calls for administrations to minimize the use of these frequencies for non-safety calling purposes by coast and ship stations.

GMDSS distress and safety frequencies are also used for calling in some of the other maritime HF bands. In each maritime HF band one channel is designated as an international calling channel pair for radiotelephony. In the 4, 6, 12 and 16 MHz bands, the distress and safety frequency is the same as the ship's transmitting frequency on the calling channel.

The radio telephony calling channels are used on a duplex basis, whilst the distress and safety frequencies are used on simplex. When a ship is calling a coast station, it transmits on the distress frequency. The problem is that at times the ship has difficulty monitoring whether there is ongoing distress traffic, because its receiver is on the corresponding coast station frequency. This problem occurs in the 4, 6, 12 and 16 MHz bands and not in the 8, 18, 22 and 25 MHz bands. The problem is being caused by the transmitting station not adhering to existing regulatory standards which require a station to listen on its transmitting frequency prior to transmitting. Equipment modification may be necessary in order to listen on the ship frequency of a duplex pair prior to transmitting on that frequency. Once initial contact has been established and working frequencies coordinated, traffic handling is accomplished directly on the coordinated working frequencies.

The CPM identified that compliance with existing Radio Regulations S52.224, which requires that a station listens before transmitting, is a method to help alleviate the interference problem. Further regulations are not required, rather enforcement of the existing regulation. CPM considered the modification of Article S52 and Appendices S13 and S17 to exclude routine calling from the HF distress and safety frequencies as a method to satisfy the agenda item. This method may require modification of existing equipment.

Canada proposed no change to divide the existing distress and calling channels into two separate frequencies - one exclusive distress and safety frequency and one international radiotelephony calling frequency. The distress frequencies should remain the same as they are at present where calling is allowed and no modifications to the distress procedures are required. Strict compliance and enforcement of existing Radio Regulations S52.224, which requires that a station listen before it transmits, would alleviate this problem.

This proposal provides the minimum modifications required in the Radio Regulations and its Appendices in order to improve the situation on the HF radiotelephony distress and safety frequencies.

CPM further encouraged the use of digital selective calling (DSC) instead of calling by radiotelephony, while recognizing that all vessels may not be fitted with DSC.

This proposal also encourages ships and coast stations to use digital selective calling. If voice calling is required, it should in the first instance be performed on the coast station working channel and then on the appropriate calling frequency.

Aeronautical issues

The interference to HF frequencies allocated to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz appears to be the result of unauthorized non-aviation use of aeronautical mobile (R) frequencies. In some parts of the world the aeronautical mobile (R) HF frequencies are being used for land mobile, broadcast, fixed point-to-point communications and in maritime applications such as in support of fishing fleets. These unauthorized uses have resulted in frequent cases of harmful interference and have diminished the spectrum available for the aeronautical mobile (R) safety-of-life applications.

Administrations should ensure that stations of services other than the aeronautical mobile (R) service refrain from using frequencies in the bands allocated exclusively to the aeronautical mobile (R) service. Administrations should make every effort to identify and locate the source of any unauthorized emission causing harmful interference. Recognizing that such emissions are capable of endangering human life and property and the safe and regular conduct of aircraft operations, Administrations should take necessary measures to prevent stations from operating in contravention of ITU Radio Regulations.

Working Party 8B and the CPM recommend modifications of Article S15 to ensure that suitable provisions are made for the aeronautical mobile (R) service.

Canada proposes modifications to Article S15 to include reference to Appendix S27. This modification will ensure special consideration is given to avoiding interference on the frequencies used for safety and regularity of flight. Currently, Article S15 only refers to Article S31 Appendix S13, which is primarily for maritime services.

It is proposed that no change be made to Appendix S27 at this time. Presently, the HF bands allocated to the aeronautical mobile (R) service are nearly saturated by the use of analogue voice communications. This spectrum must be maintained for the new digital high frequency data link (HFDL) communications. HFDL communications will provide a capability for the transfer of air traffic control and aeronautical operational control data to and from pilots operating over oceanic airspace, on polar routes, and in airspace over sparsely populated or undeveloped countries where other communications systems are not practical. The International Civil Aviation Organization (ICAO) was to have completed Standards and Recommended Practices for HFDL. Appendix S27 contains the Allotment Plan for the aeronautical use of HF aeronautical mobile (Route) service. After WRC-2000 review of Appendix S27, if necessary, should be performed by ICAO and by ITU-R Working Party 8B and consequently considered by a subsequent WRC.

CAN/24/15

Canada supports the CITEL Inter-American Proposals IAP/14/16 to IAP/14/41 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.8

Agenda item 1.8: To consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands.

Proposal for communications by earth stations on board vessels using frequencies allocated to the fixed-satellite service and used by existing space segment in the fixed-satellite service

Background information

This item concerns provision of communications by earth stations on board vessels (ESVs) using frequencies allocated to the fixed-satellite service and used by the existing space segment in the fixed-satellite service. These stations operate in three distinct modes: at sea; while stationary in or near port; and in motion approaching or departing from port.

Operations at sea (beyond a certain distance for near-shore coordination) by ESVs in the fixed-satellite service do not present a potential for interference to stations in the fixed service operating in accordance with the 6 GHz FS allocation, and therefore need not be coordinated. Operations while these earth stations are stationary at predetermined points can be coordinated bilaterally with fixed service systems. Technical and regulatory issues concern the potential for interference between in-motion operations by these ESVs operating close to shore and stations in the fixed service both on and offshore.

The studies that have been conducted in ITU-R have illustrated that the values for the minimum coordination distance are principally affected by the interference criteria required to protect the fixed service and the number of passages per unit time by vessels equipped with earth stations. Based on different values for these assumptions, the results of these preliminary studies yielded a range of values for the minimum distance from 100 km to 540 km. It should be noted that studies submitted to the CPM by some administrations suggested values for the minimum distance of 150 km to 370 km. However, there should be a single minimum distance value.

CAN/24/16

Canada supports the CITEL Inter-American Proposals IAP/14/42 to IAP/14/45 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.9

Agenda item 1.9: To take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions **213 (Rev.WRC-95)** and **220 (WRC-97)**.

Proposal addressing the table of allocation in the 1 559-1 567 MHz frequency range (with respect to MSS) and the suppression of Resolution 220

Background information

Proposals were made to WRC-97 to reallocate portions of the 1 559-1 610 MHz band which, with the exception of a fixed service allocation in some countries, currently is exclusively allocated to the radionavigation-satellite service and aeronautical radionavigation service worldwide. Other proposals were made not to change the existing allocations in these bands. In Resolution 220 (WRC-97), the ITU-R was requested to study, as a matter of urgency, the technical criteria and operational and safety requirements to determine if sharing between the aeronautical radionavigation and radionavigation-satellite services, operating or planned to be operate, in the band 1 559-1 610 MHz, and the mobile-satellite service in a portion of the 1 559-1 567 MHz frequency range, is feasible, taking into account the essential need to protect systems operating in the aeronautical radionavigation and radionavigation-satellite services in the band 1 559-1 610 MHz.

There are millions of RNSS receivers in use today for a wide range of applications, including safety-of-life-critical navigation on land, at sea, and in the air. Today, most of these receivers operate with the global positioning system (GPS), an important element of the global navigation satellite system (GNSS) that operates in the 1 559-1 610 MHz band.

GPS provides position and time information to users by means of one-way transmissions using RNSS (space-to-Earth) allocations. GPS is information technology that uses systems of hardware and software, as well as information (time and ephemeris) transmitted from satellites to provide derived information to the user.

GLONASS and GPS are established elements of the International Civil Aviation Organization (ICAO) GNSS, operating in the band 1 559-1 610 MHz. These systems are accepted by the ICAO Council for use in international civil aviation. ICAO is currently developing standards and recommended practices for international application in civil aviation. The GNSS will be used during all phases of flight, including precision approaches and landing, and under all weather conditions. The latter places extensive requirements on the performance characteristics of the system. The aeronautical use of RNSS is recognized in the Radio Regulations as a safety-of-life application. GPS is the sole basis for the formation of International Atomic Time and Coordinated Universal Time (UTC) by the International Bureau of Weights and Measures. GPS is also the primary means by which clocks are synchronized within telecommunications networks for Time Division Multiple Access transmissions. Time and frequency functions are or will be available on other RNSS systems.

As Resolution 220 (WRC-97) recognizes RNSS and ARNS systems are evolutionary and other types of GNSS are under development for operation in the band 1 559-1 610 MHz. There are both aeronautical and non-aeronautical safety-of-life services in the 1 559-1 610 MHz band, and it is well established that there is an essential need to protect systems operating in the ARNS and RNSS.

The core signal structures of the MSS and the RNSS and ARNS are fundamentally different: MSS uses a two-way signal while ARNS and RNSS transmits a weak, receive-only signal. Having systems from a radiocommunication service operate on a co-primary, co-frequency basis in the

1 559-1 610 MHz band would limit ARNS and RNSS operators' flexibility to adjust their spectrum usage, and would hamper efforts to develop a GNSS that is capable of meeting evolving international needs and of providing adequate protection for international civil use worldwide.

Studies undertaken in the ITU addressed current aeronautical radionavigation and radionavigation-satellite service systems, as well as future radionavigation services planned for this band.

These studies reached the following conclusions:

- MSS (space-to-Earth) and ARNS/RNSS are fundamentally incompatible in any portion of the 1 559-1 567 MHz band. Not only do MSS signals disrupt ARNS/RNSS, but GNSS pseudolites disrupt MSS signals.
- The –112 dB(W/m^2/MHz) power flux-density level at the Earth's surface that is mentioned in Resolution 220 clearly would not protect existing RNSS systems (such as GPS) from harmful interference.
- The RNSS is extensively used, and is continuing to undergo a tremendous expansion which drives further evolution. These factors, along with the many critical timing, positioning, and navigation uses of RNSS sharing of the 1 559-1 610 MHz band, weigh conclusively against sharing any portion of the band segment at 1 559-1 567 MHz with any co-frequency communication service.
- The use of pseudolites in the ARNS/RNSS bands at 1 559-1 567 MHz is in its early stages, but is expected to increase in terms of numbers, geographic scope, and complete utilization of the frequency band in the near future. This use is incompatible with co-frequency MSS (space-to-Earth).

CAN/24/17

Canada supports the CITEL Inter-American Proposals IAP/14/46 to IAP/14/47 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.11

Agenda item 1.11: To consider constraints on existing allocations and to consider additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions **214 (Rev.WRC-97)** and **219 (WRC-97)**.

Proposal addressing constraints on existing allocation for non-geostationary (non-GSO) MSS below 1 GHz

Background information

A number of studies have been carried out since MSS allocations for non-GSO satellite systems were first agreed at WARC-92. These have led to ITU-R Recommendations which indicate the sharing techniques which are being used by those systems to share with each other and other co-primary services.

The table below (Non-GSO MSS sharing summary) from Recommendation ITU-R M.[YA] "Methods for achieving coordinated use of multiple non-GSO MSS systems below 1 GHz and sharing with other services in existing MSS allocations" summarizes the techniques and Recommendations applied to existing MSS allocations. Many of these techniques are being employed in practice successfully.

Non-GSO MSS sharing summary

	Narrow-band	**Wideband**
Fixed and mobile (148-149.9 MHz) (455-456 MHz and 459-460 MHz in Region 2) (454-455 MHz by footnotes)	Combination: – Dynamic channel avoidance (Rec. ITU-R M.1039) – Low duty cycle – Brief message duration (Rec. ITU-R M.1185)	Combination: – Low output power density – Brief message duration – Low data rate – Filtering at satellite – Geographical separation
Fixed and mobile (137-138 MHz) (400.15-401 MHz)	Ground level pfd per RR S5.208	Ground level pfd per RR S5.208
Meteorological satellites (137-138 MHz) (400.15-401 MHz)	Assignment separation	Combination: – Low pfd at ground level – Cross polarization discrimination – Adaptive filter at satellite
Space operations Space research (137-138 MHz)	Channel avoidance	Combination: – Low pfd – Cross polarization discrimination
Space research (400.15-401 MHz)	Channel avoidance	Combination: – Low pfd – Cross polarization discrimination
Meteorological aids (400.15-401 MHz)	Channel avoidance	Combination: – Low pfd – Cross polarization discrimination

The constraints on existing allocations are reflected in the footnotes to the allocations, and in the Annex 1 to Appendix S5. These have evolved to their present form since WARC-92, and now reflect a balance with regard to sharing criteria among the primary services concerned.

These constraints have served to provide a basis for implementing non-GSO MSS systems in these bands and at the same time provide protection to other space and terrestrial services. Therefore in respect to the constraints of the MSS in existing allocations below 1 GHz, no further modifications are needed.

NOC CAN/24/18

S9.11A *e)* for a station for which the requirement to coordinate is included in a footnote of the Table of Frequency Allocations referring to this provision:

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

APPENDIX S5

ANNEX 1

1 Coordination thresholds for sharing between MSS (space-to-Earth) and terrestrial services in the same frequency bands and between non-GSO MSS feeder links (space-to-Earth) and terrestrial services in the same frequency bands

NOC CAN/24/19

1.1.1 In the bands 137-138 MHz and 400.15-401 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to terrestrial services (except aeronautical mobile (OR) service networks operated by the administrations listed in Nos. **S5.204** and **S5.206** as of 1 November 1996) is required only if the pfd produced by this space station exceeds –125 dB(W/m^2/4 kHz) at the Earth's surface.

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

NOC CAN/24/20

1.1.2 In the band 137-138 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to the aeronautical mobile (OR) service is required only if the pfd produced by this space station at the Earth's surface exceeds:

– –125 dB(W/m^2/4 kHz) for networks for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996;

– –140 dB(W/m^2/4 kHz) for networks for which complete Appendix **S4**/**3** coordination information has been received by the Bureau after 1 November 1996 for the administrations referred to in § 1.1.1 above.

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

NOC CAN/24/21

1.1.3 In the band 137-138 MHz, coordination is also required for a space station on a replacement satellite of a MSS network for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996 and the pfd exceeds –125 dB(W/m^2/4 kHz) at the Earth's surface for the administrations referred to in § 1.1.1 above.

Reasons: No modifications are required to the Tables of Criteria applicable to MSS allocations for the non-GSO systems below 1 GHz as found in No. S9.11A, or to the footnotes containing constraints which apply to the pertinent allocations.

Proposals for agenda item 1.12

Agenda item 1.12: To consider the progress of studies on sharing between feeder links of non-GSO MSS networks and GSO FSS networks in the bands 19.3-19.7 GHz and 29.1-29.5 GHz, taking into account Resolution **121 (Rev.WRC-97)**.

Proposal for the modification of S5.541A and the suppression of Resolution 121

Background information

Resolution 121 requests that the ITU-R conducts a study of sharing possibilities between GSO FSS and non-GSO MSS feeder links in the bands. In response ITU-R Working Party 4A of Study Group 4 has agreed a draft new Recommendation, “Mitigation techniques to facilitate coordination in the 20/30 GHz non-GSO MSS feeder links”.

The Recommendation includes the topics of adaptive power control, high gain antennas, geographic isolation, site diversity and link balancing.

This Recommendation is considered to have covered the requirements of Resolution 121 (Rev.WRC-97) and thus satisfies the agenda.

CAN/24/22

Canada supports the CITEL Inter-American Proposals IAP/14/48 to IAP/14/49 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.13

Agenda item 1.13: On the basis of the results of the studies in accordance with Resolutions **130 (WRC-97)**, **131 (WRC-97)** and **538 (WRC-97)**.

Proposals for agenda item 1.13.1

Agenda item 1.13.1: To review and, if appropriate, revise the power limits appearing in Articles **S21** and **S22** in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services.

Resolution 131 (WRC-97): Power flux-density limits applicable to non-geostationary fixed-satellite service systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz

Background information

WRC-97 provisionally adopted pfd limits to be applied to non-GSO FSS systems operating in these bands. In the 10.7-12.75 GHz band, WRC-97 applied the existing limits to both GSO and non-GSO systems, subject to further study by the ITU-R under Resolution 131 (WRC-97). In the 17.7-19.3 GHz, WRC-97 adopted more stringent pfd limits for non-GSO FSS systems with more than 100 satellites.

Many studies were performed by ITU-R to determine the appropriate pfd limits to be applied to non-GSO FSS systems in the aforementioned bands. The intent was to find suitable pfd limits that would ensure protection of the fixed service without unduly constraining the development of either service.

The CPM-99 agreed to limits for both frequency bands.

In the 10.7-12.75 GHz range, the CPM-99 concluded that the current limits in Article S21 are sufficient to protect the FS on the basis of the assumptions used in the studies. The CPM also recommended the use of a 1-MHz reference bandwidth for non-GSO system. The conclusions of the CPM are summarized below.

The current RR Article S21 per satellite pfd limits, as defined below and as discussed more fully in draft new Recommendation ITU-R SF.[Document 4-9S/AI] (Submitted to RA-2000 for approval), are adequate for the protection of the FS in the 10.7-12.75 GHz band from aggregate interference from three assumed non-homogeneous, non-GSO FSS systems. Moreover, the contribution of GSO interference to the sharing has been shown as not being significant. Studies support and validate this conclusion. These results would remain valid if the number of non-GSO FSS systems were in the range 3 to 5.

- in the 10.7-11.7 GHz band:

$$-126 \qquad \text{dB(W/m}^2\text{) per 1 MHz for } 0° \le \delta < 5°$$

$$-126 + (\delta - 5)/2 \qquad \text{dB(W/m}^2\text{) per 1 MHz for } 5° \le \delta < 25°$$

$$-116 \qquad \text{dB(W/m}^2\text{) per 1 MHz for } 25° \le \delta < 90°$$

where δ is the angle of arrival above the horizontal plane.

- in the 11.7-12.75 GHz band:

-124	$\text{dB(W/m}^2\text{) per 1 MHz for } 0° \le \delta < 5°$
$-124 + (\delta - 5)/2$	$\text{dB(W/m}^2\text{) per 1 MHz for } 5° \le \delta < 25°$
-114	$\text{dB(W/m}^2\text{) per 1 MHz for } 25° \le \delta < 90°$

where δ is the angle of arrival above the horizontal plane.

In the 17.7-19.3 GHz range, the conclusion of the CPM was that a tightening of the original Article S21 pfd limits for non-GSO FSS with large constellations (over 50 satellites) would ensure protection of the fixed service while not unduly constraining the development of non-GSO FSS systems. The JTG conclusions were:

The following per satellite pfd limits (also described in draft new Recommendation ITU-R SF.[Document 4-9S/TEMP/94]) (Submitted to RA-2000 for approval) are adequate for the protection of the FS in the 17.7-19.3 GHz band from aggregate interference from three assumed non-homogeneous non-GSO FSS systems. Moreover, the contribution of GSO interference to the sharing has been shown as not being significant. Studies support and validate this conclusion. These results would remain valid if the number of non-GSO FSS systems were in the range 3 to 5.

$-115 - \text{X}$	$\text{dB(W/m}^2\text{) per MHz for } 0° \le \delta < 5°$
$-115 - \text{X} + ((10 + \text{X})/20)(\delta - 5)/2$	$\text{dB(W/m}^2\text{) per MHz for } 5° \le \delta < 25°$
-105	$\text{dB(W/m}^2\text{) per MHz for } 25° \le \delta < 90°$

where δ is the angle of arrival above the horizontal plane and X is defined as a function of the number of satellites in the non-GSO FSS constellation, N, as follows:

–	for N ≤ 50	$X = 0$	(dB)
–	for 50 < N ≤ 288	$X = \frac{5}{119}(N - 50)$	(dB)
–	for N > 288	$X = \frac{1}{69}(N + 402)$	(dB)

The scaling function, X, was developed on the basis of non-GSO FSS constellations with 96, 288 and 840 satellites. Further simulations with different non-GSO FSS constellations comprising a wide range in the number of satellites (63, 126, 189, 252, and 504 satellites) and using the conservative pfd mask simulation method have confirmed the adequacy of this scaling function.

Further studies by some CITEL Administrations have shown that the interference levels obtained using the simple pfd mask methodologies used in the ITU-R studies are higher than those obtained using a more realistic modeling of the pfd entries. CITEL Administrations support the above pfd limits while noting that because of the operational characteristics of the non-GSO networks, interference margins will be present.

The objective is to ensure that the pfd limits in the bands 10.7-12.75 GHz and 17.8-19.3 GHz will provide adequate protection of the terrestrial services while not unduly constraining the design of non-GSO FSS networks. Since the studies conducted in ITU-R indicate that both objectives have been achieved with the masks proposed by the CPM, these limits should be adopted in Article S21 of the Radio Regulations.

Proposals:

1) It is proposed to retain the current S21 pfd limits in the 10.7-12.75 GHz range, but scaling to a 1-MHz reference bandwidth for non-GSO systems and remove references to further studies.

2) It is proposed to adopt the compromise S21 pfd limits in the 17.7-19.3 GHz band agreed to by the Joint Task Group 4-9-11 and remove references to further studies.

3) As a consequence, it is proposed to delete Resolution 131 (WRC-97).

4) Changes in the frequency band column of Table S21-4 referring to S5.494 and S5.496 are required because the fixed service is allocated in all countries of Region 3.

MOD CAN/24/23

MOD CAN/24/24

[12] **S21.16.6** ~~These values shall apply provisionally only to emissions of space stations on non-gostationary satellites in networks operating with a large number of satellites, that is systems operating with more than 100 satellites (see Resolution **131 (WRC-97)**).~~The function X is defined as a function of the number, N, of satellites in the non-GSO FSS constellation as follows:

– for N ≤ 50 $X = 0$ (dB)

– for 50 < N ≤ 288 $X = \frac{5}{119}(N - 50)$ (dB)

– for N > 288 $X = \frac{1}{69}(N + 402)$ (dB)

In the band 18.8-19.3 GHz, these limits apply to emissions of a space station on a non-geostationary FSS satellite for which complete coordination or notification information, as appropriate, has been received by the Radiocommunication Bureau after 17 November 1995, and which were not operational by that date.

Reasons: The CPM-99 Report maintains the original limits for non-GSO FSS systems in the band 18.8-19.3 GHz that were notified or operational prior to the end of WRC-95 per the decisions in Resolution 131 (WRC-97). In the band 17.7-18.8 GHz, the new limits would apply to all non-GSO systems irrespective of the date of receipt of information or date of bringing into operation.

ADD CAN/24/25

[12*bis*] **S21.16.6*bis*** These limits apply to emissions of a space station on a meteorological-satellite and on a geostationary FSS satellite. These limits also apply to emissions of a space station on a non-geostationary FSS satellite in the band 18.8-19.3 GHz for which complete coordination or notification information has been received by the Radiocommunication Bureau by 17 November 1995, or are in operation by that date.

Reasons: The above regulatory text (as contained in the CPM-99 Report) reflects the date-specific provisions currently in Resolution 131.

SUP CAN/24/26

[14] **S21.16.8**

SUP CAN/24/27

[15] **S21.16.9**

SUP CAN/24/28

RESOLUTION 131 (WRC-97)

Power flux-density limits applicable to non-geostationary fixed-satellite service systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz

Reasons: The provisional pfd limits in Table S21-4 are replaced with the values that, as a result of extensive ITU-R studies, were agreed by CPM-99.

ADD[12*bis*] S21.16.6*bis*, and a corresponding change in MOD[12] S21.16.6, specify the dates of application of the pfd limits in conformance with the dates established in Resolution 131 (WRC-97). Footnotes S21.16.8, S21.16.9, and Resolution 131 are no longer required.

Proposals for agenda item 1.13.2

Agenda item 1.13.2: To consider the inclusion in other frequency bands of similar limits in Articles **S21** and **S22**, or other regulatory approaches to be applied in relation to sharing situations.

CAN/24/29

There have been no technical studies carried out in frequency bands other than those considered under agenda item 1.13.1. Consequently, there should not be any limits adopted in Article S22 for frequency bands other than those identified in Resolutions 130 (WRC-97) and 538 (WRC-97) per agenda item 1.13.1.

Proposals for agenda item 1.14

Agenda item 1.14: To review the results of the studies on the feasibility of implementing non-GSO MSS feeder links in the 15.43-15.63 GHz in accordance with Resolution **123 (WRC-97)**.

Proposal for Resolution 123 (Implementing feeder links of non-geostationary satellite networks in the mobile-satellite service in the band 15.43-15.63 GHz (space-to-Earth))

Resolution 123 (WRC-97) "Feasibility of implementing feeder links of non-geostationary satellite networks in the mobile-satellite service in the band 15.43-15.63 GHz (space-to-Earth) while taking into account the protection of the radio astronomy service, the Earth exploration-satellite (passive) service and the space research (passive) service in the band 15.35-15.4 GHz"

Background information

Studies conducted subject to Resolution 123 (WRC-97) dealt with two aspects:

1) Need for the allocation to non-GSO MSS feeder links in the band 15.43-15.63 GHz (space-to-Earth).

2) Feasibility of implementing non-GSO MSS feeder links in the band 15.43-15.63 GHz (space-to-Earth) regarding protection of radio astronomy (RAS), Earth exploration-satellite (EESS) (passive) and space research (SRS) (passive) services operating in the band 15.35-15.4 GHz.

ITU-R studies have concluded that the space-to-Earth operation of non-GSO MSS feeder links in parts of the 15.43-15.63 GHz band is quite difficult and sometimes impossible, due to technical limitations that would have to be imposed on the feeder links.

The ITU-R studies complied with the provisions of Resolution 123 (WRC-97) and hence covered all issues related to agenda item 1.14. Taking into account that Resolution 123 (WRC-97) has attained its objectives and aims, it would be appropriate to suppress it.

The results of the studies, as reported in the CPM-99 Report, showed that it should be feasible to implement the existing non-GSO MSS feeder downlinks in the band 15.43-15.63 GHz taking into account the protection requirements for RAS and other passive services in this band. Providing that the existing non-GSO MSS feeder downlinks systems planning to use this band can provide the required protection to the passive services, the ITU-R studies did not identify any additional technical or operational disadvantages with respect to the existing systems.

The CPM-99 Report also concludes that, for future non-GSO MSS systems using the space-to-Earth allocation at 15.43-15.63 GHz, substantial mitigation techniques would be required to adequately protect the RAS from harmful interference.

The technical studies also concluded that, because of high levels of suppression of out-of-band emissions required, use of the band 15.43-15.63 GHz for space-to-Earth feeder links should not extend beyond non-GSO MSS satellite networks for which advanced publication information has been received by the Radiocommunication Bureau prior to WRC-2000.

Common CITEL proposals were developed to reflect this point of view.

MOD CAN/24/30

Canada supports the CITEL Inter-American Proposals IAP/14/50 to IAP/14/52
(Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.15.3

Agenda item 1.15.3: To consider the status of allocations to services other than the radionavigation-satellite service (Nos. **S5.355** and **S5.359**) in the band 1 559-1 610 MHz.

Canada encourages any administration to remove their name from footnotes S5.355 and S5.359.

Reasons: The CPM-99 Report concludes that in order to protect present and future RNSS applications in this band, the use of the fixed service in the band 1 559-1 610 MHz is not recommended. This is based on the studies conducted within the ITU-R showing some harmful co-frequency interference; it also recognizes the extensive use of RNSS and the rapid expansion of all its uses, including aeronautical and marine safety-of-life navigation.

Proposals for agenda item 1.17

Agenda item 1.17: To consider possible worldwide allocation for the earth exploration-satellite (passive) and space research (passive) services in the band 18.6-18.8 GHz, taking into account the results of the ITU-R studies.

Proposal for Earth exploration-satellite (passive) and the space research (passive) services in the band 18.6-18.8 GHz on a primary basis in Regions 1 and 3

Background information

At present, the allocations for the Earth exploration-satellite (passive) and the space research (passive) services in the band 18.6-18.8 GHz are on a primary basis in Region 2, and on a secondary basis in Regions 1 and 3.

These secondary allocations must be upgraded to primary status if the long-term ability to obtain environmental data with passive spaceborne sensors is to be preserved. Compatibility between the passive sensors and the fixed and fixed-satellite services requires adoption of constraints on the parameters of the fixed and fixed-satellite systems that use the band.

A pfd limit of –95 dBW/m^2 in a reference bandwidth of 200 MHz on geostationary systems in the fixed-satellite service will enable passive sensors to perform their mission if measurements are restricted to portions of the sensor orbit where the sensor is moving away from the equator while taking sensor data over land masses.

Similarly, limiting the power delivered to any antenna of a station in the fixed service measured across the band 18.6-18.8 GHz to not exceed 0 dBW in 200 MHz along with an antenna pattern complying with Recommendation ITU-R F.699-4 will enable sharing with the fixed service.

CAN/24/31

Canada supports the CITEL Inter-American Proposals IAP/14/53 to IAP/14/56 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 1.18

Agenda item 1.18: To consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix **18/S18**, taking into account Resolution **342 (WRC-97)**.

Proposal to modify Appendix S18 and Resolution 342

Background information

Appendix S18 of the ITU Radio Regulations defines the channels of the maritime mobile service. These channels support a variety of functions including "Distress, Safety and Calling: public correspondence, inter-ship, ship/shore/ship, port operations and ship movement". The maritime mobile service frequency band, 156-174 MHz, (effectively 156-162 MHz in the Americas due to previous domestic regulatory actions), supports maritime communications worldwide.

Working Party 8B and the CPM studied this agenda item and determined that the status of the ITU-R studies indicate that revisions of Appendix S18 to introduce new digital technologies is not possible at this conference. However, it is possible to take action to address the issue of congestion. With the rapidly increasing use of the VHF maritime mobile band, particularly for data communications, increased congestion and mutual interference is being experienced which, among others, has resulted in unacceptable degradation of the distress and safety related function for which this band is utilized. Unless action is taken this situation will only worsen as usage continues to grow.

At WRC-97, CITEL proposed simplex use of duplex channels for Appendix S18. This was approved for a few specific public correspondence channels only, channels 18 and 82-86. Note *m)* to Appendix S18 should be modified to add more channels for simplex use. This will allow for more efficient use of Appendix S18 channels and provide flexibility for administrations to meet their immediate requirements, while maintaining compatibility with the vast number of ships and pleasure craft now using the band in accordance with Appendix S18.

Working Party 8B and the CPM recommend modifications to Appendix S18 to provide administrations with further flexibility to use the channels of Appendix S18 in a simplex mode if required. This would allow the use of duplex channels in Appendix S18 in a simplex mode and would increase the number of available channels. The cost of the change would be minimal and administrations would be able to quickly address certain local problems of congestion. Furthermore, the conference could consider permitting, subject to non-interference and no protection, the use of some of these channels or sub-bands created by the conversion of duplex channels to simplex channels for the initial testing and possible future introduction of new technologies, subject to non-operational use. This would necessarily be subject to special arrangement between interested or affected administrations.

Canada along with the other CITEL Administrations propose to modify Note *m)* to allow simplex use of duplex channels for the remainder of the channels not already identified as simplex. The addition of a new Note [*z)*] is also proposed to allow the use of the simplex channels per Note *m)* for the testing and development of new technologies on a non-operational basis, subject to special arrangements between affected or interested administrations.

In addition, Canada proposes to modify Resolution 342 to continue the study of one or more new interoperable technologies for the maritime mobile service.

CAN/24/32

Canada supports the CITEL Inter-American Proposals IAP/14/57 to IAP/14/73 (Document WRC2000/14, 18 January 2000).

Proposals for agenda item 2

Agenda item 2: To examine the revised ITU-R recommendations incorporated by reference in the Radio Regulations in accordance with Resolution **28 (WRC-95)**; and decide whether or not to update the corresponding references in the Radio Regulations, in accordance with principles contained in the Annex to Resolution **27 (Rev.WRC-97)**.

Proposals to modify Resolution 27 (Rev.WRC-97) and Resolution 28 (WRC-95)

Background information

Certain provisions of the Radio Regulations make specific reference to ITU-R Recommendations. As the ITU-R Recommendations are updated, it is necessary to determine if such references should be continued, suppressed, or updated citing the revised version of the applicable ITU-R Recommendation.

Although the principle of Incorporation by Reference is widely supported by ITU members, its implementation in practice leads to various difficulties. It is important that administrations are aware of which recommendations could be candidates for incorporation by reference into the Radio Regulations. Also, administrations need to know of any ITU-R Recommendations currently incorporated by reference, which are being (or have been) revised during the current study period. Administrations would benefit greatly by being advised of such recommendations well in advance of a WRC. Therefore, a mechanism for the early identification should be established.

In order to allow administrations as much time as possible to consult their experts and to consider the implications of updating references in the Radio Regulations, to reflect changes to Recommendations which are currently incorporated by reference, the approach outlined in 1) below is proposed. Similarly, to facilitate the work of administrations in their preparation for the possible introduction of new instances where Recommendations may be incorporated by reference into the Radio Regulations, the approach outlined in 2) below is proposed.

1) Rather than have only the Radiocommunication Assembly (RA) communicate to the WRC a list of the ITU-R Recommendations currently incorporated by reference in the Radio Regulations which have been revised and approved during the elapsed study period, the Director of the Radiocommunication Bureau should provide a report to the Conference Preparatory Meeting. This report would also include a listing of those ITU-R Recommendations currently incorporated by reference which are being revised in preparation for the RA. This report would be for information only and would not confer any special status on the Recommendations listed.

2) If a Recommendation is not currently incorporated by reference into the Radio Regulations, it could only be considered for incorporation by reference if it is in response to a WRC agenda item.

MOD CAN/24/33

RESOLUTION 27 (Rev.WRC-~~97~~2000)

References to ITU-R and ITU-T Recommendations in the Radio Regulations

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that the principles of incorporation by reference were adopted by the WRC-95 and have been revised by this Conference (see Annex 1 to this Resolution);

b) that there are provisions of the Radio Regulations which employ mandatory incorporation by reference but fail to make explicit reference to the ITU-R or ITU-T Recommendations incorporated;

c) that the 199~~7~~9 Conference Preparatory Meeting (CPM-~~97~~99) for this Conference urged administrations to give further consideration to the status of material incorporated by reference:

– using the initial assessment provided by the Radiocommunication Bureau in the CPM Report and the set of principles given in Annex 1 to this Resolution;

– noting that mandatory references shall be explicit and use the appropriate regulatory language;

– taking into account the factors set out in Annex 2 to this Resolution;

d) that the Director of the Radiocommunication Bureau has drawn up a list (see Annex 1 to the CPM Report to this Conference) of the provisions of the Radio Regulations using incorporation by reference, which provides an initial assessment of the status of each reference and forms the basis for the work on appropriate referencing, examples of which are contained in Annex 3 to this Resolution;

e) that the Bureau has drawn up a list, contained in Annex 4 to this Resolution, of the ITU-R Recommendations to which explicit reference is made in the Radio Regulations,

resolves

that ITU-R and ITU-T Recommendations incorporated or proposed for incorporation by reference in the provisions of the Radio Regulations be identified and examined at WRC-~~99~~[03], with a view to establishing the correct method of reference in accordance with the principles set out in Annex 1 to this Resolution and taking into account the factors listed in Annex 2 to this Resolution, in order to complete the simplification of the Radio Regulations in respect of incorporation by reference,

further resolves

that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference,

instructs the Director of the Radiocommunication Bureau

to arrange for a review of the provisions of the Radio Regulations containing references to ITU-R or ITU-T Recommendations and propose suitable recommendations to the CPM-~~99~~[02] for inclusion in its Report to WRC-~~99~~[03], using the list of provisions contained in Annex 3 to this Resolution together with the guidance contained in Annexes 1 and 2 to this Resolution, and taking into account the list of ITU-R Recommendations contained in Annex 4 to this Resolution,

urges administrations

to use the CPM Report to WRC-~~99~~[03] in order to prepare their proposals on incorporation by reference to that Conference.

ANNEX 1 TO RESOLUTION 27 (Rev.WRC-~~97~~2000)

Principles of incorporation by reference

1 Where references are non-mandatory, it is not necessary to establish specific conditions in applying the texts quoted. In such cases, reference could, for example, be made to “the latest version” of a Recommendation.

2 Mandatory references to Resolutions or Recommendations of a world radiocommunication conference (WRC) are acceptable without restriction, since such texts will have been agreed by a WRC.

3 Where mandatory references are suggested, and the relevant texts are brief, the referenced material should be incorporated in the body of the Radio Regulations.

4 If, on a case-by-case basis, it is decided to incorporate material by reference on a mandatory basis, then the following provisions shall apply:

4.1 the referenced text shall have the same treaty status as the Radio Regulations themselves;

4.2 the reference must be explicit, specifying the specific part of the text (if appropriate) and the version or issue number;

4.3 the referenced text must be adopted by the Plenary of a competent WRC, but should not be part of the Final Acts;

4.4 all texts incorporated by reference must be readily available, by being published in a separate volume;

4.5 if, between WRCs, a referenced text (e.g. an ITU-R Recommendation) is updated, the reference in the Radio Regulations shall continue to apply to the original version until such time as a competent WRC agrees to incorporate the new version of the reference. The mechanism for considering such a step is given in Resolution **28 (Rev.WRC-~~95~~2000)**.

ANNEX 2 TO RESOLUTION 27 (Rev.WRC-~~97~~2000)

Factors to be considered for the further application of incorporation by reference

In reviewing the provisions of the Radio Regulations employing references to other texts, administrations and study groups should address the following factors:

1 whether each reference is of mandatory~~, i.e. incorporated by reference,~~ or non-mandatory character;

2 whether in existing non-mandatory references, or mandatory references which are determined to be of non-mandatory character, appropriate linking language is used, e.g. the words “should” or “may”;

3 whether in existing mandatory references, or other types of reference which are determined to be of mandatory character, clear mandatory linking language is used, e.g. the word “shall”;

4 whether the incorporated ITU-R or ITU-T Recommendation(s) are explicitly identified;

5 where referenced ITU-R or ITU-T Recommendations are not explicitly identified, determine which ones should be identified;

6 whether text incorporated from ITU-R or ITU-T Recommendations should be placed directly in the Radio Regulations instead of using incorporation by reference;

7 if the ITU-R or ITU-T Recommendation to be incorporated is, as a whole, unsuitable as treaty status text, whether to limit the reference to those portions of the ITU-R or ITU-T Recommendation which are of a suitable nature or to place the mandatory portion directly in the Radio Regulations.

Reasons: To clarify that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference. Also, minor consequential editorial changes have also been identified.

MOD CAN/24/34

RESOLUTION 28 (Rev.WRC-~~95~~2000)

Revision of references to ITU-R Recommendations incorporated by reference in the Radio Regulations

The World Radiocommunication Conference (~~Geneva, 1995~~Istanbul, 2000),

considering

a) that the Voluntary Group of Experts on simplification of the Radio Regulations (VGE) proposed the transfer of certain texts of the Radio Regulations to other documents, especially to ITU-R Recommendations, using the incorporation by reference procedure;

b) that, in some cases, the provisions of the Radio Regulations imply an obligation on Member States ‡ to conform to the criteria or specifications incorporated by reference;

c) that references to incorporated texts shall be explicit and shall refer to a precisely identified provision;

d) that, taking into account the rapid evolution of technology, ITU-R may revise the Recommendations incorporated by reference at short intervals;

e) that revised and approved Recommendations will not have the same legal force as the initial Recommendations, incorporated by reference until a competent world radiocommunication conference has so decided;

f) that it would be desirable to ensure, in the cases provided for in the Radio Regulations, that the provisions reflect the most recent technical developments,

noting

that Member States would benefit greatly from being advised, as early as possible, of which Recommendations have been revised and approved during the study period,

resolves

1 that each Radiocommunication Assembly shall communicate to the following world radiocommunication conference a list of the ITU-R Recommendations incorporated by reference in the Radio Regulations which have been revised and approved during the elapsed study period;

2 that, on this basis, the WRC shall examine those revised Recommendations, and decide whether or not to update the corresponding references in the Radio Regulations;

3 that, if the WRC decides not to update the corresponding references, ITU-R shall continue publishing the ITU-R Recommendations currently referenced in the Radio Regulations;

4 that WRCs shall place the examination of Recommendations in conformity with *resolves* 1 and *resolves* 2 of this Resolution on the agenda of future WRCs,

further resolves

5 to instruct the Director of the Radiocommunication Bureau to report to the CPM immediately preceding the WRC those ITU-R Recommendations already incorporated by reference in the Radio Regulations which have been revised and approved since the previous WRC, or which may be revised in time for the Radiocommunication Assembly;

6 that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference,

urges administrations

to participate actively in the work of the Radiocommunication Study Groups and the Radiocommunication Assembly in the revision of those Recommendations to which mandatory references are made in the Radio Regulations.

Reasons: To establish a procedure to advise administrations, well in advance of a WRC, of those ITU-R Recommendations already incorporated by reference in the Radio Regulations which have been revised and approved since the previous WRC, or which may be revised in time for the Radiocommunication Assembly. Also to clarify that, in the case of ITU-R Recommendations which are not currently referenced in the Radio Regulations, only those Recommendations which are in response to a WRC agenda item can be considered for incorporation by reference. Minor consequential editorial changes have also been identified.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

ISTANBUL, 8 MAY – 2 JUNE 2000

Corrigendum 1 to
Document 25-E
17 April 2000

PLENARY MEETING

Morocco (Kingdom of)

COMMON ARAB PROPOSALS FOR THE
WORK OF THE CONFERENCE

(This document was prepared under the auspices of the League of Arab States and is presented by the Kingdom of Morocco on behalf of the Members of the League of Arab States)

1 **Modify** the title of Document WRC2000/25 as presented above.

2 **Renumber** Proposals Nos. MRC/25/1 to MRC/25/93 to ARB/25/1 to ARB/25/93.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 25-E
25 February 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Morocco (Kingdom of)

(ARAB COUNTRIES COMMON PROPOSALS
FOR THE WORK OF THE CONFERENCE)

IMT-2000

(Agenda item 1.6.1)

The development of standards for a global mobile communication system (IMT-2000) is certainly an important achievement of ITU in actions taken for fulfilling its purposes. For IMT-2000 to start operating to the benefit of the public in general, WRC-2000 has a duty to identify frequency bands to be used by its terrestrial and space components.

Concerning the terrestrial component, the Arab Administrations concur with the conclusion relating to the identified bands amounting to a total of 230 MHz, i.e.

1 885-2 025 MHz;

2 110-2 200 MHz.

This amount of spectrum is considered appropriate for satisfying the main requirements of IMT-2000. It is recognized however, that there may be situations requiring identification of additional spectrum amounting to a total of 160 MHz. Requirements of IMT-2000 have been derived from studies mainly based on the success of cellular systems all over the world. These forecasts will depend greatly on the operating conditions as they may be defined by appropriate organs in ITU. For this reason it is proposed that WRC-2000 limits its decision to:

a) confirming the 230 MHz;

b) listing bands among which a future WRC may identify those to be used by IMT-2000 on the basis of the results of the operation of IMT-2000.

In order not to delay greatly the availability of these additional bands to IMT-2000, administrations should already be informed that the bands to be used by IMT-2000 among those identified in b) above shall be used by IMT-2000 after the year 2010 or at earlier date if agreed among the administrations concerned.

Concerning the satellite component, raises a series of questions that need to be addressed before bands are identified:

- some bands are allocated in the MSS with limitations by footnotes making the allocation practically secondary in some countries until 2005;
- in some bands allocated to the MSS such as 1 525-1 559 MHz/1 626.5-1 660.5 MHz and 1 610-1 626.5 MHz/2 483.5-2 500 MHz the number of existing or planned systems is such that identifying them for IMT-2000 will impose severe constraints on systems using or intending to use these bands;
- the operation of the satellite component within a global system requires agreement of a regulatory character on the operation conditions of IMT-2000. That agreement needs to be studied in the relevant ITU body.

Identification of bands for the satellite component is complex since it requires technical considerations as well as regulatory ones for which a type of agreement such as the GMPCS MoU developed under the auspices of ITU or the GSM MoU developed on a regional basis. Consequently the Conference is requested to take account of the above considerations when approaching that identification and to enter no modification to the bands listed in the precedent paragraph.

EARTH STATIONS OF THE FIXED-SATELLITE SERVICE ON BOARD VESSELS

(Agenda item 1.8)

Proposals have been made to WRC-97 and others to WRC-2000 tending to authorize earth stations in the fixed-satellite service to be operated on board vessels. Such use is not in conformity with the definition of the fixed-satellite service. In addition this operation raises many difficulties to our administrations, among which:

– the frequency bands proposed to be used for such operation are heavily used by the fixed service within the Arab countries and significant growth is expected in the future. Consequently the potential of causing severe interference to many of these systems is highly probable;

– the proposals referred to above all consider that the potential interference may be avoided by means of an appropriate coordination distance. While in the FSS the location of an earth station is known to the minutes of longitude and latitude, administrations that may suffer interference from a vessel has no mean to precisely locate the vessel.

Even in cases where the vessel can be located, the elimination of interference will require a time period which is incompatible with the economical operation of the terrestrial system affected.

The coordination procedure is complex and requires mobilization of significant human and financial resources and there is no reason that our administrations be faced to bearing these unpredictable costs for an operation in which they are not concerned.

Moreover, the number of vessels bearing earth stations may be such that the terrestrial administration will be obliged to conduct a number of coordination incompatible with its human and financial resources.

For the reasons listed above and other reasons, Arab Administrations object to the adoption by the Conference in any form of provisions authorizing the use of FSS earth stations on board vessels. Should, however, the Conference decide to adopt any action authorizing that use that authorization shall take account of the above concerns. In addition such vessels shall operate in the territorial waters only under a license to be delivered by the concerned authorities. In order to alleviate the cost required for the coordination, the administration responsible of the concerned vessel shall bear the cost of that coordination.

NON-GSO FSS IN THE PLANNED BANDS

(Agenda item 1.13)

Use of non-GSO systems in the planned bands is governed by footnotes S5.441, S5.484A, S5.487A and S5.516, Resolutions 130, 131 and 538. The procedures to be applied by these systems are described in the above Resolutions. The above procedures are interpreted as affording protection of the Plans of Appendices S30, S30A and S30B however this protection is not clearly stated. Irrespective of the limitations that may be imposed on these systems, it is considered essential that the protection of the Plans be stated in the footnotes permitting that use.

MOD MRC/25/1

S5.441 The use of the bands 4 500-4 800 MHz (space-to-Earth), 6 725-7 025 MHz (Earth-to-space) by the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by geostationary-satellite systems in the fixed-satellite service shall be in accordance with the provisions of Appendix **S30B**. The use of the bands 10.7-10.95 GHz (space-to-Earth), 11.2-11.45 GHz (space-to-Earth) and 12.75-13.25 GHz (Earth-to-space) by non-geostationary-satellite systems in the fixed-satellite service shall be in accordance with the provisions of Resolution **130 (WRC-97)**. Administrations intending to develop such systems shall take appropriate steps to ensure that assignments appearing in the Plans of Appendices **S30**, **S30A** and **S30B** will be fully protected. Non-geostationary FSS systems in the above bands shall be operated in such a way that any harmful interference that may occur during their operation shall be rapidly eliminated.

MOD MRC/25/2

S5.484A The use of the bands 10.95-11.2 GHz (space-to-Earth), 11.45-11.7 GHz (space-to-Earth), 11.7-12.2 GHz (space-to-Earth) in Region 2, 12.2-12.75 GHz (space-to-Earth) in Region 3, 12.5-12.75 GHz (space-to-Earth) in Region 1, 13.75-14.5 GHz (Earth-to-space), 17.8-18.6 GHz (space-to-Earth), 19.7-20.2 GHz (space-to-Earth), 27.5-28.6 GHz (Earth-to-space), 29.5-30 GHz (Earth-to-space) by non-geostationary- and geostationary-satellite systems in the fixed-satellite service is subject to the provisions of Resolution **130 (WRC-97)**. The use of the band 17.8-18.1 GHz (space-to-Earth) by non-geostationary fixed-satellite service systems is also subject to the provisions of Resolution **538 (WRC-97)**. Administrations intending to develop such systems shall take appropriate steps to ensure that assignments appearing in the Plans of Appendices **S30**, **S30A** and **S30B** will be fully protected. Non-geostationary FSS systems in the above bands shall be operated in such a way that any harmful interference that may occur during their operation shall be rapidly eliminated.

MOD MRC/25/3

S5.487A *Additional allocation:* in Region 1, the band 11.7-12.5 GHz, in Region 2, the band 12.2-12.7 GHz and, in Region 3, the band 11.7-12.2 GHz, are also allocated to the fixed-satellite service (space-to-Earth) on a primary basis, limited to non-geostationary systems and subject to the provisions of Resolution **538 (WRC-97)**. Administrations intending to develop such systems shall take appropriate steps to ensure that assignments appearing in the Plans of Appendices **S30**, **S30A** and **S30B** will be fully protected. Non-geostationary FSS systems in the above bands shall be operated in such a way that any harmful interference that may occur during their operation shall be rapidly eliminated.

MOD MRC/25/4

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) in Regions 1 and 3 and 17.8-18.1 GHz (Earth-to-space) in Region 2 by non-geostationary-satellite systems in the fixed-satellite service is subject to the provisions of Resolution **538 (WRC-97)**. Administrations intending to develop such systems shall take appropriate steps to ensure that assignments appearing in the Plans of Appendices **S30**, **S30A** and **S30B** will be fully protected. Non-geostationary FSS systems in the above bands shall be operated in such a way that any harmful interference that may occur during their operation shall be rapidly eliminated.

APPENDICES S30 AND S30A

(Agenda items 1.19, 1.19*bis*)

(Proposals in this document are limited to Appendix S30. If adopted, they have to be reflected in similar modifications to Appendix S30A.)

I Introduction

1 It is now for more than 80 years that the international community is regulating the use of the frequency spectrum through the International Radio Regulations that is part of the Basic Instruments of the International Telecommunication Union. Each time part of that spectrum become usable thanks to technological advances, the Radio Regulations was adapted to the requirements of the services using that part of the spectrum. The more a frequency band becomes heavily used the more stringent and complex are the provisions regulating its use. All the procedures developed in this continuous adaptation of the Radio Regulations to the requirements of radio services were based, and continue to be based on the equality of rights to access spectrum by all ITU Members. Since 1947 frequencies assigned by administrations to their stations are afforded a status through their notification to the International Frequency Registration Board (IFRB) and their recording in the Master International Frequency Register (MIFR). That status depended and continues to depend on the date of receipt of notifications by the IFRB the functions of which were split in 1992 between the Radio Regulations Board (RRB) and the Radiocommunication Bureau (BR). This priority of dates is expressed as the basis of "the first come, first served" approach. Different ITU conferences considered possibility of replacing this priority of date by other approaches permitting an ITU Member to access the spectrum, at any time, and to acquire the same rights as precedent users. Planning, sometimes called as "*a priori* planning", was the only possible alternative approach.

2 Proposals to ITU conferences tending to plan any frequency band were systematically opposed by big users of that band, arguing that planning is not an efficient use of the spectrum. Arab delegations in these conferences always joined its efforts to those of other developing countries supporting these proposals. It is with the same spirit that this delegation to WRC-2000 will make every effort to ensure strict application of the principles contained in the Constitution/Convention relating to the cooperation, the equality of rights in accessing the orbit/spectrum and their efficient use as well as the principles adopted by WRC-97 in its Resolution 532. Equitable access to the frequency spectrum and the orbits is for us more important than any information or commercial services provided through huge investments by private sector of other countries. Some may consider that the guarantee of access by planning is against the efficient use of spectrum, we are convinced that appropriate procedures associated to a plan will eliminate or at least greatly reduce that apparent contradiction. It is with this view that the proposals contained in this document have been prepared.

II ITU planning systems

3 Since 1947 several world or regional plans have been adopted by world or regional radiocommunication conferences. Some of them continue to be successfully applied, like the maritime and aeronautical plans. The only one that could not be adopted despite 50 years of attempts is the plan for the HF broadcasting (HFBC). When a plan is not prepared with appropriate criteria and when it is not adapted to its economical development it becomes rapidly obsolete. It was the case of the Plan of Regions 1 and 3 contained in Appendix S30. If its revision is approached

by including in the Plan any requirement, the ITU will be faced to the same problem as that of HFBC and the revision of the Plan will be impossible.

3.1 Maritime and aeronautical communications which involve the security of persons and goods were the first to require the adoption of plans, to this effect ITU adopted:

- an allotment[1] plan for the maritime service in the HF bands is contained in Appendix S25 and lists frequencies to be used in specified maritime zones;
- two allotment plans for the aeronautical mobile service in the HF bands for official traffic (OR) and for commercial traffic (R) are contained respectively in Appendices S26 and S27 which list frequencies to be used in specified aeronautical routes or zones.

3.2 Broadcasting was the only radio service for which the former Société des Nations (SDN) adopted a treaty containing some basic deontology rules to be applied by a country when broadcasting over the territory of another country. Very few countries ratified it. Before the Second World War, ITU tried, without success, to convert the principles of that treaty into a plan for the Low Frequencies (LF) and Medium Frequencies (MF) broadcasting. Broadcasting in the high frequency bands or decametric bands (HFBC) played a so important strategic role during World War II that it become evident to develop it as an international broadcasting system permitting a country to broadcast, at long distances, over the territories of other countries without need for any agreement. It was therefore necessary to develop a plan for the use of HFBC in order to avoid mutual interferences. From 1947 to 1997 several attempts were made to reach an agreement on a plan. After several years of meetings it becomes evident that planning under the required conditions (several world coverage for some countries together with the requirements of small users) was not possible and WRC-97 adopted Article S12 with improved procedures. When revising Appendix S30, it will be very useful to keep in mind the reasons for which the HFBC could not be planned, among which:

- the requirements submitted by ITU Members, these requirements increased each time a WARC increased the bands allocated to HFBC to resolve the spectrum shortage experienced by a previous conference; and
- the reluctance of a number of countries to ratify a treaty in which their respective territories are covered by transmissions of other countries without any minimal rules governing their content.

3.3 Several regional plans have been developed for the broadcasting and the maritime mobile services in the LF, MF, VHF and UHF bands. These plans are not part of the Radio Regulations they are binding only on the countries of the region concerned within the framework of Regional Agreements. They are all based on national coverage and no subregional system is authorized in these plans.

3.4 The first significant allocation of frequency bands to space services was made by WARC-71. These allocations could be agreed upon only when a compromise package was accepted for the broadcasting-satellite service. The package consisted in three parts:

[1] **S1.17** *allotment* (of a radio frequency or radio frequency channel)*:* Entry of a designated frequency channel in an agreed plan, adopted by a competent conference, for use by one or more administrations for a terrestrial or space *radiocommunication service* in one or more identified countries or geographical areas and under specified conditions.

- the planning, “stations in the broadcasting-satellite service shall be established and operated in accordance with agreements and associated plans” (*resolves* 1 of Resolution 507);
- a provisional procedure, “during the period before the entry into force of such agreements and associated plans the administrations and the Radiocommunication Bureau shall apply the procedure contained in Resolution 33”, (*resolves* 2 of Resolution 507);
- avoidance of overlaps, “In devising the characteristics of a space station in the broadcasting-satellite service, all technical means available shall be used to reduce, to the maximum, the radiation over the territory of other countries unless an agreement has been previously reached with such countries.” (S23.13)

On the basis of these allocations, WARC SAT-77 adopted the Plan contained in Appendix S30 for the broadcasting-satellite service in Regions 1 and 3. WARC Orb-88 adopted the feeder-link Plan in the fixed-satellite service contained in Appendix S30A.

3.5 The 1977 Plan was developed for national coverage with five channels for countries in Region 1 and 4 channels for countries in Region 3. A limited number of subregional systems formally accepted by the countries concerned were entered in the Plan by the 1977 Conference. They are considered as having been included in the Plan on behalf of the administrations concerned.

The procedure associated by WARC SAT-77 to the Appendix 30 Plan, for its modification, are similar to those of the Radio Regulations for the coordination of fixed-satellite systems. They are based among others on the approach of “no reply = agreement”, which have been transposed to the broadcasting satellite service in Appendix S30, without taking fully account of the legal character of the Plan as part of a treaty. That approach may be acceptable for the fixed-satellite service since the result of the coordination procedure is the recording in the MIFR, giving right to “international recognition”. It is not acceptable for a plan since, when an assignment enters in the Plan, it gives right to “international protection”, all ITU Members are bound by the treaty to protect that assignment irrespective of its content.

The limited number of channels per beam contained in Appendix S30 could not allow the economical development of satellite systems in conformity with the Plan. Taking account of the limited number of multi-administrations systems appearing in the Plan, the IFRB adopted a Rule of Procedure extending to Appendix 30 the approach of Article 11 (now S9) relating to the application of the coordination procedure by an administration “ acting on behalf of a group of named administrations” (see Rule relating to § 4.3.5). Some administrations used that opportunity to communicate to the Bureau hundreds of systems with subregional coverage, without the agreement of the countries concerned, many of these systems occupy the whole planned band. Some of these systems which have gone through the Article 4 procedure of Appendix 30 (mainly thanks to the “no reply = agreement”) have been entered in the Plan by WRC-97 without due regard to the legal implications of that action.

3.6 Provision S23.13 (former RR2674) stipulate that “In devising the characteristics of a space station in the broadcasting-satellite service, all technical means available shall be used to reduce, to the maximum, the radiation over the territory of other countries unless an agreement has been previously reached with such countries.” This provision was adopted by WARC-71 when the satellite antenna technology did not permit shaped beams. Even today, with sophisticated technology of shaped beams the overlap cannot be totally avoided. Considering the number of modifications of Appendix S30 to include sub-regional systems, it becomes necessary to distinguish between the unavoidable overlap and the intentional coverage. Annex to this document contains extracts from the RRB Rules of Procedure relating to the application of provisions of Articles S9 and S11 of the Radio Regulations to the service area. To apply S23.13 for the broadcasting-satellite service, the RRB adopted a rule extending to the "no comment = agreement" and subsequently replaced that by a rule similar to the content of Annex 1 to this document, excluding the territory of an objecting administration from the service area of the proposed system while that territory should be excluded from the coverage area to take account of the specific character of the broadcasting-satellite service and the required agreement under S23.13. Considering that the procedure of Article 4 shall start several years before the bringing into use, proposed systems are in the early stages of devise and the exclusion of territories from the coverage area should be possible in the majority of cases.

3.7 The more recent plan is the allotment plan for the fixed-satellite service in the C and ku bands adopted by WARC Orb-88. It is contained in Appendix 30B and consists of:

- Part A containing the allotments;
- Part B containing networks of existing systems; and
- List of Assignments to be associated with the Plan (see Article 5 of Appendix S30B):
  - *a)* assignments derived from allotments in Part A of the Plan;
  - *b)* assignments relating to existing systems in Part B of the Plan;
  - *c)* assignments resulting from the introduction of subregional systems;
  - *d)* assignments relating to additional uses.

As each allotment in the Plan of Appendix S30B benefits of the whole of the planned bands, the only possible modification of the Plan is limited to new ITU Members through a procedure contained in Article 7. The procedures of Appendix S30B are contained in its Article 6, they are very complex and consist of:

- Procedure for conversion of an allotment into an assignment (Section I). To each allotment is associated a set of Generalized Parameters. An assignment derived from an allotment will have more detailed characteristics and is recorded in a list.
- Procedure for the introduction of a subregional system (Section II) a subregional system is defined in Article 2 as "a satellite system created by agreement among neighbouring countries Member States of the ITU or their authorized telecommunications operating agencies and intended to provide domestic or subregional services within the geographical areas of the countries concerned." § 6.39 stipulates "All or part of the national allotments used by the subregional system shall be suspended for the period of operation of this subregional system unless it can be used in a way that does not affect allotments in the Plan or assignments made in accordance with the procedures associated with the Plan."
- Supplementary provisions applicable to additional uses in the planned bands (Section III). The procedure of this section is to be used when an administration:
  - – has a requirement whose characteristics differ from those used for the development of Part A of the Plan;
  - – intends to use a suspended allotment;
  - – intends to participate in a subregional system without suspending its allotments.

3.8 Experience gained from these planning exercises may be very useful for the revision of Appendices S30 and S30A:

- all these plans were adopted by “Service Conferences” which no longer exist in the revised Constitution/Convention. Some of these conferences were convened in two sessions. None of them, even those held in two sessions could resolve all the difficulties;
- all broadcasting plans are limited to national coverage. The subregional systems appearing in Appendix S30B were adopted by the planning conference, they did not enter the Plan through the application of a procedure;
- if real need exists for additional use of spectrum for some administrations, a frozen plan may lead these administrations to act in contravention with the Radio Regulations. Appendix S30B resolved this problem by authorizing additional uses for the duration of life of the satellite system. A similar approach can be applied when revising Appendix S30;
- when the procedures are not clear enough and do not consider practical situations they become open to interpretations.

III Proposed planning approach

4 In its Resolution 532, WRC-97 resolved that “WRC-99 should consider the results of the above studies and, if the conclusion is that such replanning is feasible, initiate an appropriate revision for completion no later than 2001”. The Inter-conference Representative Group (IRG) and the Group of Technical Experts (GTE) set up by WRC-97 in its Resolution 532 have carried out, with the assistance of the Bureau, a series of planning exercises. One of these planning exercises, communicated to the fifth meeting of the IRG, indicates that a plan is feasible on the basis of 10 contiguous channels amounting to a total spectrum of 400 MHz per coverage area in Region 1 and 12 contiguous channels amounting for 500 MHz per coverage area in Region 3. That exercise contained existing systems as defined in principle 3 of Resolution 532. **Consequently the replanning is feasible.**

The date limit for adopting a plan was the subject of difficult negotiations in WRC-97 and the year 2001 was adopted as a compromise. In this respect, WRC-97 adopted the following decisions:

a) the revision of the plan shall be initiated by WRC-99;

b) the revision shall be completed no later than 2001; and

c) Resolution 722 recommending an agenda for WRC-01 in which no reference is made to the revision of Appendices S30 and S30A.

This means that WRC-97 is referring in its Resolution 532 to a conference to be convened between WRC-99 and WRC-01. It was to that Conference that the Council was referring as “the next conference”. Such a conference is not allowed by the Constitution/Convention[2]. In addition, Resolution PLEN/9 of Minneapolis-98 fixing the program of conferences and meetings does not contain any radio conference other than the periodical ones i.e. WRC-2000 and WRC-02/03. If we

[2] The Constitution/Convention adopted the 1992 APP contained two periodical conferences: the Plenipotentiary Conferences (every four years) and World Radiocommunication Conferences (every two years). Kyoto-94 adopted a new provision permitting the convening of an extraordinary plenipotentiary conference. No similar provision exists for WRCs.

consider the number of systems communicated to ITU since WRC-95 we expect the communication of a greater number of systems prior to 2003 and the planning will be impossible to effect. **Consequently WRC-2000 is the only conference where Appendices S30 and S30A can be revised.**

During IRG-5 several additional studies have been requested. Some of these requests are reasonable and would led to positive results, others are only intended to indicate that the planning should be delayed until these studies are completed or until the difficulties identified by these studies are resolved. It is to be noted in this respect that the more the planning is delayed the more the number of cases difficult to resolve will increase The Arab Administrations are of the view that no conference, irrespective of its duration, will be able to resolve all the difficulties. For this reason they propose a dynamic planning based on the adoption by WRC-2000 of a Plan as follows:

a) The planning exercise communicated by the Bureau to the Conference on the basis of the decisions of IRG shall be considered as a draft Plan to be adopted by WRC-2000. The limited time available to the Conference will not permit it to enter in that draft Plan all the required modifications. Unresolved difficulties should be identified by the Conference as requiring further examination.

b) The Plan adopted by WRC-2000 should be limited to national coverage with 10 channels per beam in Region 1 and 12 channels per beam in Region 3.

c) Modifications of the Plan shall be limited to change of the orbital locations and entries for new ITU Members.

d) Additional uses such as use of characteristics increasing probability of harmful interference or requiring more protection, use of additional channels for national coverage, and use of subregional systems shall be entered in a list annexed to the MIFR. An entry in this list shall be made for a period of [15] years of operation and shall lapse if it is not brought into use within eight years following the first communication to the Bureau. Entries in this list shall be taken into account in any modification of the Region 1 and 3 Plan, in any modification of Region 2 Plan, in the processing of any additional use and in any coordination of a fixed-satellite system in Regions 2 and 3.

e) Systems which have been included in the planning exercise in application of principle 3 of Resolution 532 and channels, in addition to the 10 or 12 channels for which the procedure of Article 4 was successfully completed, shall be entered in the above list. Other similar systems which have not been included in the planning exercise shall be examined from the viewpoint of their compatibility with the Plan and, where appropriate, the plan will be modified in consultation with the administrations concerned shall be entered in the list.

f) IRG should be continued after WRC-2000, with the following mandate and the assistance of the Bureau:

- to review the systems having applied successfully Article 4 of Appendix S30 with the view to include them in the list annexed to the MIFR;
- in so doing, the IRG may, in consultation with the administrations concerned, modify the orbital location of those entries in the Plan and in the list annexed to the MIFR for which due diligence information was not communicated to the Bureau;
- to examine, without priority of dates, those systems communicated to the Bureau by the last day of the Conference with the view to include as many of the requested channels and orbital locations within the framework of equitable

access and avoidance of monopolization (a draft resolution will be prepared to propose more details on a manner to apply this indent);

– to report the results of these examinations, including unresolved cases, to WRC-02(03) for their consideration.

This approach is formulated in modifications to Articles 1 to 5 of Appendix S30. Similar proposals for applying the proposed planning approach to Appendix S30A will be contained in another document.

MRC/25/5

The Plan for Regions 1 and 3 resulting from the revision of Appendix **S30** shall not exceed the following number of channels per coverage area:

– 10 channels in a continuous band of 400 MHz for each country of Region 1; and

– 12 channels in a continuous band of 500 MHz for each country of Region 3.

5 Arab Administrations are convinced that the above amount of spectrum is the minimum amount of spectrum required by principle 1 of Resolution 532. At the same time it leaves enough spectrum for future additional requirements in accordance with principle 5 of the same Resolution. Taking account of the number additional uses being processed by the Bureau and possible future candidates, it will not be possible to include all of them in the Plan. Apart from the legal problems, and compatibility problems additional difficulties are generates by the existence of systems brought into use before completion of the coordination procedures. Some order is needed in respect to all these additional uses. They can be taken into consideration only through new procedures to be developed.

6 The above difficulties lead to a major question. When a Member State disagrees to the coverage of its territory by the satellite system of another Member State, can it ratify a treaty that contains that system or which will contain it through the application of a procedure? What is the actual effect of objections by that country if its territory remains in the coverage area even if it is excluded from the service area? These questions need to be considered together with the abnormal widely accepted situation in which the fixed-satellite service offers dozens of satellites providing direct-to-home (DTH) broadcasting, without being subjected to any constraint similar to S23.13, while at the same time the broadcasting-satellite service is subjected to that provision.

To free the broadcasting-satellite service from S23.13 means that that service will be similar to HFBC and this can in no way be accepted. It is therefore proposed to examine practical solutions that:

• guarantee the equitable access to the spectrum/orbit by all countries providing each of them of the same amount of spectrum in the Plan; and

• authorize, for a defined period of time, the use of additional spectrum for national or subregional coverage in a list annexed to the MIFR without the need to enter them formally in the Plan;

• achieve this balanced approach by limiting modification of the Plan to the change of the orbital location and to entries for new countries as indicated in the following proposal.

MRC/25/6

The procedures associated to the Plan for Regions 1 and 3 resulting from the revision of Appendix S30 shall provide for:

- modification of the Plan limited to the change of the orbital location and the addition of entries for new ITU Members;
- the use, for a defined period of time, of additional channels for national or subregional coverage.

ARTICLE 1

General definitions

1 For the purposes of this Appendix the following terms shall have the meanings defined below:

1.1 *1977 Conference:* World Administrative Radio Conference for the Planning of the Broadcasting-Satellite Service in the Frequency Bands 11.7-12.2 GHz (in Regions 2 and 3) and 11.7-12.5 GHz (in Region 1), called in short World Broadcasting-Satellite Administrative Radio Conference, Geneva, 1977.

1.2 *1983 Conference:* Regional Administrative Radio Conference for the Planning in Region 2 of the Broadcasting-Satellite Service in the Frequency Band 12.2-12.7 GHz and Associated Feeder Links in the Frequency Band 17.3-17.8 GHz, called in short Regional Administrative Conference for the Planning of the Broadcasting-Satellite Service in Region 2 (RARC Sat-R2), Geneva, 1983.

1.3 *1985 Conference:* First Session of the Word Administrative Radio Conference on the Use of the Geostationary-Satellite Orbit and the Planning of Space Services Utilizing It, Geneva, 1985, called in short WARC Orb-85.

ADD MRC/25/7

1.3A *2000 Conference:* World Radiocommunication Conference (Istanbul, 2000) called in short WRC-2000.

Reasons: In case it is considered appropriate to retain the list of all conferences having modified this Appendix.

NOC MRC/25/8

1.4 *Regions 1 and 3 Plan:* The Plan for the Broadcasting-Satellite Service in the Frequency Bands 11.7-12.2 GHz in Region 3 and 11.7-12.5 GHz in Region 1 contained in this Appendix, together with any modifications resulting from the successful application of the procedures of Article 4 of this Appendix.

NOC MRC/25/9

1.5 *Region 2 Plan:* The Plan for the Broadcasting-Satellite Service in the Frequency Band 12.2-12.7 GHz in Region 2 contained in this Appendix, together with any modifications resulting from the successful application of the procedures of Article 4 of this Appendix.

NOC MRC/25/10

1.6 *Frequency assignment in conformity with the Plan:* Any frequency assignment which appears in the Regions 1 and 3 Plan or the Region 2 Plan or for which the procedure of Article 4 of this Appendix has been successfully applied.

ADD MRC/25/11

1.7 *Subregional systems:* For the purpose of the application of the provisions of this Appendix, a subregional system in the Regions 1 and 3 planned bands is a broadcasting-satellite system intended to provide domestic or subregional services within the geographical areas of the countries concerned.

See Article 2 of Appendix S30B.

ADD MRC/25/12

1.8 *Additional use in Regions 1 and 3:* For the application of the provisions of this Appendix, additional uses in Regions 1 and 3 are:

a) use of the channels appearing in the Regions 1 and 3 Plan with characteristics different from those appearing in that Plan and which are capable of causing more interference or are more sensitive to interference than the corresponding entries in the Plan;

b) use of channels in addition to those appearing in the Plan;

c) participation in a subregional system.

Reasons: Several documents of the CPM, the IRG and GTE refer to either multi-administration system or subregional system. It becomes necessary to include in Appendices S30 and S30A a definition for this term.

ADD MRC/25/13

1.9 *Frequency assignment in conformity with this Appendix*: Any frequency assignment in the Regions 1 and 3 planned bands which is used or intended to be used in conformity with the provisions of this Appendix.

Reasons: Article 4 contains provisions through which additional uses listed in § 1.8 above are recorded in a list annexed to the MIFR. Some of them may receive a favourable finding and need to be qualified as being in conformity with Appendix S30.

ARTICLE 2

Frequency bands

2.1 The provisions of this Appendix apply to the broadcasting-satellite service in the frequency bands between 11.7 GHz and 12.2 GHz in Region 3, between 11.7 GHz and 12.5 GHz in Region 1 and between 12.2 GHz and 12.7 GHz in Region 2 and to the other services to which these bands are allocated in Regions 1, 2 and 3, insofar as their relationship to the broadcasting-satellite service in these bands is concerned.

ARTICLE 3

Execution of the provisions and associated Plans

3.1 The Member States in Regions 1, 2 and 3 shall adopt, for their broadcasting-satellite space stations[1] operating in the frequency bands referred to in this Appendix, the characteristics specified in the appropriate Regional Plan and the associated provisions.

3.2 The Member States shall not change the characteristics specified in the Region 1 and Region 3 Plans or in the Region 2 Plan, or bring into use assignments to broadcasting-satellite space stations or to stations in the other services to which these frequency bands are allocated, except as provided for in the Radio Regulations and the appropriate Articles and Annexes of this Appendix.

MOD MRC/25/14

[1] ~~In Region 2, s~~Such stations may also be used for transmissions in the fixed-satellite service (space-to-Earth) in accordance with No. **S5.492** of the Radio Regulations.

Reasons: WRC-97 extended the use of FSS to the three Regions.

ARTICLE 4

Procedure for modifications to the Plans

7 Proposed modifications to Article 4 are intended to go beyond a simple adaptation of the current procedures to the new Plan. Having a Plan that guaranty equitable access to the spectrum/orbit with 10 channels for each coverage area in Region 1 and 12 channels in Region 3, the purpose is to associate to that Plan procedures that makes the overall planning system of Appendix S30 flexible and dynamic by permitting the use of characteristics different from those appearing in the Plan, the use of additional channels and the development of subregional system; at the same time it avoids monopolization of the spectrum/orbit by a country or a group of countries. In this respect, proposed modifications to Article 4 are based on the following approaches:

- Limitation of modifications of the Plan to addition of entries for new ITU Members and the replacement of the orbital location of a beam by another one.
- When an assignment appearing in the Plan is used with different characteristics and does not cause more interference or require more protection, that use is not a modification of the Plan, it is recorded in the MIFR with appropriate remarks and continues to be protected through the protection of the characteristics appearing in the Plan.
- Uses that increase the occupation of the spectrum/orbit shall be examined and, where appropriate recorded in a list annexed to the MIFR. Such uses are not considered as modifications of the Plan and are limited to the duration of life of the corresponding satellites. They may concern:
  - assignments appearing in the Plan, used with characteristics different from those recorded and causing more interference or are more sensitive to interference;
  - use of additional channels;

– development of a subregional system by combining a number of assignments appearing in the Plan;

– development of a subregional system using additional channels/orbital locations.

• Avoidance of monopolization of the spectrum/orbit. Monopolization characterizes the case of a country, or a group of countries, who applied the procedures to cover several times a given geographical area, using the whole planned bands It can be avoided only by limiting the recording of their systems to their duration of life as is the case in Appendix S30B. Such uses shall not be entered in the Plan. It will also be the case of the use of characteristics different from those on the basis of which the Plan was developed when that use increases the probability of interference or require more protection than the corresponding entry in the Plan.

In so doing efforts were made to keep the provisions applicable to Region 2 unchanged.

Note by the Secretariat: The following proposals are intended to replace or modify and renumber the current text of Article 4 of Appendix S30. For clarity, new or renumbered paragraphs are shown here with the prefix "N", e.g. N4.1.

ADD MRC/25/15

Section I – Provisions applicable to Regions 1 and 3

ADD MRC/25/16

N4.1 The Plan for Regions 1 and 3 is based on national coverage from the geostationary-satellite orbit. The associated procedures contained in this Article are intended to promote long-term flexibility of the Plan by permitting administrations:

– to use their assignments appearing in the Plan with characteristics different from those appearing in the Plan[2*bis*],

– to satisfy requirements for additional uses;

– to develop subregional systems (in a balanced way among the countries in Regions 1 and 3); and

– to avoid, in that respect, monopolization of the planned bands and orbit by a country or a group of countries.

Reasons: Both WRC-95 and WRC-97 adopted in their respective resolutions a series of principles, some of them were applicable at the development stage of the Plan, others need to be incorporated in Appendix S30. Arab Administrations are of the view that such incorporation is essential for a correct application of the procedures of this Article. The avoidance of monopolization will be the subject to separate proposals, see § 3 *f)*.

ADD MRC/25/17

[2*bis*] When a provision of this Appendix refers to "characteristics appearing in the Plan" it refers to the characteristics appearing in the columns of the Plan as well as to other characteristics used for the development of the Plan.

Reasons: All characteristics used for the development of the Plan are not listed in the columns of the Plan.

ADD MRC/25/18

N4.2 When an administration of Regions 1 and 3 intends to make a modification to the Regions 1 and 3 Plan, i.e.:

a) to add a new entry in the Plan as a new ITU Member;

b) to replace the orbital location of its assignments in the Plan by another orbital location;

c) to cancel a frequency assignment from the Plan,

the procedure contained in this Article shall be applied before any notification of the frequency assignment is made to the Radiocommunication Bureau (see Article 5 of this Appendix).

Reasons: As the Plan is intended to ensure equitable access, the number of entries in the Plan for each country should not change. Other uses may be made through the procedure of this Article without being recorded in the Plan.

ADD MRC/25/19

N4.3 The procedure contained in this Article also applies when an administration of Regions 1 and 3 intends:

a) to use its frequency assignments appearing in the Plan with characteristics different from those appearing in the Plan; or

b) to use additional channels from the orbital location appearing in the Plan or from another one; or

c) to extend the service area of its assignments within its territories; or

d) to extend the service area of its assignments to cover the territory of other administrations;

e) to combine all or part of its assignments with those of other administrations in a subregional system to be operated from one of their respective orbital locations or from any other one.

Reasons: See section 7 above.

MOD MRC/25/20

~~4.1.1~~N4.4 Before an administration proposes to ~~include in the Plan, under the provisions of § 4.1 *b)*,~~use a new frequency assignment ~~to a space station or to include in the Plan new frequency assignments to a space station whose orbital position is not designated in the Plan for this administration,~~under the provisions of § N4.3 *b)* all the assignments to the service area involved should have been brought into service or have been notified to the Bureau in accordance with the relevant provisions of ~~the Plan~~this Appendix.

Reasons: Use of additional channels is not considered as a modification of the Plan.

SUP MRC/25/21

4.3 Proposed modifications to a frequency assignment in conformity with one of the Regional Plans or inclusion in that Plan of a new frequency assignment

Reasons: Consequence of the creation of new sections in Article 4.

SUP MRC/25/22

For Regions 1 and 3:

Reasons: Consequence of the creation of new sections in Article 4.

MOD MRC/25/23

~~4.3.1~~N4.5 An administration proposing ~~a modification to the characteristics of a frequency assignment in conformity with~~to modify the Regions 1 and 3 Plan~~, or the inclusion of a new frequency assignment in that Plan~~ by applying the provision of § N4.2 above or to use a frequency assignment by applying the provision of § N4.3 above, shall seek the agreement of those administrations whose services are considered to be affected, i.e.:

Reasons:

1 To cover the two possible situations, i.e. modification of the Plan and additional uses.

2 The present § 4.3.1.6 is listed among the administrations affected while it applies to all the listed cases. It is moved to be part of the heading paragraph N4.5.

MOD MRC/25/24

~~4.3.1.1~~N4.5.1 administrations of Regions 1 and 3 having a frequency assignment to a space station in the broadcasting-satellite service in the same or adjacent channel which is in conformity with the Regions 1 and 3 Plan, or in respect of which proposed modifications to that Plan in application of § N4.2 above have already been ~~published~~received by the Bureau in accordance with the provisions of § ~~4.3.5.1 or 4.3.6~~N4.11 of this Article; *or*

Reasons:

1 In all the procedures contained in the Radio Regulations it is the date of receipt by the Bureau as the starting date, not the date of publication.

2 As the reference is now to the date of receipt of information, there is no longer any need for the reference to 4.3.6.

ADD MRC/25/25

N4.5.2 administrations of Regions 1 and 3 having a frequency assignment to a space station in the broadcasting-satellite service in the same or adjacent channel which appears in the list mentioned in § N4.29.2, or in respect of which proposed use have already been received by the Bureau for publication in accordance with the provisions of § N4.11 of this Article; *or*

MOD MRC/25/26

~~4.3.1.2~~N4.5.3 administrations of Region 2 having a frequency assignment to a space station in the broadcasting-satellite service with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is in conformity with the Region 2 Plan, or in respect of which proposed modifications to that Plan have already been published by the Bureau in accordance with the provisions of § ~~4.3.5.1 or 4.3.6~~N4.16 of this Article; *or*

NOTE - Normally, this provision should not refer to “published”, it should refer to “received” as indicated in MOD N4.5.1. The same situation exists in MOD N4.9.2. Replacement of the “published” by “received” should be considered in the Conference if Regions 1 and 3 on one side and Region 2 on the other side accept the same treatment.

SUP MRC/25/27

4.3.1.3

Reasons: As a result of new numbering.

MOD MRC/25/28

~~4.3.1.4~~N4.5.4 administrations having no frequency assignment in the broadcasting-satellite service in the channel concerned but in whose territory the power flux-density value exceeds the prescribed limit as a result of the proposed ~~modification~~use or having an assignment whose associated service area does not cover the whole of the territory of the administration, and in whose territory outside that service area the power flux-density from the broadcasting-satellite space station subject to this modification exceeds the prescribed limit as a result of the proposed modification; *or*

MOD MRC/25/29

~~4.3.1.5~~N4.5.5 administrations having a frequency assignment in the band 11.7-12.2 GHz in Region 2 or 12.2-12.5 GHz in Region 3 to a space station in the fixed-satellite service which is recorded in the Master International Frequency Register (Master Register) or which has been coordinated or is being coordinated under the provisions of No. **S9.7**, or those of § 7.2.1 of this Appendix;

SUP MRC/25/30

4.3.1.6

Reasons: See the above § MOD N4.5.

(MOD) MRC/25/31

~~4.3.2~~N4.6 The services of an administration are considered to be affected when the limits shown in Annex 1 are exceeded.

ADD MRC/25/32

Section II – Provisions applicable to Region 2

SUP MRC/25/33

For Region 2:

MOD MRC/25/34

~~4.1~~N4.7 When an administration of Region 2 intends to make a modification~~[2]~~ to~~ one of~~ the ~~Regional~~Region 2 Plan~~s~~, i.e.:

a) to modify the characteristics of any of its frequency assignments to a space station[3] in the broadcasting-satellite service which are shown in the ~~appropriate Regional~~Region 2 Plan, or for which the procedure in this Article has been successfully applied, whether or not the station has been brought into use; *or*

b) to include in the ~~appropriate Regional~~Region 2 Plan a new frequency assignment to a space station in the broadcasting-satellite service; *or*

c) to cancel a frequency assignment to a space station in the broadcasting-satellite service;

the following procedure shall be applied before any notification of the frequency assignment is made to the Radiocommunication Bureau (see Article 5 of this Appendix);

MOD MRC/25/35

~~4.1.1~~N4.8 Before an administration of Region 2 proposes to include in the Plan, under the provisions of § ~~4.1~~N4.7 *b)*, a new frequency assignment to a space station or to include in the Plan new frequency assignments to a space station whose orbital position is not designated in the Plan for this administration, all the assignments to the service area involved should have been brought into service or have been notified to the Bureau in accordance with the relevant provisions of the Plan.

Reasons: The notification procedure is contained in Article 5. It appears more logical not to consider the whole Appendix S30 as the Plan.

MOD MRC/25/36

~~4.3.3~~N4.9 An administration proposing a modification to the characteristics of a frequency assignment in conformity with the Region 2 Plan, or the inclusion of a new frequency assignment in that Plan, shall seek the agreement of those administrations whose services are considered to be affected, i.e.:

Reasons: See MOD N4.5.

MOD MRC/25/37

~~4.3.3.1~~N4.9.1 administrations of Region 2 having a frequency assignment in the Region 2 Plan to a space station in the broadcasting-satellite service in the same or adjacent channel which is in conformity with that Plan, or in respect of which proposed modifications to that Plan have already been published by the Bureau in accordance with the provisions of § ~~4.3.5.1 or 4.3.6~~N4.16 of this Article; *or*

MOD MRC/25/38

~~4.3.3.2~~N4.9.2 administrations of Regions 1 and 3 having a frequency assignment to a space station in the broadcasting-satellite service with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment, which is in conformity with the Regions 1 and 3 Plan, or in respect of which proposed modifications to that Plan have already been published by the Bureau in accordance with the provisions of § ~~4.3.5.1 or 4.3.6~~N4.16 of this Article; *or*

NOTE - See MOD N4.5.3.

ADD MRC/25/39

N4.9.3 administrations of Regions 1 and 3 having a frequency assignment to a space station in the broadcasting-satellite service in the same or adjacent channel which appears in the list mentioned in § N4.29.2, or in respect of which proposed use have already been received by the Bureau in accordance with the provisions of § N4.11 of this Article; *or*

MOD MRC/25/40

~~4.3.3.4~~N4.9.4 administrations having no frequency assignment in the broadcasting-satellite service in the channel concerned but in whose territory the power flux-density value exceeds the prescribed limit as a result of the proposed modification or having an assignment whose associated service area does not cover the whole of the territory of the administration, and in whose territory outside that service area the power flux-density from the broadcasting-satellite space station subject to this modification exceeds the prescribed limit as a result of the proposed modification; *or*

MOD MRC/25/41

~~4.3.3.5~~N4.9.5 administrations having a frequency assignment in the band 12.5-12.7 GHz in Region 1 or 12.2-12.7 GHz in Region 3 to a space station in the fixed-satellite service which is recorded in the Master Register or which has been coordinated or is being coordinated under the provisions of No. **S9.7** or those of § 7.2.1 of this Appendix; *or*

MOD MRC/25/42

~~4.3.3.6~~N4.9.6 administrations having a frequency assignment to a space station in the broadcasting-satellite service in the band 12.5-12.7 GHz in Region 3 with the necessary bandwidth, any portion of which falls within the necessary bandwidth of the proposed assignment and which

a) is recorded in the Master Register, *or*

b) has been coordinated or is being coordinated under the provisions of ~~Resolution **33 (Rev.WRC-97)**~~Article **S9**, *or*

c) appears in a Region 3 Plan to be adopted at a future radiocommunication conference, taking account of modifications to that Plan which may be introduced in accordance with the Final Acts of the Conference;

SUP MRC/25/43

4.3.3.7

MOD MRC/25/44

~~4.3.4~~N4.10 The services of an administration are considered to be affected when the limits shown in Annex 1 are exceeded.

~~*For all Regions:*~~

ADD MRC/25/45

Section III – Provisions applicable to all Regions

MOD MRC/25/46

~~4.3.5~~N4.11 An administration intending to ~~modify characteristics in one of the Regional Plans~~apply provisions of § N4.2, § N4.3 or § N4.7 to a frequency assignment to a broadcasting-satellite station shall send to the Bureau, not earlier than five years but preferably not later than eighteen months before the date on which the assignment is to be brought into use, the relevant information listed in Annex 2.~~ Modifications to that Plan involving additions under § 4.1 *b)* shall lapse if the assignment is not brought into use by that date.~~

Reasons: The last sentence is transferred to ADD N4.29.

MOD MRC/25/47

~~4.3.5.1~~N4.12 Where as a result of the intended ~~modification~~use the limits defined in Annex 1 are not exceeded, this fact shall be indicated when submitting to the Bureau the information required by § ~~4.3.5~~N4.11.~~ The Bureau shall then publish this information in a special section of its Weekly Circular.~~

Reasons: The last sentence may be interpreted to apply to only this case. It is moved in a separate provision applicable to all cases.

MOD MRC/25/48

~~4.3.5.2~~N4.13 ~~In all other cases~~Where as a result of the intended use the limits in Annex 1 are exceeded the administration shall notify the Bureau of the names of the administrations whose agreement it considers should be sought in order to arrive at the agreement referred to in § ~~4.3.1~~N4.5 or § ~~4.3.3~~N4.9, as well as of those with which agreement has already been reached.

Reasons: Specify that the agreement in this case is limited to the application of Annex 1.

MOD MRC/25/49

~~4.3.6~~N4.14 The Bureau shall determine on the basis of Annex 1 the administrations whose frequency assignments are considered to be affected within the meaning of § ~~4.3.1~~N4.5 or § ~~4.3.3~~N4.9. ~~The Bureau shall include the names of those administrations with the information received under § 4.3.5.2 and shall publish the complete information in a special section of its Weekly Circular. The Bureau shall immediately send the results of its calculations to the administration proposing the modification to the appropriate Regional Plan.~~

Reasons: To cover all cases, modification to the Plan as well as other uses.

ADD MRC/25/50

N4.15 The Bureau shall also identify administrations which agreement is required in application of **S23.13**.

Reasons: Agreement under S23.13 is different from the agreement under Sections I or II of this Article. The need for such an agreement should be reflected in this Article. The Bureau already published this list, the proposal is intended to give a legal basis to the action by the Bureau.

ADD MRC/25/51

N4.16 The Bureau shall then publish the information received under § N4.11, § N4.12 and § N4.13 and the list of administrations identified in application of § N4.14 and § N4.15 in a special section of its Weekly Circular. The Bureau shall immediately send the results obtained from the application of § N4.14 and § N4.15 to the administration having initiated the application of the procedure of this Article.

Reasons: Results from the combination of this subject appearing in the precedent provisions.

(MOD) MRC/25/52

~~4.3.7~~N4.17 The Bureau shall send a telegram to the administrations listed in the special section of the Weekly Circular drawing their attention to the information it contains and shall send them the results of its calculations.

ADD MRC/25/53

N4.18 A frequency assignment of the Regions 1 and 3 Plan that is proposed to be used with characteristics different from those appearing in the Plan without increasing the probability of interference or requiring more protection than the corresponding entry in the Plan shall be recorded in the list mentioned in§ N4.29.2.

Reasons: The procedure of this Article may be applied by an administration for such a use more than three years before the bringing into use, it is necessary to record it somewhere. In accordance with ADD § N4.28.3 such a use will not be imposed a period of validity.

MOD MRC/25/54

~~4.3.8~~N4.19 An administration which feels that it should have been included in the list of administrations whose services are considered to be affected in application of Sections I and II of this Article may, giving the technical reasons for so doing, request the Bureau to include its name. The Bureau shall study this request on the basis of Annex 1 and shall send a copy of the request with an appropriate recommendation to the administration ~~proposing the modification to the appropriate Regional Plan~~having initiated the procedure of this Article.

Reasons:

1 To cover all cases, modification to the Plan as well as other uses.

2 To separate between an agreement under Sections I and II and an agreement under S23.13.

ADD MRC/25/55

N4.20 An administration which feels that it should have been included in the list of administrations which agreement is required under **S23.13**, may, giving the reasons for so doing, request the Bureau to include its name.

Reasons: For practical reasons the Plan is based on the use of minimal ellipses, while the technology permits the use of shaped beams. An administration should be authorized to request the notifying administration to use "all technical means available" and reduce the coverage over its territory.

SUP MRC/25/56

4.3.9

Reasons: All sections of Annex 1 refer to provisions requiring the application of the procedure of Article 4.

(MOD) MRC/25/57

~~4.3.10~~N4.21 The administration seeking agreement or the administration with which agreement is sought may request any additional technical information it considers necessary. The administrations shall inform the Bureau of such requests.

(MOD) MRC/25/58

~~4.3.11~~N4.22 Comments from administrations on the information published pursuant to § ~~4.3.6~~N4.16 should be sent either directly to the administration proposing the modification or through the Bureau. In any event the Bureau shall be informed that comments have been made.

MOD MRC/25/59

~~4.3.12~~N4.23 An administration identified in the application of Annex 1 that has not notified its comments either to the administration seeking agreement or to the Bureau within a period of four months following the date of the Weekly Circular referred to in § ~~4.3.5.1 or § 4.3.6~~N4.16 shall be understood to have agreed to the proposed ~~assignment~~use. This time limit may be extended:

- ~~by up to three months~~ for an administration that has requested additional information under § ~~4.3.10~~N4.21 by up to three months, or
- for an administration that has requested the assistance of the Bureau under § ~~4.3.20~~N4.35 by up to three months following the date at which the Bureau communicated the result of its action. ~~In the latter case the Bureau shall inform the administrations concerned of this request.~~

Reasons:

1 The reference to the administrations identified in application of Annex 1 is needed to indicate that it does not apply to S23.13.

2 The additional three months for an administration having requested the assistance of the Bureau shall start approximately from the moment that administration received the result of its request to the Bureau. Action by the Bureau may last several months, due to the backlog, and that administration would have no time to examine the action by the Bureau.

3 The last sentence is transferred to § N4.34.

MOD MRC/25/60

~~4.3.13~~N4.24 If, in seeking agreement, an administration modifies its initial proposal, it shall ~~again apply the provisions of § 4.3.5 and the consequent procedure with respect to~~seek the agreement of any other administration ~~whose services might be affected~~identified in application of Sections I or II or the provision § N4.15 as a result of modifications to the initial proposal.

Reasons: Need to specify the two types of agreement.

MOD MRC/25/61

~~4.3.14~~N4.25 If no comments have been received from administrations identified in the application of Annex 1 on the expiry of the periods specified in § ~~4.3.12~~N4.23, or if agreement has been reached with the administrations which have made such comments and with which agreement is necessary, the administration proposing the modification may continue with the appropriate procedure in Article 5 and shall inform the Bureau, indicating the final characteristics of the frequency assignment together with the names of the administrations with which agreement has been reached.

Reasons: To indicate that this provision applies only to agreement required under Annex 1.

ADD MRC/25/62

N4.26 In case an agreement is required under § N4.15 that agreement shall be considered as having been obtained only when the requested administration informs the Bureau of its acceptance of the proposed use.

Reasons: Agreement under S23.13 involves more than one ministerial department in many countries. As that agreement is not necessarily based on technical criteria, the administration defined in No. 1003 of the Constitution which is authorized to comment on the publication may then need to coordinate the matter at the national level. It has therefore to communicate by writing the result of that coordination as a commitment of the whole government of the country concerned.

MOD MRC/25/63

~~4.3.15~~N4.27 The agreement ~~of the administrations affected~~required in application of § N4.5, § N4.9 or § N4.15 may also be obtained in accordance with this Article, for a specified period.

Reasons: To include in this provision the two types of agreement.

MOD MRC/25/64

~~4.3.16~~N4.28 When the proposed modification to the appropriate Regional Plan or the use of a frequency assignment by a Regions 1 and 3 administration involves developing countries, administrations shall seek all practicable solutions conducive to the economical development of the broadcasting-satellite systems of these countries.

Reasons: To cover the case of a developing country proposing an additional use.

MOD MRC/25/65

~~4.3.17~~N4.29 The Bureau shall publish in a special section of its weekly circular the information received under § ~~4.3.14~~N4.24 and § N4.25 together with the names of any administrations with which the provisions of this Article have been successfully applied. ~~The frequency assignment concerned shall enjoy the same status as those appearing in the appropriate Regional Plan and will be considered as a frequency assignment in conformity with the Plan.~~

Reasons:

1 The last sentence of this provision is important and should appear in a separate provision.

2 In the case of Regions 1 and 3 it is proposed in the following provision to subject an entry in the Plan to a decision by a WRC, consequently this provision is not required.

ADD MRC/25/66

N4.29.1 Modifications of a plan shall be entered in the appropriate regional Plan, and shall enjoy the same status as those appearing in that Plan and will be considered as a frequency assignment in conformity with the Plan.

ADD MRC/25/67

N4.29.2 Other frequency uses in the Regions 1 and 3 planned bands shall be included in a list annexed to the Master International Frequency Register.

ADD MRC/25/68

N4.29.3 Except entries made in application of § N4.18, all other entries in the above list shall indicate a period of validity not exceeding [15] years except with the agreement of the affected administrations in application of the provision § N4.26.

ADD MRC/25/69

N4.30 Modifications to the Region 2 Plan involving additions under § N4.7 *b)* and uses of the Regions 1 and 3 bands entered in the list referred to in § N4.29.2, shall lapse if the new or modified assignment is not brought into use within 8 years following the receipt by the Bureau of the related information.

Reasons: The proposed modifications to the procedure of this Article are intended to give permanency to entries in the Plan. Presently, only additions to the Plan lapse after the 8-year period. There is no reason that the other modifications to the Plan should not lapse.

(MOD) MRC/25/70

~~4.3.18~~N4.31 When an administration proposing to modify the characteristics of a frequency assignment or to make a new frequency assignment receives notice of disagreement from an administration whose agreement it has sought, it should first endeavour to solve the problem by exploring all possible means of meeting its requirement. If the problem still cannot be solved by such means, the administration whose agreement has been sought should endeavour to overcome the difficulties as far as possible, and shall state the technical reasons for any disagreement if the administration seeking the agreement requests it to do so.

(MOD) MRC/25/71

~~4.3.19~~N4.32 If no agreement is reached between the administrations concerned, the Bureau shall carry out any study that may be requested by these administrations; the Bureau shall inform them of the result of the study and shall make such recommendations as it may be able to offer for the solution of the problem.

MOD MRC/25/72

~~4.3.20~~N4.33 An administration may at any stage in the procedure described, or before applying it, request the assistance of the Bureau, particularly in seeking the agreement of another administration. The Bureau shall inform the administrations concerned of this request.

(MOD) MRC/25/73

~~4.3.21~~N4.34 The relevant provisions of Article 5 of this Appendix shall be applied when frequency assignments are notified to the Bureau.

MOD MRC/25/74

~~4.4~~Section IV – Cancellation of frequency assignments

MOD MRC/25/75

N4.35 When a frequency assignment in conformity with one of the Regional Plans or in the list mentioned in § N4.29.2 is no longer required, whether or not as a result of a modification, the administration concerned shall immediately so inform the Bureau. The Bureau shall publish this information in a special section of its weekly circular and delete the assignment from the appropriate Regional Plan.

ADD MRC/25/76

N4.36 At the issue of the period indicated in § N4.29.3 as the date of termination of operation of an assignment, the Bureau shall, after consultation of the administration concerned, delete the assignment from the list mentioned in § N4.29.2.

MOD MRC/25/77

~~4.5~~Section V.1 – Master copy of the Plans and the list mentioned in § N4.29.2

MOD MRC/25/78

~~4.5.1~~N4.37 *a)* The Bureau shall maintain an up-to-date master copy of the Regions 1 and 3 Plan taking account of the application of the procedure specified in this Article. The Bureau shall publish a document listing the ~~amendments to be made to the Plan as a result of~~ modifications to the Plan made in accordance with the procedure in this Article.

b) The Bureau shall maintain an up-to-date master copy of the Region 2 Plan, including the overall equivalent protection margins of each assignment, taking account of the application of the procedure specified in this Article. This master copy shall contain the overall equivalent protection margins derived from the Plan as established by the 1983 Conference and those derived from all modifications to the Plan as a result of the successful completion of the modification procedure described in this Article. The Bureau shall prepare a document listing the amendments to be made to the Plan as a result of modifications made in accordance with the procedure described in this Article.

Reasons: The terms "amendments to be made" leaves the impression that, following that publication, some organ will modify the Plan which is not correct. It is for Region 2 to consider if the same change should be made to the last sentence of *b).*

SUP MRC/25/79

4.5.2

Reasons: The Plan is already contained in the Radio Regulations and is published after each WRC in a consolidated Regulations. This provision should be retained only if the publication mentioned in it replaces the publication of the original Plans every two years in the consolidated Radio Regulations.

ADD MRC/25/80

N4.38 The Bureau shall maintain an up-to-date master copy of the list mentioned in § N4.29.2 and shall publish an up-to-date version of that list in an appropriate form when justified by the circumstances.

ARTICLE 5

Notification, examination and recording in the Master International Frequency Register of frequency assignments to space stations in the broadcasting-satellite service

NOC

5.1 to **5.2.1**

NOC MRC/25/81

5.2.1 *a)*

NOC MRC/25/82

5.2.1 *b)*

MOD MRC/25/83

c) with respect to its conformity with the ~~appropriate Regional~~Region 2 Plan, however, having characteristics differing from those in the appropriate Regional Plan in one or more of the following aspects:

- use of a reduced e.i.r.p.,
- use of a reduced coverage area entirely situated within the coverage area appearing in the appropriate Regional Plan,
- use of other modulating signals in accordance with the provisions of § 3.1.3 of Annex 5,
- use of the assignment for transmission in the fixed-satellite service in accordance with No. **S5.492**,
- use of an orbital position under the conditions specified in paragraph B of Annex 7; *or*

NOC MRC/25/84

5.2.1 *d)*

ADD MRC/25/85

e) with respect to its conformity with the list mentioned in § N4.29.2 in cases covered by § N4.18.

Reasons: Assignments of Regions 1 and 3 which are recorded in the list in application of § N4.18 are similar to assignments of Region 2 referred to 5.2.1 *c)*.

ADD MRC/25/86

f) with respect to its conformity with the list mentioned in § N4.29.2 in all other cases.

MOD MRC/25/87

5.2.2 Where the Bureau reaches a favourable finding with respect to § 5.2.1 *a)* and 5.2.1 *b)*, the frequency assignment~~ of an administration~~ shall be recorded in the Master Register. The date of receipt of the notice by the Bureau shall be entered in Column 2d. In relations between administrations, all frequency assignments brought into use in conformity with the appropriate Regional Plan and recorded in the Master Register shall be considered to have the same status irrespective of the dates entered in Column 2d for such frequency assignments.

Reasons: Unnecessary.

MOD MRC/25/88

5.2.2.1 Where the Bureau reaches a favourable finding with respect to § 5.2.1 *a)* and 5.2.1 *c)* or 5.2.1 *e)*, the frequency assignment shall be recorded in the Master Register. The date of receipt of the notice by the Bureau shall be entered in Column 2d. In relations between administrations, all frequency assignments brought into use in conformity with ~~the appropriate Regional Plan and recorded in the Master Register~~this provision shall be considered to have the same status irrespective of the dates entered in Column 2d for such frequency assignments. When recording these assignments, the Bureau shall indicate by an appropriate symbol the characteristics having a value different from that appearing in the appropriate Regional Plan.

Reasons: Assignments covered by 5.2.1 *c)* have the same status as those covered by 5.2.1 *e)*.

MOD MRC/25/89

5.2.2.2 Where the Bureau reaches a favourable finding with respect to § 5.2.1 *a)* but an unfavourable finding with respect to § 5.2.1 *b)* and 5.2.1 *c)*, it shall examine the notice with respect to the successful application of the provisions of Resolution **42 (Rev.Orb-88)**. A frequency assignment for which the provisions of Resolution **42 (Rev.Orb-88)** have been successfully applied shall be recorded in the Master Register with an appropriate symbol to indicate its interim status. The date of receipt of the notice by the Bureau shall be entered in Column 2d. In relations between administrations all frequency assignments ~~brought into use following the successful application of the provisions of Resolution **42 (Rev.Orb-88)** and recorded in the Master Register~~recorded in application of this provision or the provision of § 5.2.2.3 shall be considered to have the same status irrespective of the dates entered in Column 2d for such frequency assignments.

Reasons: Assignments of Regions 1 and 3 appearing in the list and those of Region 2 having successfully applied Resolution 42 are of the same interim character and should have the same treatment.

ADD MRC/25/90

5.2.2.3 Where the Bureau reaches a favourable finding with respect to § 5.2.1 *f)* the assignment shall be recorded in the Master Register with an appropriate symbol to indicate its interim status. The date of receipt of the notice by the Bureau shall be entered in Column 2d. In relations between administrations all frequency assignments recorded in application of this provision or the provision of § 5.2.2.2 shall be considered to have the same status irrespective of the dates entered in Column 2d for such frequency assignments.

Reasons: See § 5.2.2.2. If this approach is adopted by the Conference, Resolution 519 may be cancelled.

NOC

5.2.3

MOD MRC/25/91

5.2.4 Where the Bureau reaches an unfavourable finding with respect to § 5.2.1 *a)*, 5.2.1 *b)* ~~and~~, 5.2.1 *c)*, 5.2.1 *e)* and 5.2.1 *f)*, the notice shall be returned immediately by airmail to the notifying administration with the reasons of the Bureau for this finding and with such suggestions as the Bureau may be able to offer with a view to a satisfactory solution of the problem.

MOD MRC/25/92

5.2.5 Where the notifying administration resubmits the notice and the finding of the Bureau becomes favourable with respect to the appropriate parts of § 5.2.1, the notice shall be treated as in § 5.2.2, 5.2.2.1 ~~or~~, 5.2.2.2, 5.2.2.3, as appropriate.

MOD MRC/25/93

5.2.6 If the notifying administration resubmits the notice without modification and insists on its reconsideration, and if the Bureau's finding with respect to § 5.2.1 remains unfavourable, the notice is returned to the notifying administration in accordance with § 5.2.4. In this case, the notifying administration undertakes not to bring into use the frequency assignment until the condition specified in § 5.2.5 is fulfilled. For Regions 1, 2 and 3, in the event that the Bureau has been informed of agreement to modification of the Plan for a specified period of time in accordance with ~~Article 4~~§ N4.27 or for the period of validity appearing in the list mentioned in § N4.29.2, the frequency assignment shall be recorded in the Master Register with a note indicating that the frequency assignment is valid only for the period specified. The notifying administration using the frequency assignment over a specified period shall not subsequently invoke this fact to justify the continued use of the frequency beyond the period specified unless it obtains the agreement of the administration(s) concerned.

NOC

5.2.7 to 5.3.2

ANNEX

Extract from the RRB Rules of Procedure relating to the exclusion of the territory of an administration from the service area of satellite system of the fixed-satellite service

S9.50

Comments relating to the exclusion of the territory of a country from the service area of a space station

1 When an Administration B requests the Bureau to exclude its territory from the service area of a space station of an Administration A, this raises the following questions:

– should that comment have any effect on the identification of the administrations concerned in the coordination process or on the assessment of the level of harmful interference?

– what action shall the Bureau take in respect of it?

2 The question of a request concerning the exclusion of the territory of a country from the service area of a space station can be studied at two different levels:

– the compatibility between services and stations and the related status that may be derived from the application of the procedures contained in the Radio Regulations, on one hand, and

– the principles embodied in the Preamble to the Convention and the Radio Regulations as well as in Resolution **1 (Rev.WRC-97)** in respect of the sovereign right of each country to use the frequency spectrum and the geostationary satellite orbit, on the other hand.

3 Compatibility matters are well defined in the Radio Regulations; they involve:

– power flux-density limitations which are deemed to avoid any problem of incompatibility without any recourse to coordination with terrestrial services;

– coordination between administrations using or intending to use stations of the same service or of different services sharing the same frequency band;

– examination by the Bureau of the probability of harmful interference in cases where, for one reason or another, agreement on coordination could not be reached between the administrations concerned.

4 The identification by the Bureau of administrations involved in a coordination process and the assessment of the probability of harmful interference are based on the technical characteristics notified by administrations. The extent to which a comment intended to reduce the service area of a space station may affect the application of Articles **S9** and **S11** should be considered on the basis of a distinction to be made between the “coverage area” and the “service area”. The coverage area results from limitations imposed by the design of the space station, and a certain degree of overlapping of territories of other countries not intending to participate in the system may be unavoidable. The Board understands that, in designing any space station, the administration concerned applies No. **S15.5,** which stipulates that “radiation in and reception from unnecessary directions shall be minimized by taking the maximum practical advantage of the properties of directional antennas whenever the nature of the service permits”. If an Administration B, not participating in a given satellite network, considers that the network was not designed to

minimize the overlapping which resulted in an unnecessary coverage of its territory, the Bureau can only transmit such comment to Administration A without any action from its side.

5 In relation to the sovereignty of the Administration B to authorize earth stations to be installed on its territory, the Bureau assumes that, in accordance with Resolution **1 (Rev.WRC-97),** an agreement existed between the two administrations. Administration B is entitled to react and indicate to the Bureau that such an agreement does not exist; however, the Bureau has no authority to modify a characteristic notified by Administration A without its agreement. If the latter refuses to modify the service area, the Bureau can only note this situation. (The licensing authority, irrespective of the application of the procedures of Article **S9**, remains under the responsibility of Administration B. See also comment under the Rules of Procedure concerning Resolution **1 (Rev.WRC-97)**.

6 In conclusion, when Administration B makes comments intending to exclude its territory from the service area of the space station of Administration A, the Bureau:

– shall consider such comments receivable and that it is a matter to be resolved between the administrations concerned;

– shall inform Administration A of the comments received requesting consultations between the administrations concerned (Administrations A and B) and will modify the service area only if Administration A agrees;

– shall enter a remark to indicate this situation when publishing a Special Section;

– shall consider, unless it receives a subsequent notification to the contrary, that there is no agreement between Administrations A and B under Resolution **1 (Rev.WRC-97)** for the use of the territory of Administration B by earth stations associated with the satellite network in question.

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 27-E
22 February 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

United Kingdom of Great Britain and Northern Ireland

PROPOSALS FOR THE WORK OF THE CONFERENCE

WRC-2000 agenda item 1.1 - Requests from administrations to delete their country footnotes or to have their country's name deleted from footnotes, if no longer required, in accordance with the limits of Resolution 26 (Rev.WRC-97)

Introduction

In Circular Letter CR/131, the Radiocommunication Bureau requests administrations to review those footnotes to the Table of Frequency Allocations (Article **S5** of the Radio Regulations) where their country names appear in order to identify any footnotes that may be reduced in scope or deleted. The need for a regular review of footnotes was established by Resolution **26** at WRC-95 and reaffirmed at WRC-97.

Proposals

The United Kingdom Administration has reviewed the footnotes and makes the following proposals in respect of those footnotes which include explicit references to the "United Kingdom":

NOC G/27/1

S5.96 In Germany, Armenia, Azerbaijan, Belarus, Denmark, Estonia, Finland, Georgia, Hungary, Ireland, Israel, Jordan, Kazakstan, Latvia, Lithuania, Malta, Moldova, Norway, Uzbekistan, Poland, Kyrgyzstan, Slovakia, the Czech Republic, the United Kingdom, Russian Federation, Sweden, Tajikistan, Turkmenistan and Ukraine, administrations may allocate up to 200 kHz to their amateur service in the bands 1 715-1 800 kHz and 1 850-2 000 kHz. However, when allocating the bands within this range to their amateur service, administrations shall, after prior consultation with administrations of neighbouring countries, take such steps as may be necessary to prevent harmful interference from their amateur service to the fixed and mobile services of other countries. The mean power of any amateur station shall not exceed 10 W.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/2

S5.162A *Additional allocation:* in Germany, Austria, Belgium, Bosnia and Herzegovina, China, Vatican, Denmark, Spain, Estonia, Finland, France, Ireland, Iceland, Italy, Latvia, The Former Yugoslav Republic of Macedonia, Liechtenstein, Lithuania, Luxembourg, Moldova, Monaco, Norway, the Netherlands, Poland, Portugal, Slovakia, the Czech Republic, the United Kingdom, Russian Federation, Sweden, Switzerland and Turkey, the band 46-68 MHz is also allocated to the radiolocation service on a secondary basis. This use is limited to the operation of wind profiler radars in accordance with Resolution **217 (WRC-97)**.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/3

S5.164 *Additional allocation:* in Albania, Germany, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Côte d'Ivoire, Denmark, Spain, Finland, France, Gabon, Greece, Ireland, Israel, Italy, Jordan, Lebanon, Libya, Liechtenstein, Luxembourg, Madagascar, Mali, Malta, Morocco, Mauritania, Monaco, Nigeria, Norway, the Netherlands, Poland, Syria, the United Kingdom, Senegal, Slovenia, Sweden, Switzerland, Swaziland, Togo, Tunisia, Turkey and Yugoslavia the band 47-68 MHz, in Romania the band 47-58 MHz and in the Czech Republic the band 66-68 MHz, are also allocated to the land mobile service on a primary basis. However, stations of the land mobile service in the countries mentioned in connection with each band referred to in this footnote shall not cause harmful interference to, or claim protection from, existing or planned broadcasting stations of countries other than those mentioned in connection with the band.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/4

S5.210 *Additional allocation:* in Austria, France, Italy, Liechtenstein, Slovakia, the Czech Republic, the United Kingdom and Switzerland, the bands 138-143.6 MHz and 143.65-144 MHz are also allocated to the space research service (space-to-Earth) on a secondary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/5

S5.211 *Additional allocation:* in Germany, Saudi Arabia, Austria, Bahrain, Belgium, Bosnia and Herzegovina, Denmark, the United Arab Emirates, Spain, Finland, Greece, Ireland, Israel, Kenya, Kuwait, The Former Yugoslav Republic of Macedonia, Liechtenstein, Luxembourg, Mali, Malta, Norway, the Netherlands, Qatar, the United Kingdom, Slovenia, Somalia, Sweden, Switzerland, Tanzania, Tunisia, Turkey and Yugoslavia, the band 138-144 MHz is also allocated to the maritime mobile and land mobile services on a primary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/6

S5.221 Stations of the mobile-satellite service in the band 148-149.9 MHz shall not cause harmful interference to, or claim protection from, stations of the fixed or mobile services operating in accordance with the Table of Frequency Allocations in the following countries: Albania, Algeria, Germany, Saudi Arabia, Australia, Austria, Bahrain, Bangladesh, Barbados, Belarus, Belgium, Benin, Bosnia and Herzegovina, Brunei Darussalam, Bulgaria, Cameroon, China, Cyprus, Congo, the Republic of Korea, Croatia, Cuba, Denmark, Egypt, the United Arab Emirates, Eritrea, Spain, Estonia, Ethiopia, Finland, France, Gabon, Ghana, Greece, Guinea, Guinea Bissau, Hungary, India, the Islamic Republic of Iran, Ireland, Iceland, Israel, Italy, Jamaica, Japan, Jordan, Kazakstan, Kenya, Kuwait, Latvia, The Former Yugoslav Republic of Macedonia, Lebanon, Libya, Liechtenstein, Luxembourg, Malaysia, Mali, Malta, Mauritania, Moldova, Mongolia, Mozambique, Namibia, Norway, New Zealand, Oman, Uganda, Uzbekistan, Pakistan, Panama, Papua New Guinea, Paraguay, the Netherlands, Philippines, Poland, Portugal, Qatar, Syria, Kyrgyzstan, Slovakia, Romania, the United Kingdom, Russian Federation, Senegal, Sierra Leone, Singapore, Slovenia, Sri Lanka, South Africa, Sweden, Switzerland, Swaziland, Tanzania, Chad, Thailand, Togo, Tonga, Trinidad and Tobago, Tunisia, Turkey, Ukraine, Viet Nam, Yemen, Yugoslavia, Zambia, and Zimbabwe.

Reasons: In order to safeguard existing services, it is imperative that the relative status of assignments in the band 148-149.9 MHz do not change. Frequency use in the United Kingdom is planned to continue on the basis of the protection afforded by the footnote to stations of the fixed or mobile services operating in accordance with the Table of Frequency Allocations.

NOC G/27/7

S5.235 *Additional allocation:* in Germany, Austria, Belgium, Denmark, Spain, Finland, France, Israel, Italy, Liechtenstein, Malta, Monaco, Norway, the Netherlands, the United Kingdom, Sweden and Switzerland, the band 174-223 MHz is also allocated to the land mobile service on a primary basis. However, the stations of the land mobile service shall not cause harmful interference to, or claim protection from, broadcasting stations, existing or planned, in countries other than those listed in this footnote.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/8

S5.269 *Different category of service:* in Australia, the United States, India, Japan and the United Kingdom, the allocation of the bands 420-430 MHz and 440-450 MHz to the radiolocation service is on a primary basis (see No. **S5.33**).

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/9

S5.296 *Additional allocation:* in Germany, Austria, Belgium, Cyprus, Denmark, Spain, Finland, France, Ireland, Israel, Italy, Libya, Malta, Morocco, Monaco, Norway, the Netherlands, Portugal, Syria, the United Kingdom, Sweden, Switzerland, Swaziland and Tunisia, the band 470-790 MHz is also allocated on a secondary basis to the land mobile service, intended for applications ancillary to broadcasting. Stations of the land mobile service in the countries listed in this footnote shall not cause harmful interference to existing or planned stations operating in accordance with the Table of Frequency Allocations in countries other than those listed in this footnote.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/10

S5.302 *Additional allocation:* in the United Kingdom, the band 590-598 MHz is also allocated to the aeronautical radionavigation service on a primary basis. All new assignments to stations in the aeronautical radionavigation service, including those transferred from the adjacent bands, shall be subject to coordination with the Administrations of the following countries: Germany, Belgium, Denmark, Spain, France, Ireland, Luxembourg, Morocco, Norway and the Netherlands.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/11

S5.314 *Additional allocation*: in Austria, Italy, Uzbekistan, the United Kingdom and Swaziland, the band 790-862 MHz is also allocated to the land mobile service on a secondary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

SUP G/27/12

S5.408

Reasons: No further requirement for such use in the United Kingdom.

NOC G/27/13

S5.431 *Additional allocation:* in Germany, Israel, Nigeria and the United Kingdom, the band 3 400-3 475 MHz is also allocated to the amateur service on a secondary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/14

S5.447 *Additional allocation:* in Germany, Austria, Belgium, Denmark, Spain, Finland, France, Greece, Israel, Italy, Japan, Jordan, Lebanon, Liechtenstein, Luxembourg, Malta, Morocco, Norway, Pakistan, the Netherlands, Portugal, Syria, the United Kingdom, Sweden, Switzerland and Tunisia, the band 5 150-5 250 MHz is also allocated to the mobile service, on a primary basis, subject to agreement obtained under No. **S9.21**.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/15

S5.451 *Additional allocation:* in the United Kingdom, the band 5 470-5 850 MHz is also allocated to the land mobile service on a secondary basis. The power limits specified in Nos. **S21.2**, **S21.3**, **S21.4** and **S21.5** shall apply in the band 5 725-5 850 MHz.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/16

S5.467 *Alternative allocation:* in the United Kingdom, the band 8 400-8 500 MHz is allocated to the radiolocation and space research services on a primary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/17

S5.501 *Additional allocation:* in Austria, Azerbaijan, Bulgaria, Hungary, Japan, Mongolia, Kyrgyzstan, Romania, the United Kingdom, Turkmenistan and Ukraine, the band 13.4-14 GHz is also allocated to the radionavigation service on a primary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/18

S5.508 *Additional allocation:* in Germany, Austria, Bosnia and Herzegovina, France, Greece, Ireland, Iceland, Italy, The Former Yugoslav Republic of Macedonia, Libya, Liechtenstein, Portugal, the United Kingdom, Slovenia, Switzerland, Turkey and Yugoslavia, the band 14.25-14.3 GHz is also allocated to the fixed service on a primary basis.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/19

S5.536B In Germany, Saudi Arabia, Austria, Belgium, Brazil, Bulgaria, China, the Republic of Korea, Denmark, Egypt, United Arab Emirates, Spain, Estonia, Finland, France, Hungary, India, Islamic Republic of Iran, Ireland, Israel, Italy, Jordan, Kenya, Kuwait, Lebanon, Libya, Liechtenstein, Lithuania, Moldova, Norway, Oman, Uganda, Pakistan, the Philippines, Poland, Portugal, Syria, Slovakia, Czech Republic, Romania, the United Kingdom, Singapore, Sweden, Switzerland, Tanzania, Turkey, Viet Nam and Zimbabwe, earth stations operating in the Earth exploration-satellite service in the band 25.5-27 GHz shall not claim protection from, or constrain the use and deployment of, stations of the fixed and mobile services.

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/20

S5.546 *Different category of service:* in Saudi Arabia, Armenia, Azerbaijan, Belarus, Bulgaria, Egypt, United Arab Emirates, Spain, Estonia, Finland, Georgia, Hungary, the Islamic Republic of Iran, Israel, Jordan, Kazakstan, Latvia, Lebanon, Moldova, Mongolia, Uzbekistan, Poland, Syria, Kyrgyzstan, Romania, the United Kingdom, Russian Federation, Tajikistan, Turkmenistan, Turkey and Ukraine, the allocation of the band 31.5-31.8 GHz to the fixed and mobile, except aeronautical mobile, services is on a primary basis (see No. **S5.33**).

Reasons: Use in the United Kingdom is planned to continue in line with the footnote.

NOC G/27/21

S5.563 *Additional allocation:* in the United Kingdom, the band 182-185 GHz is also allocated to the fixed and mobile services on a primary basis.

Reasons: The planned use of this band in the United Kingdom has not changed. The United Kingdom will review this footnote at a future world radiocommunication conference when the relevant ITU-R sharing studies have been completed.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 28-E
21 February 2000
Original: English

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Switzerland (Confederation of)

PROPOSAL FOR THE WORK OF THE CONFERENCE

POINT 4

(in accordance with Resolution 95 (WRC-97), to review
the resolutions and recommendations of previous conferences
with a view to their possible revision, replacement or abrogation)

1 Introduction

Pursuant to Resolution 95 (WRC-97), the Director, BR presented for comment and advice an updated report (Document RAG2000-1/6) on the general review of WARC/WRC resolutions and recommendations to the Radiocommunication Advisory Group (RAG) in January 2000. With regard to Resolution 10 (WARC-79), the International Committee of the Red Cross (ICRC) introduced a document (Document RAG2000-1/24) arguing that this Resolution should be retained. The RAG meeting agreed that Resolution 10 (WARC-79) was still needed, but considered that an update of the text would be necessary in order to take into account changes in technology and terminology.

2 Proposal

It is proposed that WRC-2000 considers the updated version of Resolution 10 contained in the annex to this document.

Annex: 1

ANNEX

MOD SUI/28/1

RESOLUTION 10

Relating to the use of ~~radiotelegraph and radiotelephone links~~Wireless Two-Way Telecommunications by the ~~Red Cross, Red Crescent, and Red Lion and Sun organizations~~International Red Cross and Red Crescent Movement

The World ~~Administrative~~ Radiocommunication Conference, ~~Geneva~~(Istanbul, ~~1979~~2000),

considering

a) that the worldwide ~~relief work of~~humanitarian operations carried out by the International Red Cross~~,~~ and Red Crescent~~, and Red Lion and Sun organizations is~~ Movement - composed of the International Committee of the Red Cross, the International Federation of Red Cross and Red Crescent Societies and National Red Cross and Red Crescent Societies - are of ~~increasing~~great importance and often indispensable;

b) that in such circumstances normal communication facilities are frequently overloaded, damaged, completely interrupted or not available;

c) that it is necessary to facilitate by all possible measures the reliable intervention of these national and international organizations;

d) that rapid and independent contact is essential to the intervention of these organizations;

e) that for ~~international relief work of the Red Cross, it is necessary that the national Red Cross, Red Crescent, and Red Lion and Sun organizations be able to communicate with each other as well as with the International Committee of the Red Cross and the League of Red Cross Societies~~the efficient and safe conduct of their humanitarian operations these organizations rely heavily on wireless two-way telecommunication facilities, particularly on an extensive HF and VHF radio network,

decides to urge administrations

1 to take account of the possible needs of the International Red Cross and~~,~~ Red Crescent~~, and Red Lion and Sun organizations~~ Movement for wireless two-way telecommunication ~~by radio means~~ when normal communication facilities are interrupted or not available;

2 to assign to these organizations the minimum number of necessary working frequencies in accordance with the ~~Table of Frequency Allocations; in the case of fixed circuits between 3 MHz and 30 MHz, the frequencies shall be selected, as far as possible, adjacent to the amateur bands~~Radio Regulations;

3 to take all practicable steps to protect such ~~links~~communications from harmful interference.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

RESOLUTION 80 (WRC-97) - REPORT BY THE RADIO REGULATIONS BOARD

Resolution 80 (WRC-97) instructed the Radio Regulations Board to develop Rules of Procedure to be followed in circumstances reflected in the Resolution.

A Report by the Radio Regulations Board on the action taken pursuant to the Resolution is attached for consideration by the Conference.

Yoshio UTSUMI
Secretary-General

Attachment: Report by the Radio Regulations Board

RESOLUTION 80 (WRC-97)

REPORT BY THE RADIO REGULATIONS BOARD (RRB) TO WRC-2000

Background

1 The World Radiocommunication Conference, Geneva, 1997 (WRC-97) adopted Resolution 80 (**Annex 1**). The Resolution instructed the Radio Regulations Board to develop Rules of Procedure and cited Nos. S11.30, S11.31, and S11.31.2 to be followed in examining frequency assignment notices and take into account the principles and intent of No. S0.3 of the Radio Regulations. The Rules shall be applied from a date to be decided by WRC-2000. Also, the Resolution established dates for completion of consultation with administrations and required the Board to submit a detailed report to the WRC on the action taken on the Resolution (*resolves* 3).

Steps taken by the Board

2 Pursuant to the above-mentioned requirements in the Resolution, the Board has taken a number of actions as outlined below:

2.1 After considerable discussion the Board agreed at its 11th meeting (26-30 January 1998) to adopt a “two-pronged” approach:

a) To invite administrations through a circular letter to submit ideas with respect to the Resolution so that the RRB could take these into account when developing a proposed Rule of Procedure.

b) The Board would then request that the Bureau prepare a draft Rule of Procedure based on the Board’s discussion and contributions received from administrations.

2.2 Circular Letter CR/88 of 11 February 1998 invited contributions from administrations of Member States as noted above.

2.3 The Board subsequently considered the issue further at its 12th meeting (20-24 April 1998). No proposals were submitted from administrations, therefore the Board provided guidance to the Bureau to prepare a draft Rule. This draft Rule was considered by the Board at its subsequent 13th meeting (6-14 July 1998) and it was agreed to distribute the draft Rule to administrations for comment. (With Circular Letter CR/101 of 13 July 1998) - **Annex 2**.

2.4 The Board considered the results of the consultation at its 15th meeting (1-5 March 1999). The only comments received were from the Administration of Columbia on its own behalf and on behalf of the Andean Committee of Telecommunication Authorities (CAATEL). Copies of these comments are in **Annexes 3** and **4**. There was extensive discussion by the Board on the draft Rule of Procedure and the comments received and it considered the issue again at its 16th meeting (24-28 May 1999) and 17th meeting (13-17 September 1999) respectively.

2.5 The conclusion reached by the Board was that it would not be appropriate to develop Rules of Procedure that went beyond the current proposed draft that was distributed for comments by administrations in CR/101 of 13 July 1998. The reason the Board arrived at this conclusion is that there are no provisions currently in the Radio Regulations that link the formal notification or coordination procedures with the principles stated in S0.3 of the preamble to the Regulations. However, noting the concerns implicit in Resolution 80, it has developed a possible approach for consideration by WRC-2000.

Meeting the concerns

3 The Board recognized the concerns expressed during WRC-97 that prompted the adoption of Resolution 80. These were similarly expressed by the two contributions received in response to the proposed draft Rule of Procedure on which comments were invited in Circular Letter CR/101 of 13 July 1998.

3.1 During the various deliberations of the Board it was noted that S0.3 of the Radio Regulations identified radio frequencies and the geostationary-satellite orbit as “limited natural resources”. It was noted also that, the Plenipotentiary Conference in Minneapolis (PP-98) had amended No. 196 of the Constitution (effective from 1 January 2000) to include a reference to “other orbits” in addition to the geostationary orbit. In the context of S0.3 it was observed also that the issue involved “equitable access” to both radio frequencies and the orbit “… taking into account the special needs of the developing countries and the geographical situation of particular countries”.

The criteria within S0.3 requires administrations in putting into use frequencies and usage of the GSO to take into account the need to:

- ensure rational use;
- use the resources efficiently;
- use of the minimum number of frequencies possible (economical usage);
- operate in conformity with the Radio Regulations;
- ensure equity of access by all countries;
- take into account the special needs of developing countries;
- take into account the geographical situation of other counties.

S11.31 ensures that notifications are in conformity with the RR. It is assumed that if stations are operating in conformity with the RR then the usage is rational. The criteria thus fall into two categories:

Criteria to maximize frequency/GSO availability:

- use the resources efficiently;
- use of the minimum number of frequencies possible (economical usage).

Criteria to provide access to others:

- ensure equity of access by all countries;
- take into account the special needs of developing countries;
- take into account the geographical situation of other countries.

3.2 In the context of the principles of S0.3, several members of the Board noted some difficulties likely to be experienced by administrations and in particular the administrations of developing countries.

a) The “first come first served” concept restricted and sometimes prevented access and use of certain frequency bands and orbit positions.

b) A relative disadvantage for developing countries in coordination negotiations due to various reasons such as a lack of resources and expertise.

c) Perceived differences in consistency of application of the Radio Regulations.

d) The submitting of “paper” satellites that restricted access options.

e) The growing use of the bands of the Plans of Appendices S30 and S30A by regional, multi-channel systems, which may modify the main purpose of these Plans to provide equitable access to all countries.

f) The considerable processing delays in the Radiocommunication Bureau are due to the very complex procedures required and the large number of filings submitted. These delays contribute to a coordination backlog of 18 months which could extend to three years and creates uncertain regulatory situations, additional delay in the coordination process that cannot be overcome by administrations, and the possible loss of the assignment because the allotted time is exceeded.

g) Satellite systems may already be in orbit before completion of coordination.

h) Statutory time frames, such as in S11.48, may often be insufficient for developing countries to be able to complete the regulatory requirements as well as the design, construction and launch of satellite systems.

i) No provisions for international monitoring to confirm the bringing into use of satellite networks (assignments and orbits).

Possible solution

4 Whilst noting the possible concerns outlined above, the Board considered that it could not develop Rules of Procedure that go beyond the guidance included in its proposed draft available in CR/101 of 13 July 1998. Accordingly it was considered to be necessary for other steps to be considered for possible incorporation in the Radio Regulations.

4.1 WRC-2000 is expected to consider the draft Rule of Procedure developed by the Board based on current provisions of the Radio Regulations and adopt it as a regulatory provision.

4.2 In order to assist administrations in the implementation of their satellite systems, the Conference may wish to consider adopting special provisions regarding No. S.03 for example:

ADD

S11.44*bis* Exceptionally, and in particular in the case of developing countries, an administration may request the Radio Regulations Board to grant an extension of up to a further 12 months, subject to the provisions of **S11.44B** being met, where the conditions specified under Nos. **S11.44C** to **S11.44I** are still preventing the bringing into use of any assignment of a space station of a satellite network.

ADD

S11.48*bis* Statutory time limits such as in **S11.48**, shall be extended by any periods in excess of the limits stipulated in **S9.2B** and **S9.38** that result from delays in processing in the Bureau.

4.3 The Conference may wish to develop additional procedures to address the following:

- provisions complementary to those in RR S11.44B to S11.44I covering certain difficulties that developing countries might have;
- simplification of the coordination process;
- arrangements for extended assistance, to developing countries in particular;
- use of the international monitoring system for confirmation of the use of the spectrum and any associated orbits.

ANNEX 1

RESOLUTION 80 (WRC-97)

Due diligence in applying the principles embodied in the Constitution

The World Radiocommunication Conference (Geneva, 1997),

considering

a) that Articles 12 and 44 of the Constitution (Geneva, 1992) lay down the basic principles for the use of the radio-frequency spectrum and the geostationary-satellite orbit;

b) that those principles have been incorporated in the Radio Regulations through No. **S0.3**;

c) that, in accordance with Nos. **S11.30**, **S11.31** and **S11.31.2**, notices shall be examined with respect to the provisions of the Radio Regulations, including the provision relating to the basic principles, appropriate rules of procedure being developed for the purpose,

resolves

1. to instruct the Radio Regulations Board, as a matter of urgency and within the framework of Nos. **S11.30**, **S11.31** and **S11.31.2** of the Radio Regulations, to develop the rules of procedure to be followed in examining due compliance with the principles reflected in No. **S0.3** in the process leading up to the recording of frequency assignments in the International Frequency Register. These rules shall be applied from a date to be decided by the 1999 World Radiocommunication Conference (WRC-99);

2. that the Board shall circulate the draft of these rules of procedure to administrations by 31 October 1998 with a view to receiving comments by 31 March 1999;

3. that the Board shall submit to WRC-99 a detailed report on the action taken on this Resolution.

Part A1	PREA S.03	page 1

ANNEX 2

Rules concerning the preamble to the Radio Regulations

Due diligence in applying the principles embodied in the Constitution

1 Introduction

WRC-97 in its Resolution 80 instructed the RRB to develop Rules of Procedure to be followed by the Radiocommunication Bureau (BR) when examining due compliance with the principles incorporated in the Constitution and the Radio Regulations which instruct administrations to

> *"bear in mind that radio frequencies and the geostationary-satellite orbit are limited natural resources and that they must be used rationally, efficiently and economically, in conformity with the provisions of these Regulations, so that countries or groups of countries may have equitable access to both, taking into account the special needs of the developing countries and the geographical situation of particular countries" (No. 196 of the Constitution, S0.3 of the Radio Regulations).*

These Rules of Procedure have been developed to implement that instruction. As *resolves 1* in Resolution 80 refers specifically to No. S11.31, it might be concluded that these Rules of Procedure should exclude consideration of provisions contained in Article S9 for coordination and those related to conformity with the Plans. However, as the following considerations are general, no specific distinction was found necessary.

2 Guiding principles

The whole Radio Regulations are based on the principles outlined above. They have been developed with the aim to use the radio frequencies and the GSO rationally, equitably, efficiently and economically.

The likelihood of congestion in particular frequency bands and particular arcs of the geostationary orbit has prompted Member States to deploy special means to guarantee equitable access and efficient exploitation of those limited resources. To this effect two procedural mechanisms were implemented:

- *a priori* planning to ensure equitable access to the spectrum/orbit resource; and
- coordination procedures to ensure efficiency in the use of that resource.

These mechanisms are embedded in the provisions of the Radio Regulations including the Plans appended thereto, the Regional Agreements and the Resolutions from WARCs/WRCs. This fact ensures that the BR, in applying the specific provisions related to coordination and registration of frequency assignments to stations of various terrestrial and space radiocommunication services, observes and effectively applies those principles.

Part A1	PREA S.03	page 2

3 Relevant provisions of the Radio Regulations

The provisions of the Radio Regulations that have an impact on the regulatory and technical examination of frequency assignment notices by the Radiocommunication Bureau with respect to the efficient use of and the equitable access to the usable radio-frequency spectrum and satellite orbits, can be grouped in several categories (references in bold have mandatory character):

- provisions which are setting general principles (e.g. S0.2, S0.3, S0.4, S4.1, S12A.2, S16.1);
- provisions which are setting general rules concerning the use of frequencies with a view to obtaining economy in the use of frequencies (e.g. S3.3. S3.4, S3.9, S15.1, S24.4, S24.6, S43.1, S43.2, **S43.4**, S52.69);
- provisions which are guiding the administrations in the choice of frequencies, taking into account the propagation mechanisms (e.g. S4.11, S4.12, S43.5);
- provisions which are setting the emission characteristics with the intent to contribute to the efficient use of the spectrum (e.g. S3.4, **S3.5-S3.7**, S3.9, **S4.5,** S15.9);
- provisions which specify the modulation characteristics (e.g. **S3.15**, **S5.57**, **S5.64**, **S5.79, S5.80**, **S5.218**, **S24.2**, **S52.55**);
- provisions which are setting power limits with the intent to contribute to greater reuse of frequencies or the protection of the GSO (e.g. **S5.86**, **S5.92**, S5.96, **S5.105**, **S5.106, S5.107,** S5.124**, S5.125, S5.129, S5.147, S5.152, S5.154, S5.482, S5.485, S21.3, S21.5, S21.8, S21.14, S23.7, S52.56, S52.104, S52.117, S52.127, S52.143, S52.144, S52.172, S52.184 - S52.186, S52.188, S52.219, S52.220, S52.227, S52.260**);
- provisions which are setting pfd limits with the intent to contribute to an efficient sharing between different services (e.g. **S5.311, S5.407, S21.6, S22.5** and many other provisions making reference to RS46).

4 Other relevant regulatory provisions

In the review of the provisions for coordination and notification of frequency assignments relating to space services, WRC-97 developed several new regulations.

By Resolution 49 (WRC-97) administrations are required to provide due diligence information, i.e. provide evidence that the intended use of the spectrum/orbit resource is a real project to be implemented in a certain time frame.

S11.44 now limits the time between the receipt by the Bureau of the request for advance publication of the description of a satellite network and the date of its bringing into use to five years (previously six years). This delay, during which the network is protected vis-à-vis later new networks, can be extended by two years (previously three years) if the due diligence information in accordance with Resolution 49 can be provided, the coordination is effectively under way or other specified circumstances justify an extension.

Part A1	PREA S.03	page 3

The same provisions now also clarify that it is not sufficient to bring into use only one assignment of the whole network in order to maintain the ongoing protection for all assignments in the network. Rather is each assignment now treated on its own and can thus loose its right to protection.

These new regulations thus enhance considerably the possibilities to access the spectrum/orbit resources in that they eliminate the obligation to protect unreal projects.

5 Conclusions

In its examinations, the BR shall continue to take account of those provisions which have mandatory character. As in the past, non-conformity with such provisions will result in an unfavourable finding.

The BR shall remind administrations, when appropriate and in an economical way, of those provisions dealing with the rational, efficient and economical use of the spectrum/orbit resource which are of a general nature, are addressed to administrations, do not have a mandatory character and consequently cannot be taken into account in the examinations of the BR.

ANNEX 3

Santa Fe de Bogotá, 19 January 1999

From:	Ministry of Communications, Colombia
To:	Mr V. Timofeev, Chairman, Radio Regulations Board
References:	Resolution 80 (WRC-97) Circular Letter CR/101

Dear Mr Chairman and members of the Board,

The Administration of Colombia hereby informs you that it has received the above-mentioned circular-letter in which the Board submits for the Members' consideration draft Rules of Procedure for implementation of the provisions contained in No. S0.3 of the Radio Regulations, in fulfilment of the task given to the Board by the 1997 World Radiocommunication Conference (WRC-97) in *resolves* 2 of Resolution 80.

Our Administration, having carefully studied Annex 2 to Circular Letter CR/101, concerning due diligence in applying the principles embodied in the Constitution, hereby submits the following comments for your consideration.

1 Colombia considers that the aforementioned annex does not constitute a set of Rules of Procedure which will ensure due compliance with the principles reflected in No. S0.3 in the process leading up to the recording of frequency assignments in the International Frequency Register.

Thus, this Administration is of the opinion that the proposal submitted to the Union's membership for consideration does not fulfil the task set by WRC-97, as it does not establish or identify the Rules of Procedure required for effective due diligence in applying the principles embodied in the Constitution.

2 Given that the last WRC devoted particular attention to the urgent need to endow the ITU Radio Regulations with Rules of Procedure that will ensure due compliance with No. S0.3, the proposal should necessarily comprise a prescriptive text setting out the necessary procedural provisions, as was approved by the Member States.

3 A list of the provisions in force that could be related to the subject is certainly a point of departure for carrying out the task set in Resolution 80 (WRC-97), but it can hardly constitute the requisite instrument for ensuring, guaranteeing and rendering truly effective the observance and application of the basic principles governing the use of the radio-frequency spectrum and the geostationary-satellite orbit.

For, if it did, there would have been no need for Resolution 80 to hand down clear instructions for the formulation of the Rules of Procedure required for due compliance with the provisions of No. S0.3, there would have been no point in the Conference's adopting the resolution, and there would be no need to revise the procedure in force for the use of frequencies and the geostationary-satellite orbit.

4 The Administration of Colombia therefore considers that while Annex 2 may be regarded as an approach put forward by the Board, in that it contains those provisions of the Radio Regulations applicable to such principles, it is not adequate to satisfy the decisions adopted by the

world radiocommunication conference, at which the Members of the Union implicitly recognized the insufficiency of the existing regulations and the need to introduce new provisions for the purpose.

5 Acceptance of the Board's conclusion, to the effect that BR should continue, as hitherto, to comply with the existing provisions, would not only fail to provide the recommended legislative solution, but would also imply disregarding the Union's clear instructions and requirements on the subject.

6 Since the substance of the principles set forth in No. S0.3 goes much further than simply calling upon administrations to observe those principles, it is imperative that the Board should prepare and develop rules that truly and effectively enable BR to examine notices from the viewpoint of S0.3, so that all countries or groups of countries may enjoy equitable access to the geostationary-satellite orbit, taking into account the special needs of the developing countries and the geographical situation of particular countries.

7 A brief study of the radio-frequency and geostationary-satellite orbit notification and registration procedures applied hitherto, following the rules that supposedly, in the Board's view, are sufficient to guarantee such equitable access, clearly reveals that the results achieved hardly fulfil the objective of the principles laid down by the Union.

8 It is difficult to fathom why the Board proposes that the Radiocommunication Bureau be instructed to continue its examinations without taking account of the instructions given in Resolution 80.

9 Colombia also fails to understand how the lack of contributions from administrations can serve as justification for dispensing the Board of its duty under Resolution 80; as a body of experts, the Board should take all the necessary measures to ensure that the task handed down by the Conference is executed, and collaborate with administrations to this end.

In the light of the above, the Administration of Colombia hereby expresses its opposition to the Board's approach to the effect that the provisions relating to the rational, efficient and economic use of the spectrum/orbit resource cannot be taken into account in the Bureau's examinations, and respectfully requests the Board to proceed with implementation of the task handed down in Resolution 80 (WRC-97) by preparing the requested Rules of Procedure for submission to the Members of the Union for consideration.

Since it is the Board which has the capability and expertise to draw up such Rules and, for that very reason, was given the task by the Conference, the first important step would be for it to prepare a draft, for subsequent submission to administrations requesting them to send in contributions and comments. The Board's inversion of the logical order of that process has had the practical consequence of making it impossible for administrations to present their comments, let alone contributions, precisely because in order to do so they require the expertise and experience which are lacking, particularly in the developing countries, which are those most interested in the adoption of the measures in question.

Colombia therefore wishes to request the Board, in the first instance, to develop a draft of the Rules of Procedure, so that, in fulfilment of its duties, it may then proceed with consultations, the presentation of reports and the receipt of comments, based on which it may prepare the final version of the said draft Rules.

Yours faithfully,

Claudia de Francisco
Minister of Communications

ANNEX 4

Santa Fe de Bogotá, 28 January 1999

From:	Ministry of Communications, Colombia
To:	Chairman of RRB
Our Ref.:	0095
Subject:	Resolution 80 (WRC-97) Circular Letter CR/101

For the attention of the Chairman and members of RRB

Dear Sirs,

The Andean Committee of Telecommunication Authorities (CAATEL) held its seventh Extraordinary Meeting from 20 to 22 January 1999 in Cartagena de Indias, Colombia.

One of the items on the agenda concerned the Rules of Procedure for application of the principles embodied in the Constitution - Resolution 80 (WRC-97), in respect of which the Andean Committee of Telecommunication Authorities adopted Resolution CAATEL VII - EX-46.

In accordance with its Article 5, I hereby submit to you a copy of that Resolution.

Yours faithfully,

Claudia de Francisco
President of CAATEL

Annex: as mentioned.

RESOLUTION CAATEL VII - EX-46

The Andean Committee of Telecommunication Authorities (CAATEL)

considering

1. that the World Radiocommunication Conference (WRC-97), in its Resolution 80, instructed the Radio Regulations Board, as a matter of urgency, to develop the rules of procedure to be followed in examining due compliance with the principles reflected in No. S0.3 of the Radio Regulations in the process leading up to the recording of frequency assignments in the International Frequency Register;

2. that WRC-97 instructed the Board to circulate the draft of those rules of procedure to administrations by 31 October 1998 with a view to receiving comments by 31 March 1999;

3. that the Chairman of the Radio Regulations Board, by Circularm letter CR/101 of 13 July 1998, circulated the document entitled "Rules concerning the Preamble to the Radio Regulations - Due diligence in applying the principles embodied in the Constitution", containing the following conclusion: "In its examinations, the BR shall continue to take account of those provisions which have mandatory character. As in the past, non-conformity with such provisions will result in an unfavourable finding. The BR shall remind administrations, when appropriate and in an economical way, of those provisions dealing with the rational, efficient and economical use of the spectrum/orbit resource which are of a general nature, are addressed to administrations, do not have a mandatory character and consequently cannot be taken into account in the examinations of the BR";

4. that the aforementioned document and its conclusions do not constitute the draft rules of procedure enabling BR to examine due compliance with the principles reflected in No. S0.3 of the Radio Regulations;

5. that the rules of procedure for application of Article 44 of the ITU Constitution and of No. S0.3 of the Radio Regulations should be geared towards guaranteeing equitable access to the geostationary-satellite orbit and associated frequencies, taking into account the special needs of the developing countries and the geographical situation of particular countries,

resolves

ARTICLE 1. To make known its disagreement with the view expressed by the Radio Regulations Board in Annex 2 to Circular Letter CR/101, to the effect that provisions dealing with the rational, efficient and economical use of the spectrum/orbit resource cannot be taken into account in the examinations of BR. Such disagreement is based on the fact that, under the terms of No. 78 of the Constitution (Geneva, 1992), the functions of the Radiocommunication Sector are to fulfil the purposes of the Union "by ensuring the rational, equitable, efficient and economical use of the radio-frequency spectrum by all radiocommunication services, including those using the geostationary-satellite orbit", and, that one of the functions of the Radio Regulations Board is specifically "the performance of any additional duties, concerned with the assignment and utilization of frequencies, as indicated in No. 78 of this Constitution". It is thus clear that both the Board and BR, as well as the entire Radiocommunication Sector, have an obligation to ensure that their actions are geared towards guaranteeing the rational, efficient and economical use of the spectrum/orbit resource.

ARTICLE 2. To request the Radio Regulations Board to develop the rules of procedure for examination of due compliance with the principles reflected in No. S0.3 of the Radio Regulations in the process leading up to the recording of frequency assignments, as it was instructed to do by the World Radiocommunication Conference in Resolution 80 (WRC-97).

ARTICLE 3. To remind the Board that the rules of procedure to be developed should provide adequate provisions which, in line with the principle of equitable use of the geostationary orbit, guarantee to administrations that do not have access to orbital positions their right to use the geostationary orbit.

ARTICLE 4. To approach Consultative Committee III of CITEL with a view to ensuring that the work being done in preparation for the 2000 World Radiocommunication Conference (WRC-2000) includes the study and follow up of the subject of due compliance with the relevant authorities.

ARTICLE 5. To request the President of CAATEL to submit this Resolution to the Radio Regulations Board and to Standing Consultative Committee III of the Inter-American Telecommunication Commission (CITEL) on behalf of the Administrations of the member countries of the Andean Community; namely Bolivia, Colombia, Ecuador, Peru and Venezuela.

PLENARY MEETING

Uzbekistan (Republic of)

PROPOSALS FOR THE WORK OF THE CONFERENCE

* Pursuant to Resolution 26 (Rev.WRC-97), the Secretariat notes that this contribution was received on 25 February 2000.

Position of the Republic of Uzbekistan on WRC-2000 agenda item 1.1

Agenda item 1.1 - Requests from administrations to delete their country footnotes or to have their country name deleted from footnotes, if no longer required, in accordance with Resolution 26 (Rev.WRC-97)

1 The Republic of Uzbekistan requests that Uzbekistan's name be deleted from footnotes S5.152, S5.154 and S5.387 in Article S5 of the Radio Regulations (ITU, 1998 edition):

MOD UZB/30/1

S5.152 *Additional allocation:* in Armenia, Azerbaijan, China, Côte d'Ivoire, Georgia, the Islamic Republic of Iran, Kazakstan, Moldova, ~~Uzbekistan,~~ Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the band 14 250-14 350 kHz is also allocated to the fixed service on a primary basis. Stations of the fixed service shall not use a radiated power exceeding 24 dBW.

MOD UZB/30/2

S5.154 *Additional allocation:* in Armenia, Azerbaijan, Georgia, Kazakstan, Moldova, ~~Uzbekistan,~~ Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the band 18 068-18 168 kHz is also allocated to the fixed service on a primary basis for use within their boundaries, with a peak envelope power not exceeding 1 kW.

MOD UZB/30/3

S5.387 *Additional allocation:* in Armenia, Azerbaijan, Belarus, Georgia, Kazakstan, Mali, Mongolia, ~~Uzbekistan,~~ Kyrgyzstan, Slovakia, the Czech Republic, Romania, Russian Federation, Tajikistan, Turkmenistan and Ukraine, the band 1 770-1 790 MHz is also allocated to the meteorological-satellite service on a primary basis, subject to agreement obtained under No. **S9.21**.

Remark - It is proposed to the administrations listed in footnotes S5.152 and S5.154 that they support Uzbekistan's proposal, and that the footnotes in question be deleted.

NOC

2 The Republic of Uzbekistan requests that Uzbekistan's name be retained in the following footnotes in Article S5 of the Radio Regulations (ITU, 1998 edition):

S5.56, S5.87A, S5.93, S5.96, S5.99, S5.133, S5.139, S5.155, S5.155A, S5.163, S5.175, S5.177, S5.201, S5.202, S5.206, S5.221, S5.262, S5.277, S5.290, S5.312, S5.314, S5.323, S5.359, S5.382, S5.422, S5.454, S5.455, S5.469, S5.473, S5.483, S5.546 and S5.550.

3 The Republic of Uzbekistan requests that Uzbekistan's name be inserted in footnote S5.481 to the Table of Frequency Allocations (Article S5 of the ITU Radio Regulations, Geneva, 1998):

MOD UZB/30/4

S5.481 *Additional allocation:* in Germany, Angola, China, Ecuador, Spain, Japan, Morocco, Nigeria, Oman, Uzbekistan, Democratic People's Republic of Korea, Sweden, Tanzania and Thailand, the band 10.45-10.5 GHz is also allocated to the fixed and mobile services on a primary basis.

4 The Republic of Uzbekistan, on the basis of actual use of the radio-frequency spectrum in Uzbekistan, requests the addition of new footnotes to the Table of Frequency Allocations (Article S5 of the ITU Radio Regulations, Geneva, 1998):

ADD UZB/30/5

S5.69A *Additional allocation*: In Uzbekistan, the band 190-255 kHz is also allocated to the aeronautical radionavigation service on a primary basis.

ADD UZB/30/6

S5.94A *Additional allocation*: In Uzbekistan, the bands 2 170-2 173.5 kHz, 2 190.5-2 194 kHz, 2 625-2 650 kHz, 4 063-4 438 kHz, 6 200-6 525 kHz, 8 195-8 815 kHz, 12 230-13 200 kHz, 16 360-17 410 kHz, 18 780-18 900 kHz, 19 680-19 800 kHz, 22 000-22 855 kHz, 25 070-25 210 kHz and 26 100-26 175 kHz are also allocated to the fixed and land mobile services on a primary basis.

ADD UZB/30/7

S5.127A *Additional allocation*: In Uzbekistan, the bands 4 000-4 063 kHz and 8 100-8 195 kHz are also allocated to the land mobile service on a primary basis.

ADD UZB/30/8

S5.133A *Additional allocation*: In Uzbekistan, the bands 5 480-5 680 kHz and 6 685-6 765 kHz are also allocated to the fixed service on a primary basis.

ADD UZB/30/9

S5.146A *Different category of service*: In Uzbekistan, the allocation of the band 10 150-11 175 kHz to the mobile, except aeronautical mobile (R), service is on a primary basis.

ADD UZB/30/10

S5.158 *Additional allocation*: In Uzbekistan, the band 25 550-25 670 kHz is also allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

ADD UZB/30/11

S5.195 *Additional allocation*: In Uzbekistan, the bands 108-117.975 MHz, 137-137.025 MHz, 137.025-137.137 MHz, 137.175-137.825 MHz, 137.825-138 MHz and 146-148 MHz are also allocated to the aeronautical mobile (OR) service on a primary basis. In assigning frequencies to stations of the aeronautical mobile (OR) service, account shall be taken of the frequencies assigned to stations in the aeronautical mobile (R) service.

ADD UZB/30/12

S5.253 *Different category of service*: In Uzbekistan, the allocation of the band 267-272 MHz to the space operation (space-to-Earth) service is on a primary basis.

ADD UZB/30/13

S5.277A *Additional allocation*: In Uzbekistan, the band 430-440 MHz is also allocated to the mobile, except aeronautical mobile, service on a primary basis.

ADD UZB/30/14

S5.375A *Additional allocation*: In Uzbekistan, the band 1 645.5-1 646.5 MHz is also allocated to the fixed service on a primary basis.

ADD UZB/30/15

S5.387A *Additional allocation*: In Uzbekistan, the band 1 770-1 794 MHz (centre frequency: 1 782 MHz) is also used by the meteorological aids service (radars and radiosondes) on a primary basis. Stations of other services to which this band is allocated shall not cause harmful interference to the meteorological aids service.

ADD UZB/30/16

S5.416A *Additional allocation*: In Uzbekistan, the band 2 500-2 700 MHz is also allocated to the broadcasting service on a primary basis.

ADD UZB/30/17

S5.450A *Different category of service*: In Uzbekistan, the allocation of the band 5 470-5 650 MHz to the radiolocation service is on a primary basis.

5 The Republic of Uzbekistan proposes amendments to the following footnotes to the Table of Frequency Allocations (Article S5 of the ITU Radio Regulations, Geneva, 1998):

MOD UZB/30/18

S5.262 *Additional allocation:* in Saudi Arabia, Armenia, Azerbaijan, Bahrain, Belarus, Bosnia and Herzegovina, Bulgaria, Colombia, Costa Rica, Cuba, Egypt, the United Arab Emirates, Ecuador, Estonia, Georgia, Hungary, Indonesia, the Islamic Republic of Iran, Iraq, Israel, Jordan, Kazakstan, Kuwait, Liberia, Malaysia, Moldova, Nigeria, Uzbekistan, Pakistan, the Philippines, Qatar, Syria, Kyrgyzstan, Slovakia, Romania, Russian Federation, Singapore, Somalia, Sri Lanka, Tajikistan, Turkmenistan, Ukraine and Yugoslavia, the band 400.~~05~~15-401 MHz is also allocated to the fixed and mobile, except aeronautical mobile, services on a primary basis.

335.4-410 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
400.05-400.15	STANDARD FREQUENCY AND TIME SIGNAL-SATELLITE (400.1 MHz) S5.261 ~~S5.262~~	

Reasons: Modification of the frequency band to 400.15-401 MHz will safeguard the standard frequency and time signal-satellite service against potential unwanted interference from other services. Limitation of the use of that band by mobile services is necessary in order to protect the services to which the bands in question are allocated.

MOD UZB/30/19

S5.359 *Additional allocation:* in Germany, Saudi Arabia, Armenia, Austria, Azerbaijan, Belarus, Benin, Bulgaria, Cameroon, Spain, France, Gabon, Georgia, Greece, Guinea, Guinea-Bissau, Hungary, Jordan, Kazakstan, Kuwait, Latvia, Libya, Mali, Mauritania, Moldova, Mongolia, Nigeria, Uganda, Uzbekistan, Pakistan, Poland, Syria, Kyrgyzstan, the Democratic People's Republic of Korea, Romania, Russian Federation, Senegal, Swaziland, Tajikistan, Tanzania, Turkmenistan, Ukraine, Zambia and Zimbabwe the bands 1 550-1 645.5 MHz and 1 646.5-1 660 MHz are also allocated to the fixed service on a primary basis. Stations of the fixed service shall not cause harmful interference to operation of the radionavigation-satellite service (space-to-Earth). Administrations are urged to make all practicable efforts to avoid the implementation of new fixed-service stations in the bands 1 550-1 555 MHz, 1 610-1 645.5 MHz and 1 646.5-1 660 MHz.

Reasons: In accordance with ICAO Recommendation 1/4 on incompatibility of use of the radionavigation-satellite service and fixed services in the frequency band 1 559-1 610 MHz.

In order to ensure protection of the radionavigation-satellite service from interference caused by fixed services which are allowed to operate in the band in question on a primary basis.

MOD UZB/30/20

S5.565 The frequency band above 275~~-400~~ GHz may be used by administrations for experimentation with, and development of, various active and passive services. In ~~this~~the bands listed below, a need has been identified for the following spectral line measurements for passive services:

– radio astronomy service: ~~278-280 GHz and 343-348 GHz~~275-323 GHz, 327-371 GHz, 388-424 GHz, 426-442 GHz, 453-510 GHz, 623-711 GHz and 795-909 GHz (these bands are used and will be used in the future for radio observatories);

– Earth exploration-satellite service (passive) and space research service (passive): 275-277 GHz, ~~300-302 GHz, 324-326 GHz, 345-347 GHz,~~ 294-306 GHz, 316-334 GHz, 342-349 GHz, 363-365 GHz, ~~and~~ ~~379-381 GHz~~371-389 GHz, 416-434 GHz, 442-444 GHz, 496-506 GHz, 546-568 GHz, 624-629 GHz, 634-654 GHz, 659-661 GHz, 684-692 GHz, 730-732 GHz, 851-853 GHz and 951-956 GHz.

Future research in this largely unexplored spectral region may yield additional spectral lines and continuum bands of interest to the passive services. Administrations are urged to take all practicable steps to protect these passive services from harmful interference~~ until the next competent world radiocommunication conference~~.

MOD UZB/30/21

6 The Republic of Uzbekistan proposes the following modifications to the Table of Frequency Allocations (Section IV, Article S5 of the Radio Regulations).

6.1 In the band 1 613.8-1 626.5 MHz, modify the category of the mobile-satellite service (space-to-Earth) to primary for all Regions.

1 610-1 660 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
1 613.8-1 626.5 MOBILE-SATELLITE (Earth-to-space) AERONAUTICAL RADIONAVIGATION ~~Mobile-satellite~~MOBILE-SATELLITE (space-to-Earth) S5.341 S5.355 S5.359 S5.363 S5.364 S5.365 S5.366 S5.367 S5.368 S5.369 S5.371 S5.372	**1 613.8-1 626.5** MOBILE-SATELLITE (Earth-to-space) AERONAUTICAL RADIONAVIGATION RADIODETERMINATION-SATELLITE (Earth-to-space) Mobile-satellite (space-to-Earth) S5.341 S5.364 S5.365 S5.366 S5.367 S5.368 S5.370 S5.372	**1 613.8-1 626.5** MOBILE-SATELLITE (Earth-to-space) AERONAUTICAL RADIONAVIGATION Mobile-satellite (space-to-Earth) Radiodetermination-satellite (Earth-to-space) S5.341 S5.355 S5.359 S5.364 S5.365 S5.366 S5.367 S5.368 S5.369 S5.372

Reasons: To create equal conditions for both directions of communication (space-to-Earth and Earth-to-space) in the mobile-satellite service (global mobile personal communications systems by satellite).

6.2 Review footnote S5.120 “For the use of the bands allocated to the amateur service at 3.5 MHz, 7.0 MHz, 10.1 MHz, 14.0 MHz, 18.068 MHz, 21.0 MHz, 24.89 MHz and 144 MHz in the event of natural disasters, see Resolution **640***”, in the light of the abrogation of Resolution 640 at WRC-97.

6.3

MOD UZB/30/22

S5.413 In the design of systems in the broadcasting-satellite service in the bands between 2 5~~00~~20 MHz and 2 6~~90~~70 MHz, administrations are urged to take all necessary steps to protect the radio astronomy service in the band 2 690-2 700 MHz.

Reasons: The bands 2 500-2 520 MHz and 2 670-2 690 MHz for all the Regions are not allocated to the broadcasting-satellite service and there is no reference to this footnote in the table.

Position of the Republic of Uzbekistan on WRC-2000 agenda items 1.2-1.20

Agenda item 1.2 - To finalize remaining issues in the review of Appendix S3 to the Radio Regulations with respect to spurious emissions for space services, taking into account Recommendation 66 (Rev.WRC-97) and the decisions of WRC-97 on adoption of new values, due to take effect at a future time, of spurious emissions for space services

Uzbekistan supports the results of the ITU-R studies on additions and modifications to Appendix S3, while keeping the same values for spurious emission limits for the transmitters of different services and applications.

Agenda item 1.3 - To consider the results of ITU-R studies in respect of Appendix S7/28 on the method for the determination of the coordination area around an earth station in frequency bands shared among space services and terrestrial radiocommunication services, and take the appropriate decisions to revise this Appendix

Uzbekistan supports adoption of the improved method of calculating coordination areas around earth stations developed by ITU-R, but nevertheless considers that the methodology in question must not lead to any significant increase in coordination areas calling for additional coordination by interested administrations, and that further studies need to be carried out within ITU-R on the application of the methodology. Furthermore, WRC-2000 should instruct ITU-R to develop a single software program for the calculation of coordination areas around earth stations in order to unify and simplify the coordination process.

Agenda item 1.4 - To consider issues concerning allocations and regulatory aspects related to Resolutions 126 (WRC-97), 128 (WRC-97), 129 (WRC-97), 133 (WRC-97), 134 (WRC-97) and 726 (WRC-97)

Uzbekistan:

- supports the use of the frequency bands 31.8-33.4 GHz, 37-39.5 GHz, 40.5-42.5 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz by high-density systems in the fixed service, subject to solution of the procedural questions relating to sharing with other services;
- does not object to allocation to the FSS (space-to-Earth) of the band 40.5-42.5 GHz on condition that pfd limits are set to protect the radio astronomy service in the band 42.5-43.5 GHz and criteria are introduced to ensure the protection of terrestrial services.

Furthermore, Uzbekistan considers that a definition of “high-density fixed service” is required.

Agenda item 1.5 - To consider regulatory provisions and possible additional frequency allocations for services using high altitude platform stations, taking into account the results of ITU-R studies conducted in response to Resolution 122 (WRC-97)

Uzbekistan proposes at the present time not to support an additional frequency band allocation for high altitude platform stations in the fixed service and to extend the time-frame in Resolution 122 (WRC-97) to the next WRC (WRC-03), since additional studies are required within ITU-R on sharing with other systems as well as an analysis of practical operation in frequency bands already allocated.

Agenda item 1.6 - Issues related to IMT-2000:

1.6.1 - Review of spectrum and regulatory issues for advanced mobile applications in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of such applications and that priority should be given to terrestrial mobile spectrum needs, and adjustments to the Table of Frequency Allocations as necessary

Uzbekistan supports the studies carried out by ITU-R, but believes that the adoption of a decision on the allocation of additional frequency bands should not be considered before 2003, on the basis of practical experience with the operation of IMT-2000 systems in existing allocations under No. S5.388, and this footnote and Resolution 212 should be maintained as they stand.

1.6.2 - Identification of a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000

Uzbekistan supports ITU-R’s conclusion that multimode terminal operation and worldwide roaming is possible without a global control channel.

Agenda item 1.7 - Review of the use of the HF bands by the aeronautical mobile (R) and maritime mobile services with a view to protecting operational, distress and safety communications, taking into account Resolution 346 (WRC-97)

Uzbekistan supports proposals relating to protection of the frequencies allocated to the aeronautical mobile (R) service from interference. It considers that there are no bases for re-allocating HF bands between the aeronautical mobile (R) and maritime mobile services, and supports the introduction of additional procedures designed to protect frequencies used for distress and safety communications.

Agenda item 1.8 - To consider regulatory and technical provisions to enable earth stations located on board vessels to operate in the fixed-satellite service (FSS) networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz, including their coordination with other services allocated in these bands

Uzbekistan objects to the use of FSS stations on board vessels in the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz, considering that it is first necessary to develop appropriate regulatory and technical procedures to protect the operation and development of fixed service stations.

Agenda item 1.9 - To take into account the results of ITU-R studies in evaluating the feasibility of an allocation in the space-to-Earth direction to the mobile-satellite service (MSS) in a portion of the 1 559-1 567 MHz frequency range, in response to Resolutions 213 (Rev.WRC-95) and 220 (WRC-97)

Uzbekistan considers that the global navigation satellite system must enjoy protection, as a safety-of-life service. Therefore, the frequency band 1 559-1 610 MHz should be completely free of any non-radionavigation systems. Accordingly, we oppose any allocation of 1 559-1 567 MHz for the mobile-satellite service and are in favour of the deletion of Resolution 220 (WRC-97).

Since studies have not demonstrated the feasibility of allocating a portion of the 1 350-1 525 MHz band for the mobile-satellite service (space-to-Earth), it is proposed that the Radio Regulations remain unchanged in respect of that band.

Agenda item 1.10 - To consider results of ITU-R studies carried out in accordance with Resolution 218 (WRC-97) and take appropriate action on this subject

Uzbekistan supports ITU-R’s studies for accommodating the global maritime distress and safety system (GMDSS) and aeronautical mobile-satellite (R) service systems, and on broadening the list of communications belonging to the category of distress and safety signals.

Agenda item 1.11 - To consider constraints on existing allocations and to consider additional allocations on a worldwide basis for the non-geostationary (non-GSO) MSS below 1 GHz, taking into account the results of ITU-R studies conducted in response to Resolutions 214 (Rev.WRC-97) and 219 (WRC-97)

Uzbekistan proposes that the existing allocation for non-GSO MSS below 1 GHz should not be modified and that new allocations for this service should not be adopted in that band.

It is proposed not to modify the allocation of the band 405-406 MHz, and to delete Resolution 219 (WRC-97), in order to leave this band for the meteorological aids service and protect existing systems in adjacent frequency bands.

Agenda item 1.12 - To consider the progress of studies on sharing between feeder links of non-GSO MSS networks and GSO FSS networks in the bands 19.3-19.7 GHz and 29.1-29.5 GHz, taking into account Resolution 121 (Rev.WRC-97)

Uzbekistan supports the results of studies carried out by ITU-R. Resolution 121 (Rev.WRC-97) may be deleted.

Agenda item 1.13 - On the basis of the results of the studies in accordance with Resolutions 130 (WRC-97), 131 (WRC-97) and 538 (WRC-97):

1.13.1 - To review and, if appropriate, revise the power limits appearing in Articles S21 and S22 in relation to the sharing conditions among non-GSO FSS, GSO FSS, GSO broadcasting-satellite service (BSS), space sciences and terrestrial services, to ensure the feasibility of these power limits and that these limits do not impose undue constraints on the development of these systems and services

1.13.2 - To consider the inclusion in other frequency bands of similar limits in Articles S21 and S22, or other regulatory approaches to be applied in relation to sharing situations

Uzbekistan supports the results of ITU-R studies on the allocation of frequency bands for the development of non-geostationary FSS networks, subject to guaranteeing protection for geostationary FSS and BSS networks and networks in the fixed service.

Agenda item 1.14 - To review the results of the studies on the feasibility of implementing non-GSO MSS feeder links in the 15.43-15.63 GHz in accordance with Resolution 123 (WRC-97)

Uzbekistan supports use of the frequency band 15.43-15.63 GHz by non-GSO MSS feeder links, subject to limiting the number of systems operating in this band to those in respect of which information is received by ITU-R by the end of WRC-2000, and setting a limit on the pfd from such systems in the band 15.35-15.4 GHz in order to protect radio astronomy.

Agenda item 1.15 - Issues related to the radionavigation-satellite service

1.15.2 - To consider the addition of the space-to-space direction to the radionavigation-satellite service allocations in the bands 1 215-1 260 MHz and 1 559-1 610 MHz

Uzbekistan supports allocation of the frequency bands 1 215-1 260 MHz and 1 559-1 610 MHz to the radionavigation-satellite service (space-to-space).

1.15.3 - To consider the status of allocations to services other than the radionavigation-satellite service (Nos. S5.355 and S5.359) in the band 1 559-1 610 MHz

Uzbekistan considers that the radionavigation-satellite service should enjoy sufficient protection and, therefore, the fixed service should be removed from the frequency band 1 559-1 610 MHz. A two-stage approach is proposed: granting primary status until 2005 and secondary status until 2015, followed by deletion of the FS allocation after 2015.

Agenda item 1.16 - To consider allocation of frequency bands above 71 GHz to the Earth exploration-satellite (passive) and radio astronomy services, taking into account Resolution 723 (WRC-97)

Uzbekistan supports the proposal to allocate frequencies above 71 GHz on a worldwide basis.

Agenda item 1.17 - To consider possible worldwide allocation for the Earth exploration-satellite (passive) and space research (passive) services in the band 18.6-18.8 GHz, taking into account the results of the ITU-R studies

Uzbekistan supports the 18.6-18.8 GHz allocation for passive Earth exploration-satellite and space research services on a primary basis subject to the introduction of criteria enabling sharing with FS and FSS.

Agenda item 1.18 - To consider the use of new digital technology for the maritime mobile service in the band 156-174 MHz and consequential revision of Appendix 18/S18, taking into account Resolution 342 (WRC-97)

Uzbekistan supports amendments to the Radio Regulations aimed at introducing and developing digital technologies in the maritime mobile service in the band 156-174 MHz, and the continuation of studies on the subject within ITU-R.

Agenda item 1.19 - To consider the report of the Inter-Conference Representative Group (IRG) submitted by the Director of the Radiocommunication Bureau and determine the basis for replanning by the next conference so as to afford each country an amount of spectrum that permits the economical development of a broadcasting-satellite service system

Uzbekistan supports the ITU-R studies and securing the implementation of the provisions of Resolution 532 (WRC-97), in particular the provision for each country of no less than ten (10) analogue channels and implementation of the principles laid down in Annex 1.

Agenda item 1.19*bis* - In accordance with Article S14, to consider objections expressed by administrations with respect to the Radio Regulations Board's Rules of Procedure relating to the application of RR No. 2674/S23.13 in order for the Bureau to modify its findings in accordance with the conclusions of the Conference

Uzbekistan supports the proposals to extend the Rules of Procedure also to networks notified before the stipulated date (18 November 1995) if they were not brought into service by that date.

Agenda item 1.20 - To consider the issues related to the application of Nos. S9.8, S9.9 and S9.17 and the corresponding parts of Appendix S5 with respect to Appendices S30 and S30A, with a view to possible deletion of Articles 6 and 7 of Appendices S30 and S30A, also taking into consideration Recommendation 35 (WRC-95)

Uzbekistan supports inclusion of the provisions of Articles 6 and 7 of Appendices S30 and S30A in the overall Article S9 of the Radio Regulations, regulating the coordination procedure for all remaining services, in order to facilitate the task of the administrations and the Bureau.

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 31-E
25 February 2000
Original: Spanish

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Cuba

PROPOSALS FOR THE WORK OF THE CONFERENCE

Introduction

The Administration of Cuba has great pleasure in submitting its proposals to the World Radiocommunication Conference (WRC-2000) and once again confirms that its delegation is prepared to make strenuous efforts, together with the other delegations attending the Conference, to obtain results that will enable the various issues comprising the Conference agenda to be resolved for the benefit of ITU and its entire membership.

In drawing up its proposals, the Administration of Cuba has taken into account a number of elements that constitute a balance which it sees as important to achieving results geared to meeting the various needs to be addressed by the Conference. These elements include the following:

- ensuring the efficiency and reliability of communications that are associated with the safety of human life and property;
- paying special attention to aspects related to environmental protection through the use of radiocommunication systems;
- facilitating equal access by all countries to the “radio spectrum” as a natural resource, bearing in mind their different needs in the light of their specific characteristics and current stage of development;
- ensuring rational, efficient and economical use of the radio-frequency spectrum;
- giving special consideration to the needs of developing countries, bearing in mind that radiocommunications may be of vital importance to the development of their telecommunication networks and services;
- allowing for the development and use of new technologies by facilitating the introduction of new radiocommunication services and systems;
- providing an adequate degree of protection for existing services and systems.

In preparing its proposals, the Administration of Cuba has also taken into account the latest results of the technical studies conducted in ITU-R and the CPM-99 Report.

CONTENTS

Item 1.2: Appendix S3 to the Radio Regulations

In considering Appendix S3 and Recommendation 66 (Rev.WRC-97), the Administration of Cuba has taken into account the ITU-R studies concerning Recommendation ITU-R SM.329-7, as well as § 7.1 of the CPM Report, and agrees that the appropriate amendments should be made to Appendix S3 in order to transform the spurious emission limits currently shown as design objectives for space services into regulatory limits.

We also consider it necessary to avoid amateur earth stations having to comply with more stringent spurious emission limits than amateur stations operating in the same frequency bands, and to exempt from limits space stations intended for operation in deep space, whose spurious emissions are undetectable, in both cases avoiding the unnecessary expense of complying with limits that are not required.

Lastly, we consider it appropriate to make the relevant amendments concerning spurious emission limits for radar systems in order to make it clear that such limits apply only under Section II and to establish that the limits are based on radiated emissions and should not be measured at the transmission line.

On the basis of the foregoing, Cuba submits the following proposal:

APPENDIX S3

Table of maximum permitted spurious emission power levels

Section I – Spurious emission limits for transmitters installed on or before 1 January 2003 (valid until 1 January 2012)

MOD CUB/31/1

6 ~~The measurement methods for radar systems should be guided by Recommendation ITU-R M.1177. For those radar systems for which acceptable methods of measurement do not exist,~~Radar systems are exempt from spurious emission limits under this section. In all cases, the lowest practicable power of spurious emission should be achieved.

Reasons: To make it clear that spurious emission limits do not apply to radar systems under this section.

Section II – Spurious emission limits for transmitters installed after 1 January 2003 and for all transmitters after 1 January 2012

MOD CUB/31/2

8 Guidance regarding the methods of measuring spurious emissions is given in the most recent version of Recommendation ITU-R SM.329. The e.i.r.p. method specified in that Recommendation should be used when it is not possible to measure the power supplied to the antenna transmission line, or where it is advisable in view of the antenna attenuation characteristics at the spurious emission frequencies. Additionally, the e.i.r.p. method may need some modification for special cases, e.g. beam-forming radars.

Reasons: To take account of antenna attenuation characteristics at spurious emission frequencies.

ADD CUB/31/3

11*bis* As an emitted signal becomes more and more narrow (to the limiting case of an unmodulated carrier with theoretical necessary bandwidth of zero), the application of the term “necessary bandwidth” as used in determining the region where spurious emission limits apply to space services, becomes more and more difficult. In the limit, ±250% of necessary bandwidth (generally recognized as establishing the region beyond which spurious emissions are defined), approaches zero. Beacon and other unmodulated signals, such as those used in uplink and downlink circuits in the control and tracking of satellites, are examples of cases where it is difficult to apply, in a practical manner, the term “necessary bandwidth” in determining where out-of-band emissions end, and spurious emissions begin. Pending further studies and definitive action by a future world radiocommunication conference, to specify the region where spurious emission limits apply for transmitters using amplifiers to transmit essentially an unmodulated signal (or a signal with very small bandwidth), the amplifier bandwidth is taken to be the necessary bandwidth (in calculating the regions where spurious emissions will apply).

Reasons: To adequately recognize the case of very narrow-band and unmodulated signals.

ADD CUB/31/4

11*ter* For satellites employing more than one transponder, and when considering the limits for spurious emission as indicated by § 11 to Appendix **S3**, spurious emissions from one transponder may fall on a frequency at which a companion, second transponder is transmitting or in the guardband between two transponders. In these situations, if it can be demonstrated that the level of spurious emission from the first transponder is well exceeded by fundamental emissions from a second transponder transmitting from the same satellite into the same service area, or by its out-of-band emissions into the guardband, then the limits of Appendix **S3** should not apply to those spurious emissions.

Reasons: To avoid unnecessary design and operational requirements for adjacent transponders in the same transmitting satellite.

MOD CUB/31/5

TABLE II

Attenuation values used to calculate maximum permitted spurious emission power levels for use with radio equipment

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
All services except those services quoted below:	43 + 10 log (*P*), or 70 dBc, whichever is less stringent
Space services (earth stations) [10, ~~14~~16]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Space services (space stations) [10, ~~14~~17]	43 + 10 log (*P*), or 60 dBc, whichever is less stringent
Radiodetermination[14]	43 + 10 log (*PEP*), or 60 dB, whichever is less stringent

TABLE II (*end*)

Service category in accordance with Article S1, or equipment type[15]	**Attenuation (dB) below the power supplied to the antenna transmission line**
Broadcast television[11]	46 + 10 log (*P*), or 60 dBc, whichever is less stringent, without exceeding the absolute mean power level of 1 mW for VHF stations or 12 mW for UHF stations. However, greater attenuation may be necessary on a case by case basis.
Broadcast FM	46 + 10 log (*P*), or 70 dBc, whichever is less stringent; the absolute mean power level of 1 mW should not be exceeded
Broadcasting at MF/HF	50 dBc; the absolute mean power level of 50 mW should not be exceeded
SSB from mobile stations[12]	43 dB below *PEP*
Amateur services operating below 30 MHz (including with SSB)[~~12~~16]	43 + 10 log (*PEP*), or 50 dB, whichever is less stringent
Services operating below 30 MHz, except space, radiodetermination, broadcast, those using SSB from mobile stations, and amateur[12]	43 + 10 log (*X*), or 60 dBc, whichever is less stringent, where *X* = *PEP* for SSB modulation, and *X* = *P* for other modulation
Low-power device radio equipment[13]	56 + 10 log (*P*), or 40 dBc, whichever is less stringent
Emergency position-indicating radio beacon Emergency locator transmitter Personal location beacon Search and rescue transponder Ship emergency, lifeboat and survival craft transmitters Land, aeronautical or maritime transmitters when used in emergency	No limit

MOD CUB/31/6

14 ~~These values are "design objectives". This note will not be applicable after WRC-99.~~ Radiodetermination (radar) system spurious emission attenuation (dB) shall be determined for radiated emission levels, not at the antenna transmission line. The measurement methods for determining the radiated spurious emission levels from the radar systems should be guided by Recommendation ITU-R M.1177.

Reasons: To take account of antenna attenuation characteristics at spurious emission frequencies.

ADD CUB/31/7

[16] Amateur earth stations operating at frequencies below 30 MHz are included in the service category “Amateur services operating below 30 MHz (including with SSB)”.

ADD CUB/31/8

[17] Space stations intended to operate in deep space (defined in **S1.177**) are exempt from spurious emission limits.

Reasons: To avoid unnecessary limits.

Item 1.3: Revision of Appendix S7/28

The Administration of Cuba has examined the ITU-R studies on Appendix S7, particularly Recommendation ITU-R P.620-4 and the draft new Recommendation in Document 1/1004, and has noted the objectives, which allow determination of the coordination area in frequency bands between 100 MHz and 105 GHz and provide for a single consolidated recommendation covering all methods for determining coordination areas.

In considering the procedure for the revision of Appendix S7, Cuba has studied the various options set out in the CPM Report and has reached the conclusion that the option identified in the report as “Method 3” offers the best solution to this issue, since it proposes a regulatory text based on the Recommendation for incorporation in the Radio Regulations. This would enable the language of the Recommendation to be modified in order to give it regulatory status, and at the same time would preclude any possibility of interpretation or any doubt as to its binding nature.

Furthermore, the adoption of a procedure based on a resolution having the format of Resolution 60 would provide a mechanism for updating the system parameter values to be considered without affecting the binding nature of the text, any proposed amendments being submitted for consideration to and, as the case may be, adoption by a WRC for incorporation in the text of the Regulations.

CUB/31/9

Replace the text of Appendix S7 with text based on Recommendation ITU-R SM.[Document 1/1004] and create a mechanism, by means of a new resolution to replace Resolution 60, for updating the system parameter values, when such updating is deemed necessary, through the inclusion of an extraordinary item on the agenda of a WRC.

Item 1.4: High-density fixed services (Resolutions 126 (WRC-97), 133 (WRC-97) and 726 (WRC-97))

Having considered the issue of frequency allocations for high-density fixed services (HDFS), Cuba attaches importance to the identification of bands that provide the best possibilities for the use of HDFS systems in developing countries, having particular regard to propagation characteristics in tropical areas with high rain precipitation rates resulting in high levels of radio path loss - hence the importance of being able to have access to adequate frequency bands where constraints on the operation of such systems under the above-mentioned conditions are not excessive.

A study of the existing allocations in the Table of Frequency Allocations has shown the bands 31.8-33.4 GHz and 37-40 GHz as being the most appropriate for these purposes.

In examining the studies on Resolution 126 (WRC-97), the Administration of Cuba considered the CPM Report and noted that, although HDFS applications in the 31.8-33.4 GHz band have to share with the radionavigation, space research and inter-satellite services, the general situation in the band is certainly favourable to the development of HDFS systems, bearing in mind that, to date, the radionavigation service in this band is used by only one administration, which implies a low volume of use of the service (in § 6.1.1.2 of the CPM Report a maximum of 80 airborne radars are identified). It can therefore be considered that frequency coordination would not be difficult with administrations close to the territory of the administration using such systems or to areas where their use is authorized. Moreover, the application of certain mitigation techniques could substantially reduce the apparent sharing difficulties.

In view of the small radar population in this band, it might be worthwhile to envisage establishing characteristics, to be taken into account for future systems to be operated in the band, which facilitate sharing. In this connection, Cuba proposes that future radar equipment in this band should use pulse coding circuitry, as suggested in § 6.1.1.3.2 of the CPM Report.

As regards sharing with the inter-satellite service, which shares the 32-33 GHz band, the CPM Report concludes that such sharing is feasible if adequate limits are established for the pfd produced at the surface of the Earth by space station emissions. An important point in this connection is that, since no system is thus far operational in the band in question, such limits can be established without the risk of imposing restrictions on a system already in operation.

Lastly, as regards sharing with the space research service, Cuba proposes the adoption of a limit for the pfd produced at the Earth's surface identical to that established for the same service in the band 37-38 GHz.

With regard to the studies concerning Resolution 133 (WRC-97), Cuba concurs with the conclusion in § 6.1.2.3 of the CPM Report that "FS systems in this band should be accommodated for HDFS usage".

SUP CUB/31/11

S5.547A

Reasons: No longer necessary.

MOD CUB/31/12

S5.547 The bands 31.8-33.4 GHz, 37-40 GHz, 51.4-52.6 GHz, 55.78-59 GHz and 64-66 GHz are available for high-density applications in the fixed service ~~(see Resolution **726 (WRC-97)**)~~. Administrations shall take account of such utilization when considering use of these bands.

Reasons: It has been demonstrated that the use of HDFS in these bands is both feasible and appropriate. Furthermore, it would not appear necessary to continue the studies, and Resolution 726 (WRC-97) could therefore be deleted were the additional text proposed for S5.547 to be adopted.

SUP CUB/31/13

RESOLUTION 726 (WRC-97)

Frequency bands above 30 GHz available for high-density applications in the fixed service

Reasons: No longer necessary.

ADD CUB/31/14

S5.547F Radar equipment introduced in the band 31.8-33.4 GHz after 1 January 2002 should use pulse coding circuitry. Administrations using airborne radars in the band 31.8-33.4 GHz, outside their national boundary, are urged to take all practicably feasible measures to protect the radiocommunication services of other administrations operating in accordance with the Table of Frequency Allocations.

Reasons: Cuba proposes that use of the band 31.8-33.4 GHz for HDFS systems should commence, given that the studies have shown sharing between the different services allocated in the band to be feasible if appropriate measures, including prior frequency coordination, are applied. Special consideration has been given to § 6.1.1.3.2 of the CPM Report, which refers to technical and operational measures that the radionavigation service might adopt to facilitate such sharing.

SUP CUB/31/15

RESOLUTION 126 (WRC-97)

Use of the frequency band 31.8-33.4 GHz for high-density systems in the fixed service

Reasons: No longer necessary - the studies show that use of HDFS in this band is feasible.

MOD CUB/31/16

Reasons: To adjust the limits for pfd at the surface of the Earth produced by space radiocommunication services sharing the bands 31.8-33 GHz and 37-40 GHz with the fixed service, taking into account high-density applications.

SUP CUB/31/17

RESOLUTION 133 (WRC-97)

Sharing between the fixed service and other services in the band 37-40 GHz

Reasons: No longer necessary.

Item 1.5: Issues related to high altitude platform stations (HAPS)

The Administration of Cuba has noted the studies carried out in connection with the deployment of high altitude platform stations and considers that they require an additional period before any conclusions can be reached. In particular, attention should be paid to the application of mitigation techniques in view of the sharing difficulties between HAPS systems and other services using the bands 47.2-47.5 GHz and 47.9-48.2 GHz.

Cuba has also looked into the feasibility of extending the application of HAPS to frequency bands below 47 GHz, identifying the 18-32 GHz range in particular. This too requires further study.

On the basis of the foregoing, Cuba submits the following proposals to the Conference.

CUB/31/18

Maintain unchanged the current provisions of the Radio Regulations concerning the use of HAPS and extend the studies indicated in Resolution 122 (WRC-97), submitting their results to the next WRC for review.

CUB/31/19

Request ITU-R to conduct studies into the feasibility of identifying additional frequency bands for HAPS in the 18-32 GHz range, taking account of sharing with other radiocommunication services allocated in these bands.

Reasons: To maintain unchanged the current provisions on the use of HAPS pending further studies on sharing with other services, and to consider accelerating studies into the feasibility of identifying additional spectrum for HAPS in the 18-32 GHz range.

Item 1.6.1: Spectrum and regulatory issues in the context of IMT-2000

When considering the matter of identification of the necessary spectrum for the terrestrial component of IMT-2000, the Administration of Cuba began by drawing up a set of guidelines for selecting appropriate frequency bands, which are summed up below:

– select bands which can be used globally or whose characteristics are such as to make their future evolution feasible, with a view to universal use to the maximum extent possible;

– keep to a minimum the designation of non-contiguous spectrum segments in order to ensure that the industry can develop simple equipment which facilitates universal use of the frequency bands concerned and allows maximum economies of scale in marketing;

– take account of the current development of second-generation systems and provide the conditions for their ongoing evolution towards IMT-2000;

– take into account the needs of the other radiocommunication services to which the bands in question are allocated, select those bands that will involve the least impact for those services and take steps to ensure their future development.

The Administration of Cuba has worked on the basis of the above guidelines. Although it has been unable to identify an additional band for use by IMT-2000 in the short term and on a global scale, it has considered a combined proposal which includes the identification in a new footnote of the bands 806-960 MHz and 1 710-1 885 MHz for future evolution towards IMT-2000, taking into account their current use by second-generation systems.

In evaluating this proposal, Cuba considered the advantage, in the case of the band 1 710-1 885 MHz, of using a band contiguous with those already existing in the Radio Regulations. Although the band is already widely used by second-generation mobile services in many countries where, in many cases, their evolution will be possible only in the medium and long term, it does offer the possibility of harmonizing frequency plans with the current use for duplex separation. In other countries, however, where the fixed service is the main user of this band, it is feasible to continue using it and, as the need is identified, to begin introducing IMT-2000 by reorganizing frequency plans for the fixed service, providing, where necessary, for its ordered migration to other segments of the spectrum.

Cuba further considers that the band 806-960 MHz is the continuation of a set of bands that are widely used by second-generation systems, which immediately makes them natural candidates for evolution towards IMT-2000 systems. However, the existence of several different frequency plans for these systems calls for different types of treatment, and their evolution may in many cases be expected to extend over the long term.

These bands should be identified with a view to future development and maximum possible harmonization of the corresponding frequency plans, and to allowing every country, regardless of the region in which it is located, to select the bands best suited to its future needs for development in these systems.

It must also be borne in mind that these bands could be of great use for IMT-2000 applications in developing countries: the possibility of coverage using broader cells means that such systems can be used in part as a supplement to fixed networks in fixed wireless access applications, enabling the spectrum to be used efficiently and economically for the provision of services in locations with few users and where propagation is difficult, as well as to remote users and isolated areas.

On the basis of the foregoing, Cuba also proposes modifying the allocation to the mobile service in the band 902-928 MHz for Region 2 in order to make the same spectrum available to the three Regions, thereby allowing individual administrations maximum flexibility in choosing the future development of their services in these bands with a view to satisfying IMT-2000 requirements.

An important aspect of this proposal is that it would also increase the possibilities for administrations in the Region that so decide to use current second-generation systems such as GSM-900 to meet pressing mobile service development needs without having to resort to the use of bands already envisaged for the initial implementation of IMT-2000 worldwide.

Cuba also proposes modifying Resolution 212 (Rev.WRC-97) in order to align it with the above proposals for the identification of new bands and to bring it up to date, taking account of the need to pursue the task of identifying additional spectrum for global use by IMT-2000.

One final aspect of this proposal which was considered in the context of adjustments to the Table of Frequency Allocations under this agenda item concerns a new allocation to the fixed service in frequency bands where there is the appropriate technology, able to meet many of the requirements currently accommodated in bands in the 1-3 GHz range in a considerable number of countries in the region, the objective being to avoid congestion in these bands and keep them, to the maximum extent possible, for future use by mobile services and, where essential, to make available sufficient spectrum for the orderly transfer of services that use segments identified nationally for the development of IMT-2000 systems once the country proposes introducing them. To that end, Cuba proposes primary allocation of the band 10-10.45 GHz to the fixed and mobile services in Region 2, taking into account the needs of tropical countries in the region, where the use of higher frequencies for the development of the technologies currently using this band is subject to additional constraints due to the corresponding propagation characteristics.

ADD CUB/31/22

S5.321A In the bands 806-960 MHz and 1 710-1 885 MHz, mobile services are operated whose long-term evolution to International Mobile Telecommunications-2000 (IMT-2000) is envisaged. Such use does not preclude the use of these bands by other services to which they are allocated. For the implementation of IMT-2000 in these bands, see Resolution **212 (Rev.WRC-2000)**.

Reasons: To establish provisions which take into account the future development of existing second-generation systems with a view to allowing, to the greatest possible extent, for harmonization of the bands for long-term use by IMT-2000.

To modify the allocation to the mobile service in Region 2 in the band 902-928 MHz, with the aim of facilitating the future development of IMT-2000 systems and allowing its use in order to meet the shorter-term needs of second-generation systems, also bearing in mind the advantages offered by those bands for the implementation of mobile services in developing countries and the extension of those services in combination with fixed wireless access applications.

SUP CUB/31/23

S5.326

Reasons: Not necessary owing to the proposed change of category for the allocation to the mobile service except aeronautical mobile service in the band 902-928 MHz in Region 2.

RESOLUTION 212 (Rev.WRC-~~97~~2000)

Implementation of International Mobile Telecommunications-2000 (IMT-2000)*[*]

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ITU-R has recommended the 1-3 GHz and surrounding bands as the most suitable for IMT-2000;

b) that ITU-R has ~~recommended approximately 60 MHz for use by personal stations and approximately 170 MHz for use by mobile stations~~identified maximum values for the anticipated spectrum needs of the terrestrial component taking into account the geographical areas where traffic is the highest;

c) that ITU-R has recognized that space techniques are an integral part of IMT-2000;

d) that~~, in No. **S5.388**, this Conference has identified~~ bands to accommodate this ~~future~~ service~~,~~ on a worldwide basis are identified in No. **S5.388**;

e) that the most recent studies conclude that the bands identified in No. **S5.388** are insufficient to accommodate the medium- and long-term requirements of IMT-2000 in those areas where the traffic is the highest;

f) that frequency bands currently used by other mobile services whose evolution to IMT-2000 in envisaged in the long term are identified in No. **S5.321A**,

considering further

~~*a)*~~ that ITU-R has ~~not completed its studies regarding duplexing methods, modulation techniques, channelling arrangements, signalling or communication protocols;~~completed its development of recommendations containing specifications for the IMT-2000 radio interface,

~~*b)* that no worldwide intersystem numbering plan currently exists that would facilitate worldwide roaming,~~

---

[*] IMT-2000 was previously known as Future Public Land Mobile Telecommunication Systems (FPLMTS).

noting

a) that the implementation of the terrestrial component of IMT-2000 in the bands 1 885-2 025 MHz and 2 110-2 200 MHz is expected to commence around the year 2000, subject to market and technical considerations;

b) that, in addition to the above, it is envisaged that the bands 806-960 MHz and 1 710-1 885 MHz will be used by those administrations wishing to implement IMT-2000, bearing in mind the long-term evolution of second generation systems which utilize frequencies in those bands;

~~b~~c) that the availability of the satellite component of IMT-2000 in the bands 1 980-2 010 MHz and 2 170-2 200 MHz simultaneously with the terrestrial component of IMT-2000 ~~in the bands identified in No. **S5.388**~~ would improve the overall implementation and the attractiveness of IMT-2000 to both developed and developing countries,

invites administrations

a) to give due consideration to the accommodation of other services currently operating in these bands when implementing IMT-2000~~,~~;

b) to consider also the possibilities for harmonizing the spectrum currently used by second-generation systems in the bands identified in No. **S5.321A** when planning the process for the evolution of those systems to IMT-2000,

invites ITU-R

to continue its studies with a view to developing suitable and acceptable technical characteristics for IMT-2000, including identification of the additional spectrum required, that will facilitate worldwide use and roaming, and ensure that IMT-2000 can also meet the telecommunication needs of the developing countries and rural areas,

invites ITU-T

a) to complete its studies of signalling and communication protocols;

b) to develop a common worldwide intersystem numbering plan and associated network capabilities that will facilitate worldwide roaming,

resolves

that administrations which implement IMT-2000:

a) should make the necessary frequencies, in the bands identified herein, available for ~~system~~ development of the system according to their requirements;

b) should use those frequencies when implementing IMT-2000 ~~is implemented~~;

c) should use the relevant international technical characteristics, as identified by ITU-R and ITU-T Recommendations.

Reasons: To update Resolution 212 and take measures in accordance with the proposal to identify candidate bands for evolution to IMT-2000, specifically the band 1 710-1 885 MHz for possible long-term global application of IMT-2000, and the band 806-960 MHz, in accordance with the proposed addition of No. S5.321A, taking into account the spectrum segments within this frequency range that are currently used by second-generation systems, with the aim of facilitating, to the maximum extent possible, the process of harmonizing the future use of this spectrum.

Item 1.6.2: Global radio control channel for IMT-2000

With regard to the question of identifying a global radio control channel to facilitate multimode terminal operation and worldwide roaming of IMT-2000, and in the light of the latest ITU-R studies which conclude that the operation of such terminals and worldwide roaming of IMT-2000 are possible without a specific global control channel, the Administration of Cuba submits the following proposal:

CUB/31/31

WRC-2000 has decided to take no action to identify a specific global radio control channel.

Reasons: Not necessary.

Item 1.7: Use of the HF bands by the maritime and aeronautical services

The Administration of Cuba recognizes that harmful interference in the HF bands allocated for distress and safety communications in the aeronautical mobile (R) and maritime mobile services has increased, particularly in certain parts of the world, owing to unauthorized and indiscriminate use of these bands.

ITU-R studies on appropriate interference mitigation techniques are not yet complete and, in particular, there is a need to address in greater depth the consequences for ship and aircraft operations of introducing such techniques, which may require modifications to existing facilities, including equipment installed relatively recently on ships to comply with the GMDSS. This may mean new investments by administrations and shipping companies and it would also be necessary to introduce modifications to the Radio Regulations. Consequently, solving the problem would involve additional costs for the services affected by the interference, as the adoption of mitigation techniques by victim receivers would not eliminate the source of the interference, particularly in the case of emissions from unlicensed transmitters which are difficult to locate and control.

Furthermore, the aeronautical mobile (R) frequencies 3 023 kHz and 5 680 kHz have been allocated for use by the aeronautical and mobile maritime services and manned space vehicles in search and rescue operations. In addition, all the frequencies in the HF bands allocated exclusively to the aeronautical mobile (R) service are used for communications relating to safety pursuant to No. S43.1. Unauthorized use by other services is on the increase, causing serious degradation in communications relating to safety, and is in breach of the requirements of the Radio Regulations, particularly the provisions of Appendix S27.

Cuba is in favour of introducing changes to Article S15 in order to include the reference to Appendix S27, since Article S15 refers only to Article S31 and Appendix S13, designed principally for the maritime services. However, it considers that Appendix S27 should remain unchanged, since this spectrum should be maintained for new high-frequency digital communications for data links. Should it prove necessary, the review of Appendix S27 will be carried out by a later WRC taking account of the results of the ICAO and ITU-R studies.

For the foregoing reasons, Cuba's proposal to WRC endorses all measures designed to eliminate all unauthorized use of the frequencies allocated to the aeronautical mobile (R) service between 2 850 kHz and 22 000 kHz.

ARTICLE S15

Interferences

Section I – Interference from Radio Stations

MOD CUB/31/32

S15.8 § 4 Special consideration shall be given to avoiding interference on distress and safety frequencies and those related to distress and safety identified in Appendix **S13** and to safety and regularity of flight identified in Appendix **S27**.

Reasons: To include the frequencies in Appendix S27 which are related to safety and regularity of flight under Article S43.

Section VI – Procedure in a case of harmful interference

MOD CUB/31/33

S15.28 § 20 Recognizing that transmissions on the distress and safety frequencies and those related to safety and regularity of flight (see Article **S31** and Appendi~~x~~ces **S13** and **S27**) require absolute international protection and that the elimination of harmful interference to such transmissions is imperative, administrations undertake to act immediately when their attention is drawn to any such harmful interference.

Reasons: To increase the provisions for the protection of frequencies related to safety and regularity of flight included in Appendix S27.

In considering Resolution 346 (WRC-97), the Administration of Cuba took into account the fact that some HF distress and safety frequencies allocated to the maritime service are also used for routine international calling, which can cause interference in distress and safety communications where the caller fails to comply with No. S52.224 which requires that before transmitting on the carrier frequencies 4 125 kHz, 6 215 kHz, 8 291 kHz, 12 290 kHz or 16 420 kHz a station shall listen on the frequency for a reasonable period to make sure that no distress traffic is being sent. Stations in distress are exempt from this requirement, but their calls are not included among the causes of interference in distress communications under way when a new distress call is launched.

Cuba considers that, for the time being, there is no need to introduce any modification for the purpose of dividing existing distress and security channels into two separate frequencies. Distress and safety frequencies should therefore remain unchanged, continuing to be used for non-safety calling. Accordingly, no modification of distress procedures is necessary; it would suffice to request administrations to ensure strict compliance with No. S52.224 of the Radio Regulations.

NOC CUB/31/34

S52.224 § 99 1) Before transmitting on the carrier frequencies 4 125 kHz, 6 215 kHz, 8 291 kHz, 12 290 kHz or 16 420 kHz a station shall listen on the frequency for a reasonable period to make sure that no distress traffic is being sent (see Recommendation ITU-R M.1171).

Reasons: This provision should be maintained. Cuba considers that no further provisions in this respect are necessary.

Item 1.8: Earth stations located on board vessels in the bands 4/6 GHz

Having considered this agenda item, Cuba has reached the conclusion that WRC-2000 should introduce no changes to the current use of the bands 3 700-4 200 MHz and 5 925-6 425 MHz, in view of the following considerations.

The use of earth stations on board vessels is the main feature defining the maritime mobile-satellite service (see the definition in No. S1.29). There is no doubt that this service is provided in duly regulated frequency bands where issues of coordination between earth stations and other radiocommunication services are not complex and where equipment characteristics are clearly defined. They also involve the use of GMDSS distress communications, which is undoubtedly the most important aspect of the whole field of maritime telecommunications and therefore warrants a special legal regime and regulatory treatment.

It follows that any change or variation in the regulatory environment of maritime communications, particularly where the high seas are concerned, requires a very detailed analysis which must take account of the many different factors that have a decisive influence on the regulatory regime applied by administrations in respect of the radiocommunication facilities under their jurisdiction and the services using them.

In addition to the legal complexities of carrying out maritime communications via satellite networks registered internationally in the fixed-satellite service, this agenda item addresses the complex issue of availability for such communications in the bands 4/6 GHz, which are widely used in all regions for the development of the fixed service, and in which some systems constitute the main communication axes in the national networks of a considerable number of countries.

The sharing of these bands between the fixed service and the fixed-satellite service is based on a balance which has been well sustained over the years and has enabled both services to use the spectrum very efficiently without the imposition of restrictions curbing their development. The sharing is based on limitation of the pfd at the surface of the Earth produced by space station emissions corresponding to an acceptable level of interference for virtually all possible networks in the fixed service. The situation could be improved by avoiding directions that intercept the geostationary orbit in the case of fixed-station antennas of high-sensitivity networks, and by coordinating earth stations and terrestrial stations in accordance with Appendix S7.

Since coordination with earth stations on board vessels on the high seas is extremely complicated and would not appear to be practicable, the option considered consists of establishing a minimum distance from any coastal territory from which earth stations on board vessels could operate. However, preliminary studies to date have not reached a definitive value for the distance. It would therefore be premature to take any decision before completing more detailed studies to ensure the protection of important existing and planned fixed service systems in the 6 GHz band. Moreover, there is lack of clarity as to the mechanisms for ensuring strict observance of the minimum distance, which would mean suspension of communications by the vessels in question.

It has been argued that procedures should be established to allow rapid interaction with ships equipped with earth stations, or with the responsible administrations, in order to eliminate immediately any non-compliance with restrictions resulting in harmful interference in the fixed-service networks of another administration. Whether this could be applied in practice, however, appears doubtful, particularly in developing countries, which would need to have a complex structure for the purpose, including a monitoring network enabling them to identify unlawful emissions as soon as they occurred in the above-mentioned frequency band. In practice, most of them lack this resource.

ADD CUB/31/37

RESOLUTION AAA

Use of the bands 3 700-4 200 MHz and 5 925-6 425 MHz for communications with earth stations located on board vessels

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that there is a demand for global wideband satellite communication services on vessels;

b) that the technology exists that would permit the use of earth stations on board vessels in the bands 3 700-4 200 MHz and 5 925-6 425 MHz;

c) that the above-mentioned bands are shared with equal rights by the fixed-satellite service and terrestrial services;

d) that earth stations on board vessels have the potential to cause unacceptable interference to the fixed and mobile service systems in the band 5 925-6 425 MHz;

e) that fixed and mobile service systems have the potential to cause interference to earth stations on board vessels in the 3 700-4 200 MHz band,

noting

a) that, at present, earth stations on board vessels can operate in fixed-satellite service networks in the bands 3 700-4 200 MHz and 5 925-6 425 MHz only under No. **S4.4** of the Radio Regulations;

b) that operation within the territorial sea is at the discretion of the administration with territorial authority, in which case the relevant procedures of that administration will apply;

c) that operation of earth stations on vessels from specified fixed points at locations outside the territorial sea but for which an administration has territorial jurisdiction is fully within the FSS,

recognizing

the need for further studies on this subject,

requests ITU-R

1 to continue studies on the regulatory, technical and operational aspects of the use of earth stations on board vessels in bands shared by the FSS with terrestrial services;

2 in conducting such studies, to place particular emphasis on aspects related to ensuring the protection of terrestrial service networks without imposing on them any additional restrictions whatsoever,

urges administrations

to participate actively in the above-mentioned studies by submitting contributions to ITU-R,

resolves

to invite WRC-02/03 to review the results of the above-mentioned studies with a view to determining whether it is feasible for earth stations on board vessels to use part of the frequency bands 3 700-4 200 MHz and 5 925-6 425 MHz and, if so, to make the necessary regulatory arrangements,

requests the Secretary-General

to bring this Resolution to the attention of the International Maritime Organization (IMO).

Reasons: To take steps allowing for fuller examination of this question through studies on its technical, regulatory and operational aspects, taking into account the need to ensure not only the protection but also the unrestricted development of terrestrial services sharing bands with earth stations on board vessels.

WRC-02/03 is requested to review the results of these studies and to reach a conclusion on the basis thereof as to whether it is feasible to use earth stations on board vessels in these frequency bands and, in the event of an affirmative conclusion, to prepare appropriate regulatory provisions to that end.

Item 1.9: MSS in the 1 559-1 567 MHz frequency range

The band 1 559-1 610 MHz has been allocated on a primary basis to the aeronautical radionavigation service and the radionavigation-satellite service. Currently the two components of the GNSS, namely the GLONASS and the GPS, operate in this band. The GNSS has been chosen as the basic technology for navigation with ICAO’s CNS/ATM systems.

On the basis of the CPM Report, the Administration of Cuba considers that any sharing of this band with other systems may produce harmful interference in the aeronautical services which are crucial for safety.

It is essential that, in future, the entire band assigned to the GNSS (1 559-1 610 MHz) should remain free from interference from non-aeronautical sources, so as to be able to ensure the introduction of new RNSS applications in the band 1 559-1 567 MHz. Cuba therefore considers that no new allocations should be made to the MSS in the band 1 559-1 567 MHz.

MOD CUB/31/38

SUP CUB/31/39

RESOLUTION 220 (WRC-97)

Studies to consider the feasibility of use of a portion of the band 1559-1610 MHz by the mobile-satellite service (space-to-Earth)

Reasons: The studies on this subject have reached the conclusion that sharing in the band 1 559-1 567 MHz is not feasible.

Item 1.10: Use by the MSS of the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz

The Administration of Cuba has considered the results of the ITU-R studies concerning Resolution 218 (WRC-97) and the protection requirements for distress and safety communications and communications related to safety and regularity of flight.

It took into account the fact that concerns were expressed at WRC-97 concerning generic allocation to the MSS in connection with a series of technical and operational points affecting the aeronautical and maritime mobile-satellite services in respect of the need to ensure sufficient spectrum access when necessary. Concern was therefore expressed about the feasibility of pre-emption between the various networks.

Notwithstanding the foregoing, WRC-97 agreed on generic allocation to the MSS in the band 1.5/1.6 GHz and established No. S5.353A for the distress, urgency and safety communications of the GMDSS and No. S5.357A for the AMS(R)S with the intention of providing priority access to the AMS(R)S in the future when the spectrum is coordinated. However, the CPM Report notes that the complexity and cost of implementing intra-system prioritization and pre-emption between different types of MES standard designations is greater than within one standard designation, and that further studies are therefore required to define the technical and operational requirements that will satisfy the needs of the AMS(R)S/GMDSS, together with studies on the alternative of implementing a system that could use spectrum flexibly between different MSS networks.

In Cuba's view, it is necessary to accelerate the ITU-R studies on the feasibility and definition of mechanisms for facilitating the implementation of intra-system prioritization and pre-emption, with the participation of ICAO, IMO, interested administrations and MSS operators. In this connection, it notes the results of the ICAO studies, which conclude that the future spectrum needs of the AMS(R)S for safety purposes will be 10.8 MHz in 2010 and 18 MHz beyond that date.

In view of the foregoing, Cuba is in favour of implementing measures that ensure prioritization and pre-emption for urgency and safety communications of the GMDSS and aeronautical communications with priority 1 to 6 under Article S44 of the Radio Regulations, in accordance with Nos. S5.353A and S5.357A.

CUB/31/40

Adopt measures that ensure the necessary spectrum access for future AMS(R)S communications and establish appropriate technical provisions and standards in the bands 1 525-1 559 MHz and 1 626.5-1 660.5 MHz, in order to ensure that GMDSS communications and aeronautical communications in Categories 1 to 6 under Article S44 have priority and immediate access at all times.

Item 1.11: Non-geostationary mobile-satellite service below 1 GHz

In considering the restrictions on existing allocations to the mobile-satellite service in frequencies below 1 GHz, Cuba reached the view that they should be maintained so as to continue providing adequate protection to the other services sharing frequency bands below 1 GHz with the mobile-satellite service and to allow unrestricted growth of these services in the future.

As regards additional allocations to the mobile-satellite service in frequencies below 1 GHz, no appropriate bands have been identified for this purpose. Furthermore, Cuba considers that the studies indicated in Resolution 219 (WRC-97) have been concluded and that the resolution should therefore be discontinued. On this issue in particular, Cuba agrees fully with the statement in the CPM Report that co-channel sharing between MSS systems using narrow-band modulation techniques and the MetAids service in the band 401-406 MHz is not feasible. It also agrees with the conclusion that transition of the MetAids service out of the band 405-406 MHz is not feasible. It therefore proposes that no change should be made to existing allocations, in view of the importance of MetAids in this frequency band, particularly for developing countries, bearing in mind that any transition to higher bands would involve a significant increase in the costs of new radiosondes, which would hamper the development of meteorological service programmes in many developing countries.

In view of the foregoing, Cuba submits the following proposals to the Conference:

NOC CUB/31/41

S5.219 The use of the band 148-149.9 MHz by the mobile-satellite service is subject to coordination under No. **S9.11A**. The mobile-satellite service shall not constrain the development and use of the fixed, mobile and space operation services in the band 148-149.9 MHz.

NOC CUB/31/42

S5.221 Stations of the mobile-satellite service in the band 148-149.9 MHz shall not cause harmful interference to, or claim protection from, stations of the fixed or mobile services operating in accordance with the Table of Frequency Allocations in the following countries: Albania, Algeria, Germany, Saudi Arabia, Australia, Austria, Bahrain, Bangladesh, Barbados, Belarus, Belgium, Benin, Bosnia and Herzegovina, Brunei Darussalam, Bulgaria, Cameroon, China, Cyprus, Congo, the Republic of Korea, Croatia, Cuba, Denmark, Egypt, the United Arab Emirates, Eritrea, Spain, Estonia, Ethiopia, Finland, France, Gabon, Ghana, Greece, Guinea, Guinea Bissau, Hungary, India, the Islamic Republic of Iran, Ireland, Iceland, Israel, Italy, Jamaica, Japan, Jordan, Kazakstan, Kenya, Kuwait, Latvia, The Former Yugoslav Republic of Macedonia, Lebanon, Libya, Liechtenstein, Luxembourg, Malaysia, Mali, Malta, Mauritania, Moldova, Mongolia, Mozambique, Namibia, Norway, New Zealand, Oman, Uganda, Uzbekistan, Pakistan, Panama, Papua New Guinea, Paraguay, the Netherlands, Philippines, Poland, Portugal, Qatar, Syria, Kyrgyzstan, Slovakia, Romania, the United Kingdom, Russian Federation, Senegal, Sierra Leone, Singapore, Slovenia, Sri Lanka, South Africa, Sweden, Switzerland, Swaziland, Tanzania, Chad, Thailand, Togo, Tonga, Trinidad and Tobago, Tunisia, Turkey, Ukraine, Viet Nam, Yemen, Yugoslavia, Zambia, and Zimbabwe.

Reasons: To maintain mobile-satellite service stations in the band 148-149.9 MHz as secondary to stations of the fixed and mobile services operating in accordance with the Table of Frequency Allocations in the countries listed, and to maintain the provision that the mobile-satellite service shall not constrain the development and use of the fixed and mobile services.

NOC CUB/31/43

S5.254 The bands 235-322 MHz and 335.4-399.9 MHz may be used by the mobile-satellite service, subject to agreement obtained under No. **S9.21**, on condition that stations in this service do not cause harmful interference to those of other services operating or planned to be operated in accordance with the Table of Frequency Allocations.

Reasons: To maintain stations of the mobile-satellite service in the bands 235-322 MHz and 335.4-399.9 MHz as secondary to stations of the fixed and mobile services operating in accordance with the Table.

NOC CUB/31/44

S5.286B The use of the band 454-455 MHz in the countries listed in No. **S5.286D**, 455-456 MHz and 459-460 MHz in Region 2, and 454-456 MHz and 459-460 MHz in the countries listed in No. **S5.286E**, by stations in the mobile-satellite service, shall not cause harmful interference to, or claim protection from, stations of the fixed or mobile services operating in accordance with the Table of Frequency Allocations.

NOC CUB/31/45

S5.286C The use of the band 454-455 MHz in the countries listed in No. **S5.286D**, 455-456 MHz and 459-460 MHz in Region 2, and 454-456 MHz and 459-460 MHz in the countries listed in No. **S5.286E**, by stations in the mobile-satellite service, shall not constrain the development and use of the fixed and mobile services operating in accordance with the Table of Frequency Allocations.

Reasons: To maintain stations of the mobile-satellite service allocated in the bands 454-455 MHz in the countries listed in Nos. S5.286D and S5.286E, and 455-456 MHz and 459-460 MHz in Region 2 and in the countries listed in No. S5.286E, as secondary to stations of the fixed and mobile services operating in accordance with the Table, and to maintain the provision that the mobile-satellite service shall not constrain the development and use of the fixed and mobile services.

NOC CUB/31/46

1.1.1 In the bands 137-138 MHz and 400.15-401 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to terrestrial services (except aeronautical mobile (OR) service networks operated by the administrations listed in Nos. **S5.204** and **S5.206** as of 1 November 1996) is required only if the pfd produced by this space station exceeds –125 dB (W/m^2/4 kHz) at the Earth's surface.

NOC CUB/31/47

1.1.2 In the band 137-138 MHz, coordination of a space station of the MSS (space-to-Earth) with respect to the aeronautical mobile (OR) service is required only if the pfd produced by this space station at the Earth's surface exceeds:

– –125 dB (W/m^2/4 kHz) for networks for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996;

– –140 dB (W/m^2/4 kHz) for networks for which complete Appendix **S4**/**3** coordination information has been received by the Bureau after 1 November 1996 for the administrations referred to in § 1.1.1 above.

NOC CUB/31/48

1.1.3 In the band 137-138 MHz, coordination is also required for a space station on a replacement satellite of a MSS network for which complete Appendix **3** coordination information has been received by the Bureau prior to 1 November 1996 and the pfd exceeds –125 dB(W/m^2/4 kHz) at the Earth's surface for the administrations referred to in § 1.1.1 above.

Reasons: The existing provisions are considered adequate for sharing by the mobile-satellite service and terrestrial services, and particularly for the protection of the aeronautical mobile (OR) service.

NOC CUB/31/49

335.4-410 MHz

Allocation to services		
Region 1	**Region 2**	**Region 3**
403-406	METEOROLOGICAL AIDS Fixed Mobile except aeronautical mobile	

Reasons: This band should be maintained to ensure continued development of the meteorological aids service, especially radiosonde systems, which are particularly important in this band for developing countries.

SUP CUB/31/50

RESOLUTION 219 (WRC-97)

Studies relating to consideration of the allocation to the non-geostationary mobile-satellite service in the meteorological aids band 405-406 MHz and the impact on primary services allocated in the adjacent bands

Reasons: The studies referred to in Resolution 219 (WRC-97) are considered to have been completed. ITU-R has carried out studies taking account of sharing between the MSS and the meteorological aids service, use of the band for the meteorological aids, Earth exploration-satellite and meteorological-satellite services, and the repercussions of spurious emissions in this band on the COSPAS-SARSAT system and the radio astronomy service. On the basis of these studies, CPM-99 concluded that in the near future operation of the MSS in the band 405-406 MHz will not be considered feasible.

Item 1.13: Proposals for revision of the power flux-density limits appearing in Article S21 and Resolution 131 (WRC-97)

Cuba has considered the revision of Article S21 with a view to adjusting the established values for the power flux-density limits at the surface of the Earth produced by emissions from non-GSO FSS space stations, in order to protect stations in the fixed service.

In its analysis it took into account the results of the ITU-R studies and of the CPM Report, and reached the conclusion that the power flux-density limits reflected in the Report constitute adequate values for protecting fixed-service systems in the frequency bands between 10.7-12.75 GHz and 17.7-19.3 GHz. Cuba therefore proposes to the Conference that Article S21 should be amended accordingly in order to reflect these values.

The proposal for amendment of Article S21 includes a corresponding modification to the band 11.7-12.2 GHz for Region 2, with a view to having power flux-density limits that allow protection of fixed-service stations vis-à-vis emissions from GSO FSS space stations operating in this frequency band in Region 2 in accordance with No. S5.488 of the Radio Regulations (see proposals CUB/31/55 and CUB/31/66).

Lastly, in addressing the revision of Article S21, Cuba notes that No. S21.7, which concerns the power limits applicable to terrestrial stations in the case of trans-horizon systems, refers to the 1 970-2 010 MHz band, yet the segment between 1 970 and 1 980 MHz is not allocated to space services in the Table of Frequency Allocations in Article S5 of the Radio Regulations. It concludes that this is a misinterpretation requiring the appropriate modification, to which end it submits proposal CUB/31/51 below to the Conference.

MOD CUB/31/51

S21.7 5) Transhorizon systems in the 1 700-1 710 MHz, ~~1 970~~1 980-2 010 MHz, 2 025-2 110 MHz and 2 200-2 290 MHz bands may exceed the limits given in Nos. **S21.3** and **S21.5**, but the provisions of Nos. **S21.2** and **S21.4** should be observed. Considering the difficult sharing conditions with other services, administrations are urged to keep the number of transhorizon systems in these bands to a minimum.

Reasons: The band 1 970-1 980 MHz is not allocated to space services in the Table of Frequency Allocations of the Radio Regulations.

[12] **S21.16.6** These values shall apply provisionally only to emissions of space stations on non-geostationary satellites in networks operating with a large number of satellites, that is systems operating with more than 100 satellites (see Resolution **131 (WRC-97)**).

The function X is defined as a function of the number, N, of satellites in the non-GSO FSS constellation as follows:

– for N ≤ 50 $X = 0$ (dB)

– for 50 < N ≤ 288 $X = 5(N - 50)/119$ (dB)

– for N > 288 $X = \left(N + 402\right)/69$ (dB)

In the band 18.8-19.3 GHz, these limits apply to emissions of a space station on a non-geostationary FSS satellites for which complete coordination or notification information, as appropriate, has been received by the Radiocommunication Bureau after 17 November 1995, and which was not operational by that date.

ADD CUB/31/60

[aa] **S21.16.6*bis*** These limits apply to emissions of a space station on a meteorological-satellite and on a geostationary FSS satellite. These limits also apply to emissions of a space station on a non-geostationary FSS satellite in the bands 18.8-19.3 GHz for which complete coordination or notification information has been received by the Radiocommunication Bureau by 17 November 1995, or are in operation by that date.

NOC CUB/31/61

[13] **S21.16.7**

SUP CUB/31/62

[14] **S21.16.8**

SUP CUB/31/63

[15] **S21.16.9**

Reasons: Cuba considers that the limits proposed constitute appropriate values for providing protection to fixed service systems.

SUP CUB/31/64

RESOLUTION 131 (WRC-97)

Power flux-density limits applicable to non-geostationary fixed-satellite service systems for protection of terrestrial services in the bands 10.7-12.75 GHz and 17.7-19.3 GHz

Reasons: Cuba considers that adequate action has already been taken and that the resolution is therefore no longer necessary.

Application of RR Nos. S5.488 and S5.491

1 WRC-97 agreed to the development of non-GSO FSS systems in the band 11.7-12.2 GHz (Region 2) and 12.2-12.5 GHz (Region 3) among others. Although the current provisions of Nos. S5.488 and S5.491 limit these FSS allocations to national and subregional systems, in Cuba's view this limitation was established long before and bears no relation to the later decision to develop non-GSO FSS systems in these bands.

In view of the foregoing, Cuba considers that the necessary modifications should be made to the above footnotes in order to make it clear that the limitations do not apply to non-GSO FSS systems.

2 Another point to be considered is that the Radio Regulations Board, at its 13th meeting, revised the Rules of Procedure in respect of No. S5.488 applying to the use of the frequency band 11.7-12.2 GHz by the FSS in Region 2, noting that as a consequence of the application of the modifications introduced by WRC-97, as from 1 January 1999, fixed-service stations would no longer have protection in respect of emissions from space stations of geostationary-satellite networks.

The foregoing can be explained by the fact that, in revising No. S5.488, WRC-97 modified the text thereof by deleting the explicit reference to No. S9.21, and in modifying the provisions of Article S21, established power flux-density limits for this frequency band in Region 2, but referenced them only to emissions from non-GSO FSS space stations.

Having examined this matter, the Administration of Cuba considers it essential that WRC-2000 should address this problem so as to remedy what Cuba believes to be the result of an unintentional omission, WRC-97 having at no time intended to eliminate protection of the Region 2 fixed service systems operating in the above-mentioned frequency band.

To solve the problem, Cuba considers that the Conference should decide to establish appropriate power flux-density limits, thereby completing Table S21-4 in Section V of Article S21, as is common practice in the Radio Regulations for the protection of terrestrial services in the frequency bands which they share, on a primary basis, with the fixed-satellite service (space-to-Earth). In this connection, Recommendation ITU-R SF.385-5 establishing maximum permissible values of power flux-density to protect fixed-service systems has been revised on the grounds that the limits corresponding to the band immediately above also provide adequate protection for the fixed service in the band 11.7-12.2 GHz. The limits in question are those currently applied for emissions from non-geostationary satellites in the bands 11.7-12.7 GHz and emissions from geostationary satellites in the bands 12.2-12.75 GHz.

MOD CUB/31/65

S5.488 The use of the bands 11.7-12.2 GHz by geostationary-satellite networks in the fixed-satellite service in Region 2 and 12.2-12.7 GHz by the broadcasting-satellite service in Region 2 is limited to national and subregional systems. ~~The use of the band 11.7-12.2 GHz by the fixed-satellite service in Region 2 is subject to previous agreement between the administrations concerned and those having services, operating or planned to operate in accordance with the Table, which may be affected (see Articles **S9** and **S11**).~~ For the use of the band 12.2-12.7 GHz by the broadcasting-satellite service in Region 2, see Appendix **S30**.

Reasons: To establish power flux-density limits in Article S21 which provide adequate protection to terrestrial systems in this frequency band. This would make it unnecessary to identify the administrations whose services might be affected by FSS networks, while also making it clear that the limitation to national or subregional systems does not apply to non-GSO networks.

CUB/31/66

Adopt the following power flux-density limits to ensure the protection of terrestrial services against emissions from geostationary space stations in Region 2 in the band 11.7-12.2 GHz:

-148	dB(W/m^2)	for	$\theta \leq 5°$
$-148 + 0.5(\theta - 5)$	dB(W/m^2)	for	$5° \leq \theta \leq 25°$
-138	dB(W/m^2)	for	$25° \leq \theta \leq 90°$

Reasons: These limits, which are consistent with Recommendation ITU-R SF.358-5, are considered adequate for the protection of terrestrial services in the band 11.7-12.2 GHz. Furthermore, their establishment would allow effective sharing between terrestrial services and the GSO FSS without the need for coordination procedures and without the risk of terrestrial services, operating or planned, losing priority if an administration fails to notice in time the publication of a request for coordination under No. S9.21 in a special section of the BR Weekly Circular.

Cuba proposes including these limits in Table S21-4 (see proposal CUB/31/55), which would still allow for the application of S21.17 in order to obtain agreements with other administrations in cases where it is proposed to exceed the limits, but without the need for a coordination procedure.

MOD CUB/31/67

S5.491 *Additional allocation:* in Region 3, the band 12.2-12.5 GHz is also allocated to geostationary-satellite networks the fixed-satellite (space-to-Earth) service on a primary basis, limited to national and sub-regional systems. The power flux-density limits in Article **S21**, Table **S21-4** shall apply to this frequency band. The introduction of the service in relation to the broadcasting-satellite service in Region 1 shall follow the procedures specified in Article 7 of Appendix **S30**, with the applicable frequency band extended to cover 12.2-12.5 GHz.

Reasons: To make it clear that the limitation to national and sub-regional systems does not apply to non-GSO networks.

3 Lastly, the Administration of Cuba notes that both footnotes use the expression “limited to national and sub-regional systems” for certain allocations to space radiocommunication services, and considers that it would be appropriate that the Conference adopt a single definition establishing the precise scope of the limitation, which is essential, in Cuba’s view, for the treatment of such cases in relation to the other provisions of the Radio Regulations. This would also enable the Radio Regulations Board, by taking it into account, to establish Rules of Procedure that are applicable to all cases equally.

On the basis of the foregoing, Cuba proposes that the Conference adopt the following proposal:

CUB/31/68

Where a footnote to the Table, concerning an allocation to a space radiocommunication service, indicates that its use is limited to national and sub-regional systems, unless specified otherwise this implies that:

– the entire service area is located within the region in question;

– in the case of a national system, the service area is limited to the territory of the notifying administration;

– where the service area covers the territory of several administrations which by common agreement have so decided in order to form a sub-regional system, the latter shall be limited to the territory of these administrations and shall be notified by one of them on behalf of the administrations forming the group identifying them as such;

– if the satellite network operates within an international system to which countries outside the Region in question belong, the notification shall state that use is limited to the territories of the member administrations located in the Region in question and, if any, of other administrations in the Region which have so decided, and shall identify such administrations.

Use of the non-geostationary fixed-satellite service in the band 17.3-17.8 GHz in Region 2

Resolution 538 (WRC-97), in establishing provisional limits to the level of interference caused by a non-GSO FSS system to GSO systems in the frequency bands covered by the resolution, did not specify values for the band 17.3-17.8 GHz in Region 2, but simply indicated that further studies were necessary.

In Region 2 there are three sharing situations in this context:

1) interference to the non-GSO FSS receiving space station caused by emissions from space stations of GSO systems;

2) interference to the GSO FSS receiving space station (BSS feeder links) caused by emissions from earth stations in the non-GSO FSS;

3) interference to receiving earth stations in the BSS and GSO FSS (17.7-17.8 GHz) caused by emissions from transmitting earth stations in the non-GSO FSS.

As the CPM Report itself states, the first sharing situation is not different from that existing between transmitting space stations in the GSO FSS and receiving space stations in the non-GSO FSS in the band immediately above, and therefore requires no specific provision.

With regard to the protection of BSS feeder-link receiving space stations, it has been ascertained that such protection is feasible by establishing uplink power flux-density limits for the protection of BSS feeder links in Regions 1 and 3 in the same frequency band. It is likely that such limits will have to be applied in any case in Region 2 to protect BSS feeder links from uplink non-GSO FSS emissions in Regions 1 and 3.

Although sharing between ubiquitous BSS and non-GSO FSS is not feasible, this band could be used for gateway stations in the non-GSO FSS, which would mean a considerable reduction in the number of earth stations in this service which can be expected to operate in the Region, creating a very different situation for sharing. Studies indicate that a maximum coordination distance of 100 km would be an adequate value, which means that gateway earth stations located at a distance of more than 100 km from the territory of another administration would ensure protection for BSS receiving earth stations located in that administration's territory. Moreover, if the location of non-GSO BSS gateway stations was properly chosen, sharing between both services in the same country would be feasible.

Furthermore, forecasts of BSS development in the band 17.3-17.8 GHz are not clear for many countries in Region 2. It is probable that, to some extent, their satellite broadcasting requirements in the medium and even the long term will be met by allocating them in the Plan for the 12 GHz band. Consequently, allocation of the band 17.3-17.8 GHz to the non-GSO FSS might be an attractive option, as it will give administrations greater flexibility in the use of this segment of the spectrum, particularly if regulatory provisions are made to allow the sharing of these services without penalizing development of the BSS by administrations when they decide on it. Sharing between GSO and non-GSO FSS earth stations must remain subject to S9.17A.

On the basis of the foregoing considerations, Cuba submits the following proposal to the Conference:

MOD CUB/31/69

TABLE **S22-2**

Frequency band (GHz)	**Aggregate pfd dB(W/m^2/4 kHz)**	**Percentage of time during which aggregate pfd level may not be exceeded**
17.3-18.1 ~~in Regions 1 and 3 and 17.8-18.1 in Region 2~~	–163	100%

Reasons: To establish in Article S22 (Table S22-2) uplink epfd limits for the band 17.3-17.8 GHz in Region 2 and to indicate that the limits agreed on by the Conference for the entire 17.3-18.1 GHz band must be the same for the three Regions.

MOD CUB/31/70

S5.515 In the band 17.3-17.8 GHz, sharing between geostationary-satellite networks in the fixed-satellite service (Earth-to-space) and the broadcasting-satellite service shall also be in accordance with the provisions of § 1 of Annex 4 of Appendix **S30A/30A**.

MOD CUB/31/71

S5.516 The use of the band 17.3-18.1 GHz by geostationary-satellite systems in the fixed-satellite service (Earth-to-space) is limited to feeder links for the broadcasting-satellite service. For the use of the band 17.3-17.8 GHz in Region 2 by feeder links for the broadcasting-satellite service in the band 12.2-12.7 GHz, see Article **S11**. The use of the bands 17.3-18.1 GHz (Earth-to-space) ~~in Regions 1 and 3 and 17.8-18.1 GHz (Earth-to-space) in Region 2~~ by non-geostationary-satellite systems in the fixed-satellite service is subject to the application of the provisions of No. **S9.12** for the coordination with other non-geostationary-satellite systems in the fixed-satellite service. The provisions of Resolution **538 (WRC-~~97~~2000)** apply.

ADD CUB/31/72

S5.516A In Region 2, earth stations of non-geostationary-satellite systems in the fixed-satellite service in the band 17.3-17.8 GHz are limited to operating with antennas of not less than 4.5 metres in diameter and with elevation angles greater than or equal to 10º. Sharing with the broadcasting-satellite service is subject to obtaining the agreement indicated in **S9.21** with administrations whose territory is at a distance of less than 100 km from the location of the earth station of the non-geostationary-satellite system.

Reasons: To allow use of this band in Region 2 for non-GSO FSS system links (Earth-to-space), while ensuring sharing conditions that do not restrict development of the BSS.

NOTE - Cuba considers that this situation requires further study in ITU-R.

APPENDIX S5

Identification of administrations with which coordination is to be effected or agreement sought under the provisions of Article S9

MOD CUB/31/73

TABLE S5-1A (*end*)

~~17.8-18.1 GHz (R2)~~	~~**S5.516**~~	~~Non-GSO FSS~~[2]	~~↑~~	~~---~~	~~see Res. **538**~~

Reasons: To align Table S5-1 of Appendix S5 with the foregoing proposals.

Item 1.18: Revision of Appendix S18

Having considered the steps taken so far regarding the use of new technologies for the maritime mobile service in the band 156-174 MHz and the consequent revision of Appendix S18, Cuba is of the view that the studies on the introduction of new technologies are not yet complete and that this Conference is therefore not in a position to decide in favour of any particular technology. Nor would it be judicious at present to identify spectrum for new technologies which are still under study. However, Cuba is aware of the existing problems and believes that it is necessary to find at least a provisional solution allowing more efficient use of the 156-174 MHz band.

It therefore proposes increasing the number of channels available in the band 156-174 MHz by modifying footnote *m)* to Appendix S18 to increase the use of duplex channels in simplex mode.

To that end, it submits the following proposal to the Conference:

APPENDIX S18

Table of transmitting frequencies in the VHF maritime mobile band

(See Article **S52**)

NOTE – For assistance in understanding the Table, see notes *a)* to *n)* below.

MOD CUB/31/74

Specific notes

MOD CUB/31/75

m) These channels (18 to 27 and ~~82~~78 to 86) may be operated as single frequency channels, subject to special arrangement between interested or affected administrations.

Item 1.19*bis*: Rules of Procedure relating to RR No. 2674/S23.13

The Administration of Cuba has considered the application of the Rules of Procedure relating to RR No. S23.13 in relation to the provisions of Annex 1 to Resolution 531 (WRC-95). While agreeing that the service area of a BSS network may comprise only the territories of administrations that have given their consent thereto, Cuba considers that the wording of § 4.3 of the Annex to Resolution 531 (WRC-95) and of the relevant Rules of Procedure is not sufficiently clear and introduces a certain ambiguity.

Under the procedure currently in use, where it exceeds the territory of the notifying administration the service area should be defined in terms of the other administrations included in the area, and the notifying administration must indicate whether it has obtained a special agreement with those administrations on the inclusion of their territories in the service area. The procedure then establishes that the relevant special sections of the BR will indicate agreements already obtained under No. S23.13 or agreements applied for but not yet obtained. Thereafter, those administrations which have not been consulted, but whose territories appear in the service area published in the relevant special section, have a period of four months from the date of publication in which to react and so indicate if they do not wish their territories to be included in the service area.

The foregoing suggests that an administration which, for whatever reason, has not communicated within the established period its disagreement to inclusion in the service area, will find that the emissions of the network in question have acquired the right to protection in its territory, which raises the following questions. A right to protection against what emissions? Who is entitled to claim such protection? What happens if the administration responsible for the territory decides to use other terrestrial radiocommunication services, in conformity with the Table, whose emissions do not comply with the levels required for protection of the emissions of the broadcasting-satellite service within its own territory? Is this not a part of every administration's sovereign right to regulate its radiocommunication services within its own territory?

The problem is better illustrated by Appendix S30, where the service area is the area in which the administration responsible for the service is entitled to claim protection for it. According to Article 6 of Appendix S30, such protection applies in respect of the emissions of terrestrial stations. If an administration whose territory has been included in the service area pursuant to the above procedure decides, in exercise of its sovereign right to regulate its telecommunications, to use terrestrial service stations that conform to the Radio Regulations such that their emissions do not affect the territory of neighbouring administrations, but that are incompatible with the protection of the BSS system in question in its own territory, would it have to apply the Article 6 procedure and make a request for the coordination of its terrestrial stations, within its territory, to the administration in whose name the BSS frequency assignment is recorded?

The following question also requires clarification. Does an administration have the authority, pursuant to its sovereign rights, to decide that, as from a specified date, a service will not be provided in its territory? Would it be consistent with the principle of ensuring rational and efficient use of a scarce resource, such as the spectrum, to impose restrictions in such cases on the services of other administrations by demanding levels of protection in a territory whose administration is not interested in using the protected system?

Furthermore, under the current procedure, when an agreement is not reached with an administration, its territory is excluded from the service area, which means that the right to protection within such territory is not considered for the network in question and that thereafter the administration initiating the BSS project is entitled to bring it into use. But this overlooks the fact that if the initial service area has been reduced, in all likelihood the coverage area of the network can be adjusted and hence reduced proportionally. It is precisely this situation which gives rise to part of No. S23.13 and which should be reflected explicitly in the corresponding rules, bearing in mind that if the responsible administration fails to modify the coverage area of its network, rational and efficient use of the spectrum will not be achieved, which could result in additional constraints for the development of the radiocommunication services of other administrations.

On the basis of the foregoing, Cuba considers that the following minor modifications would suffice to solve these problems:

CUB/31/76

Where BR special sections relating to BSS networks include requests to other administrations for agreement to the inclusion of their territories in the network service area, only those administrations that have responded in the affirmative to such requests shall be deemed to have consented to the inclusion of their territories in the planned service area.

CUB/31/77

Once the consultation process is completed, the administration responsible for the planned network shall, in accordance with No. S23.13, adjust the coverage area of the network to the service area resulting from the consultation process.

CUB/31/78

An administration whose territory is included in the service area of a BSS network may at any time indicate the exclusion of its territory from that service area. Such exclusion shall imply only withdrawal of the right to protection for that network in the territory in question and at no time may imply the imposition of changes to the characteristics established for the network.

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Note by the Secretary-General

REPORT ON ADMINISTRATIVE DUE DILIGENCE APPLICABLE TO SOME SATELLITE COMMUNICATION SERVICES

This document contains the Report of the Director of the Radiocommunication Bureau pursuant to the requirements of Resolution 49 (WRC-97) and Resolution 85 (Minneapolis, 1998).

The Conference is invited to consider the Report and, in particular, the matters raised in the concluding paragraph.

Yoshio Utsumi
Secretary-General

Attachment: 1

ATTACHMENT

Director, Radiocommunication Bureau

REPORT ON IMPLEMENTATION OF RESOLUTION 49 (WRC-97) ON DUE DILIGENCE

1 The Radiocommunication Bureau presents this Report on the activities it has undertaken pursuant to the requirements of Resolution 49 (WRC-97) and Resolution 85 (Minneapolis, 1998). Under the provisions of these Resolutions, the Director of the Radiocommunication Bureau is required to report to WRC-2000 and to future radiocommunication conferences on the results of the implementation of the administrative due diligence procedure. WRC-2000 is also required, under the provisions of Resolution 85 (Minneapolis, 1998) to evaluate the results of the implementation of administrative due diligence and to inform the following Plenipotentiary Conference in 2002 of its conclusions in that regard.

Implementation steps

2 Circular Letter CR/96 of 2 June 1998 provided a form RS49 and detailed instructions for completion according to a timetable based on the date of bringing into use and regulatory registration status of satellite networks. The PC-based SpaceCap software for RS49 electronic data submission was made available to administrations with the Space Radiocommunication Systems CD-ROM (March, 1999).

3 In order to help administrations comply with Resolution 49 (WRC-97), the Bureau provided in Circular Letter CR/97 dated 20 June 1998, for information purposes, a comprehensive list of planned or existing satellite networks for which the administrative due diligence information was required. The list focused on the most urgent requirements, i.e., the satellite networks with a date of bringing into use, including any authorized extension, prior to 1 July 1998. Subsequently, on 30 April 1999, a list of networks with a planned date of bringing into use between 1 July 1998 and 1 October 1999 for which due diligence information was required, was sent to administrations indicating that information should be submitted by 1 October 1999. A similar list covering the period 1 October 1999 - 30 April 2000 and 1 May 2000 - 31 October 2000 was addressed to administrations respectively on 3 September 1999 (information to be submitted by 30 April 2000) and during ***March 2000*** (information to be submitted by 31 October 2000).

4 As a follow-up action on the above circular letters, individual letters and subsequent reminders to administrations, the Bureau immediately captures any received due diligence information in a database that is made available to administrations on the ITU website (http://www-br/sns/res49.html). Information is analysed for each administration on a network level, i.e., comparison between the list of networks with a date of bringing into use prior to the appropriate deadline and the list of networks with due diligence information provided by administrations in order to establish a list of networks for which due diligence information is still missing. Prior to the publication in the BR International Frequency Information Circular (IFIC) (RES49/-- special section), a further examination is undertaken network by network to verify compliance with Resolution 51 (WRC-97)/No. S11.44 in respect of the regulatory period to bring a satellite network into use, to cross-check references to special sections and associated frequency ranges.

5 As a result of the above examination, whenever it appears that due diligence information is still missing, the Bureau initiates further action as foreseen by <*resolves* 6> of Resolution 49 (WRC-97):

i) to inform the concerned administration of the list of satellite network(s) or frequency ranges for which the required due diligence information was not received by the Bureau before the regulatory expiry date; and

ii) to cancel part or all of the related Special Section(s) and publish this information in the IFIC.

Results of the process

6 Detailed information/statistics on the processing by the Bureau of Resolution 49 (WRC-97) due diligence requests and notices are in Annex 1. At this stage in the implementation of Resolution 49 (WRC-97), the Bureau has not encountered any administrative difficulty in applying the provisions and in gathering and publishing information, although it has involved the collection of considerable data and the application of Bureau resources (approximately 1 professional staff per annum). One issue has, however, been identified by the Bureau and raised with the Radio Regulations Board which suggested that it be considered by the Conference (see paragraph 9 below). In terms of results, it will be noted that the Bureau has taken action pursuant to <*resolves* 6> of Resolution 49 to cancel and publish accordingly, the related special sections in respect of 37 satellite networks (see Annex 2). As noted in Annex 2, however, all of these cancellations had reached the maximum (nine year) period for bringing into use pursuant to the application of <*resolves* 1 and 2> of Resolution 51 (WRC-97) and S11.44 of the Radio Regulations and hence would have been cancelled in any event.

7 A particular feature of implementation of the Resolution is that when requested to provide due diligence information (triggered by the original date of bringing into use of their satellite networks), administrations have generally requested, wherever it is possible, extension of the regulatory period for bringing their satellites into use up to the maximum limit authorized by the Radio Regulations (S11.44 and S11.44B to S11.44I). It is noted that, in the case of networks for which an API was received prior to 22 November, 1997, the period for bringing the satellite into use may be six years plus the extension pursuant to No. 1550 (<*resolves* 3> of Resolution 51 (WRC-97) refers). The result of these provisions is that, for a majority of cases, the due diligence information needs to be provided not later than 21 November 2003 (<*resolves* 2> of Resolution 49 (WRC-97). Any effect of administrative due diligence may not, therefore, be fully apparent until at least that date. In the meantime, the Bureau continues to undertake its examination of the networks in accordance with the relevant provisions of the Radio Regulations.

8 The Bureau notes also that, in addition to publication in the IFIC, due diligence information is made available on the ITU website. The Bureau has not so far received queries from any administration on the information received and published pursuant to the requirements of the Resolution.

Consideration by the Radio Regulations Board

9 As noted above, the Bureau has not encountered any specific difficulties in implementing Resolution 49 (WRC-97) in the terms established by the Conference and subsequently by the RRB, in particular at its 16th Meeting (Geneva, 24-28 May 1999). However, one issue which the Bureau raised with the RRB and included in the RRB's decisions of the above meeting, is brought to the attention of WRC-2000 in order to request guidance from the Conference as to whether <*resolves* 3> of Resolution 49 (WRC-97) includes satellite systems which are already in operation.

10 The RRB's advice was sought by the Bureau, following a letter from the Administration of Russia disputing the Bureau's conclusions concerning Russian satellites included in a list of networks proposed for cancellation because of missing Due Diligence information. That administration expressed the view that Resolution 49 did not apply to satellite networks which have been implemented (including the associated earth segments) and notified as having been put into operation. The Board at its 16th Meeting considered the matter and in essence concluded that:

i) for satellite networks which are under coordination, i.e. not yet recorded in the MIFR, administrations should provide Due Diligence information in accordance with <*resolves* 2> of Resolution 49 (WRC-97), i.e. not later than 21 November 2003, or before the expiry of the notified period for bringing the satellite into use; and

ii) for satellite networks which are partly or fully recorded in the MIFR, administrations would have to provide the Due Diligence information in accordance with <*resolves* 3> of Resolution 49 (WRC-97) not later than 21 November 2000.

11 Noting the above situation and the views expressed by the Administration of Russia, the Board considered that it would be desirable to seek guidance from WRC-2000 as to whether <*resolves* 3> of Resolution 49 (WRC-97) includes satellite systems already in operation. In view of the Board's decisions, the Bureau revised the list of Russian satellite networks for which due diligence had been originally by 1 July 1998 (in accordance with *resolves* 2) and the Administration of Russia subsequently provided the necessary information.

12 In order to enable the Bureau to process the due diligence information where submission is required before 21 November 2000 for satellite networks or systems recorded in the MIFR, as required by <*resolves* 3> of Resolution 49 (WRC-97), guidance from WRC-2000 is requested to indicate the appropriate regulatory approach to apply concerning the provisions of <*resolves* 3> of Resolution 49 (WRC-97).

Conclusion

13 The Conference is invited to consider the above report and, in particular, to provide guidance to the Radiocommunication Bureau on the matter considered by the RRB (paragraphs 7-10 above). The Conference is also invited to draft a report to the next Plenipotentiary Conference as required by the *resolves* of Resolution 85 (Minneapolis, 1998).

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Addendum 1 to Document 33-E
20 April 2000
Original: Russian

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Russian Federation

PROPOSALS FOR THE WORK OF THE CONFERENCE

AGENDA ITEM 1.13.1

The Russian Federation supports the results of ITU-R studies on non-GSO FSS sharing with space and terrestrial radio services in the frequency bands indicated in Resolutions 130, 131 and 538 (WRC-97), subject to protecting the operation and development of GSO FSS and GSO BSS systems.

The Russian Federation supports the inclusion in the Radio Regulations of the limits on non-GSO FSS system emissions specified in the CPM-99 Report which ensure the protection of existing and planned terrestrial and space service systems.

At the same time, in view of the problems which administrations might face in checking the actual levels of interference caused by non-GSO FSS systems, the Russian Federation proposes:

ADD RUS/33/18

1) the adoption of a new Resolution requesting ITU-R to undertake, as a matter of urgency, further development of methods of checking and measuring levels of $epfd_{down}$ caused by non-GSO FSS systems and of verifying their compliance with operational limits in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz and 19.7-20.2 GHz:

RESOLUTION RRR (WRC-2000)

Further development of methods of checking and measuring the epfd$_{down}$ levels generated by non-geostationary systems in the fixed-satellite service and of verifying their compliance with the operational limits in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz and 19.7-20.2 GHz

The World Radiocommunication Conference (Istanbul, 2000),

considering

a) that WRC-97 adopted, in Article **S22**, provisional epfd limits to be met by non-GSO FSS systems in order to protect GSO FSS and GSO BSS networks in parts of the frequency range 10.7-30 GHz;

b) that WRC-2000 has revised Article **S22** to ensure that the limits contained therein provide adequate protection to GSO FSS and GSO BSS systems without causing undue constraints to any of the systems and services sharing these frequency bands;

c) that Article **S22** contains validation epfd$_{down}$ limits, operational epfd$_{down}$ limits and additional operational epfd$_{down}$ limits for specific antenna diameters applicable to non-GSO FSS systems in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz and 19.7-20.2 GHz;

d) that compliance of a notified non-GSO FSS system with the validation limits will be verified by the Radiocommunication Bureau in accordance with Nos. **S9.35** and **S11.31**;

e) that compliance of an operating non-GSO FSS system with the operational limits and the additional limits for specific antenna diameters is not to be verified by the Radiocommunication Bureau;

f) that administrations responsible for non-GSO FSS systems shall guarantee their compliance with the additional operational epfd$_{down}$ limits;

g) that there is a need to continue developing methods of checking and measuring levels of epfd$_{down}$ generated by non-GSO FSS systems and of verifying their compliance with the operational limits,

recognizing

a) that the ITU-R study groups have developed a recommendation containing a functional description of the software to be used by the Radiocommunication Bureau for verifying the compliance of a notified non-GSO FSS system with the validation epfd$_{down}$ limits;

b) that the ITU-R study groups have concluded that compliance of an operating non-GSO FSS system with the operational epfd$_{down}$ limits can be verified by local measurements and have confirmed the feasibility of carrying out such measurements;

c) that the ITU-R study groups have concluded that compliance of an operating non-GSO FSS system with the additional epfd$_{down}$ limits cannot be verified by local measurements,

resolves to instruct ITU-R

to undertake, as a matter of urgency, further development of methods of checking and measuring levels of epfd$_{down}$ caused by non-GSO FSS systems and of verifying that they meet the operational limits in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz and 19.7-20.2 GHz, *invites administrations*

to participate actively in the aforementioned studies, by submitting appropriate material for consideration in ITU-R,

instructs the Director of BR

to report on the progress of these studies to WRC-02/03.

ADD RUS/33/19

2) the inclusion of the following additional wording in the revised Resolution 130 proposed in the CPM-99 Report:

– under *considering further*:

"*) that WRC-2000 has adopted operational $epfd_{down}$ limits to protect GSO FSS systems in the frequency bands 10.7-12.75 GHz, 17.8-18.6 GHz and 19.7-20.2 GHz which have to be met by non-GSO FSS systems during their operation;"

– under *resolves*:

"2 that an administration responsible for the operation of a non-GSO FSS system shall give any other administration access to information on the current parameters of the orbital constellation of the non-GSO FSS system and other data that may be required in order to check that the non-GSO FSS system meets the operational $epfd_{down}$ limits".

ADD RUS/33/20

3) the addition of the following wording in the notes to Table S22-4A set out in the CPM-99 Report:

"* The operational limits to the $epfd_{down}$ radiated by non-GSO FSS systems shall be the values given in Table S22-1A or Table S22-4A, whichever are the more stringent".

INTERNATIONAL TELECOMMUNICATION UNION

WRC-2000 WORLD RADIOCOMMUNICATION CONFERENCE

Document 33-E
6 March 2000
Original: Russian

ISTANBUL, 8 MAY – 2 JUNE 2000

PLENARY MEETING

Russian Federation

PROPOSALS FOR THE WORK OF THE CONFERENCE

In preparing for WRC-2000, the Russian Federation has focused on the need to ensure smooth operation, future development and enhancement of operating and planned radio services, taking into account technological progress and international cooperation for improving the efficiency of use of the radio-frequency spectrum.

The Russian Federation highly commends the results of the studies carried out within ITU in preparation for WRC-2000, reflected in the Report of the Conference Preparatory Meeting (CPM-99), which constitutes a sound basis for discussion and decision-making at the conference. The Russian Federation also considers the preparatory work carried out within regional organizations to be extremely fruitful and useful.

While on the whole supporting the conclusions in the CPM-99 Report and associating itself with a number of common European proposals, in order to complement and expand upon those conclusions and proposals the Russian Federation wishes to submit the following proposals to WRC-2000 on various agenda items.

Agenda item 1.1

The Russian Federation proposes that the Russian Federation's name be deleted from footnotes S5.387 and S5.418.

MOD RUS/33/1

S5.387 *Additional allocation:* in Armenia, Azerbaijan, Belarus, Georgia, Kazakstan, Mali, Mongolia, Uzbekistan, Kyrgyzstan, Slovakia, the Czech Republic, Romania, ~~Russian Federation,~~ Tajikistan, Turkmenistan and Ukraine, the band 1 770-1 790 MHz is also allocated to the meteorological-satellite service on a primary basis, subject to agreement obtained under No. **S9.21**.

MOD RUS/33/2

S5.418 *Additional allocation:* in Bangladesh, Belarus, China, Rep. of Korea, India, Japan, Pakistan, ~~Russian Federation,~~ Singapore, Sri Lanka, Thailand and Ukraine the band 2 535-2 655 MHz is also allocated to the broadcasting-satellite service (sound) and complementary terrestrial broadcasting service on a primary basis. Such use is limited to digital audio broadcasting and is subject to provisions of Resolution **528 (WARC-92)**. The provisions of No. **S5.416** and Article **S21**, Table **S21-4**, do not apply to this additional allocation.

Agenda item 1.4

With respect to Resolutions 128 (WRC-97), 129 (WRC-97) and 134 (WRC-97), the Russian Federation, on the basis of the material in the CPM-99 Report, considers that the band 40.5-42.5 GHz may be allocated for the fixed-satellite service with the appropriate pfd limits at the Earth's surface indicated in the CPM Report, which make sharing possible between FSS space stations and terrestrial systems in the fixed service. The CPM Report also states that sharing between FSS receiving earth stations and FS transmitting stations is technically feasible with geographical separation between the systems by means of coordination areas. It is also necessary to limit out-of-band emissions from FSS space stations in order to protect the radio astronomy service in the adjacent band 42.5-43.5 GHz (Recommendation ITU-R RA.796-1). Allocation of the band 40.5-42.5 GHz for the FSS should not modify the existing allocation of that band under Article S5 of the Radio Regulations.

Allocation of the band 40.5-42.5 GHz to the FSS (space-to-Earth) in Region 1 will make it possible to allocate this band to various radio services on a worldwide basis.

MOD RUS/33/3

ADD RUS/33/4

S5.XXX The aggregate power flux-density radiated in the band 42.5-43.5 GHz by all space stations of any non-GSO FSS (space-to-Earth) system operating in the band 41.5-42.5 GHz shall not exceed –137 dB(W/m^2) in any 1 GHz band at the site of a radio astronomy station for more than 2% of the time. The power flux-density radiated in the band 42.5-43.5 GHz by GSO FSS (space-to-Earth) systems operating in the band 41.5-42.5 GHz shall not exceed –137 dB(W/m^2) in any 1 GHz band at the site of a radio astronomy station. These limits will be refined in accordance with Resolution **128 (Rev.WRC-2000)**.

Reasons: To protect radio astronomy.

MOD RUS/33/5

RESOLUTION 128 (Rev.WRC-~~97~~2000)

Allocation to the fixed-satellite service (space-to-Earth) in the 41.5-42.5 GHz band and protection of the radio astronomy service in the 42.5-43.5 GHz band

The World Radiocommunication Conference (~~Geneva, 1997~~Istanbul, 2000),

considering

a) that ~~this Conference has added a primary allocation~~the band 41.5-42.5 GHz is allocated to the fixed-satellite service (space-to-Earth) ~~in the band 41.5-42.5 GHz~~ in all Regions ~~2 and 3 and in certain countries in Region 1~~ and that this band is adjacent to the band 42.5-43.5 GHz which is allocated, *inter alia,* to the radio astronomy service for both continuum and spectral line observations;

b) that unwanted emissions from space stations in the fixed-satellite service (space-to-Earth) in the band 41.5-42.5 GHz may result in harmful interference to the radio astronomy service in the band 42.5-43.5 GHz;

c) that various technical means may be used to reduce these unwanted emissions from space stations in the fixed-satellite service;

d) ~~that a limited number of radio astronomy stations worldwide require protection, and that there may be means to limit the susceptibility of radio astronomy receivers to interference~~that WRC-2000 has set preliminary limits to protect the radio astronomy service from unwanted fixed-satellite service emissions in the band 41.5-42.5 GHz,

taking into account

the relevant provisions of the Radio Regulations,

~~*resolves*~~

~~that administrations shall not implement fixed-satellite systems in the band 41.5-42.5 GHz until technical and operational measures have been identified and agreed within ITU-R to protect the radio astronomy service from harmful interference in the band 42.5-43.5 GHz,~~

invites ITU-R

1 to ~~study~~carry out studies, as a matter of urgency, ~~the harmful interference that space stations in the fixed-satellite service (space-to-Earth) operating in the band 41.5-42.5 GHz may cause to stations~~ in order to refine the preliminary pfd limits established in No. **S5.XXX** so as to protect the radio astronomy service ~~operating in the band 42.5-43.5 GHz~~from unwanted fixed-satellite service emissions in adjacent bands;

2 to identify technical and operational measures that may be taken to protect stations in the radio astronomy service operating in the band 42.5-43.5 GHz, ~~including geographical separation and out-of-band emission limits to be applied to space stations operating in the fixed-satellite service in the band 41.5-42.5 GHz,~~ as well as measures that may be implemented to reduce the susceptibility of stations in the radio astronomy service to harmful interference;

3 to report on the results of these studies to the Conference Preparatory Meeting for WRC-~~99~~03,

urges administrations

to participate actively in the aforementioned studies by submitting contributions to ITU-R~~,~~.

~~*requests*~~

~~WRC-99 to take appropriate action based on those studies.~~

Reasons: Preliminary technical and operational measures having been identified to protect the radio astronomy service in the band 42.5-43.5 GHz from harmful interference caused by the fixed-satellite service operating in the adjacent band, Resolution 128 needs to be amended to provide for further studies with a view to refining those measures.

Agenda item 1.6.1

Terrestrial component of IMT-2000

Introduction

The Russian Federation supports the studies carried out by ITU-R, but believes that the adoption of a decision on the allocation of additional frequency bands should not be considered before WRC-03, on the basis of practical experience once the operation of IMT-2000 systems has started in existing allocations under No. S5.388. In taking the decision, account should be taken of the economic consequences of reallocating frequencies and the different requirements in terms of additional allocations for both the terrestrial and the space component in different countries of the world.

RUS/33/6

The Russian Federation proposes that no amendments be made to the current provisions of the Radio Regulations with respect to additional allocations for the terrestrial component of IMT-2000 at this Conference, and that supplementary studies be pursued with a view to adopting an appropriate decision at a forthcoming WRC. It also proposes that footnote S5.388 and Resolution 212 (WRC-97) should be maintained as they stand.

Reasons:

1 WARC-92 allocated the frequency bands 1 885-2 025 MHz and 2 110-2 200 MHz for IMT-2000 in accordance with the provisions of No. S5.388, including the bands 1 980-2 010 MHz (uplink) and 2 170-2 200 MHz (downlink) for the space component. The basic provisions associated with that allocation were incorporated by WARC-92 in the text of Resolution 212 (WRC-97), since amended in the light of the results of WRC-95 and WRC-97. Subsequently, in the course of WRC-95, the frequency bands 2 010-2 025 MHz (uplink) and 2 160-2 170 MHz (downlink) within the IMT-2000 range in Region 2 were allocated for the mobile-satellite service (MSS).

2 In order to satisfy future spectrum requirements for IMT-2000, and especially its terrestrial component, WRC-2000 agenda item 1.6.1 includes a review of spectrum and regulatory issues pertaining to the use of the spectrum by advanced land mobile radiocommunication systems in the context of IMT-2000, noting that there is an urgent need to provide more spectrum for the terrestrial component of IMT-2000 and that first priority should be given in this allocation to land mobile service applications.

3 The CPM Report considers overall requirements for the terrestrial component of IMT-2000 in areas with the highest forecasted traffic demand in all three Regions[1] as the sum of:

---

[1] 555 MHz in Region 1, 390 MHz in Region 2 and 480 MHz in Region 3.

the frequency bands already allocated for IMT-2000 under No. S5.388; the frequency bands allocated in the three Regions for existing second-generation mobile radiocommunication systems; and additional frequency bands. According to ITU-R calculations, the amount of additional spectrum required in the 2010 time-frame is 160 MHz for all three Regions. However, this conclusion fails to take into account the following factors:
